A
MEDICINAL
DICTIONARY:

INCLUDING

PHYSIC, SURGERY, ANATOMY, CHYMISTRY, AND BOTANY,

In all their BRANCHES relative to MEDICINE.

TOGETHER WITH A

HISTORY *of* DRUGS;

An ACCOUNT of their Various

PREPARATIONS, COMBINATIONS, and USES;

AND AN

INTRODUCTORY PREFACE,

Tracing the PROGRESS of PHYSIC, and explaining the THEORIES which have principally prevail'd in all Ages of the World.

With COPPER PLATES.

By *R. JAMES*, M.D.

VOL. II.

The LORD *hath created Medicines out of the Earth, and he that is wise will not abhor them,* Eccleſiaſticus, Chap. xxxviii. Verſe 4.

A

MEDICINAL DICTIONARY:

BEING A

BODY of PHYSIC and SURGERY.

CAL CAL

CALDAR, Tin. *Johnson.*

CALDARIUM. The ſame as *Laconicum*. *Blancard.* See LACONICUM.

It alſo imports any Veſſel for boiling Liquids.

CALDERIÆ *Italicæ*. Hot Baths near *Ferrara* in Italy, good in Difficulty of Urine. *Caſtellus.*

CALDUS, for CALIDUS, (θερμὸς) is frequently uſed by *Scribonius Largus. Caſtellus.*

CALEFACIENTIA.

The *Calefacientia* of the *Latins* are the ſame with the θερμαίνοντα of the *Greeks*, and denote no more than what we commonly call *warming Medicines.* That the Natures and Qualities of the ſeveral Medicines, coming under this Denomination, may be the more thoroughly underſtood, it is neceſſary to obſerve, that there may be Heat without any external Appearance of Fire, and that it diſcovers its Preſence by numberleſs Effects; but in no Caſe more conſpicuouſly than by the Dilatation of the Air in the Thermometer, *Boerhaave's Chym. Vol.* 1. The Means, then, by which Warmth is generated in Bodies, are the very ſame with thoſe by which apparent Fire is produced: Where there is Heat, there alſo is a proportionable and correſpondent Motion and Agitation of the Parts of the Body ſaid to be hot; and, *vice verſa*, where there is an Agitation of the Parts, there is a proportionable Heat or Warmth.

Motion, conſidered in an abſtract and metaphyſical Light, does not generate Heat, ſince a Body, moving *in Vacuo*, can never produce any ſuch Effect; ſo that Warmth muſt be originally owing to a briſk and lively Attrition of ſuch Bodies as are naturally ſuſceptible of Heat, and capable of communicating it, *Mazini Mech. Med.* and *Acta Eruditorum Lipſiæ*, for the Year 1729. The Generation of Heat in Bodies, and its ſeveral Degrees, are determined by three Mechanical Axioms; the firſt of which is,

1. That the more denſe the Matter is, the Degree of Heat generated is proportionably the greater: By the Laws of Mechanics, if two Bodies move with an equal Degree of Velocity, the Effects produced by them will bear a direct Proportion to their reſpective Denſities, or Quantities of Matter.

2. The greater or ſtronger the mutual Preſſure of the Parts of one Body upon thoſe of another is, the Heat generated is, *cæteris paribus*, proportionably the more intenſe: Thus two Plates of Iron, gently and ſlowly moved upon each other, do not produce the ſame Degree of Heat, as when the Attrition is ſtronger and briſker.

3. The denſer Bodies are, the ſtronger their mutual Preſſure, and the quicker their Motions, the greater is the Degree of Heat produced; for in proportion as the Velocity is increaſed, ſo the mutual Reſiſtance between the Body moved, and that which may be ſaid to ſuſtain the Motion, is augmented.

From theſe Conſiderations we come to underſtand, why ſuch human Bodies as are denſe, hard, ponderous, robuſt, accuſtom'd to Exerciſe, and abound with compact Humours and Juices, are always found not only warmer, but alſo require a longer time to become cold than others; ſince ſuch Bodies, by a vigorous Application of the Solids to the Fluids, render'd denſe by Compreſſion, may reaſonably be ſuppoſed not only to generate a greater Degree of Heat, but alſo to retain it longer than Bodies of an oppoſite Make, or in another State. Hence alſo we underſtand, why the internal Parts of Carcaſes, deprived of vital Heat, grow cold very ſlowly; whereas their external Parts become ſo very ſoon. On the contrary, it is obvious, that lax, flaccid, languid, and weak Bodies, can never excite ſuch a Degree of Heat in their aqueous Humours; becauſe the Attrition of their Parts being weaker, their Fluids muſt be leſs denſe, and the Surfaces of their Parts the more lax, and conſequently leſs capable to retain the generated Heat. See *Boerhaav. Chym. Vol.* 1. *Ariſtotle* was well appriſed how much the Denſity or Thinneſs of the Blood, flowing in the Veſſels of Animals, contributed to generate or produce Heat in their Bodies, as is obvious from the following Paſſage in *Lib.* 2. *Cap.* 4. *de Part. Animal.* "That Blood, ſays he, which is too much di-"luted, is cold, and conſequently cannot become hard: But "thoſe Animals whoſe Blood abounds with a great Number of "groſs thick Fibres, have more of an earthy Principle in their "Conſtitutions, and are fierce, wrathful, and furious, for "Rage begets Warmth; and ſolid Bodies, and all Subſtances "of a firm Texture, when become hot, warm more power-"fully than ſuch as are of a moiſt and humid Nature. Now "the Fibres of ſuch Animals are ſolid, and of a terreſtrial "Nature; ſo that, by Rage, Fermentations and preternatural "Heats are excited in the Blood: Hence it happens, that "Bulls and Boars are of a fierce, a wrathful, and furious Diſ-"poſition, becauſe their Blood abounds more in ſolid Fibres "than that of ſome other Animals." For the Maſs of Blood conſiſts not only of red Globules, ſuch as come more ſtrictly under the Denomination of Blood, but alſo of Serum, in which theſe Globules ſwim; and the larger the Quantity of Serum is, the thinner and more diluted the Maſs of Blood muſt of courſe be, and *vice verſa*. On the other hand, the thinner the Blood is, the more faint and weak the Attrition cauſed by its Motion muſt be; and the weaker its Attrition is, the ſmaller the Degree of Heat generated muſt be; therefore the thinner the Maſs of Blood is, the fainter the Heat produced by it muſt be, and *vice verſa*. *Boerhaav. Inſtitut. Med. Sect.* 223. Hence the Reaſon is obvious, why Men of hardy robuſt Conſtitutions, who have their Veſſels fill'd with a thick and rich Blood, are more ſubject to burning Fevers, and inflammatory Diſorders, than thoſe of lax and weak Conſtitutions, whoſe Veſſels contain a thin and much diluted Blood. Hence alſo appears the Reaſon, why Veneſection is the moſt infallible Method of diminiſhing the Heat of the Body; becauſe, by leſſening the Quantity of the Blood, its Attrition in the Veſſels, on which the Denſity of the Humours depends, is proportionably leſſen'd. But to conſider the Method in which Heat is generated and increaſed in the human Body, a little more accurately: The Blood itſelf is a Body; the Heart alſo, and an Artery, are Bodies; and conſequently the Heart cannot contract itſelf without preſſing upon the Blood, and this Preſſure is continued by the Arteries. When a Body moves through a Cylinder, the Attrition produced is little or none at all; whereas when the ſame Body moves from the Baſe towards the Apex of a conical Canal, it muſt ſtrike againſt its Sides: Hence ariſes a Repercuſſion, and conſequently an Attrition. Now the Arteries of our Bodies are ſuch conical Canals, and conſequently reſiſt the Impreſſion of the Blood; therefore an Attrition muſt neceſſarily be produced; and by Natural Philoſophy we are taught, that where there is Attrition, there alſo muſt be Heat; ſo that there can be no Heat in the human Body, but what is produced by the Circulation of the Fluids; and when this Circulation is ſtopp'd, the Heat is of courſe deſtroy'd. Hence the Degrees of Heat, in a human Body, are moſt properly eſtimated by the

Pulſe; ſince the beſt Pulſe denotes an equable Heat diffuſed thro' all the Body; whereas the Pulſe, preternaturally increaſed or diminiſh'd, indicates a proportionable Increaſe or Diminution of Heat, *Boerhaav. Inſtit. Med. Sect.* 220. and 968. Hence the Reaſon is obvious, why the Arterial Blood of the Brain is the coldeſt of any; ſince, in the Arteries of the Brain, the Syſtole and Diaſtole are very faint and languid, becauſe, upon their entering the Cranium, they loſe their muſcular Coat. This Obſervation, for the ſame Reaſon, holds true with regard to the Blood in the Bones. The muſcular Coat of the Arteries produces a proportional Preſſure of the Parts of the Blood upon each other: Hence ariſes Attrition, and this Attrition ceaſing, or being diminiſh'd, the Heat accordingly ceaſes, or is impair'd. From theſe Circumſtances we are alſo able to account for the arterial Blood being hotter than the venous Blood, ſince, in the Arteries, the Blood is always carried from wider into narrower Parts, where the Reſiſtance, the Preſſure, the Attrition, and conſequently the Heat, are increaſed; whereas, in the Veins, the Blood is carried from narrower into wider Parts, where the Reſiſtance, the Preſſure, the Attrition, and conſequently the Heat, are diminiſh'd. The Reaſon why ſome Men, otherwiſe in a good State of Health, who faint away upon ſeeing Phlebotomy perform'd, firſt become cold at the Extremities, is, becauſe in theſe Parts the Humours firſt begin to ſtop. Since, then, all the Heat in a human Body is produced by the Motion of the Fluids, and ſince the Exceſs of Heat bears a joint Proportion to the Attrition of the moving Fluids with themſelves, and with the Veſſels in which they flow, it is hence obvious, that whatever increaſes the Velocity of their circulatory Motion, muſt of courſe augment the Heat of the Body; ſo that, by Motion or Exerciſe alone, the Degrees of Heat are not only increaſed in a human Body, but alſo bear a Proportion to the Velocity of that Motion, whether it be Running, or any other kind of Exerciſe. The Reaſon why *Hippocrates*, in the fifteenth Aphoriſm of his firſt Section, aſſerts, that in Winter, and the Spring, the Belly is naturally hotter than at other Seaſons, is, becauſe at theſe Times the Blood flows thro' Veſſels braced up, and render'd narrow, by the Influence of the external Cold; for, if the ſame Quantity of any Liquid is to move thro' a Veſſel or Canal narrower by one half than the Veſſel it formerly moved in, it will flow quicker by one half than it did in the other: Hence its Attrition, and conſequently its Heat, muſt be increaſed. "The "Circulation of the Blood," according to *Hoffman*, in *Med. Rat. Syſt.* "is the immediate and productive Cauſe of Heat in "the human Body; and all Subſtances which increaſe this "Circulation, produce correſpondent Degrees of Heat in it; "whereas ſuch Subſtances as retard its Motion, of courſe pro- "portionably impair the Heat." From what has been ſaid, it is obvious, that under the Denomination of heating Medicines, all ſuch are to be rank'd, as increaſe the Velocity of the Circulation, and produce a greater Preſſure of the Veſſels upon the Fluids; ſince upon this Circumſtance depends the Denſity of the Humours, which, as it is the principal Cauſe, ſo may it alſo prove the Effect of an increaſed Degree of Heat. Among the Medicines of this Kind, we may reckon,

1. Stimulating Subſtances, among which are the Four greater hot Seeds of Aniſe, Caraway, Cumin, and Fennel; the Four leſſer hot Seeds of Biſhops-weed, Stone-parſley, Smallage, and wild Carrot; and the Four hot Ointments, which are the *Ointment of Marſhmallows*, that of *Agrippa*, that call'd the *Unguentum Aregon*, and the *Unguentum Martiatum*.

2. To this Claſs alſo belong Aſtringents, and ſuch Subſtances as block up the Pores externally; ſuch as moderate Cold, a heavy Air, cold Water, tight Cloaths, or thick Bedcloaths.

3. Among ſuch Things as increaſe the Heat of the human Body, we may alſo reckon Muſcular Motion, and principally Frictions.

In the laſt Place, to this Claſs belongs external Heat, whether occaſioned by the Fire, or the Air; to which we may alſo refer the warm Atmoſphere immediately ſurrounding the Body itſelf, when ſhut up from a Communicaton with the neighbouring cool Air; when, for Inſtance, the Body, being covered cloſe up in Bed, becomes gradually warmer by the Heat exhaled from itſelf. According to *Celſus*, *L.* 1. *C.* 3. "the Degrees "of Heat are increaſed in the Body by Unction, by Salt-water, "eſpecially if hot, by all ſaline Subſtances, and by auſtere "Wine." The Diſtinction of heating Medicines, according to their ſeveral Degrees, ſeems to bear an Air of Abſurdity in it, ſince theſe Degrees cannot be abſolutely determined, but are merely relative to the ſeveral Conſtitutions to whom ſuch Medicines happen to be exhibited. As for Heat externally apply'd to the Body, 'tis to be obſerv'd, that a dry Heat is more proper for generating Warmth in the Conſtitution, than a moiſt one; ſince the latter, at firſt, excites the Senſation of Heat, but afterwards augments the Cauſe from which the Senſe of Cold proceeds, by relaxing the Veſſels, diminiſhing their Reſiſtance, and conſequently impairing the Preſſure which ought to be made upon the Fluids. In this Senſe we are to underſtand *Hippocrates*, when, in the ſixteenth Aphoriſm of his fifth Section, he aſſerts, that "too frequent an Uſe of hot Subſtances is attended "with Tenderneſs of the Fleſh, and Weakneſs of the "Nerves."

Old Perſons, and People of wither'd, dry, and rigid Conſtitutions, ſeem to be proper Exceptions from this Rule; ſince, in conſequence of the Relaxation to be expected from a moiſt Heat, the Paſſages of the Humours, through their capillary Veſſels, are render'd more free and open. The Health of ſuch Patients is, according to *Valleſius*, in his *Philoſophia Sacra*, moſt effectually conſulted by following the Example of pious King *David*, in the like Circumſtances. *Langius*, in the twelfth Epiſtle of his firſt Book, among the Fomentations which afford the moſt kindly Warmth, reckons a young Puppy, or a little Boy, laid in the Boſom of an old Man; and immediately ſubjoins theſe Words: "Thus," ſays he, "when "*David* was ſeventy Years of Age, and his native Heat ſo "much exhauſted, that he could not become warm by any "other Means, he, by the Advice of his Phyſicians, got *Abi-* "*ſhagh*, the lovely *Shunamite*, to ſleep in his Arms, that the "decay'd Strength of his Stomach might be reſtored by the "kindly Warmth imparted by the blooming Lady."

When the Parts are refrigerated by the external Air, provided they are not become quite rigid by the Exceſs of the Cold, and the Blood is ſtill capable of circulating, they are reſtored to their former Vigour, by being firſt immerſed in cold Water, and afterwards beſprinkled with it; upon which they begin gradually to aſſume a genial Warmth. *Levini Lemnii occulta Naturæ Miracula*, *L.* 4. *C.* 20.

From what has been ſaid it is obvious, that heating Medicines are not only proper, but neceſſary, where thin and diluted Humours are to be inſpiſſated; where the ſolid Parts, become flaccid, are to be rendered tenſe; and where the Circulation of the Juices is either to be promoted when ſtopt, or accelerated when too faint and languid, the Pulſe of the Patient, in the mean time, directing the Phyſician how far to carry on his Deſign: So that heating Medicines, ſkilfully apply'd, muſt be adapted to what we call cold Conſtitutions; to ſuch as abound with a recrementitious Mucus, to ſuch as are too much relaxed, to the Leucophlegmatic, and conſequently to ſuch as are afflicted with œdematous Tumors. But they who practiſe Phyſic ought to take due Care, that heating Medicines be exhibited gradually; and that the Body be not warm'd by their Influence all on a ſudden, leſt, by that means, the Fluids, ſtagnating in the flaccid Veſſels, ſhould be too haſtily driven into the capillary Veſſels, and there form the moſt dangerous Obſtructions. A Man, for Inſtance, who, by being long accuſtomed to a ſedentary Life, and a want of due muſcular Motion, is become pale, and has acquired a flaccid State of all his Fibres, when, all on a ſudden, he uſes any violent Motion, or takes large Doſes of intenſly hot Medicines of the more ſtimulating and acrid Kind, he immediately begins to breathe with Difficulty, and dread a Suffocation, in conſequence of the Humours moving too violently through the Veſſels, as yet too lax, and unable to make a mutual Reſiſtance to the Impetus of the Fluids, which of courſe ruſh into the capillary Veſſels, and diſtend them ſometimes to ſuch a Degree as to burſt them, and occaſion a Diſcharge of their Contents. Accidents of this Nature happen not only in cachochymic Habits, which abound with acrid and viſcid Humours, but alſo in plethoric Conſtitutions, where the Juices are good, but move in too ſlow and languid a manner. *Boerhaav. Aph.* 118. But as a temperate Heat is abſolutely neceſſary for the Preſervation of Life and Health, ſo, as we are told by *Hoffman*, in his *Med. Rat. Syſt.* if this Heat is increaſed beyond its due Degree, an irreparable Loſs of the finer Fluids is ſuſtained; and all thoſe Diſorders brought on, which draw their Origins from the Juices being too much inſpiſſated, or rendered acrid by the Diſſipation of their diluting, balſamic, and aqueous Parts. According to *Hoffman*, in *Med. Rat. Syſt.* "Heat generates Salts in the Juices of Animals; "for which Reaſon, when the Heat is increaſed, as happens in "Fevers, the Urine contains a larger Quantity of Salts, and is "of a deeper Colour; whereas the more moderate the Heat of "the Body is, which is generally the Caſe with thoſe habitu- "ated to a Life of Eaſe and Temperance; the fainter the Co- "lour of the Urine is, and the ſmaller Quantity of Salts it con- "tains." From this Paſſage we learn, that a Change in the State and Condition of the Urine is another Sign of the Heat of the Body being increaſed or diminiſh'd; by which, as well as the State of the Pulſe, the Phyſician ought to be directed in the Uſe of heating Medicines. From what has been ſaid, it is obvious, that the Uſe of hot Subſtances is prejudicial in rigid Bodies, where the Juices move quickly, and with a conſiderable Impetus; and conſequently, that they muſt abſolutely be abſtain'd from in feveriſh Heats, and acute inflammatory Diſorders. According to *Hoffman*, in the Treatiſe laſt quoted, "Hot Subſtances, and ſuch as agitate the Blood too violently, "eaſily convert a mild Humour into a Poiſon, and a mild Di- "order into one of the malignant Kind." He alſo adviſes "you

" young Men, and ſuch as are in the Vigour of their Age, to " abſtain, as much as poſſible, from ſuch Subſtances as are hot, " or have a Tendency to throw the Blood into Commotions; " leſt, by ſuch a Piece of Imprudence, they ſhould be ſuddenly " cut off by inflammatory Diſorders." That heating Medicines ought alſo to be ſparingly and cautiouſly exhibited to Infants, is alſo obvious, ſince their Juices are eaſily put into Motion, and their Veſſels ſoon irritated; for, according to *Hippocrates*, in the fourteenth Aphoriſm of his firſt Section, they who are in a growing State contain a great deal of innate Heat. Now, that heating Medicines perform the various Offices of Corroboratives, Reſolvents, and Diſcutients, is ſufficiently obvious to any one that conſiders, that the Fibres, the Membranes, and the Blood-veſſels, derive a certain Tone, and elaſtic Force, from heating Subſtances; by which means the Circulation of the Juices is render'd briſk and lively. But that an Exceſs of this Heat renders People weak and languid, is a Truth confirm'd by Experience: The Reaſon of it ſeems to be, that the thin and aqueous Humours of the Body being too much exhauſted, the Blood muſt, of courſe, be deprived of the Matter allotted by Nature for the Reparation and Nouriſhment of the Solids. The incomparable *Boerhaave*, after making repeated Experiments by means of *Fahrenheit*'s Mercurial Thermometers, in order to determine the greateſt Degree of Heat the human Body could endure or breathe in, affirms, that the vital Heat in Men amounts to ninety-two Degrees; whereas in Children it often amounts to ninety-four; that a Man is always hotter than that Portion of the Atmoſphere which ſurrounds him; and that he cannot bear a Heat in his Body greater than an hundred and a few odd Degrees, without a Ceſſation of the Circulation, and Death; in which Caſe the Injury is firſt diſcover'd by a Depravation of the ſeveral Actions of the Head and Lungs. He alſo affirms, that no one can live in an Air which has ninety Degrees of Heat; but that all Animals hitherto known die very quickly in it. *Boerh. Chym.*

CALENDULA. A Plant uſually thus diſtinguiſh'd.

Calendula, Offic. *Calendula ſativa*, GARDEN MARIGOLD, Raii Hiſt. 1. 337. Hort. Monſp. 28. *Calendula ſimplici flore*, Ger. 601. Emac. 739. *Calendula ſimplex*, Park. Parad. 298. *Caltha flore ſimplici*, J. B. 3. 101. Cod. Med. 25. Hiſt. Oxon. 3. 13. *Caltha vulgaris*, C. B. 275. Tourn. Inſt. 498. Boerh. Ind. A. 113. *Chryſanthemum*, *Caltha*, *Calendula*, Chab. 358. GARDEN MARIGOLD.

The Root of the Marigold is thick, whitiſh, and ſucculent, not much branch'd, and dying as ſoon as it has ripen'd the Seed. The Leaves are long, pretty thick, and juicy, of a pale-yellow Colour, broader at the End than at that Part next the Stalk, ſomewhat clammy in handling; the Stalks grow a Foot or more high, beſet with ſmaller Leaves. The Flowers grow ſingly at the End of the Stalks, conſiſting of a Border of yellow Petala, ſet about a middle Thrum, of dark-reddiſh fiſtular Floſculi; of a ſtrong, ſomewhat reſinous, Smell, ſtanding in green, ſcaly Calyces, likewiſe clammy in feeling. The Seed is pretty large and crooked, of a browniſh Colour. *Miller's Bot. Off.*

Of the *Caltha*, or *Calendula*, there are ſeveral Species; but the moſt noted for Medicinal Virtues is that mentioned above.

This Plant is frequently found in the Gardens, and is of ſo prolific a Nature, that 'tis no eaſy Taſk to root it out of a Soil in which 'tis once ſown. It begins to flower in the Month of *May*, and continues to produce Flowers through all the Summer Months; from which Circumſtance ſome imagine it has receiv'd the Names *Calendula*, and *Flos omnium Menſium*. Some call it *Solſequia*, or *Solſequium*, and *Sponſa Solis*; becauſe its Flower opens at the Riſing, and ſhuts at the Setting, of the Sun.

According to *Bruyerinus*, this Herb is frequently prepared in Broths; and its Leaves, when firſt appearing, are made an Ingredient in Sallads. The Flowers are only uſed in the Shops. Theſe are of an aromatic Smell; and when chew'd, exert a penetrating, and almoſt burning Acrimony: Hence they derive their ſudorific Virtues, in which they are ſcarce inferior to Saffron itſelf. For this Reaſon the Flowers of the *Marigold* have merited a Place among the Catalogue of Alexipharmacs; and, according to *Schulzius*, in his *Prælectiones*, have had uncommon Efficacy aſcribed to them, by ſome very celebrated Phyſicians, in the Cure of malignant and peſtilential Fevers. *Velſchius* informs us, that upon the breaking out of a peſtilential Fever, *Le Fevre* preſcribed the Juice of the *Marigold*, to be taken in White-wine as a Vehicle, by which moſt of the Patients who uſed it recover'd; and that this ſame Medicine was the celebrated *Arcanum* of *Veſlingius*, *Eph. N. C. D.* 1. *a.* 4. According to *Ray*, the Juice may be given from one Ounce to two, for the ſame Intention. In Conſequence of the Flowers of the Marigold being poſſeſſed of an alexipharmac and ſudorific Quality, they are, by ſome, added, as a fifth, to the other four Cordial Flowers. They may be properly preſcribed where-ever ſtimulating Medicines are neceſſary; for which Reaſon a Decoction of them is frequently exhibited, in order to promote an Eruption of the Small-pox; and, according to *Ray*, a Poſſet-drink, impregnated with the Flowers, has for a long time been uſed in *England*, to anſwer the ſame Intention. By reaſon of their reſolvent and aperient Qualities, they are uſed in Decoctions for the Cure of the Jaundice, and for provoking the obſtructed Menſes. Beſides, when uſed as an Ingredient in Vapour-baths, they not only excite the Menſes, but alſo expel the Fœtus and Secundines. *Etmuller*, for the Cure of the Yellow-jaundice, recommends an Ounce of the expreſs'd Juice of the Flowers to be taken with one Dram of the Powder of Earth-worms, upon an empty Stomach. But the ſame Author informs us, that *Riverius* thought the Flowers appropriated and adapted to provoke the Menſes. Theſe Flowers bruiſed with Wine, and beſprinkled with Salt, contribute, when externally apply'd, to the Diſcuſſion of Tumors. " I was informed," ſays *Paulli*, " by a Man of Candor, that Warts were extir- " pated by the Juice of freſh-gathered Marigold-flowers: But " the Practice of anointing the Warts three different times up- " on three *Fridays*, is too ſuperſtitious to deſerve the Counte- " nance of a Perſon of Senſe; for they muſt be anointed with " this Juice till we obſerve them fade, and fall off." On account of the Efficacy of the Marigold in extirpating Warts, it is by ſome called *Verrucaria*. According to *Moriſon*, the Flowers reduc'd to a Powder, cure the Tooth-ach, if laid upon a little Cotton, and apply'd to the Part affected.

The Country Women have a Cuſtom of churning the Flowers with their freſh Butter, in order to give it a grateful yellow Colour. *Moriſon* informs us, that the Leaves of the Herb are ſaid to be hot, and to contain a certain heating Acrimony, which yet does not exert itſelf at firſt, on account of the Moiſture with which it is join'd. For this Reaſon they are ſaid to render the Body ſoluble, if uſed as other Pot-herbs. Hence we may reaſonably conjecture, that the Uſe of the Marigold-leaves in Food is proper for ſuch as have any ſcorbutic Taint in their Conſtitutions. According to *Paulli*, *Camerarius* preſcribes the Seeds of the Marigold againſt Worms, and affirms, that for anſwering that Intention, they are equal to thoſe of Sorrel, Purſlain, and Plantain, which are ſaid to be effectual againſt all Worms whatever. Vinegar of Marigold-flowers is recommended as an Antidote againſt the Plague, if the Phyſician takes ſome Ounces of it before he attends Patients labouring under that Diſtemper. With this View it is alſo apply'd to the Wriſts, the Temples, and the Noſtrils. It is certain, that common Wine-vinegar alone produces the ſame Effect in the like Caſe; for which Reaſon *Schulzius* affirms, " That if the *Marigold* Flowers do not much augment the " Virtues of the Vinegar, yet 'tis at leaſt certain they neither " deſtroy nor diminiſh them." According to *Moriſon*, the Water diſtil'd from Marigold-flowers is a ſpeedy and infallible Cure for Redneſs and Inflammations of the Eyes, if dropt into them in the Morning, and at Night; or if a Piece of Linen Cloth, or a little Cotton, is dipt in it, and laid over the Eyes. This Water is alſo ſaid to be effectual againſt the Plague; and the Conſerve is extol'd as anſwering the ſame Intention. The *Unguentum Calendulæ Florum*, in the *Diſpenſatorium Pharmaceuticum Ratiſbonenſe*, is prepared by boiling freſh-gather'd Marigold-flowers with new and unſalted Butter. The *Syrupus Calendulæ* is, by *Quercetan*, in his *Pharmacopœia Dogmaticorum reſtituta*, recommended as a Specific againſt all paralytic Diſorders.

CALENDULA ARVENSIS.

Calendula ſive Caltha, Cod. Med. 25. *Calendula minor arvenſis*, Rupp. Flor. Jen. 138. *Caltha arvenſis*, C. B. Pin. 276. Raii Hiſt. 1. 338. Tourn. Inſt. 499. Elem. Bot. 399. Herb. Par. 182. Vaill. Bot. Par. 26. Boerh. Ind. A. 113. Hiſt. Oxon. 3. 14. Mart. Hiſt. 1. 135. *Caltha minima*, J. B. 3. 103. *Caltha ſive Calendula minima*, Chab. 359. *Calendula arvenſis*, Ger. 603. *Calendula ſylveſtris*, Ger. Emac. 741. WILD MARIGOLD.

Its Leaves are ſtinking, bitter, and give a faint Tincture of Red to the blue Paper: If burnt in the Candle, they crackle, a little like Nitre; which ſeems to ſhew, that the natural Salt of the Earth is arrived there, with hardly any other Change than being united with a great deal of fetid Sulphur and Earth. Some prefer the wild *Marigold* to that of the Gardens. Its Juice is given from one Ounce to four: They mix an Ounce of it with a Dram of the Powder of Earth-worms, which has imbibed, a little before, ſome Drops of Spirit of Sal Ammoniac. The Infuſion of the Leaves and Flowers of *Marigold* is taken from three Ounces to ſix; the Extract, and the Conſerve, from one Dram to two. All theſe Preparations are excellent for the Jaundice, Palſy, Dropſy, Small-pox, malignant Fevers, and Green-ſickneſs. Its Leaves and Flowers are good to eat as a ſallad, eſpecially for Children who have ſcrophulous Tumors. *Ceſalpinus* preſcribed the Water of *Marigold* for contagious Diſtempers: *Tragus* commended it as an excellent Remedy to cure the Redneſs and Inflammation of the Eyes: *Ceſalpinus* ſyringed the Juice of *Marigold* into the Ears to kill Worms; and applied the Powder, with Cotton, to the Teeth which ached violently: To reſtore the Appetite, he adviſed to uſe the Flowers in Bud, pickled in Vinegar. At *Paris* they apply its Leaves to all ſorts of Tumors, and Ulcers, which have callous Edges,

Edges. For Corns, they put ſome Leaves between the Corn and the Stocking, and do not forbear Walking. *Martyn's Tournefort.*

CALENDULA PALUSTRIS *Populago*, Offic. Raii Synop. 3. 272. Dill. Cat. Giſſ. 52. Elem. Bot. 237. *Populago flore majore*, Tourn. Inſt. 273. Boerh. Ind. A. 298. *Caltha paluſtris*, J. B. 3. 470. Chab. 485. Raii Hiſt. 1. 700. Merc. Bot. 1. 25. Phyt. Brit. 19. *Caltha paluſtris major*, Ger. 670. Emac. 817. Mer. Pin. 18. *Caltha paluſtris vulgaris ſimplex*, COMMON SINGLE MARSH MARIGOLD, Park. Theat. 1213. *Caltha paluſtris flore ſimplici*, C. B. Pin. 276. Rupp. Flor. Jen. 105. Buxb. 50. *Pſeudo-helleborus ranunculoides pratenſis rotundifolius ſimplex*, Hiſt. Oxon. 3. 461. MARSH MARIGOLD. *Dale.*

It grows in watery Soils, and flowers in the Month of *May*. The Herb is only uſed in the Shops; and is ſaid, by *Dioſcorides*, to be good for removing Pains of the Loins. According to *Boerhaave*, it is of a cauſtic Quality, highly acrid, and reſembling Hellebore. *Dale Pharmacol.*

CALENTURE. A ſort of Fever, attended with a ſudden Delirium, which is common to Sailors in warm Climates, eſpecially upon paſſing the *Line*.

The following Caſe will give an Idea of the Diſtemper, and the uſual Method of treating it.

In *Auguſt* 1693. I was call'd, about Four in the Morning, to ſee a Sailor on board the *Albemarle* Man of War in the Bay of *Biſcay*, in a violent Calenture. He was between thirty and forty Years of Age, pretty tall, but thin, and had not much Fleſh about his Bones. When I ſaw him firſt, I found him in the Hands of three or four of his Comrades, who were hardly able to manage him, becauſe of his Strugglings, and conſtant Endeavours to get from them. I obſerved, he very often cried out, He would go into the green Fields: His Looks were as furious and wild as thoſe of a Lion; and, every-now-and-then, he would heartily curſe thoſe that held him. The firſt Thing I did was to examine his Pulſe: I felt, 'tis true, a diſorderly Motion of the Blood in the Artery, and a burning fiery Heat all over his Habit of Body; but could perceive no Diſtinction or Vibration of Pulſe at all. The Surgeon of the Ship, a good experienced Man in that way, had, before I came, attempted to bleed him; but tho' the Vein of the Arm was fairly open'd, yet could he not procure an Ounce of Blood from thence. Upon that I order'd him to open the Frontal Vein, which ſucceeded no better, for that ſoon ſtopp'd too. This put me upon trying, a third time, what Effects the Opening the Jugular Vein might have: From this Vein, tho' our Orifice was pretty large, we had about two Ounces of florid thick Blood, and then it quite ſtopp'd there too. I was, I muſt confeſs, not a little ſurpriſed at this; and order'd the Surgeon to unbind his Arm, and try whether he could make him bleed again at that Orifice, which I remember he did in a ſmall Quantity, and then ſtopp'd as before. However, having three Orifices open at that time, we drew Blood ſometimes from one, and ſometimes the other, where we ſaw it run moſt freely. After ſeveral Eſſays of this Kind, I always obſerved, as the Veſſels emptied, he bled more freely, and as faſt as I deſired. Not long after this, (for he bled well enough now) I obſerved his Strugglings were not ſo ſtrong, his Ravings, and Crying after green Fields, left off, his wild Looks much abated, and not only his Pulſe had recover'd its due and regular Vibrations, but his Heats were moderated too, and the Fury of his Spirits laid to that degree, that he, that juſt now was as furious as a Lion, was grown ſo tame, that one Man was able eaſily to manage him as he pleaſed. In this half Hour, as near as we could gueſs, we took from him about fifty Ounces of Blood from the three Orifices mention'd. By this time I thought we had enough; ſo I order'd him to his Hammack, as ſoon as we had ſecured the Orifices from bleeding again, and directed the Surgeon to give him an Ounce of Diacodium in a Draught of Barley-water, as he went into it. Upon this he ſlept till about Noon, when he awaked with no other Complaint but of Weakneſs from his Loſs of Blood, and a Soreneſs all over his Body, occaſion'd, I preſume, from his violent Convulſions, and Endeavours to get looſe.

It is very probable, that when they are ſeiz'd with this violent Heat and Diſorder, which, for the moſt part, happens in the Night, they ſteal privately over-board into the Sea, imagining they are going into the green Fields: And this I take to be the Reaſon we ſee ſo few; tho' I have heard frequently in the *Mediterranean*, in Summer-time, and very hot Weather, of Seamen loſt in the Night, which the Sailors took for granted were gone off, upon ſuch-like Occaſions, unobſerved. And I remember very well, this Perſon was actually going over-board, when one of his Brethren, who ſuſpected his Deſign, as he told me, caught hold of him juſt as he was going to leap off, call'd for Help, and ſecured him by this Accident. And laſtly, Calentures happen oftener by Night than by Day, becauſe our Ships are moſt cloſely ſhut up by Night, and are leſs airy than they are in the Day-time. *Philoſ. Tranſ. Abr. Vol.* 4. by Dr. *Oliver.*

The following Directions are given by Dr. *Shaw.*

Reſt ſhould be encouraged. Barley-water, with White-wine, is a proper Drink. All Malt-liquors and Spirits are prejudicial. In general, a ſlender liquid Diet is the moſt convenient.

The firſt Step to be taken in the Cure is to bleed the Patient. It not unfrequently happens in this Caſe, that the Veſſels are ſo full, and the Juices ſo viſcid, that ſeveral Veſſels muſt be open'd to obtain the deſired Quantity of Blood; for which Reaſon the Orifice ſhould be made pretty large. The Jugular Vein is here thought preferable to thoſe of the Arm.

Eight or ten Hours after Bleeding, an Emetic may be exhibited; and at Night a large Epiſpaſtic ſhould be applied to the Neck. The Bleeding may be repeated as often as there appears to be Occaſion. A Paregoric ſhould be given at Night, when the Patient goes to Reſt.

When the Diſtemper is pretty well abated, give a lenient Cathartic.

> Take of the beſt Sena-leaves, two Drams and an half; of Rhubarb, cut down, half a Dram; of Salt of Tartar, half a Scruple; of Coriander-ſeeds bruiſed, one Scruple: Infuſe all in a ſufficient Quantity of Spring-water. To every two Ounces and a half of the ſtrain'd Liquor, add of ſolutive Syrup of Roſes, ſix Drams; Syrup of Buckthorn, two Drams; of Spiritus Nitri Dulcis, and Sal Volatile Oleoſum, each thirty Drops: Make up into a Draught, to be uſed in Conjunction with a proper Regimen, and repeated twice or thrice as Circumſtances require.

Gentle Diaphoretics may alſo be of Uſe; and the Cure may be completed with the *Cortex*. This is the common Method of curing a Calenture at Sea.

I have been the leſs copious upon the Subject of a Calenture, becauſe it is a Diſtemper I have never ſeen, nor could I ever get any authentic Account of it from Gentlemen of the Profeſſion who have been at Sea. Some of the Surgeons who attended the laſt Expedition into the *Weſt-Indies*, aſſure me, that they never met with any Diſtemper attended with the Symptoms attributed to a Calenture; and that they believe nothing is meant by it but a violent Fever, attended with a ſudden Delirium.

CALERUTH is an Indication of a Deſire to the firſt Perpetual; as when any Thing has a Deſire to return to the firſt Matter from which it proceeded. *Ruland. Johnſon.*

CALESIAM, H. M. *Arbor baccifera racemoſa, vitis floribus, Acinis oblongis compreſſis monopyrenis.*

It is a very tall and beautiful Tree: The Wood is of a dark-purple Colour, ſmooth, and flexible; the Flowers grow in Cluſters, at the Ends of the Boughs, very like the Flowers of Vines, and are ſucceeded by Berries in Cluſters, like Grapes or Currants, which are of a round oblong Figure, flattiſh, green, cover'd with a thin Rind, and full of a ſucculent and inſipid Pulp, incloſing a green, oblong, flattiſh Stone, within which is a white, and almoſt inſipid, Kernel. Beſides the genuine Fruit, which ſucceeds the Flowers, there is another Sort, which grows to the Trunk and Branches, and is larger than the genuine, wrinkled, Kidney-ſhaped, cover'd with a watery-green Rind, and conſiſting of a green, denſe, and humid Pulp, within which is ſometimes found a ſmall reddiſh Worm. This Baſtard-fruit, as *Ray* remarks, is no other than Galls or Tumors, excited by the Bites of Inſects, to be a Receptacle for their Eggs, and Nouriſhment for their Brood.

It grows every-where in *Malabar*, bears Fruit once a Year, and is fruitful from ten Years Standing to fifty and upwards: Of the Wood they make Sheaths for Knives and Swords.

The Bark pulveriz'd, and made into an Ointment with Butter, cures the Spaſmus Cynicus, and Convulſions excited by great Wounds; and alſo heals malignant Ulcers, and mitigates the Pains of the Gout. The Juice of the Bark cures Aphthæ; and, taken inwardly, is a Remedy for the Dyſentery. The Bark of this Tree, with that of the *Codampulli*, reduced into a Powder, purges the Belly, and carries off pituitous and atrabilious Humours. Half a Tea-cup-full of the Decoction of the Leaves and Bark, in Water, is uſually given to Women juſt before their Labour, in order to promote an eaſy Delivery. *Raii Hiſt. Plant.*

CALI, Pot-aſh. *Rulandus.*

CALICHAPA. The true white Thorn. *Caſtellus.*

CALIDARIUM. The Name by which *Celſus*, *Lib.* 1, *Cap.* 4. calls that Part of the antient Baths which the *Greeks* named πυριατήριον (*Pyriaterium*), or ὑπόκαυσον (*Hypocauſtum*). See BALNEUM.

CALIDRIS *Belonii*, *Jonſt.* in *French*, *Chevalier*. A Water-fowl, of the Bigneſs of a Pigeon, well feather'd, with a long red Bill, blackiſh towards the upper Part; its Head, Neck, Wings, and Tail, are of an Aſh-colour; its Belly white, with very long Legs.

Becauſe its Body is high-mounted, and its Walk ſwift, they call it the *Chevalier*, as tho' it were mounted on Horſeback. It lives about Meadows, Pools, and Rivulets: Its Fleſh is very delicious, and of a good Smell. There are ſeveral Sorts of them,

them, which differ in Colour: They contain much volatile Salt, and Oil somewhat exalted.

The Calidris is a Reſtorative and Corroborative. *Lemery des Drogues.*

CALIDUM, θερμὸν. hot. See CALEFACIENTIA.

CALIETA, *Calitta.* The yellow Fungi on the Juniper-ſhrub. *Paracelſus de Icteric. Cap.* 2.

CALIGO, in a Medicinal Senſe, is an Obtenebration of the Eyes. See ACHLYS and AMAUROSIS.

CALIN. A kind of Metal, like Lead and Tin, prepared by the *Chineſe*; of which they make ſeveral ſorts of Utenſils in *Japan*, *Cochin-china*, and *Siam*; they even cover their Houſes with them. We often ſee Cheſts for Tea made of that Metal, and they import Coffee-pots of the ſame. *Lemery des Drogues.*

CALIX. See CALYX.

CALLÆON, κάλλαιον. The Gills of a Cock, which, as well as the Comb, *Galen*, *Lib.* 3. *de Al. Fac. Cap.* 21. ſays is a ſort of Food, which can neither be commended nor condemn'd.

CALLAF. A low ſhrubby Tree, of ſmooth Wood, and Leaves ſomewhat reſembling thoſe of the Cherry-tree, ſerrated at the Edges, and growing out from the Extremities of the Branches, which are ſtrait, without Joints, flexible, and of a yelloviſh Colour. The Flowers, which are produced before the Leaves, come forth very thick in *December*, at equal Diſtances; and are a ſort of oblong downy little Balls, of a whitiſh Yellow, or true yellow Colour, and of a fragrant Smell.

It has a Place in the Gardens of the Nobility, on account of its incomparable Fragrancy; and is cultivated with great Care by the Peaſants, for the Profit which they make of its Flowers.

They prepare an excellent Water of the Flowers, eſpecially at *Damaſcus*, which is of ſo ſtrengthening a Virtue, that we have none, that I know of, to be compared with it; for, by the extraordinary Sweetneſs of its Smell, it wonderfully relieves Perſons under a Lipothymy. The *Moors* uſe this Water, both internally and externally, in burning and in peſtilential Fevers: It refrigerates and moiſtens. They make an Oil alſo of the Flowers, which is ſerviceable to many Purpoſes.

This Plant, I am perſuaded, was not rightly known to the *Arabian* Authors, no not to *Avicenna* himſelf, tho' he often mentions it, much leſs to his Interpreters, who render the Words *Callaf*, *Dechen el Callas*, by *the Willow*, *the Water of the Willow*, and *the Oil of the Willow*; for the *Callaf* is ſo far from being a Willow, tho' it be very like the low broad-leaved Willow, on which Account I once took it for a Willow, that they are quite diſtinct Plants, differing in Name, Figure, and Virtues. Firſt, their Names among the *Arabians* are different; for one is called *Callaf* and *Ban*, the other, that is the Willow, *Saſſaf*, not *Saſſas*, or *Saſaf*, as *Avicenna*'s Interpreters wrongly read the Word. They are alſo of different Qualities; for one has a ſweet Smell, the other none at all. The *Callaf* is uſed by the *Moors* in Fevers; but they make no Uſe at all of the Willow. Hence it is plain, that the *Callaf*, or *Ban*, is not truly a Willow; however, ſince it has a great Agreement with the broad-leaved Willow, both in Leaves and Flowers, it ſignifies not much, if you call it the Aromatic Willow. *Proſper Alpinus*, *Rerum Ægypt. Lib.* 3. *Cap.* 15.

CALLARIAS, καλλαρίας. A kind of Sea-fiſh, which *Aldrovandus* and *Rondeletius* take for the Whiting, others for a different Kind, of which they give no Deſcription. *Caſtellus.*

CALLECAMENON. Burnt Copper. *Rulandus.*

CALLENA. A Kind of Saltpetre. *Rulandus.*

CALLIA. A Name in *Dioſcorides* for the ANTHEMIS, which ſee.

CALLIBLEPHARON, καλλιβλίφαρον, from κάλλος, Beauty, and βλίφαρον, an Eye-lid. A Medicine appropriated to the Eye-lids. As the Eye-lids are ſubject to be deform'd ſeveral Ways, ſo there muſt be various Kinds of *Calliblephara*; for the Hairs may increaſe too faſt, or fall off, or be of an ill Colour, or be rang'd in a diſorderly manner. An Excreſcence of Hair is from a Redundance of Humour, their falling off is commonly owing to an acrimonious Humour, their Whiteneſs to a pituitous Humour, their Redneſs to a Humour of a like Colour. Calliblephara therefore muſt conſiſt, in a great meaſure, of ſuch Medicines as are moderately drying, and conſume the Humour which vitiates the Hairs; ſuch are Armenius Lapis, Terra Ampelitis, Soot of Frankincenſe, burnt Antimony and Lead, Squama Æris, and ſuch-like Medicines, which are endu'd with an acrimonious and drying Quality. *Marcellus*, the Interpreter of *Dioſcorides*, ſays, that the *Greeks* called both the Medicines againſt the Diſeaſes of the Eye-lids, and ſuch as contributed only to their Beauty and Gracefulneſs, by the common Name of *Calliblephara*, which, for that Reaſon, was by *Pliny* variouſly applied, according to the ſeveral Exigencies, to the different Remedies which ſerve for Glutinating, for Replication, for adorning, for Circumlition, or Anointing of the Eye-lids. *Hermolaus* and *Ruellius* call the Application of ſuch Remedies as adorn the Eye-lids, and give them an artificial Colour, *Circumlitiones*. *Garraus.*

Pliny's *Calliblephara* are burnt Roſe-leaves, the Aſhes of burnt Date-ſtones, mixed with Spikenard, the Marrow of the Right fore Leg of an Ox pounded with Soot, and Terra Ampelitis; which laſt, he ſays, is an Ingredient in *Calliblephara*, and ſuch Medicines as dye Hairs. *Pliny.*

CALLICREAS, καλλίκρεας. The ſame as PANCREAS, which ſee.

CALLIETTE. See CALIETA.

CALLIGONUM, from κάλλος, Beauty, and γόνυ, a Joint, or Knot; the ſame as POLYGONUM, which ſee.

CALLIOMARCUS. The *Gauliſh* Name in *Marcellus Empiricus*, *Cap.* 16. for the Herb *Equiungula*, or Colts-foot.

CALLIONYMUS, καλλιώνυμος, from κάλλος, Beauty, and ὄνομα, a Name. A Fiſh called alſo *Uranoſcopus*, that is, the Star-gazer, frequently found in the *Mediterranean* Sea. It is ſaid to be a preſent Remedy for a Cataract. It is reckon'd by *Hippocrates*, *Lib.* 2. περὶ διαίτης, among the drieſt of Fiſhes, and therefore recommended by him, *Lib.* περὶ τῶν ἐσθιομένων, as proper Food in the Leucophlegmacy, in ſplenetic Diſorders, and a Diſtemper called by him Παχὺ νόσημα, "a groſs Diſeaſe," cauſed by a Collection of white Phlegm in the Belly after a long Fever. See PACHYS.

CALLIPHYLLUM, καλλίφυλλον, from κάλλος, Beauty, and φύλλον, a Leaf. A Species of *Adiantum*, otherwiſe called *Trichomanes*. The Word is uſed by *Hippocrates* in the ſeventh Book of the Epidemics.

CALLITRICHUM, καλλίτριχον, from κάλλος, Beauty, and θρὶξ, Hair. A Name for *Adiantum*, or Maiden-hair.

CALLONE, καλλόνη, from κάλλος, Beauty. In *Hippocrates* περὶ ἐυσχημ. the Phraſe καλλόνη βίου ſignifies the Ornaments of Life; and καλλόνη, in *Heſychius*, is expounded by ἐυπρέπεια, Decency, Decorum.

CALLOPISMUS, καλλωπισμὸς, from κάλλος, Beauty, and ὤψ, Countenance, Aſpect, fine Dreſs, or Furniture, which makes a gay Show. *Hippocrates*, *Lib.* περὶ ἑβδομάδων.

CALLOS, κάλλος, Beauty.

CALLOSITAS, τύλωσις, Callouſneſs. See CALLUS.

CALLOSUM CORPUS. A Part of the Brain thus called. See CEREBRUM.

CALLUS, τύλος, πῶρος, a Callus, ſignifies in general any cutaneous, carneous, or oſſeous Hardneſs, whether natural, or preternatural; but moſt frequently it means the *Callus* generated about the Edges of a Fracture. *Calli*, πῶροι, in ſeveral Places of *Galen*, ſignifies the Nodes in the Gout. *Calloſitas* and *Callus*, τύλωσις and τύλος, are, in a ſpecial Senſe, ſpoken of the Eye-lids, in *Galen*, *Lib.* 7. *de C. M. S. Lib. Cap.* 7. and *Scribonius Largus*, *No.* 36. *& ſeq.* For the *Callus* generated in the Soles of the Feet, or Palms of the Hands, ſee CLAVUS. *Callus* has alſo a particular Signification, in which it means the *Calloſum Corpus* of the Brain.

Paracelſus, *de Ulceribus*, gives the Name of *Callus* to an Abſceſs, or Ulcer, that owes its Original to an acrimonious and arſenical nutritious Juice, which excites a vehement Itching.

CALMET. Antimony. *Rulandus.*

CALOCATANOS. The *Gauliſh* Name in *Marcellus Empiricus*, *Cap.* 20. for the Wild-poppy.

CALOCHIERNI *Carduus Cretenſibus*, J. B. *Atractylidi & Cnico ſylveſtri ſimilis*, C. B.

It ſeems to be only a larger Species of Atractylis, and is very common in *Greece* and *Candy*. It was called *Atractylis* from ἄτρακτος, a Spindle, becauſe the Women formerly uſed them for Spindles, and even to this Day the *Greek* Women about *Conſtantinople* make Spindles of them, as Mr. *Lovell* relates; for in theſe Parts it grows to a Man's Height, and when it is come to Maturity, the Leaves fall off, and the Stalk grows dry and rigid. The ſame Gentleman aſſures us, that it is of a different Species from the common downy Atractylis, which alſo grows in great Plenty in the ſame Parts. *Raii Hiſt. Plant.*

CALOMELANOS TURQUETI.

This is a Name given by *Riverius* to a certain purgative Medicine which he frequently preſcrib'd in his Practice. It is prepar'd in the following manner:

> Take of Mercurius Dulcis, one Scruple; and of Scammony impregnated with Sulphur, or of Reſin of Jalap, half a Scruple: Reduce theſe to a Powder, mix them intimately, and form into Pills, with a Mucilage of Gum Tragacanth. *Etmul. L.* 2. 146.

CALOMELAS, καλομέλας, from καλὸς, good, and μέλας, Black, becauſe of its Colour and Virtues, is Mercury well pounded with Sulphur, and reduc'd to a black Subſtance. *Blancard.*

But CALOMELAS, or Calomelanos in the common Acceptation is Mercurius Dulcis, ſix times ſublim'd. See MERCURIUS.

CALONIA, καλονία. A Sort of Myrrh. *Calonian* Myrrh, (καλονία σμύρνα) with Oil of Roſes, is adviſed in Suffumigations for the Uterus, in *Hippocrates* περὶ γυναικ. φύσ.

CALOR, Heat. See CALEFACIENTIA.

CALTHA, CALTHULA. The ſame as CALENDULA, which ſee.

CALVA, CALVARIA. The ſame as CRANIUM, which ſee.

CALVATA. The ſame as PHALACRA, which ſee.

CALUFAL, CALUFR, CALUFAX. *Indian* Oil. *Johnſon. Rulandus.*

CALVITIES, CALVITIUM, φαλάκρωσις, φαλάκρωμα, μαδάρωσις, μάδισις, μαδαρθρὸς. Baldneſs, or a want of Hair, particularly on the Sinciput. *Galen, Lib.* 1. *de C. M. S. L. Cap.* 2. ſays, that the *Alopecia*, *Area*, *Ophiaſis*, and *Tinea*, proceed from a Corruption of the nutritious Humour, but the *Calvities* from a Defect of Humour. *Caſtellus.*

See ALOPECIA and PILI.

CALUMENON, καλούμενον, καλόμενον, called. *Galen*, in his Comment on theſe Words of *Hippocrates*, *de Rat. Vict. in Morb. Acut.* τὸ δὲ ὀξύμελι καλόμενον πῶμα, "the Drink "called Oxymel," ſays, that when *Hippocrates* adds καλούμενον, "called," or καλεῖσθαι, "to be called," to a Name, he intends to ſignify ſometimes, that ſuch an Appellation is far from being uſed by all the *Greeks*, ſometimes that it is improper, and ſometimes that it denotes ſome artificial Thing: But (as he goes on) we cannot imagine, that he meant, that the Word *Oxymel* denoted ſomething artificial; therefore he condemn'd the Word as improper, or taxes it as not ſufficiently receiv'd in Uſe. And perhaps he condemn'd the Word as importing, that the Medicine conſiſted only of Vinegar and Honey; or implying a Difference in Honey, as if one ſhould ſay, that ſome Sorts of Honey were ſour.

CALUSA. Cryſtal. *Rulandus. Johnſon.*

CALX.

What the *Latins* call *Calx*, is by the *Greeks* term'd τίτανος, or ἀσβόλη, and, by the *Engliſh*, *Lime*. This Word, among Apothecaries, Chymiſts, and Phyſicians, denotes whatever is ſubjected to a certain Operation called *Calcination*, or *chymical Corroſion*. That the Nature of what we call a *Calx* or *Lime* may be the better underſtood, this Operation muſt be previouſly explain'd. All ſolid Bodies, then, are the Objects of *Calcination*; and the Effect of the Operation ſo called is a Deſtruction of the former Connexion and Coheſion of the Particles of theſe Bodies, together with a Change of Colour, Smell, Taſte, and other Qualities of a like Nature, depending upon the entire Texture of the whole Body; ſo that the Bodies ſubjected to this Operation are reduc'd to a Powder, or into ſmaller Portions, or at leaſt become friable, for which Reaſon *Calcination* is by ſome called *a chymical Pulverization*. Thus, by *Etmuller*, *Calcination* is defin'd *ſuch a Corroſion and Diſſolution of compact Bodies into their minuteſt Parts, whereby Metals and Minerals are reduc'd to Calx, and Vegetables to Aſhes, or at leaſt whereby the Body, whatever it is, becomes friable.*

This Operation receives different Names, according to the various Manners in which it is perform'd; and the Effects reſulting from theſe ſeveral Methods are no leſs different, than the Names the Methods themſelves have receiv'd. In that Method, which by way of Eminence we commonly call *Calcination*, the combuſtible Parts of the Bodies are conſum'd by being expoſed either to the common Fire, or to that of the Sun, whilſt ſuch Parts as elude the Action of the Heat are left behind; and this may properly be called *Calcination by actual Fire*. Of this Kind are not only the Calcinations of metallic and other mineral Subſtances, but alſo the Incineration obſervable in the Deflagration of Vegetables for preparing lixivial Salts, and in the Calcination of ſome Animals, ſuch as Crabs, Moles, and ſome others. *Calcination* is called *Uſtion*, when applied to Hartſhorn, Alum, and Braſs, and theſe Subſtances themſelves are diſtinguiſh'd by the Epithet *burnt*. This Operation is alſo called *Toaſting*, when applied to Rhubarb, and ſome other Subſtances. When Bodies are rarefied, and reduc'd to Powder, by the Reverberation or Reflexion of a Flame from the Sides of a Furnace, Calcination is in this Caſe call'd *Reverberation*; and, when common Salt is calcin'd, *Decrepitation* is the Term which Cuſtom has made expreſſive of the Thing.

There is another Species of Calcination, which is perform'd by an Addition of proper Menſtruums, either with or without the Aſſiſtance of Fire; and this is properly called *Corroſion*, or *Calcination by potential Fire*. Of this Kind are firſt the *immerſive* and *vaporoſe Calcinations*, or *Corroſions* of Bodies; when, for Inſtance, the Body to be calcin'd is either immers'd in its proper Menſtruum, as Copper in Spirit of Nitre, or Lead in Vinegar; or when the Body is ſuſpended in a cloſe Veſſel, in ſuch a manner, that the Steams ariſing from the Menſtruum may act upon it; when, for Inſtance, Iron is ſuſpended over *Aqua-fortis*, in order to be calcin'd into Crocus of Mars; or when Copper and Lead are ſuſpended over Vinegar, in order to be converted into Verdegriſe, and Ceruſs. Of this Kind, in a particular manner, is that Species of Calcination, called Philoſophical Calcination, or Calcination without Fire, when, for Inſtance, ſome Parts of Animals, ſuch as the Bones, Horns, and Hoofs, are, in the Diſtillation of Waters, ſuſpended in the Head of the Still, that, being penetrated by the aſcending Vapour, they may become more porous and friable. But in the Shops Bones are not, for the moſt part, philoſophically calcin'd in an Alembic, but are boil'd in Water till they are render'd ſoft and friable by the Hand. Then having cleanſed them, and taken off the blackiſh exterior Scurf, they are dry'd, and reduc'd to a Powder. The *Cornu cervi philoſophicum*, the human *Cranium*, the Teeth of the Boar, and thoſe of the Sea-horſe, are thus prepar'd. *Tralles de Remed. Terr.* Secondly, to the *Calcination* by *potential Fire* belongs that perform'd by *Illination*, when neither the Steam of the Menſtruum, nor Immerſion in it, are uſed, but the Body to be calcin'd is only anointed with it, as when Oil or Spirit of Vitriol, or of Sulphur, are laid upon a Plate of Iron, in order to produce a Corroſion. Thirdly, to the ſame Kind of *Calcination* belongs *Amalgamation*. Fourthly, *Fumigation*. Fifthly, *Detonation*. Sixthly, *Granulation*, which is alſo called *fuſory Calcination*. Seventhly, *Cementation*, or *Stratification*. Eighthly, *Extinction*, or *extinctory Calcination*, when for Inſtance, ignited Cryſtal is extinguiſhed in common Water, and then reduc'd to a Powder. That Species of Calcination which is perform'd by Fire alone, or by means of a dry Menſtruum, is called *dry Calcination*; whereas that which is perform'd by means of a liquid Menſtruum, is called *moiſt or humid Calcination*. The learned *Bohnius* calls that Species of *Calcination* perform'd by Fire, with the Addition of a Menſtruum, *mix'd Calcination*. The Calcination of Minerals perform'd by the Air, or rather in the Air, do not conſtitute a particular Claſs, but are to be rank'd among thoſe perform'd by means of a liquid Menſtruum; becauſe ſuch a one capable of calcining the Body is lodg'd in the Air, whilſt for Inſtance, the ſaline corroſive Particles with which it is impregnated, being diſſolv'd by its humid Parts, and apply'd to the metallic Body, corrode it, or whilſt the Humidity of the Air itſelf penetrates the ſaline Parts of the mineral Body, diſſolves, and puts them into ſuch a Commotion, that they corrode, and, as it were, calcine the Body in which they reſide.

'Tis now obvious, not only what a *Calx* is, but alſo that the ſeveral Species of *Calxes* muſt vary.

1. According to the Subſtances or Bodies from which they are obtain'd.

2. According to the Nature of the particular Menſtruum uſed in the Preparation.

3. According to the greater or ſmaller Degree of Fire apply'd; or according to the greater or ſmaller Quantities of humid inflammable Parts expel'd, or according as the Parts of the Bodies are more or leſs divided by the Calcination.

'Tis alſo obvious, that all Calcinations of Bodies are perform'd either by taking away the aqueous, oleous, and combuſtible Subſtance, connecting the Parts mutually with each other, or by interpoſing ſome foreign and heterogeneous Subſtance, which deſtroys the Connexion and Coheſion of the Parts. From what has been ſaid, we may alſo conceive how in ſome calcin'd Bodies ſomething is loſt; that is, thoſe Parts which could be either deſtroy'd, or exhaled by the Fire; and how in ſome others there is an Addition made by means of the Menſtrua, of which they have retain'd ſome Parts in the Calcination, and conſequently may have their Weight increaſed. From what has been advanc'd we may alſo comprehend, how ſome *Calxes*, by the Expulſion of that which they have receiv'd from the Menſtruum, may be reſtor'd to their original Form, and how ſome others may be ſo, by a Reſtitution of what they had loſt in the Calcination. Of the former Kind are the Calxes of Metals produc'd by corroſive Menſtruums; of the latter Sort are metallic Calxes produc'd by Fire alone. 'Tis an Obſervation of no ſmall Importance in Medicine, that as Subſtances calcin'd by Menſtruums, or what we call potential Fire, retain ſomething of the Menſtruum employ'd, by which a Change is induced on their Natures, which are to be judg'd of by the reſpective Menſtruums uſed; ſo alſo Subſtances calcin'd by actual Fire undergo a certain Change, and aſſume an acrid, heating, and drying Nature, which they formerly wanted, and by which they are juſtly ſaid to approach to the Nature of a *Calx*.

It muſt alſo be obſerv'd, that, generally ſpeaking, the Word *Calx*, when placed alone, imports that *Lime* which is moſt univerſally uſed in human Life, and which is prepar'd of Stones, and ſometimes the Shells of Shell-fiſhes burn'd. This Subſtance is diſtinguiſh'd by different Epithets, according to the different States in which it is. Thus we have *Quick-lime*, *Slaked-lime*, and *Waſhed-lime*.

Quick-lime, by the *Greeks* called κονία, or τίτανος ἄσβεστος, or ſimply ἄσβεστος, is no more than a calcarious Stone, burn'd into a Calx of a white cineritious Colour, of an acrid and pungent Taſte, and which, when it has not been too long expoſed to the Air, produces an Efferveſcence, Smoak, and a conſiderable

ſiderable Degree of Heat, when Water is pour'd upon it; but when it is penetrated by the moiſt and humid Parts of the Air, it ceaſes to produce an Effervescence, and becomes a kind of Powder.

Quick-lime may be prepar'd not only of the Stone commonly call'd Lime-ſtone, but alſo of Marble, and other Stones of a cloſe Contexture, and hard Nature. In ſome Parts of *France* it is prepar'd of a ſort of Flint, which is capable of being calcin'd. In *Holland*, and ſome other Countries, where Lime-ſtone is not to be found, they prepare it of the Sea-ſhells found on the Shore, which they calcine by the Aſſiſtance of a ſtrong and violent Fire. But this Species is leſs proper, both for the Purpoſes of Architecture and Medicine, than that which is prepar'd of Stone. The *Americans*, according to *Labat*, prepare a Quick-lime of ſubmarine Plants and Lithophytes; and, in ſeveral Parts of *England*, where a proper Stone cannot be had, Lime is made of Chalk-ſtones calcin'd.

To the due Preſervation of Quick-lime, 'tis abſolutely neceſſary it ſhould be kept from Water, ſince, when it is ſaturated by that Fluid, it becomes a pinguious white kind of Maſs, of the Conſiſtence of a Poultis, and this is call'd *Slak'd-lime*. Hence 'tis obvious, that the moſt proper Method of preſerving *Quick-lime* is, to ſhut it up in cloſe Veſſels, lodg'd in a dry Place, that it may not imbibe the moiſt Particles of the Air, to which it is otherwiſe greatly diſpos'd. The Method of extinguiſhing *Quick-lime* for Chirurgical and Medicinal Intentions, is, to add ſix or eight, and, according to the *London Diſpenſatory*, twelve Parts of warm Water to one Part of the *Quick-lime*. Rain Water ſlakes the *Lime* better than common Water, and hot Water produces the ſame Effect better than that which is cold. The Water thus impregnated with the Molecules of the *Quick-lime*, and filtrated, after ſtanding twenty-four Hours, is call'd a *Solution of Quick-lime*, as alſo the *Lixivium*, and the *Water of Quick-lime*; and the pinguious Subſtance floating on its Surface in form of a Pellide, is call'd the *Cream or Flower of Quick-lime*. Thoſe who deſire a weak Lime-water, after this Filtration pour freſh Water on the remaining *Lime*, and this they call ſecondary *Lime-water*. After this ſecond Solution, if freſh Water is ſtill added to the Lime, it is almoſt inſipid when pour'd off from it. But after ſeveral Infuſions, the *Lime*, when again calcin'd, becomes capable of producing a good and rich *Lime-water*. *Mem. de l' Acad. Roy. des Sciences*, for the Year 1700. In the *Diſpenſatorium Pharmaceuticum Ratiſbonenſe*, the Water diſtil'd from Oak-leaves ſeems, without any Reaſon, to be preſcrib'd for preparing *Quick-lime Water*, ſince it has no more Virtues for that Purpoſe than common diſtil'd Water. *Slak'd-lime*, a ſecond time waſh'd, and, as it were, edulcorated by an Affuſion of freſh Water, and then dry'd after the Water is pour'd from it, is call'd *Waſh'd-lime*, or *Prepar'd-lime*.

As for the ſeveral Uſes to which *Lime*, in its different States, is apply'd, by Architects, Builders, Plaſterers, Cloth-whiteners, Dyers, Sugar-refiners, Tanners, Cementers of China-ware, and other Mechanics, we paſs them over, as being foreign to our Purpoſe; only we muſt obſerve, that the Chymiſts ſeem to have borrow'd the Uſe of *Quick-lime* from the Architects, ſince they uſe it mix'd either with the White of an Egg, or with Cheeſe, not only for ſtrengthening their crack'd Glaſſes, but alſo for luting the Junctures of Veſſels, in order to prevent the Eſcape of Mineral Spirits in Diſtillation.

The Nature and conſtituent Principles of *Quick-lime* will moſt advantageouſly be diſcover'd by the Obſervations and Experiments of the Moderns, which will occur as we proceed in pointing out its Medicinal Virtues and Uſes. Mean time the antient Accounts of it muſt not be omitted.

"*Quick-lime*," then, according to *Pliny*, in the twenty-fourth Chapter of his thirty-ſixth Book, "is of the utmoſt Importance in Phyſic, but muſt be choſen freſh-calcin'd, and "before any Water has been thrown upon it, in which Caſe it "burns, diſcuſſes, draws, and puts a ſeaſonable Stop to ſpreading Ulcers; when corrected with Vinegar and Oil of Roſes, "it induces Cicatrixes; it alſo cures Luxations, when mix'd "up with Hog's Lard, or liquid Reſin, in Honey. This ſame "Compoſition alſo contributes to the Cure of the King's-evil." *Dioſcorides*, in the ninety-firſt Chapter of his fifth Book, has theſe Words concerning *Quick-lime*: "All Lime, ſays he, in "general, is of a hot, pungent, and cauſtic Nature, and, "conſequently, cicatrizes. When mix'd with ſome other "Subſtances, ſuch as Fat and Oil, it maturates, ſoftens, and "diſſipates it; it alſo cicatrizes Ulcers. It is thought moſt "effectual when freſh-calcin'd, and uſed before any Water has "been pour'd upon it." *Matthiolus*, from *Galen*, recounts its Virtues in the following Words: "*Quick-lime* is of ſo "cauſtic a Quality as to induce an Eſchar; immediately after "it is extinguiſh'd, it alſo induces a kind of Eſchar; but loſes "much of its cauſtic Quality, and, conſequently, becomes "much leſs proper for that Purpoſe after it is kept a few Days. "In Proceſs of Time it becomes entirely incapable of forming "an Eſchar, tho' it ſtill continues to heat and diſſolve the Fleſh. "If it is waſh'd in Water, it loſes its Pungency, and becomes a Powder; in which State it dries, without exaſperating the Part to which it is apply'd. If it is twice, "thrice, or oftener waſh'd, it entirely loſes its Pungency, and "dries powerfully, without exaſperating." *Paulus Ægineta*, in the third Chapter of his ſeventh Book, informs us, "That when it is waſh'd in Sea-water, it becomes a ſtrong "and efficacious Diſcutient." *Lime* ſeems, by the Antients, to have been only apply'd externally, in Caſes where an acrid, corroding, drying, and diſcutient Topic was thought requiſite; for, when internally us'd, it was eſteem'd a Poiſon, which violently corroded the Stomach and Inteſtines; and, as Correctors to its virulent and poiſonous Qualities, emollient and viſcid Subſtances were preſcrib'd, ſuch as Juice of Mallows, and pinguious Subſtances proper for obtunding Acrimony, ſuch as Decoctions of Linſeed, Sea-grape, and Rice, together with Milk, Hydromel, pinguious Broths, and proper Juices. *Dioſcorides*, *Lib.* 6. *Cap.* 91. and *Paulus Ægineta*, *Lib.* 5. *Cap.* 61. But the Moderns uſe *Quick-lime* as a Medicine, both externally and internally. However, before I mention the ſeveral Purpoſes to which they apply it, or ſpecify the various Medicinal Uſes of *Slak'd-lime*, of the Water or Lixivium of *Quick-lime*, of the *Cream of Quick-lime*, and of waſh'd *Lime*, I ſhall firſt inquire what may be diſcover'd concerning the Natures and Properties of each, from the Experiments made upon them by the Curious.

Quick-lime, then, by an Addition of Water, becomes ſo intenſely hot, as to ſet combuſtible Bodies, that touch it, on Fire. Among other Circumſtances proving this Property of *Quick-lime*, none is more remarkable than the burning of a Ship loaded with this Commodity, when the Water, in conſequence of ſome Accident, had Acceſs to it. Quick-lime, however, ſometimes remains in cold Water for a whole Day, without exciting any Heat; but immediately exerts its burning Qualities, upon the Addition of boiling Water. *Du Hamel. Hiſt. Quick-lime*, upon an Addition of Acids, produces an Effervescence, and diffuſes urinous Vapours. *Eph. N. C. D.* 1. *a.* 6. Upon an Addition of Oil, it neither produces an Effervescence, nor acquires any Degree of Heat; neither is it ſlak'd by Spirit of Wine. *Hiſt. Acad. R. Sc.* But if Spirit of Wine is diſtil'd from Quick-lime, it aſſumes an alcaline Quality, *Eph. N. C. D.* 1. *a.* 6. Quick-lime, thrown into human Urine, raiſes a highly acrid and igneous Vapour; and, when diſtil'd with the ſame, yields a highly acrid, volatile, and igneous Liquor, like that obtain'd from it when diſtil'd with Flowers of Sal Ammoniac. When mix'd with Pot-aſh, by the Affuſion of Water, it affords a highly acrid, alcaline, and igneous Salt. *Willis* made the following Analyſis of *Quick-lime*: He put about a Pound and an half of it into a large Cucurbit; then adding Water to it, he adapted the Head to a large Receiver; upon which, in the Space of five Minutes, the Water and Lime began to ſwell, and produce an Effervescence; at the ſame time the Steam and Smoak rais'd heated all the Veſſels to ſuch a Degree, that they could ſcarce be touch'd. There came over into the Receiver ſix Ounces of a limpid Water, which was not in the leaſt acrid, but had a ſweetiſh ſtyptic Taſte. He boil'd the Powder remaining in the Cucurbit in common Water, and, whilſt he was evaporating the Lixivium, made of it, over a gentle Fire, there was form'd, on the Surface of the Liquor, a white cruſtaceous Pellicle, which was alſo of a ſweetiſh Taſte. When this Pellicle was taken off, a freſh one ſucceeded it; and, when the Liquor was totally exhal'd, nothing of an acrid or ſaline Nature remain'd in the Bottom of the Veſſel. *Willis. Diatriba de Fermentatione*, *Cap.* 10. So great is the Acrimony of *Quick-lime*, that when apply'd externally to the Skin of any Animal which is hot and moiſt, it forms an Eſchar upon it; and, when exhibited internally, it acts like a Cauſtic. For this Reaſon it is a Subſtance very proper for killing or baniſhing Inſects. If it is reduc'd to a Powder, mix'd with Sugar, and ſwallow'd by Mice, it infallibly kills them. For theſe Reaſons it is, by the Moderns, as well as the Antients, claſs'd among the acrid Poiſons. *Foreſt. Obſ. Med. L.* 30 *Obſ.* 8. *ſchol. Kircheri. Mund. Subterr. T.* 2. *Lanzon. T.* 1. *Vateri Phyſ. Exper. & Ioel. T.* 2. *Boerhaave*, in his *Inſtit. Med. Sect.* 1143. ranks it among thoſe Poiſons, which by conſtricting, incraſſating, obſtructing, and drying, kill either quickly or ſlowly, according to their reſpective Virulence; and to prevent the fatal Effects of which, Vomits, Purges, diluting Subſtances, ſpirituous Acids, ſpirituous and oleous Alcalis, and all ſaponaceous Subſtances, are proper. Accordingly, in *Eph. N. C. D.* 3. *a.* 2. *o.* we have an Account of a Woman who eat two Apples, inadvertently put into a Bag in which there had formerly been *Quick-lime*, ſome of which adhered to the Apples. Soon after ſhe eat them, ſhe was afflicted with a preternatural Heat of her Throat and *Oeſophagus*, an Oppreſſion of her Stomach and Præcordia, and an inſatiable Thirſt. Theſe Symptoms were follow'd by a Swelling of the Belly, an univerſal Sweat, and Convulſions. In *Eph. N. C. Vol.* 2. *o.* 86. we have an Account of a young Man, who, upon pouring Water upon *Quick-lime*, was ſo ſtrongly affected by the aſcending Vapour, that he was ſeiz'd with an Oppreſſion of the Præcordia, and a violent and moſt frequent Coughing and Sneezing, which laſted for almoſt twelve Hours without Intermiſſion; by which Accident he

was

was weaken'd to ſuch a Degree, that when he walk'd abroad in the Sun, or uſed any Exerciſe ſufficient to excite a Diaphoreſis, the Sneezing return'd, and continu'd for ſome Hours. The Stones in the Lungs, mention'd in *Eph. N. C. D.* 1. *a.* 3. *o.* 16. and which are there ſaid to be generated by frequently drawing in the Duſt of *Quick-lime* with the Breath, by no means prove its poiſonous Quality, but only that it is capable of being divided into ſo fine a Powder, as to be imperceptibly drawn in with the Air, and form'd into Concretions in the Lungs.

The Water of *Quick-lime* is of an acrid, ſtyptic, and, at the ſame time, a ſomewhat ſweetiſh Taſte. A white, and ſomewhat hard, Pellicle or Cruſt is ſoon produc'd on its Surface; and if this Pellicle is either drawn aſide, or totally taken off, a freſh Pellicle ſucceeds it. When it has ſtood thus for a whole Year, in a Veſſel cover'd with Paper, if the Pellicle be broke every two or three Days, and ſunk to the Bottom, if, about the Middle of the Year, there is a new Addition made of common Water diſtil'd, if the Materials are now-and-then agitated with a ſmall Stick, and if, at the Year's End, the whole Water is evaporated, it leaves a very dry *Calx* or *Lime*, about an eighth Part heavier than the *Quick-lime* originally employ'd in making the Lixivium. *Eph. N. C. D.* 1. *a.* 3. *Hoffman* ſays, that *Quick-lime-water* evaporates entirely over a gentle Fire, without leaving any thing behin. Quick-lime-water neither produces an Effervеſcence, nor coagulates, with Acids; for tho' it runs into a bitteriſh neutral Salt, yet it is not coagulated. In particular, when Spirit of Salt is added to Water of *Quick-lime*, there is no Effervеſcence produc'd, and yet the Acid of the Salt is chang'd into a neutral Salt, which, after Evaporation, remains very white in the Bottom of the Glaſs, and has exactly the ſame Appearance with Spume of Nitre in the Form of *ſmall Flakes*. This Powder is of a ſomewhat bitteriſh Taſte, but of a fix'd Nature; for it neither fuſes in the Fire, nor does it eaſily yield its acid Spirit, unleſs by an Addition of Oil of Vitriol, which, by attacking the calcarious Principle, and intimately uniting itſelf with it, diſentangles the acid Spirit of the Salt from its Embraces. When Water of *Quick-lime* was added in ſo large a Quantity to the beſt Spirit of Nitre, as that the Spirit was entirely ſaturated with it, the Mixture, when evaporated, left a certain thick, viſcid, and yelloviſh Gum, which could not be dried, but diſſolved in the Air, and which had a ſaline and very pungent Taſte. *Quick-lime-water*, prepar'd of Quick-lime before calcin'd with common Sulphur, that it might receive an Addition of Weight from this Circumſtance, when it was added to the beſt Spirit of Nitre in ſuch a Quantity as to ſaturate it, the Mixture, upon Evaporation, left in the Bottom of the Veſſel a yelloviſh-white Salt; which being diſſolv'd in a digeſtive Heat, with ſeveral repeated Affuſions of diſtil'd Water, and again evaporated, left a highly pungent Salt, reſembling ſmall ſquare Stones, wrap'd up, as it were, in a ſmall Portion of yellow Gum or Honey; and when a little diſtil'd common Water was added to this Salt, and the Mixture was agitated, the Whole of this Honey-like Subſtance was diſſolv'd, the ſmall Concretions of Salt remaining entire, white, pellucid, and beautiful as ſmall Diamonds. *Eph. N. C. L. C.* Water of Quick-lime aſſumed a milky Colour, upon an Addition of Spirit of Sal Ammoniac, as alſo by an Affuſion of Oil of Tartar per Deliquium. And ſince, by adding Water of *Quick-lime* to Urine, or to Sal Ammoniac, an urinous Spirit is perceiv'd to exhale, it may, according to *Tournefort*, ſerve us in inquiring whether there is any Sal Ammoniac conceal'd and wrap'd up in any particular Plant. Quick-lime-water, ſaturated with an Infuſion of Galls, becomes thick, aſſumes a browniſh-grey Colour, and on its Surface appears a remarkable black Spot, like a Drop of Ink. The Water of Quick-lime, mix'd with a Solution of corroſive Sublimate Mercury, becomes yellow or reddiſh; when mix'd with common Spirit of Wine, it becomes ſomewhat warm; and, by an Addition of the Solution of Sublimate, the Whole is chang'd into a Gold-colour. *Du Hamel Hiſt.* It ferments with all Syrups, and the Admixture of every acid Liquor renders it turbid. If it is mix'd with Milk, it prevents its Coagulation, which is contrary to what *Etmuller* aſſerts in *Commentar. de Bononienſi Artium Inſtituta*. In the Memoirs of the Royal Academy for the Year 1700. we are told, that Oxen which had unluckily drank *Quick-lime-water*, died ſoon after; and that the Wines which had been ſophiſticated with it, prov'd prejudicial to thoſe who drank them, by their exceſſive and immoderate Heat.

Cream or Cremor of *Quick-lime* is an inſipid Powder, which is with great Difficulty diſſolv'd in Water. *Mem. Ac. R. S.* for the Year 1724.

Slak'd-lime is of a leſs acrimonious Nature than *Quick-lime*, and produces a leſs conſiderable Effervеſcence with Acids. Builders of Walls, and Bricklayers, however, find it to be in ſome meaſure acid, ſince it renders their Hands rough, and ſometimes exulcerates them, but carries off all itchy Eruptions which happen to appear upon them. *Ramazini.* The Vapour ariſing from the Walls of Houſes newly cover'd over with Quick-lime, proves of a very noxious Quality to thoſe who continue for any conſiderable Time, or ſleep, in them, during the Night. Daily Experience, and numberleſs unconteſted Facts, prove the Truth of this. The Symptoms which generally ſeize thoſe who live in new-plaſter'd Houſes, are principally Fevers, violent and long-continu'd Sneezings, a Senſation of *Suffocation* about the Fauces, an Infarction of the Breaſt, with a ſlow Fever. *Hoffman Med. Rat. Syſt. Boerhaave*, in *Aphor.* 1060. obſerves, that a Palſy may be produc'd by the Vapour of *Slak'd-lime*; and, in *Inſtit. Med.* he ranks it in the ſame Claſs of Poiſons with *Quick-lime*.

Waſh'd-lime is an unactive Body, or a *Caput Mortuum* deſtitute of Acrimony. When this Subſtance is again calcin'd in a Crucible over a ſtrong Fire, and common Water is added to it, it produces neither Effervеſcence nor Ebullition, but always throws up a Pellicle on its Surface, which when remov'd, a freſh one appears for a conſiderable Number of Times. Upon an Addition of the Solution of any fix'd Alcali, a Lixivium, for Inſtance, of Pot-aſh, it throws up no remarkable Pellicle; but a faint Appearance, as it were, of Fat, is obſerved to float upon the Surface here-and-there. By the Addition of Spirit of Nitre, it excites a remarkable and noiſy Effervеſcence, with a Number of large Bubbles, and a ſenſible Heat, which penetrates the Glaſs, and ſtrongly affects the Hand which is apply'd to it; and a thick white Pellicle, of a ſweetiſh Taſte, floats on its Surface. A Solution of *Waſh'd-lime*, a ſecond time calcin'd, made with Spirit of Salt, filtrated, and diſtil'd from a Retort, yielded a ſimple inſipid Phlegm, and the *Caput Mortuum* which remain'd was white, light, and ſwel'd, like burn'd Alum; it excited a ſenſible, and, as it were, burning Heat on the Tongue; and had a nauſeous, and ſomewhat bitteriſh Taſte. When common Water was added to this Subſtance, ſo ſtrong a Heat was produc'd, that the Hand was not able to bear it; the whole Glaſs became intenſely warm, large Bubbles appear'd in the Liquor, and the Noiſe of the Effervеſcence was ſufficiently audible. *Etmuller.*

From what has been ſaid, we may reaſonably infer, that Quick-lime poſſeſſes ſome of the Qualities peculiar to alcaline Salts. *Tournefort* ſuſpects, that ſomewhat of a vitriolic Acid is lodg'd in it. *Helmont* affirms, that there are two Salts in *Quick-lime*; the one a lixivial Alcali, and the other an Acid; and, from a Diſſolution of theſe two by Water, and their conſequent mutual Action on each other, he accounts not only for their Accenſion, but alſo, whilſt they deſtroy each other, for their Coagulation. Hence he endeavours to deduce the Uſe of Quick-lime in Architecture.

Boecler, *L.* 1. *Part* 3. informs us, from *Herman*, that *Quick-lime* contains a large Quantity of an alcaline Salt, and very little of an acid one; but that they are both volatile and corroſive, and mix'd with a large Quantity of Earth. *Etmuller* is of Opinion, that *Quick-lime* contains both an Acid and an Alcali, join'd to earthy Particles. That it contains an Acid, he proves from the following Conſiderations: Firſt, becauſe newly-prepar'd Water of *Quick-lime* deſtroys the volatile Salts on which it is pour'd, fixes them, and transforms them, with itſelf, into an earthy Subſtance. Secondly, becauſe the Water of *Quick-lime* is render'd turbid, and precipitated by an Infuſion of the lixivial Salt of Tartar, ſince the earthy Particles are extruded, and ſent to the Bottom, from the Acid lodg'd in the Lime-water, by means of the Alcali of the Tartar, which is readily abſorb'd by the Acid. His third Argument, which is, that Milk is coagulated by Water of *Quick-lime*, is inconcluſive, ſince, upon trying the Experiment, no ſuch Effect is produc'd. He proves that Quick-lime contains an Alcali, from the following Topics: Firſt, becauſe the Water of a Solution of Quick-lime diſſolves and extracts ſulphureous Subſtances, common Sulphur, and Sulphur of Antimony, in the ſame manner that Lixiviums of alcaline Salts uſually do. Secondly, becauſe, when *Quick-lime* is added to Sal Ammoniac, it permits its volatile Salt and Spirits to come forth, in the ſame manner as when alcaline Salts are added to it. Thirdly, becauſe the Water of Quick-lime reſtores the Colour to an Infuſion of nephritic Wood, after it has been deſtroy'd by Vinegar. Fourthly, becauſe it produces, tho' ſlowly, a Precipitation in the Solution of Mercury Sublimate, of the Colour of *Minium*. Hence he infers, that the Water of *Quick-lime* contains both an acid and an alcaline Salt diſſolv'd; and, conſequently, that it is ſomewhat of the Nature of Sal Ammoniac. But he aſſerts, that the ſaline and acid Particles of Quick-lime partake of the Nature of fix'd Alcalis, and produce all the Effects aſcribed to them. According to *Hoffman*, "There are two Principles "lodg'd in Quick-lime, the one very fix'd and earthy, the "other very ſubtile, penetrating, volatile, and, as it were, of "a fiery Nature. So long as theſe are join'd and connected "with each other, they are ſo far from being diſunited by the "ſtrongeſt Degree of Fire, that they are rather more firmly "join'd together by it. But when, by the Aſſiſtance of "Water, and more particularly by boiling, the volatile Prin-"ciple is ſeparated from the more fix'd and earthy Part, it "diſcovers its volatile Nature by this Circumſtance, that by "means of a gentle Heat it is wholly diſſipated in the Air. "Hence Water of *Quick-lime*, tho' of a very acrid Taſte, "evaporates wholly, without leaving ſo much as one Particle

"of

" of a fix'd Matter. But if ſaturated Water of Quick-lime " is boil'd with well-calcin'd Salt of Tartar, it acquires ſo " cauſtic, corroſive, and penetrating a Quality, that it is not " only very hot and pungent on the Tongue, but may alſo be " uſed for a potential Cauſtic, ſince it eats and conſumes the " Fleſh. Of ſuch a Salt, with Spirit of Wine, is prepared a " highly acrid Tincture, commonly call'd the Tincture of Quick-" lime, or of Salt of Tartar; and this Tincture is of uncommon " Efficacy in provoking Urine. A Lixivium is alſo prepar'd in " this manner from *Quick-lime* and Salt of Tartar, which is high-" ly proper for diſſolving and extracting Tinctures from com-" mon Sulphur or Antimony. Spirit of Sal Ammoniac alſo, pre-" par'd with Quick-lime, in its penetrating Smell, acrimonious " Taſte, and even in its Volatility, far ſurpaſſes that prepared " of Pot-aſh and Sal Ammoniac. All theſe Circumſtances " evidently demonſtrate, that there is in burn'd Calxes not " a ſaline Principle, but a highly ſubtile volatile one, which is, " nevertheleſs, of a terreo-igneous Nature, and which is capa-" ble of adding the higheſt Acrimony, and alſo a cauſtic " Virtue, to fix'd as well as volatile urinous Salts; of diſſolving " oleous and pinguious Subſtances; and of fixing and retaining " volatile Subſtances, eſpecially ſuch as are of an acid Nature." *Homberg* found experimentally, that Mercury diſſolv'd with Spirit of Nitre, and by reiterated Diſtillations to Dryneſs, united in a hard Maſs to its ſolvent Acid, was by the Addition of *Quick-lime* reviv'd, when ſubjected to Diſtillation by a large Fire, the acid Spirits being thus ſeparated, but render'd weaker. Theſe Circumſtances ſeem to point out the alcaline Nature of Quick-lime, ſince it join'd itſelf to an Acid, and thus freed the Mercury from its Solvent. He then had an Inclination to try whether, by ſeveral Lixiviums, the Salt could be extracted from the Lime; but the Experiments were made in vain, nor after the Evaporation was there any thing found, beſides the terreſtrial and inſipid Cruſts, which generally are left after the Evaporation of Lime-water. *Du Hamel Hiſt.* Hence he claſſes Quick-lime among the earthy Alcalis; and, by Experiments made with Spirits of Salt and Nitre, he found that *Quick-lime* was not of a more alcaline Nature than *Slak'd-lime*, ſince both of them requir'd almoſt an equal Quantity of an Acid for their Diſſolution; only with this Difference, that the *Quick-lime* produc'd a greater Effervescence than that which was ſlak'd. *Mem. Acad. R. Sc.* A. 1700. But *Quick-lime* does not ſeem to be a ſimple earthy Subſtance, of an abſorbent or alcaline Nature; for it has nothing in common with abſorbent or alcaline Earths, except that it produces an Effervescence with Acids, whereas it has many Properties in common with alcaline Salts. The cauſtic Acrimony of *Quick-lime* is not to be found in an abſorbent Earth, which is inſipid. *Quick-lime* reſolves reſinous Subſtances, juſt as an alcaline Salt does. Sulphur, when boil'd in *Quick-lime-water*, is diſſolv'd, and yields a red Tincture, like that which ariſes from fix'd alcaline Salts with Sulphur. The filtrated Liquor, by an Addition of an acid Liquor, yields a precipitated Magiſtery, like that commonly form'd in preparing Milk of Sulphur. Quick-lime promotes the Fuſion of Sand, triturated Flint, and Cryſtal, for making Glaſs, juſt as fix'd alcaline Salts do. But abſorbent Earths, ſuch as Chalk, produce no ſuch Effect, unleſs they are previouſly reduced to a *Calx*. Quick-lime tinges Syrup of Violets of a green Colour, as fix'd alcaline Salts do. With a Solution of corroſive Sublimate Mercury it yields a yellow Precipitate, as fix'd alcaline Salts do; only with this Difference, that the Precipitate produc'd by the fix'd alcaline Salts is of an Orange, and that produc'd by the *Quick-lime* of a Lemon-colour; becauſe ſome of the white earthy Particles of the *Quick-lime* are aſſociated with the Precipitate. *Quick-lime*, as well as fix'd alcaline Salts, abſorbs the Acid of the Sea-ſalt in Sal Ammoniac, and by that means ſets the volatile urinous Salt at Liberty, which ſimple abſorbent Earths do not. The now enumerated Properties of Quick-lime are not found in Lime-ſtone before Calcination. They who deny that there is a fix'd alcaline Salt in Quick-lime, alleging that by Elixiviation the Salt cannot be extracted from it, ſeem to prove nothing at all, becauſe an alcaline Salt, by the Force of Fire united to the Sand in Glaſs, cannot be drawn from it by Elixiviation, tho' 'tis certain, that ſuch a Salt is really in it. As to that Queſtion, What is the Origin of the alcaline Salt in *Quick-lime*? I anſwer, that it is form'd in it, firſt, of the aluminous, vitriolic, or nitrous Acid contain'd in the Lime-ſtone; and, ſecondly, of the Acid of the Wood or Coal uſed in Calcination. *Geoffroy*, in *Mem. Acad. R. Sc. A.* 1720. The alcaline Nature of *Quick-lime* ſeems to be prov'd by that Property of Quick-lime Water, by which it ſerves to precipitate Metals, diſſolv'd by their proper acid Menſtruums. *Mem. Acad. R. Sc. A.* 1711. The alcaline Nature of Quick-lime is alſo prov'd from that Species of ſympathetic Ink, in which it is made an Ingredient. *Le Fevre* thinks, that from the alcaline Nature of Lime we may deduce the Origin of that alcaline Salt, which is wrap'd up in ſome mineral Waters; ſince, in the Earth where ſuch Waters abound, the Sulphur and the calcarious Earth concur, and the Acid of the Sulphur, being diſengaged from the Water, acts upon the Alcali of the Lime, and joins itſelf to it; juſt as the like Salt is produc'd from common Sulphur and Quick-lime-water, by boiling them together, and then filtrating and evaporating the Solution. *Hiſt. Acad. R. Sc. A.* 1730. Thus, I think, it can hardly be deny'd, that both Quick and Slak'd-lime are of an alcaline Nature, on account of the Effects produc'd by them. In the mean time, I can ſcarce believe, that *Quick-lime* agrees in every reſpect with an alcaline Salt; for according to *Stahl*, in his *Specimen Becher.* " *Quick-*" *lime* differs from an alcaline Salt, firſt, in that it is not fus'd " by Fire; ſecondly, when diſſolv'd in Water, it evidently " evaporates in the Air; thirdly, it has no remarkable Taſte, " much leſs a cauſtic one; fourthly, it does not coagulate Acids " into a dry or cryſtalline, but into a kind of liquid Conſiſtence; " fifthly, Quick-lime itſelf never arrives at a liquid Conſiſtence; " ſixthly, with Sulphur, it runs into a dry Conſiſtence reſembling " Cryſtals, which an Alcali does not; ſeventhly, with Sand it is " form'd into hard Concretions; eighthly, it is alſo form'd into hard " Concretions, with Mucuſes, Whites of Eggs, and Curd of Milk, " all which Subſtances are rather colliquated by alcaline Salts; " ninthly, it fixes Sulphurs more. It agrees with an alcaline Salt in " theſe reſpects: Firſt, that it ſaturates Acids; ſecondly, detains " them ſtrongly; thirdly, precipitates other Subſtances diſſolv'd by " them; fourthly, changes them, tho' not by the ſame Property " an Alcali does; fifthly, it diſſolves Sulphur and pinguious Sub-" ſtances, and much more ſuch as are mucid." Among all thoſe who have contended for a Salt, of whatever kind, in *Quick-lime*, none, ſo far as I know, ever exhibited it to the View, before the celebrated *Du Fay*, tho' all of them ſuſpected the Preſence of a Salt, from the Effects it produc'd. He was the firſt who found a Salt in *Quick-lime*, and that in the Pellicle, or Cream, floating on a Solution of it. This Salt was indeed very impure, and ſheath'd up in a great deal of Earth; but, by a ſecond Proceſs, he ſhew'd it ſeparated from the Earth, and more pure than it formerly was. He took eight or ten Pounds of Quick-lime, in Pieces as large as one's Fiſt; he laid them *Stratum ſuper Stratum* on a Furnace, with live Coals; and when the Pieces were red-hot, he took them off, one by one, and extinguiſh'd them in Rain-water, filtrated and warm; for, if common Water is us'd, then leſs Salt is obtain'd. Then he ſuffer'd the Water, with the Lime extinguiſh'd in it, to boil for about a Quarter of an Hour; and whilſt the Water was as yet boiling, he pour'd it off by Inclination into ſome earthen Veſſels. After he had ſuffer'd it to ſettle for ſome time, he pour'd it off again by Inclination into other Veſſels; taking care that no Particles of the Lime itſelf ſhould be carry'd along with it. This Water, upon Evaporation, afforded the Salt of Quick-lime, which is not very pungent, and cannot be felt, unleſs a Spoonful of it is put into the Mouth, and taſted for ſome time; and when diſſolv'd by boiling it in a large Quantity of common Water, or a proportionably ſmaller one of Rain-water, and then filtrated, and evaporated, it becomes purer, but is not white. This Salt, before Depuration, produces a conſiderable Effervescence with Acids, and more particularly Oil of Vitriol; but, when depurated, it neither produces an Effervescence with Acids nor Alcalis: So that it ſeems to belong to the Claſs of *neutral* or *middle Salts*. When lodg'd in a Cellar, upon a Piece of Marble, it diſſolves after a conſiderable Time, if it is impure, into a Liquor of a yellowiſh Colour, ſomewhat inclin'd to red; but much ſooner, if it is pure. Tho' this Salt is ſoon diſſolv'd in a Cellar, yet it has this remarkable Property, that it cannot be diſſolv'd except in a large Quantity of Water. Another Method of extracting the Salt from *Quick-lime*, us'd by the ſame Mr. *Du Fay*, is this: *Quick-lime*, left long in the open Air, and, conſequently, extinguiſh'd by its Humidity, is diſtil'd to Dryneſs, from a coated Glaſs Retort. The diſtil'd Liquor is ſomewhat reddiſh, clear, and not very acid. It ſcarcely produces any Effervescence, either with Acids or Alcalis. It becomes very little red with Spirit of Nitre. It is pour'd upon the powder-like Matter of the *Quick-lime* left in the Retort, with which it produces an Effervescence, and a violent Heat. Then 'tis to be digeſted, filtrated, and evaporated. This diſtil'd Liquor, if pour'd upon Quick-lime, or upon Lime extinguiſh'd in the Air, alſo extracts the Salt from it, but in a ſmaller Quantity. The Salt now deſcrib'd is not of a volatile Nature, but, on the contrary, very much fix'd in the Fire, ſince it did not fly off in that large Fire in which the Lime-ſtones were calcin'd. But leſt it ſhould be pretended, that the Salt obtain'd in this Caſe was owing, firſt, to the repeated Calcination with Wood; or, ſecondly, to the Air, to whoſe Humidity it had been long expoſed, for the ſake of being extinguiſh'd; or, thirdly, to the Water employ'd, which might have poſſibly abounded with Salts, the Experiment was made with Quick-lime, extinguiſhed in diſtil'd River-water, and the clear Solution being pour'd off by Inclination, and evaporated to Dryneſs, the Salt extracted was like the former. *Mem. Acad. R. Sc. A.* 1724. We have ſeen then, that *Quick-lime* is poſſeſs'd of the Properties of an alcaline Salt; afterwards, we have ſeen, that a Salt of a neutral

a neutral or ſaline Nature, or what is commonly call'd a *Sal Salſum*, was extracted from it. It ſeems very probable, that thoſe Effects of Quick-lime, which diſcover it to be of the Nature of an alcaline Salt, are owing to this, that its Salt has a great Quantity of an earthy, abſorbent, and alcaline Matter join'd with it. *Quick-lime* raiſes a more violent Effervescence with Acids, than *Slak'd-lime*. This Phænomenon *Homberg* accounts for from the Particles of Fire which enter the *Lime-ſtone* during Calcination, and adhere firmly in its Pores, being lock'd up, and retain'd therein, by the contracting Cold; and whilſt theſe are expel'd by the Acids, which penetrate the Lime, the above-mention'd Motion of Effervescence is excited. *Mem. de l' Acad. Roy. des Sciences, A.* 1700.

Others alſo derive its Effervescence, Heat, and Fire, from Water being pour'd upon the Quick-lime, which expels the latent Fire with a kind of Impetus. See *Vitruv. L.* 2. *C.* 5. *Williſ. Ferm.* and *Du Hamel. Phil. Tom.* 4. But, then, that Fire ſhould be united, and, as it were, concreted with Bodies during Calcination, ſeems a precarious Hypotheſis, till the Thing ſhall be more clearly demonſtrated. Mean time, it is certain, that Quick-lime, the fiercer and the longer continu'd the Fire is, in which it is calcin'd, excites ſo much the more Heat, that is, actual Fire, in cold Water; in like manner as alcaline fix'd Salts, which, the longer and more ſtrongly they have been ſubjected to the Fire, the more Heat they produce when thrown into Water. *Boerhaave's Chym.* 'Tis diſputed, whether the Properties by which Quick-lime differs from Slak'd, ought to be aſcrib'd to the changing Action of the Fire. *Helmont* was of this Opinion; for he expreſſes himſelf thus: "Stones, which may be calcin'd, "acquire the Nature of Salt, and the Acrimony of Lime. "But that very Thing is a Tranſmutation into a new Gene- "ration, promoted by Fire; but not an Extraction, Educ- "tion, or Separation of the Thing contain'd. But this "Diſcovery the Chymiſts owe to me." Of the Preſence of a moſt acrid Salt in Quick-lime, if we may believe *Stentzelius de Venenis*, no one will doubt, who has ever ſo ſmall an Inſight into its Nature and Operation; for it is prepar'd of Lime-ſtone, containing in it a moſt ſtrong acid Salt, which is calcin'd by the Force and Power of the Fire; divided into ſmaller Pieces, becomes a friable Subſtance; and is tranſmuted into an acrid Salt, conſiſting of the ſmalleſt Points and Spiculæ, and which comes neareſt to the Nature of an alcaline Salt. Quick-lime, therefore, affects the Body preciſely in the ſame manner as the more acrid Alcalis do; ſince, by the Sharpneſs and Stiffneſs of its Particles, it excoriates and corrodes the Solids, diſſolves and colliquates the Fluids, and, by the too great Increaſe of Attrition, brings on Putrefaction and Death, *&c. Stentzel. de Venenis, Lib.* 2.

Whether the Motion among the Parts of the Quick-lime render'd dry, and, as it were, greedy of Moiſture, by the Fire, ariſes from the Re-action of the Æther, or rarefy'd Air, at the Moment when an Acid, or Water, enters its Pores, of which the Fire produces a great Number; or whether that Virtue, by which Quick-lime differs from that which is ſlak'd, ought to be aſcrib'd to the Salt of the former, which either is not in the latter, or is there weaken'd, or in a ſmaller Quantity, are Points not to be determin'd without a larger Number of Experiments than have hitherto been made, with a Deſign to aſcertain the Truth in this Matter.

In Surgery Quick-lime is of Uſe, where a cauſtic burning Force is requir'd. *Celſus, Lib.* 5. *Cap.* 6 and 7. reckons it among the corroſive and burning Remedies. For Inſtance, in making the Separation of a Sphacelus, Quick-lime, reduc'd to a fine Powder, may be ſprinkled on the Part; or it may be reduced to a Lixivium, by Deliquium, in a ſubterraneous Place, together with Pot-aſh, and, after Filtration, apply'd. *Boerh. Aphor.* 462. and *Mat. Med.* It is alſo uſed in making cauſtic or ſeptic Stones. Thus, three Parts of Quick-lime, and two Parts of Pot-aſh, are powdered, and mixed together, and the Oil of theſe, by Deliquium, is evaporated to Dryneſs, which muſt be expoſed to a ſtrong Heat in a Crucible till it fuſes, and then caſt into Molds. *Boerh. Mat. Med.* and *Chym. Vol.* 2. In the *Paris* and *Bruſſels Diſpenſatories*, and *Lemery's Chymiſtry*, two Parts of Pot-aſh are taken, to one Part of Quick-lime. In the *Pharmacop. Aug.* under the Title of *Potential Cautery*, equal Parts of each are taken. *Charas* teaches the ſame Method; where, at the ſame time, he intimates, that Salt of Tartar, or the lixivial Salt of Vegetables, may be employ'd for the ſame Purpoſe. In the *Edinburgh Diſpenſatory* the Proportion is the ſame; but it is directed, that the Pot-aſh be ſprinkled over the Quick-lime, powdered, and well calcin'd in a Crucible; and, afterwards, that they be kept in a Wind-furnace till the Salt becomes fluid; let a ſufficient Quantity of Spring-water be pour'd on the Maſs, receiv'd in an Iron Veſſel; ſo let it be macerated for ſome Days, filtrated, and inſpiſſated to the Hardneſs of a Stone. *Muſitanus (Chir. Tom.* 4.) gives the following Directions for carrying on the Proceſs:

Take of Soap-lees, two Pounds; of Quick-lime, one Pound: To theſe pour boiling Water; let them be united together; when the Whole is clear, pour it into an Iron Pan; add half an Ounce of Sal Ammoniac; and, by boiling, reduce it to the Hardneſs of a Stone.

The Potential Cautery of *Felix Platerus* is prepar'd by a ſomewhat ſhorter, and leſs tedious Proceſs; for it is no more than an highly acrid Lixivium of the Soap-boilers, prepar'd with Quick-lime, and boil'd in an Iron Pan, till its Humidity is ſo much evaporated, that it begins to become dry. Then it is to be remov'd from the Fire; and, the Maſs beginning now to grow ſolid, is to be taken out with an Iron Spatula, and kept in a Glaſs Veſſel, cloſe ſtop'd, in a hot Place.

The Method of applying it is this: An adheſive Plaiſter, with a ſufficiently large Perforation in the Middle, is laid upon the Part to be cauteriz'd. Then the Cautery is laid upon the perforated Part of the Plaiſter, and another Plaiſter apply'd over it, that it may not diſſolve by the Moiſture of the Air. It is to remain on the Part for half an Hour, or three Quarters, after which the Skin, how thick ſoever, will be burn'd and mortify'd, without any Pain. The Falling off of the Eſchar is to be promoted by the Unguentum Roſatum, or any other Digeſtive. It is, by others, call'd Corroſive, Cauſtic, or Infernal Stone. *Fuller* mightily extols an Epithem, which is made of Quick-lime, reduc'd to ſuch a Conſiſtence, with a ſufficient Quantity of liquid Honey, as to be ſpread upon dreſs'd Leather, in form of an Unguent; to be apply'd to the Part affected, and, as often as it dries, to be renew'd. He ſays it is an extraordinary and approv'd Remedy againſt Scorbutic and Rheumatic Pains, and that he never yet knew it try'd in the true Gout; but is of Opinion, that it would be very efficacious. It is alſo good againſt Chilblains. In the *Leyden Diſpenſatory* the Unguentum Calcis is compoſed of Quick-lime, with the Addition of emollient and drying Ingredients. The ſame Compoſition is in the *Antidot. Ben.* where it is not Quick-lime, but Lime ten times waſh'd, which is preſcrib'd. It is call'd *Unguentum de Calce Compoſitum Jo. de Vigo*; and is commended for Burns of any kind, Itchings, Eryſipelas, and old Ulcers of the Legs. For the ſame Purpoſe, but with leſs Effect, is us'd the *Unguentum de Calce Simplex*, (*ibid.*) which is compos'd of Quick-lime ſeven times waſh'd with Roſe-water, and which is then to be reduced to the Form of a Liniment, with Oil of unripe Olives, or Oil of Roſes, and the Whites of two Eggs, with a ſufficient Quantity of Wax. In *Lemery's Pharm. Mynſicht's* Ointment of Quick-lime is compounded of Quick-lime, Orpiment, Root of Florentine Orris, Sulphur, Nitre, a Lixivium of Bean-ſtalks, and Oil of Spike. This is recommended for a good Depilatory. *Valleri* propoſes, for this Intention, Quick-lime alone, and Arſenic boil'd with Water. *Joel* recommends equal Parts of Quick-lime and Orpiment, powder'd, and boil'd together, in an acrid Lixivium, to the Conſiſtence of a Poultis. The Depilatory of the *Italians* is prepar'd of four Ounces of Quick-lime, of Orpiment, Litharge, and Starch, each an Ounce, in a ſufficient Quantity of Water, to which is ſometimes added an equal Quantity of Salt of Tartar and Soap, and a ſufficient Quantity of Oil of Elder, according to *Fick.* *Mynſicht's* Pills of Quick-lime, in *Lemery's Pharm.* to be put into hollow Teeth, that ake, are thus prepared:

Take half an Ounce of Quick-lime; of Wheaten-meal, long Pepper, Pomegranate-bark, and Galls, of each two Drams; of Henbane-ſeed, Cloves, Opium, and burn'd Alum, each four Scruples: Mix, and, with the Extract of Pellitory of *Spain*, make a Maſs, of which afterwards let oblong Pills be made, with Oil of Cretan Origanum and Camphire. *Mynſicht.*

Tilingius's Pills of Quick-lime, for the ſame Uſes, are made of Quick-lime, long Pepper, Henbane, and Opium, with Juice of the Root of Pellitory of *Spain*, according to *Fick.* The moſt familiar Maſticatory of the *Indians* is Quick-lime, with the Betel-leaf, and the Fruit of the *Indian* Nut; inſtead of which, the moſt common Maſticatory in *America* is of Tobacco-leaves and Quick-lime, according to the ſame Author.

The Water of Quick-lime, from its extraordinary Uſe, has been dignified by the Name of *Aqua Pretioſa*, or *Benedicta Chirurgorum*; for it is a good outward Medicine, not only for cleanſing foul and putrid Wounds and Ulcers, but alſo for diſſipating cutaneous Diſorders; for which Purpoſes it is generally apply'd tepid, with a Linen Cloth, either alone, or impregnated with ſimple or camphorated Spirit of Wine; it is very proper for diſcuſſing ſerous and œdematous Tumors, if frequently apply'd warm with a Sponge or Linen Cloth; but particularly if

œdematous

tedematous Swellings in the Feet are in Danger of a Gangrene, which is known by an Appearance of Spots upon the Part, this Water is highly proper, not only becauſe it diſſolves the Tumors, but alſo becauſe it preſerves from Gangrene. It alſo carries off Inflammations, and reſiſts Gangrene, whether apply'd by itſelf, or with Sugar of Lead; but the Application ought to be pretty frequently renew'd. In Herpes and Serpigo, whether ulcerated or not, it is an experienced Remedy. *Hippocrates (De Morb. Popul. C. 2. Sect. 5.)* orders Lime-water, but ſo prepared, as not to exulcerate, to be uſed for the Vitiligo and Leproſy. The Moderns commend it in the Itch, if the Parts affected be waſh'd either with it alone, or together with Sulphur, in the common Itch, or with Mercurius Dulcis in thoſe of the malignant Kind. *Etmuller*, for the ſame Intention, preſcribes one Pint of Quick Lime-water, and from three Drams to half an Ounce of pulveriz'd Sulphur; theſe are to be boiled together; and after the Liquor is percolated, the Joints of the Body infected with the Itch are to be waſh'd with it; or at leaſt the Ointment apply'd to the Joints may be waſh'd with it. Three Drams of the Scoriæ of Regulus of Antimony, added to one Pint of Quick Lime-water, are more ſucceſsfully uſed in a ſcurfy Itch. This Mixture is of ſingular Service, when apply'd externally. Two Drams of Mercurius Dulcis, diſſolved in a Pint of Lime-water, is a Medicine of ſingular Service in ſome Chirurgical Caſes, ſince it radically cures all Ulcers of the Body, even thoſe of the longeſt Standing; and is ſucceſsful againſt any Species of Itch. But this Caution of *Ludovicus* muſt be obſerv'd, who in his *Pharm.* ſays, "Water of Quick Lime, ſaturated with Sulphur, is indeed a good topical Medicine, but requires Circumſpection; leſt meeting with ſaline Humours of a like Quality with itſelf, it ſhould rather increaſe than remove the Diſorder." A Circumſtance full of Danger is alſo often to be dreaded, which is the repelling the ſcabious Matter from the Skin to the internal Parts by conſtricting and obſtructing the cutaneous Pores by a drying Medicine. This Danger is beſt prevented by the Uſe of other Evacuants at the ſame time. Lancinating Pains of the Legs are frequently very much reliev'd by the Legs being put into this Water; which is alſo ſaid to take away a Polypus of the Noſtrils, if frequently apply'd. A Man forty Years of Age, having a Laſſitude all over his Body, and being afflicted with a Heavineſs and Pains of his Feet and Loins, boil'd Quick Lime-water in a Kettle, and apply'd it warm, by means of Linen Cloths, to the Belly, and the Region of the Pubes and Kidneys, for almoſt the whole Night; and by a plentiful Evacuation of Urine was cured. But in a Fever, with the Head-ach, a Cataplaſm prepar'd of Quick Lime-water apply'd to the Head, kill'd the Patient, as we may ſee in *Lindeſtolpe de Ven.* When Quick Lime-water is by well ſhaking mixt with any mild Oil, that, for Example, of Linſeed or Olives, it then acquires the Form or Conſiſtence of a Balſam, which is of ſingular Service, when apply'd externally, in freſh Burns, and alſo conduces to ſtop Inflammations. *Slare Saceb. Boyle Specif.* Quick Lime-water may alſo be impregnated with Copper, by ſtanding in a brazen Baſon: by this means it aſſumes a beautiful ſapphire Colour, and proves an excellent Remedy againſt Puſtules, Ulcers, Scabies, and Itching of the Eyes. In the *London* and *Edinburgh* Diſpenſatories, there is an *Aqua Sapphirina*, which is nothing but Water of Quick Lime, in which a little Sal Ammoniac is diſſolv'd, and which has ſtood for ſome time in a Braſs Veſſel, for the ſake of acquiring an azure Colour. In *Schroder's Pharm.* it is called the *Sapphirine Water* for the Eyes; for it is commended againſt all Blemiſhes of the Eyes, and alſo for cleanſing all ſorts of Ulcers. Empirics ſell it for Sapphire-water, againſt Humours and other Diſorders of the Eyes. *Boot. Lib. 2. Cap. 293. Etmuller* aſſerts, That no Remedy is more effectual againſt cancerous Ulcers, than this Water; and that it is very efficacious when the Eyes are hurt by the Small Pox. This Water may be more or leſs diluted, according to the Intention, becauſe, when it is not ſo, it is of too acrid a Quality. It is likewiſe highly eſteemed againſt Films of the Eyes. That which is call'd the *Aqua Cœleſtis* conſiſts of the Water of Quick-lime, Sal Ammoniac, and Alum. The Aqua Calcis of *Rulandus* for Burns is prepared of five Ounces of Quick Lime boiled with four or five Pints of Spring-water in a Braſs Veſſel. When the Liquor is filtrated, as much Vitriol is added to it, as is ſufficient for giving it a bluiſh Colour; and as much of the Sugar of Lead, as is ſufficient to make it become milky. This Water is commended as a good Application to Parts burn'd or frozen, Gangrenes, Eryſipelas, Fiſtulas, Itch, malignant Ulcers, if often apply'd to the Parts affected in the Day-time with warm Linen Cloths, *Coll. Leyd.* If twenty Grains of corroſive Sublimate Mercury are diſſolved in a Pint of Quick Lime-water, according to the *Paris Diſpenſatory*, and *Lemery's Chym.* or thirty Grains, by the Direction of the *Edinburgh Diſpenſatory*; or half an Ounce, agreeable to *Lemery's Diſpenſatory*; we have the *Aqua Phagedænica*, ſo much celebrated for external Uſe in deſtroying fungous Fleſh in Wounds, cleanſing ſordid Ulcers, and againſt Gangrenes. Some, who would render its Uſe the ſafer, mix with it Spirit of Wine well dephlegmated. Others alſo mix with it Arſenic, and Spirit of Vitriol. *Charas Pharm.* According to *Etmuller*, the Aqua Phagedænica uſed in *France*, eſpecially to put a Stop to beginning Gangrenes, particularly of the nervous Parts, is thus prepared:

Take ten Quarts of common Water; let four Pounds of Quick Lime be added to them; and when the Ebullition is at an End, add two Ounces of pulveriz'd Arſenic, and one Ounce of pulveriz'd Maſtich: Let all theſe be well ſtirr'd with a wooden Spatula, till the Quick Lime ſubſides to the Bottom; then let the clear Water be pour'd off; to which add two Ounces of Sublimate Mercury, and ſix Ounces of rectify'd Spirit of Wine. Mix them together.

He ſays this Water is really excellent in Practice; and that, if it ſeems too acrid, it may be corrected by the Addition of more Spirit of Wine. The compound Polychreſt-water of Quick Lime, moſt uſeful againſt Tumors with Inflammation, moiſt Exulcerations, and Diſpoſitions to a Gangrene, he directs to be prepared thus:

Take four or five Pounds of Quick-lime; a Pound and an half of Sal Ammoniac; half a Pound of Litharge; of Olibanum, Myrrh, and Maſtich, each half an Ounce; of Camphire, one Dram: Let them be boil'd together, till the Litharge be diſſolved. Let this be apply'd twice or thrice a Day warm with Linen Cloths.

In *Courland* this Compoſition is uſual, under the Name of

The WHITE EPITHEM.

Take three Ounces of Quick Lime; ſix Drams of camphorated Spirit of Wine; one Dram of Sugar of Lead; half a Scruple of Mercurius Dulcis: Mix them together.

With Cremor of Quick Lime, according to *Etmuller*, the Lips of a cancerous Ulcer may be anointed, that the corrupted Part may be conſum'd, while the ſound remains. With Bole Armoniac 'tis a Specific in the Ozœna. *Ludovicus*, in his *Pharm.* gives this Advice concerning the Cremor: "It is not unſucceſsful outwardly in ſordid and inveterate Ulcers; but in an exulcerated Cancer, Spina Ventoſa, or ſteatomatous Swellings, it ought to be cautiouſly apply'd; ſince inſtead of promoting the intended Separation, it often increaſes the Pain, and augments the Diſcharge of Matter."

Slak'd Lime may be ſubſtituted in the Room of Quick Lime, when a little leſs Acrimony is neceſſary. In the *Eaſt-Indies* it is apply'd to the Temples to diſſipate Head-achs ariſing from Refrigeration; and is uſed for the Wounds inflicted by Scorpions, and Stings of Waſps. But for diſpelling cold Tumors of the Knees and Abdomen, and diſcharging Wind, they reduce it with a Mixture of Honey into the Form of a Plaiſter, which they leave apply'd till it falls off of itſelf, after having perform'd its deſir'd Effect. However, before the Application of this Plaiſter, they anoint the Part affected with Oil. In the *Eaſt-Indies* it is alſo mix'd with Tobacco-juice, as a Remedy proper for killing Worms diſcover'd in Wounds. *Lettr. Edif.* and *Leeuwenh. Epiſt.* 124.

Waſh'd Lime is a Chirurgical Remedy, which dries without Pungency, and is proper for Burns, and too moiſt Ulcers. Hence Ointments of waſh'd Lime are in high Requeſt for Burns. For Example:

Mix waſh'd Lime with Oil of Roſes or Linſeed; and let them be well ſtirr'd in a Leaden Mortar, to the Conſiſtence of an Ointment, which is excellent for Burns.

This Medicine is prepared in a Leaden Mortar; for by this means the Particles of the Lead are ſucceſſively abraded, and united with the Ointment; a Circumſtance which contributes not a little to heighten its Excellence.

A very uſeful Remedy is alſo produc'd from waſh'd Lime againſt any kind of Ulcers.

Take as much as you pleaſe of Lime twice or thrice waſh'd, and almoſt dry'd; add Linſeed-oil, a ſufficient Quantity; tinge it of a Fleſh-colour with the choiceſt Bole: And thus you have an excellent Ointment.

Joel informs us, that Lime reduc'd to a very fine Powder, and waſh'd three or four times with Roſe-water, and again reduc'd to Powder, is an excellent Remedy againſt Venereal Ulcers of the Pudenda, if 'tis ſprinkled on them, as it removes and conſumes all Impurities, and quickly brings on a Cicatrix. In the *Ph. Aug.* that of *Antwerp*, and that of *Lemery*, there is an

an Ointment of Lime, made of wash'd Lime and Wax, each three Ounces; and one Ounce of Oil of Roses; which is also commended for Burns, and drying of Ulcers. If Lime be slak'd with Vinegar, thrice wash'd, and reduc'd with Oil of Roses to the Form of a Liniment, it heals Burns without any Trace of a Cicatrix, and suffers no Blisters to arise, *Mus. Worm.* Thus far of the external and chirurgical Uses of Quick Lime, and its Preparations. The Effects it produces may be accounted for, either from its corroding, burning, cleansing, and, consequently, acrimonious Quality, or from its drying and astringent Properties.

Whoever reflects on the foregoing Remarks concerning the fatal Effects, not only of Quick, but also of Slak'd Lime, whereby they have merited a Place in the Catalogue of Poisons, will, in all Probability, never reason himself into a Persuasion, that either Slak'd Lime, or the Lixivium of Quick Lime, can with Safety be used internally. But there are celebrated Physicians, who being instructed by successful Experiments, have ventured to commend, in many Diseases, the internal Use of both Slak'd Lime, and of Quick Lime-water. Thus Slak'd Lime is prescrib'd by some for a Clyster, in the Dysentery, as an astringent, drying Remedy. And according to an Observation of Mr. *Homberg*, a Man was cured of an Hypochondriac Disorder, by a Medicine prepared of two Parts of Quick Lime extinguished by the Air, mixt with one Part of Sal Ammoniac; twenty Grains of which were exhibited for a Dose. And Lime dissolved per Deliquium holds not the last Place among aperient Medicines. *Du Hamel's Hist.* Quick Lime-water is most frequently used through *Great Britain* and *Holland*, for purging away all kind of Chronical Diseases, *Schulz. Præl.* In *Bates's Dispensatory* what is call'd *Aqua Benedicta*, is prepar'd of

One Pound of Quick Lime, with eight Pints of Water, boil'd and filtrated after settling.

Three or four Ounces of this may be prescrib'd thrice a Day, or as common Drink, for a Month, in several Cases; such as Redness of the Face, Pustules, Strumæ, Asthma, Phthisis, Empyema, malignant Dysentery, aqueous Tumors of the Scrotum, Fluor Albus, the wandering Gout, Freckles, Herpes, Gangrene, Œdema, Tumors of the Knees and Legs, all Ulcers attended with an Afflux of Humours, as also in a Diabetes. What in the same Dispensatory is call'd *Aqua Benedicta Composita*, is made of

One Ounce of Sassafras-bark, six Ounces of squeez'd and ston'd Grapes, and six Drams of Nutmeg; all which together are to be infus'd cold in six Pints of the forementioned *Aqua Benedicta*, for two Days, and then strain'd.

This is said to be of the same Effect with the former, but more powerful in some Cases. In the *Edinburgh Dispensatory*, the simple *Aqua Benedicta* is the same with that mentioned above; but the Compound is thus made.

Take of the Raspings of the Wood and Bark of Sassafras, two Ounces; of Nutmegs, three Drams; of sliced Liquorice, one Dram; of fresh Lime-water, four Pints: Digest for two Days; and to the percolated Liquor add two Ounces of the balsamic Syrup.

Sylvius, one of the most celebrated Physicians in *Holland*, says, in his *Prax. Med. L. 1. C. 6. § 14.* "That Quick "Lime prepared of burnt Flint or Shells, admirably corrects a "saline Acrimony like that contained in marine and fossil Salt, "and in most saline Substances; so that it is no more to be "dreaded by any prudent Physician, but is with Confidence to "be used in the Form of a Lixivium, in many Disorders." In *Great Britain*, *Willis*, according to *Etmuller*, gave Quick Lime-water not only in Exulcerations, or an Abscess of the Parts situated within the Breast, but also for cleansing and deterging Abscesses of any Parts of the Abdomen after breaking; and in the Diabetes. The same *Willis*, for a diuretic Medicine, commends a Mixture made of

Four or six Ounces of Quick Lime-water, and one Dram, or a Dram and an half, of Tincture of Salt of Tartar; of which a Draught is to be taken twice or thrice a Day.

In Spitting of Blood, *Bennet* proposes this compound Lime-water:

Take of Comfrey, common Knot-grass, Plantain, Burnet, each one Handful: Let them wither in Quick Lime; and after they are perfectly dry, let them be infused in common Water; which may be added to them till they are of the Consistence of a thick Pulp. Let the Infusion be continued for three Days, and the Matter often stirr'd; then let them lie in a cool Cellar, and let the clearest Water be pour'd off by Inclination. Of this let the Patient take six Ounces for four or five Mornings successively; and tho' the Case should appear pretty desperate, the Remedy will scarcely fail of Success. *Bened. Theat. Tab. p. m.* 140.

Among the *French* Authors, *Spanius* says, That Quick Lime-water, drank with Milk or Whey, performs wonderful Effects in internal Ulcers, Diarrhœas, and the Dysentery. Dr. *Burlet*, a Physician of *Paris*, and a Member of the Royal Academy of Sciences, has given a Dissertation on the Use of Quick Lime-water, of the Passages of which most useful for a practical Physician, I shall here give an Abstract. Quick Lime-water, then, mixed with an equal Quantity of Cows Milk, sweeten'd with Sugar, drank thrice a Day, three Ounces being taken for each Dose, is of Use in the Dysentery. In other Diseases it may be mixt with Remedies appropriated to the particular Nature of the Disorder; for Example, in the Scurvy and Dropsy, with about a tenth Part of its Weight of the Tinctura Metallorum; six Ounces of which Mixture daily given for a Dose, in such Cases, fuse the Humours, and provoke Urine. Against those Cachexies to which young Women are subject, he prescribes the following Mixture.

Take of Quick Lime-water, and Tinctura Metallorum, each four Ounces; of the Powder of Aloes, one Ounce; of Filings of Steel, two Drams: Let them infuse for forty Hours. If to this Mixture three Drams of the Resin of Jalap be added, we have an excellent Purgative in the Dropsy, two Spoonfuls of which are to be given every other Day, in Broth of Flesh, or the Juice of red Cabbage.

In Quartans, and every kind of the more obstinate and intermitting Fevers, Peruvian Bark is with Success given with Quick Lime-water, and some Drops of the Tinctura Metallorum. In the Asthma and Atrophy,

Take of Quick Lime-water, eight Pints; of Sassafras-wood, Aniseed, and Liquorice-roots, each four Ounces; of Currants, and Damask-grapes, half a Pound: Let them be infused without Heat. Two Ounces and somewhat more of this Infusion may be exhibited twice a Day.

The following Observations have been made concerning the Use of Quick Lime-water. It often excites Nauseas; and palls the Appetite to such a Degree, that it is sometimes necessary to prescribe *Alicant* Wine, Wormwood-wine, or *Venice* Treacle. It sometimes induces Leanness, and dries too powerfully; sometimes it excites Heat, renders the Patient costive, causes plentiful Discharges of Urine, and often raises a Diaphoresis. Mixt with Milk, or a vulnerary Decoction, it is very often useful in the Cure both of internal and external Ulcers. It stops Hæmorrhages, Diarrheas, the Fluor Albus, and the Gonorrhea. It is of Service in Relaxations of the Viscera, and in a Diabetes. It is of Use in all inward Obstructions and Tumors, when they have not degenerated into a Scirrhus or Cancer, and in Scrophulæ not yet inveterate; mixt with Milk, it prevents its Coagulation, and is consequently proper for those whose first Passages abound with an Acid, which forbids the Use of Milk. increases the purgative Qualities of Scammony, Aloes, and Jalap. That the Use of Quick Lime-water may be successful, it should be long continued; but it is strictly to be adverted to, that it is proper only in Countries situated to the North; and that in such Disorders only as draw their Origins from an acid, an austere, a viscid, a mucous, or pituitous Cause; in Cases where a due Degree of Motion and Stimulus are wanting in the Fluids; and where fix'd muriatic Salts lodg'd in the Blood are to be corrected and disposed for an easy Evacuation: For Example; in *Holland*, where the Climate is cold, the Air somewhat thick with the Damps of the Marshes, where the Drink is Beer, the Food Cheese, Butter, and Salt-fish, the Blood is by these means render'd too crude, less fluid than it ought to be, and, consequently easily stopt in the capillary Vessels. Hence proceed Obstructions, and chronical Diseases; for which Alteratives are of singular Service; among which Quick Lime-water, in Conjunction with *Tinctura Metallorum*, a highly penetrating Medicine, is none of the least considerable, since it is exhibited with great Success. It is obvious therefore, in what Species of the Scurvy Quick Lime-water becomes a laudable Medicine, when daily drank to the Quantity of three or four Ounces. From what has been said, it is now manifest, that Quick Lime-water proves hurtful, when exhibited at the time of the necessary Evacuations, such as the Menses, Hæmorrhoids, and in Diarrheas, which it suppresses: Nor is it proper in Cases where there is a Weakness of Appetite, or Loathing of Food, where the

the Patient is either emaciated or coſtive, or where a preternatural Heat or Thirſt prevails. It is equally prejudicial in Caſes where the Fluids are inclin'd to an Alcaleſcence, where the Bile is too much exalted, where the Humours have aſſum'd a ſalino-putrid Quality, or are in a State of Diſſolution, attended with an Acrimony. It is alſo hurtful in Diſorders of the hot and acute Kind, and in Caſes where the Fluids are already too much parched, or put into too briſk and lively Motions. Hence it muſt of courſe be highly improper in that Species of Scurvy, which is accompanied with Putrefaction, and draws its Origin from a rancid Oil, and an acrid Salt. For which Reaſons, in the hotter Climates, ſuch as *Paris*, the Uſe of it is generally attended with unhappy Conſequences. But in Caſes where it is proper, that is moſt ſafely uſed which is prepar'd of one Pound of Quick-lime, with eight Pints of Water pour'd upon it. In many Inſtances, where a gentle Stimulus is only requir'd, the ſecondary Water of Quick-lime is to be preferr'd. *Hamel's Hiſt. the Memoirs of the Royal Academy of Sciences*, 1700. *Slare Sacch. Boerh. Chym. Vol. II.* From the Premiſſes we may rationally conclude, that, whatever is the Effect of Quick-lime-water, it ought to be attributed to the alcaline and highly minute Molecules of the Quick-lime, incorporated with the Water; for on theſe depends that Virtue by which it abſorbs Acids, dries, and conſequently corroborates, and acts like a Styptic; but proves aperient, where an Alcali, meeting an Acid, conſtitutes a neutral Salt, which acts both like an Aperient and Deobſtruent, by exciting a Diaphoreſis, and promoting a Diſcharge of Urine.

As Quick-lime-water has a Tendency to deſtroy Acidity and Phlegm, hence the anthelminthic Remedy of the *Indians* is not to be eſteem'd abſurd, who drink it in the Morning three Days ſucceſſively againſt Worms of the Inteſtines. *Lettr. Edif.* Whether Quick-lime-water, internally uſed, is a Remedy proper for diſſolving the Stone, muſt be judg'd of from this Circumſtance, that it reduces to a Mucilage Stones cut from Patients afflicted with that Diſeaſe. *Barthol. Epiſt. Cent. 4. Reiger.*

CALYPTER, καλυπτὴρ, from καλύπτω, to hide. A carnous Excreſcence covering the hæmorrhoidal Vein. Περιπέφυκεν αὐτῇ (αἱμαλίδι) καλυπτὴρ ὁ τῆς σαρκός. "There grows about "it (the bleeding Vein) a Calypter, or Covering of Fleſh." *Hippocr.* περὶ αἱμορροΐδων.

CALYPTRA. See the Explication of this under the Article BOTANY.

CALYX. See BOTANY.

CAMANHAYA, *Braſil.* Marcgr. A capillary Herb, which grows upon the higheſt Trees, ſo as quite to cover them; it is of a grey Colour, like a ſort of Down, and is adorned at certain Diſtances with ſix, five, three, two, or perhaps but one Leaf, like that of Roſemary. It ſeems to be a Dodder. *Ray, Hiſt. Plant. Index.*

CAMARA, καμάρα, in Anatomy, is the Fornix of the Brain; and the camerated or vaulted Part of the Auricle, leading to the external Foramen. See AURIS.

CAMARA is alſo a Species of LYCHNIS, which ſee. *Ray Hiſt.*

CAMARA-JAPO, *Piſon.* A Species of *Mentaſtrum*, or Horſe-mint. It ſhoots up one round hairy reddiſh Stalk, to the Height of two Feet; the Leaves are lightly ſerrated, and greyiſh underneath, ſtanding oppoſite by Pairs, with many leſſer ones adjoining. On the upper Branches of the Stalk ſtand the Flowers, in the Form of an Umbella, coming forth all the Year round, almoſt like thoſe of Tanſey, with Stamina of a watry azure Colour, and ſmelling like Horſe-mint, as the whole Plant alſo does, which is of a bitteriſh and aromatic Taſte. The Seed is ſlender, long, and black, and, when ripe, is blown away out of its downy Huſks. *Ray Hiſt. Index.*

CAMARA-MIRA, *Piſonis.* It is, ſays *Piſo*, a Plant a Cubit high, of a ſlender and woody Stalk, bearing one ſmall yellow Flower, which, what is to be wondered at, opens at all times of the Year, at Eleven o'Clock in the Forenoon, and continues expanded till Two in the Afternoon, when they all ſhut up together till the next Day. I made this no leſs true than delightful Obſervation, ſays he, in my Travels thro' the Deſarts, and it partly ſupplied the Want of a Watch. It grows in *Braſil.* *Ray, Hiſt. Plant.*

CAMARA-TINGA. A Species of *Chamæpericlymenum*, or Dwarf Honey-ſuckle, growing in *Braſil.* It bears a red, and ſometimes a yellow Flower, which is of an extraordinary Fragrancy, and the Herb itſelf ſmells ſweeter than Mint. The Flowers are ſucceeded by Cluſters of green Berries, of the Bigneſs of Elder-berries. *Ray, Hiſt. Plant.*

CAMARA-CUBA, *Braſilianis*, Marcgr. is an Herb with hairy rough Leaves like Nettles, and Flowers of the Size of thoſe of the Buphthalmum, of a fine yellow Colour, conſiſting of nine Leaves, with a large yellow Umbilicus in the middle, whence riſe little black Stamina, of a Smell between Nettle and Mint. To the Flowers ſucceeds oblong blackiſh Seed, like that of Succory; the Plant feels quite glutinous *Ray, Hiſt. Plant.*

CAMARAN-BAJA. A Species of LYSIMACHIA, which ſee.

CAMARIN-BAS, *vel Umari*, Piſon. Marcgr. *Arbor pruniſera Braſilienſis, fructu Perſici inſtar malli.* It is a Tree of a moderate Height, and bears a ſmall yellow Flower, ſucceeded by an oval Fruit, of the Size of a Plum, which looks and taſtes like our Peach, and is green, inclining to a pale yellow. The Pulp is little in Quantity, ſweet, and yellowiſh, incloſeing a large, oval, whitiſh Stone, which contains a Kernel that is good to eat; the Fruit is ripe, and falls off in *March.*

The Fruit eaten raw diſturbs the Stomach, and is very ſubject to excite Vomiting; therefore they uſe to boil it whole, and, bruiſing it with the Kernel, eat it with Fleſh or Fiſh inſtead of Bread.

It grows very plentifully in the graſſy Fields, about the River *Cumbas*, and *Rio grande*; the Fruit falls off in *March*, and is gathered up.

Piſo mentions another Species of this Tree, leſs tall, and bearing Fruit not unlike the former, but of a blackiſh Colour, and a ſouriſh Taſte, which tempers the immoderate Heat of the Stomach, and is very acceptable to feveriſh Perſons. *Ray, Hiſt. Plant.*

CAMARIUM. The ſame as CAMARA, which ſee.

CAMAROSIS, CAMAROMA, καμάρωσις, κάμαρωμα, is a Fracture of the *Cranium*, in which the broken Bone is elevated Vaultwiſe. *Paulus, Lib. 6. Cap. 90.* ſays, "It is "a Diviſion of the Cranium in which the Bone is elevated, "or, according to *Galen*, a Receſſion of the Bone to the in-"ternal Parts, and an Excavation, as in an *Ecpieſma.*" This is the Senſe which *Paulus* puts upon *Galen*'s Words, which ſeems to contradict his own Definition. The Place he quotes is in *Galen, Lib. 6. M. M. Cap. 6.* "*Engiſomata*, ἐγγίσωματα, "are Fractures of the Cranium, in the middle of which the "Bone preſſes upon the Membrane; but *Camaromata* are "Fractures of the ſame Part, in which the Middle is eleva-"ted; but when the ſound Part firſt begins to ſeparate from "that which is affected, the *Camaromata* recede inwards, and "preſs upon the Membrane." Thus *Galen:* By which it appears, that in a *Camaroma* the Extremities of the broken Bone tend inwards towards the Membrane, ſo as to preſs upon it; but the adjacent Parts of the Bone are elevated, and recede from the Membrane; and conſequently, in this Species of Fracture, there is a double Eminence of the Bone on the Sides of the Wound. *Gorræus.*

Camaroſis, in a general Acceptation, is defined by *Galen, Def. Med.* "a Diviſion of a Bone, when, being fractured on "both Sides at once, it takes the Form of a Vault." Καμάρωσίς ἐστιν ὀστοῦ διάλυσις, μιᾷ τῇ τοῦ ὀστοῦ ἅμα κυλάσθαι ἐξ ἀμφοτέρων, καὶ παραπλησίως καμάραις ὀχυμαλίσθαι.

CAMARU. A Species of SOLANUM, which ſee.

CAMATOS, κάματος. Labour, Fatigue, a Diſeaſe.

CAMBAR. A ſpagirical Term, derived, as is ſaid, *Theat. Chymic. Vol. 5.* from *Canna*, Fire, and *Bar*, a Son. The Explication of this Word is not intelligible, at leaſt by me.

CAMBIL. *Terra rubra. Rulandus.*

CAMBIUM. A Term in Uſe formerly to ſignify the nutritious Humour, which deriving its Origin from the Blood, is ſo concocted, prepar'd, and aſſimilated as to ſupply what that Part has loſt, *& tum illa Naturam ſuam cambiat*, and changes Nature with it. *Sennertus, Tom. I.*

CAMBOGIUM, Offic. Commel. Flor. Mal. 66. *Carcapuli*, THE INDIAN YELLOW ORANGE OF MALABAR. Park. Theat. 1635. J. B. 1. 105. Chab. 5. C. B. Pin. 437. Raii Hiſt. 2. 1661. *Carcapuli Malabarenſium*, Jonſ. Dendr. 26. *Carcapuli Acoſtæ fructu, malo aureo ſimili*, Pluk. Almag. 81. *Arbor Indica, quæ Gummi guttæ fundit, fructu acido ſulcato, mali magnitudine*, Commel. Flor. Mal. 66. *Coddam-Pulli ſeu Ota-Pulli*, Hort. Mal. 1. 41. Tab. 24. *Carcapuli*, Linſcot. Ind. Orient. Part. 4. *Arbor Indica Gummi Guttam fundens, fructu dulci rotundo, Ceraſi magnitudine; Kannawakoraka, Kapnajicoraka, Gobkathu, Ghoraka Cingh.* Herm. Muſ. Zeylan. 26. GAMBOGE. See GUMMI GUTTA.

CAMBUCA, or *Cambuca membrata.* A Bubo, an Ulcer or Abſceſs of the Pudenda, a Boil in the Groin. *Caſtellus. Rulandus.*

CAMBUI, or the wild *American* Myrtle of *Piſo* and *Marcgrave.* There are two Species of this Plant, which on account of their Fragrancy, and the Aſtringency of their Leaves, Flowers, and Fruit, well deſerve the Name of the *Wild-myrtle.* The firſt is a ſhrubby Plant, with broad Leaves, and is like the black Cherry-tree, as to external Appearance, in Branches, Leaves, Flowers, and Fruit; but exceeds it as to its internal Qualities; for not only the Leaves and Flowers are of an excellent Smell, but the black Berries are very juicy, with a grateful Aſtringency, which makes them acceptable to all ſorts of People, and ſold in the Market. The latter Kind

is red, and is as much ſuperior to the other in Goodneſs, as it is exceeded by it in Size, the Fruit being highly delicious, as well as medicinal; it bloſſoms in *October*, the Flower being very white, fragrant, and tetrapetalous. The red Berries refreſh and corroborate the Stomach, and allay feveriſh Heats. The Juice or Decoction of the Leaves and Fruit uſed outwardly heal Ulcers, eſpecially in the Legs, and by their aſtringent and cleanſing Qualities are ſerviceable in other Diſeaſes. Uſed in Bathing, they are very ſucceſsful in Fluxes of the Belly or Uterus; they are alſo ſerviceable for the ſame Purpoſes as the common Myrtle. There is a third Species called the White-myrtle, but this is not ſo common as the others. *Ray, Hiſt. Plant.*

CAMELINA, CAMELINE. See ERYSIMUM.

CAMELOPARDALIS, CAMELOPARDUS, καμηλοπάρδαλις, καμηλόπαρδος, from κάμηλος, a Camel, and πάρδαλις, or πάρδος, a Leopard. A Beaſt ſo called, according to *Varro*, not becauſe it is generated between a Camel and a Leopard, but becauſe it is ſhaped like a Camel, and ſpotted like a Leopard; or, according to *Pliny*, becauſe it has a Head like a Camel, but has its Body variegated with Spots like a Leopard. *Horace* deſcribes it in the following Verſe, according to the common, tho' erroneous Notion,

Diverſum Panthera Genus confuſa Camelo.

The *Camelopardalis*, otherwiſe called *Camelopardalus*, *Ovis fera*, *Giraffa*, *Anabula*, *Nabis*, *Saffarat*, and *Nabula Æthiopica*, is a kind of Camel, but ſpotted like a Leopard. It is near as big as an ordinary Camel, and has two ſmall Horns, with a Tubercle in the middle of its Forehead, which might almoſt paſs for a third Horn. Its Neck is ſeven Feet in Length, and cover'd with Hair like that of a Horſe; its Tail is ſmall, thin, and hairy towards the End. It is cloven-hoofed like an Ox, its Tongue is two Feet in Length, round like an Eel, and of a dark Colour, inclining to a Violet. It feeds upon Graſs and Herbs, and the tender Branches of Trees, which by the Advantage of its long Neck it eaſily reaches.

It is found in *Ethiopia*, and other Parts of *Africa*, and is very gentle and tractable. The Horns and Hoofs raſped, pulverized, and taken inwardly, are good for the Epilepſy, ſtop a Looſeneſs, and reſiſt Poiſon. *Lemery des Drogues.*

CAMELUS, Offic. Aldrov. de Quad. Biſul. 880. Jonſ. de Quad. 67. *Camelus Capſinus*, Charlt. Exer. 13. *Camelus Dromos*, Geſn. de Quad. 59. *Camelus unico in dorſo gibbo*, Raii Synop. A. 143. THE CAMEL, or DROMEDARY.

It is found in *Aſia* and *Africa*. The Parts uſed in Medicine are the Blood, Gall, Dung, and Urine. The Blood helps the Dyſentery, promotes Conception, and cures the Epilepſy; the Dung is recommended in Apoplexies; the Urine is ſuppoſed to be effectual for cleanſing and whitening the Teeth. *Dale* from *Pliny*.

Authors differ much about the Camel and the Dromedary. The Gentlemen of *Paris*, our *Ray*, and others, call by the Name of *Dromedary*, an Animal which has but one Bunch on his Back; but call a Camel, one which has two Bunches on that Part. But I have been told by an ingenious Perſon, who very lately travelled into *Aſia* and *Africa*, and agrees with *Johnſon*, that the Camel is an Animal with only one Bunch on his Back, but the Dromedary has two; and that this latter was a very ſcarce Creature, and made uſe of by the Nobility only for its Swiftneſs; but the Camel was principally uſed for performing Journeys. *Dale.*

CAMERATIO. The ſame as CAMAROSIS, which ſee.

CAMET, CAMES. Silver. *Rulandus.*

CAMINUS, κάμινος. It ſignifies both the Furnace, and the Place through which the Smoke paſſes off. In *Rulandus* it ſignifies a Bell.

CAMIRI *Indis*, Cluſ. *Fructus rotundus inæqualis cineraceus ſaxeus*, C. B. *Fructus juglandis fere magnitudine duriſſimus, Indis Camiri, ſapore nucis moſchatæ*, J. B.

The Fruit weighs about an Ounce, and is not unlike a Walnut ſtript of its outer green Shell, rough, broader in the upper Part, but ending below almoſt in an obtuſe Point; the Shell is thick, and as hard as a Stone, containing a white Kernel, which taſtes much like an Almond. *Ray, Hiſt. Plant.*

CAMISIA *Fœtus*. The Shirt of the Fœtus; it is put for the *Chorion*, which ſee.

CAMMARUM, CAMMORUM, CAMARUM, κάμμαρον, κάμμορον, κάμαρος, is a Species of Shrimp of the Crab kind. Κάμμορον in *Dioſcorides*, *Lib.* 4. *Cap.* 77. is alſo a Species of Aconite, called alſo θηλυφόνον; and by *Nicander* in *Alexipharmic. Verſe* 41. πολλάκις θηλυφόνον ἢ κάμμορον. Here the Scholiaſt writes, that it is called κάμμορον, becauſe κακῷ μόρῳ διαφθείρει, "It kills with cruel Death." *Pliny*, *Lib.* 27. *Cap.* 3. ſays it is called *Cammoron*, becauſe it has a ſmall Root, reſembling the Sea Cammarum. Κάμμαρος, or κάμμορος, is a Species of Crab, called by *Athenæus* κάμμαρος. And κάμμαρον, in *Galen's* Exegeſis, is an Animal reſembling a ſmall Sea-ſhrimp; and alſo Aconitum, becauſe it has a Root like that Animal; but then he adds, that neither of theſe Senſes will agree with that Word, as it is uſed by *Hippocrates*, *Lib. de locis in Homine*, where he preſcribes the Application of the *Cammorum* in burning Heats. Hence *Erotian* ſays, that not only the Animal is called κάμμορον, but the Moſs which adheres to it goes by the ſame Name. *Zeno* takes it for *Cicuta*, *Zeuxis* for a refrigerating Medicine. Thus *Galen:* The Paſſage where the Word is found in *Hippocrates* runs thus: Τὰς δὲ πυρώσιας πότοῖσι καὶ φορήμασιν, ὥσπερ τὸν πυρετὸν ψυκτηρίῳ φαρμάκῳ ἰκλύειν, καμμάρῳ, ἢ ἄλλῳ τινὶ τοιούτῳ. "The burning Heats muſt be allayed by drinking or ſupping of Liquids, "as by ſome refrigerating antifebrile Medicine, ſuch as the "*Cammarum*, or ſomething of that Kind." Here *Galen* and *Erotian* for καμμάρῳ both read καμμόρῳ. For tho' the Word in the Index of *Erotian* be καμμάρῳ yet in his reciting the above-mention'd Paſſage of *Hippocrates* he reads καμμόρῳ. He obſerves alſo, that this Word occurs but once in *Hippocrates*, and that *Zeuxis*, in the ſecond Book of his Exegetics, took it for ſome refrigerating Medicine; and that *Dioſcorides*, *Lib.* 4. of his *Materia Medica*, ſays, that Aconitum is by ſome called κάμμορον, by others θηλυφόνον [Woman-killer]; becauſe the Root applied as a Peſſary is mortal within the Space of a Day, as *Theophraſtus* and *Pliny* write; and the latter ſays, that by means hereof *Calfurnius Beſtia* killed his Wives when they were aſleep. *Erotian*, rejecting the Opinion of *Lycus*, who reads καμάρῳ in *Hippocrates* with a ſingle μ, and takes it to be meant of a Place in the Bath where Inunction was perform'd, ſo called, becauſe it was vaulted, thinks we are to underſtand it, as *Zeno* and *Zeuxis* did, of ſome refrigerating Medicine, as *Cicuta*, which, apply'd by way of Cataplaſm, is an extraordinary Refrigerant. *Galen* ſeems to be of the ſame Opinion. *Erotian* further tells us, that *Diodorus* the Grammarian, and *Zeno* a Follower of *Herophilus*, aſſure us, that *Cicuta* was by the *Dorians* inhabiting *Italy* called κάμορον, κάμμορον, and κάμαρον, ὡς ταχύμορόν τι ὄν, "as producing "fatal and deadly Effects."

CAMNO, κάμνω, to labour, in *Hippocrates* ſignifies to labour under any Diſorder, to be ſick.

CAMOMILLA. A corrupt Word for *Chamæmelum*, Chamomile.

CAMOTES. See BATTATAS HISPANICA.

CAMPANA, a Bell, in Chymiſtry, is a Receptacle for the Gas of Sulphur, where it is concentrated and collected together into a thin aqueous Matter, in order for the Preparation of the acid Spirit of Sulphur. *Caſtellus.*

CAMPANIFORM *Flowers*, [of *Campana*, a Bell, and *Forma*, Shape] ſuch Flowers as in Shape reſemble a Bell.

CAMPANULA. Bell-flower.

The Characters of the *Campanula* are,

The Summit of the Pedicle is expanded into an Ovary, whoſe Apex is crown'd with a monophyllous quinquifid Calyx, divided into five long Segments. The Flower conſiſts of one Leaf, is ſhap'd like a Bell, and is, before blown, of a pentagonal Figure, and, when fully open'd, is cut into five Segments at the Top. The Seed-veſſel is, for the moſt part, divided into three Cells, each having a Hole at the Bottom, by which the Seed is emitted. *Boerhaave* enumerates thirty-four different Species of this Plant; but I find no medicinal Virtues attributed to any but the following.

CAMPANULA ESCULENTA, *Rapunculus*, Offic. *Campanula radice eſculenta, flore cæruleo*, Herm. Cat. Hort. Lugd. Bat. 107. Boerh. Ind. A. 248. Tourn. Inſt. 111. Elem. Bot. 90. Dillen. 107. Rupp. Flor. Jen. 24. Buxb. 52. *Rapunculus*, Chab. 260. *Rapunculus eſculentus*, C. B. Pin. 94. Raii Hiſt. 1. 739. Synop. 3. 277. Hiſt. Oxon. 2. 455. *Rapunculus eſculentus vulgaris*, GARDEN RAMPIONS. Park. Theat. 647. *Rapunculus vulgaris campanulatus*, J. B. 2. 795. *Rapuntium parvum*, SMALL RAMPION. Ger. Emac. 453. Ger. 369. Mer. Pin. 104. Merc. Bot. 1. 64. Phyt. Brit. 105. RAMPIONS.

The Seed is recommended for Defluxions of the Eyes, and the Juice for Pains in the Ears. The Root is eſteem'd an agreeable Ingredient in Spring Sallads, and is ſaid to excite an Appetite; it is ſometimes eaten boil'd. If taken with long Pepper, it has the Reputation of increaſing Milk.

Trachelium, *Cervicaria*, Offic. *Trachelium majus*, Ger. 369. Emac. 448. Raii Hiſt. 1. 732. Mer. Pin. 119. *Trachelium majus, flore purpureo*, Park. Parad. 354. *Trachelium majus, ſive Cervicaria*, Merc. Bot. 1. 73. Phyt. Brit. 122. *Campanula, Cervicaria.* Chab. 263. *Campanula vulgatior, foliis Urticæ, major & aſperior*, C. B. Pin. 94. Hiſt. Oxon. 459. Boerh. Ind. A. 249. Tourn. Inſt. 109. Elem. Bot. 90. Raii Synop. 3. 276. Dill. Cat. Giſſ. 126. Rupp. Flor. Jen. 23. *Campanula major & aſperior, folio Urticæ*, J. B. 2. 805. Buxb. 52. THROATWORT.

The whole Plant, but eſpecially the Root, is of a drying and aſtringent Quality; for which Reaſon a Decoction of it is of good Uſe in the Beginning of an Inflammation, or Ex-

ulceration

ulceration of the Mouth and Tonſils, and in other Diſorders which require Aſtriction. It is alſo, no doubt, ſerviceable in the Cure of all other Ulcers, on account of its remarkably drying Virtue. The Root is of a white and tender Subſtance, and proper to be eaten in a Sallad for Breakfaſt, in the Spring. *Raii Hiſt. Plant.*

MEDIUM, Offic. *Medium Dioſcoridis*, Rauw. 284. *Medium Dioſcoridis Rauwolfio*, J. B. 2. 805. Chab. 26. *Viola Mariana peregrina*, Park. Theat. 646. *Viola Mariana laciniatis foliis, peregrina*, C. B. Pin. 94. *Campanula foliis profunde inciſis, fructu duro*, Tourn. Corol. 3. SYRIAN BELL-FLOWER.

It grows in *Syria* and *Greece*; the Root and Seed are in Uſe; the Root ſtops the Menſes, but the Seed provokes them.

Dale is of Opinion, with *Rauwolfius*, that the above Plant is to be taken for the *Medium* of *Dioſcorides*, rather than the *Viola Mariana*, which *Matthiolus* takes for it, becauſe it beſt agrees with that ſhort Deſcription which *Dioſcorides* has left us of the *Medium*. "The *Medium*, ſays he, grows in ſtony "and ſhady Places; has Leaves like the Iris, a Stalk three "Cubits in Height, which bears a large purple round "Flower. It has a ſmall Seed like the Cnicus, and a Root "three Quarters of a Foot in Length, of the Thickneſs of a "Walking-ſtick, and of a rough Taſte."

Campanula arvenſis erecta, H. L. Bat. *Onobrychis arvenſis vel Campanula arvenſis erecta*, C. B. Pin. 215. *Pentagonion, viola Pentagonia*, Tabern. Icon. 316. *Viola arvenſis ejuſdem*, 304.

The Root of this Plant is uſually eaten as a Sallad in the Spring.

CAMPE, καμπὴ, from κάμπτω, to bend. A Flexure, or Bending. The Word is uſed by *Galen, de Uſu Partium, Lib.* 11. *Cap.* 11. where, ſpeaking of the admirably contrived Perforations from the Noſtrils into the Palate, he obſerves, that they are diſpoſed in ſuch a manner, as that the Beginning of Reſpiration might not lie in a direct Line with the Aſpera Arteria, but that there might be καμπὴ, a Deflexion, or Bending, with a ſort of Turning or Winding, before the Air arrives at the Artery; which, he ſays, is attended with two Conveniencies; one, that of preventing the Lungs from being refrigerated by an immoderately cold Air; and the other, the intercepting Particles of Duſt, Aſhes, or any thing of that Kind, in their Paſſage to the Artery.

Καμπὴ is alſo uſed for ἰγνὺς, the Ham, becauſe it is the Part uſually bended; alſo for a Joint, and for an Articulation, or Flexure of the Fingers.

CAMPHORA.

The Camphire is a kind of Plant, which belongs to the Claſs of dicotyledonous monopetalous Trees, whoſe Ovary is concealed in the Flower, and its Fruit ſoft, and full of callous Seeds. The Leaves are like thoſe of the Pear-tree, fibrous, and ſtand alternately upon the Branches; the Flower conſiſts of one Leaf, which is divided into five or ſix Segments; the Fruit is like a Nut, lodged in a concave Calyx, has a brittle Shell, and a bifid Kernel. *Boerhaave Index alter Plant. quæ in Horto Lugd. Bat. aluntur.*

The Root of the Camphire-tree has but few, and thoſe ſtrong, Diviſions, which ſmell ſtronger of the Camphire than the other Parts, and yield more of it in the Boiling. The Bark is ſomewhat rugged, of a ruſſet Colour; ſmooth on the younger Branches, of a greeniſh Colour, ſhining, quite ſmooth and mucous on the inner Superficies, and therefore eaſily ſeparated. The Tree contains a large, fungous, and ligneous Medulla, or Pith; the Wood is white, but when dry reddiſh, with Variegations, of a pretty lax Subſtance, compoſed of ſomewhat thick Fibres, and is ſometimes uſed for making of Cabinets, but grows rough with Age, when the volatile Reſin forſakes its Pores. The Leaves, which ſtand ſingle and diſorderly upon ſlender carinated Pedicles, an Inch and half in Length, and ſometimes of a reddiſh-green Colour, are membranaceous, three Inches or more in Length, from a ſhort acute Beginning dilating into an Oval, and ending in an oblong narrow Mucro, or Point, undulated round the Margin, and often edged with a thin paliſh Stripe; the upper Face of a deep and ſhining Green, but the under herbaceous, and, as it were, Velvet-like; the main Rib in the Middle being prominent on both Sides, and of a whitiſh Green; a few lateral Fibres thence extending themſelves in manner of an Arch to the Circumference, between which run many leſſer ones for the better ſtrengthening of the Leaf; at the Extremities of the Fibres are often obſerved ſmall Tubercles. The Flowers come forth at the Tops of the ſmall Branches, when the Tree is of a good Age and Bigneſs, in *May* and *June*, from the Alæ of the Leaves, ſtanding on ſlender Pedicles, which are two Inches in Length, cluſter'd, and divided into other very ſhort Pedicles, each of them furniſhed with a very ſmall Perianthium. The Flowers are white, hexapetalous, radiated within the Compaſs of a Coriander-ſeed, with oval Petals, and nine Chives with their Apices, diſpoſed in ſuch a manner, that three of them preſs upon the Style, and are ſurrounded by the reſt in a Circle, which are each of them ſeparated by ſmall yellow carnous ſoft Tubercles, looſely growing to the Umbilicus. The Flower, as the Calyx grows to it, is ſucceeded by a Berry, which, when ripe, is of a black Purple, and ſhining, of the Size of a large Pea, in a manner turbinated, with a ſoft purpliſh Pericarpium, and taſting like Camphire mixed with Cloves. The Kernel within is of the Size of a Pepper-corn, cover'd with a black ſhining Rind, bifid, oleous, and inſipid; and grows in the Weſtern Parts of *Japan*, and the adjacent Iſlands, to the Largeneſs of the Linden-tree. *Kæmpf. Amœnitates exoticæ. Breyn. Cent.* 1.

The *Camphora Officinarum*, or καφορὰ, is not mentioned by the antient *Greeks*, and was firſt introduced into the *Materia Medica* by the *Arabians*. It is a Subſtance of a ſingular Nature, dry, friable, powder'd with Difficulty, light, white, pellucid, reſembling the Cryſtals of Salts, of an acrid and ſomewhat bitteriſh Taſte, and of a penetrating Smell, highly diſagreeable to ſome. It flames in an open Fire, and, when kindled, burns till it is totally conſumed. It alſo burns in Water, and ſends up a thick dark-coloured Smoak, which produces a blackiſh Soot. When put into a pure Glaſs Veſſel, with an Alembic fitted to it, it melts by the Force of the Fire, aſcends in the Alembic, and concretes again in the Form of Camphire, not in the leaſt changed. This Phænomenon may be obſerved by thoſe who try the Experiment frequently. In a moderately warm Air it gradually waſtes, and flies off, unleſs it be kept in cloſe Glaſs Veſſels, by which means it may be preſerved for ſome Years. In all pure Oils, and inflammable Spirits, it perfectly diſſolves; as it does alſo in *Alcohol* of Wine, being mixed with it in nearly equal Quantities, in which Caſe it looks very clear and pellucid, and is extremely odoriferous; and, being diſtil'd, comes over almoſt intirely, with the Alcohol, or ſoon after it, in an homogeneous Liquor. The Camphire does not evaporate after a Solution, before its Menſtruum is exhaled, and therefore may be well preſerved in theſe Liquors. Alcohol, in which Camphire has been diſſolved, being kindled, the Camphire is not kindled nor conſumed, before all the Alcohol, whoſe inflammable Elements are of a more ſubtile Nature, is entirely burnt and waſted; after which the Camphire, which is collected at the Bottom of the Veſſel, begins to burn, yielding a more ſtrong, white, bright, and vibrating Flame than the Alcohol, together with a black Smoak of the Taſte and Smell of Camphire, and leaving no Fœces at the Bottom of the Veſſel. Concentrated Oil of Vitriol diſſolves Camphire into a thick Liquor, of a reddiſh-yellow Colour, and void of Smell. Camphire is diſſolved alſo in Aqua-regia, and Spirit of Salt; and, being put into fuming Spirit of Nitre, is diſſolved without Noiſe, or any remarkable internal Agitation or Incaleſcence, and even without any Vapour. It is diſſolved alſo in Aqua-fortis, the Acid of the Spirit of Nitre receiving no Alteration thereby; for this Solution, which is like Oil, is ſtill fit to diſſolve Silver or Mercury. When Camphire has been diſſolved in Oil of Cinnamon, this Oil, which before would make an Effervеſcence, attended with Flame, if mix'd with fuming Spirit of Nitre, now loſes this Property. Camphire, diſſolved in a Fluid, is revived, and floats on the Surface of the Menſtruum, by an Addition of Water, or of an alcaline Salt. Camphire is not diſſolved in aqueous and alcaline Menſtruums; nor in the mild and gentle Acids of Vegetables, ſuch as Vinegar. Many celebrated Chymiſts have taken Camphire for a ſolid volatile oleous Salt, form'd like the *Offa Helmontiana*, of a ſaline and an oleous Principle; but this Sentiment is contradicted by other Authors. I think we may, with *Boerhaave*, affirm it to be a highly perfect, moſt ſimple, and volatile Reſin; or an Oil of a ſolid Form and Conſiſtence. But it is a kind of heteroclite Reſin; for there is no other Reſin known, which can be entirely ſublimed dry, without leaving any Fœces, and without undergoing a Change as to its Parts, or which, being kindled, burns away entirely, without leaving any Earth or Aſhes. *Hoffman* ſeems to favour this Opinion, when he affirms, that Camphire is, as it were, a diſtil'd Oil in a dry Form, or a moſt ſubtile volatile Oil, which ſeems to have in its Compoſition a certain ſubtile Acid, to which its ſolid Form is owing, and of which it may be deprived, if it is mix'd with Salt of Tartar, and ſubjected to Diſtillation with highly rectified Spirit of Wine; for in this Caſe a Spirit is yielded, whoſe Taſte and Smell diſcover it to be ſufficiently ſaturated with the Corpuſcles of the Camphire, and which, when pour'd into Water, does not become milky; nor is any of the Camphire precipitated, as happens with camphorated Spirit of Wine. What remains after the Drawing off the Spirit, is a pretty well ſaturated Solution of Camphire, but of a browniſh Colour, and in Taſte highly reſembling Camphire. But when it is dropp'd into Water, it does not run into a thick Coagulum, like camphorated Spirit of Wine, but may commodiouſly and eaſily be mixed with the Water; for the Salt of Tartar, entering into the moſt intimate Texture and Compoſition of this Subſtance, diſſolving the oleous and thick Parts, and inducing a Change on the more ſubtile Acids, occaſions a Reſolution of this Subſtance into highly ſubtile Parts, not afterwards to be coagulated; and the Change of its Colour from White to Brown is owing to the Sulphur or phlogiſtic

phlogiſtic Principle being diſentangled, and ſet at Liberty, by the Alcali, *Hoffm. Obſ. Phyſ.* We are confirm'd in the Truth of Camphire's being a pure inflammable Oil in a ſolid Form, by this Circumſtance, that in very hot Climates, and even ſometimes in *Europe*, aromatic Subſtances are often heated to ſuch a Degree, that their Oils are converted into Camphire, as happens in the Diſtillation of the Oil of Aniſe, Cardamoms, Caraway, Fennel, Laurel, Zedoary, Cinnamon, Southernwood, and Thyme. The ſame Phænomenon is ſometimes obſerved to happen, when theſe Oils, dropping thro' a long narrow or cold Worm, form themſelves into a ſolid kind of Maſs, which blocks up the Cavity of the Worm, but may be again diſſolved by Heat, *Boerh. Chym. Vol.* 2. But becauſe theſe camphorated Subſtances want either the Hardneſs, the Smell, or the other Properties of the common Camphire of the Shops, we ſhall only here treat of that Camphire which is produced by the *Arbor Camphorifera*, and which is called the *Camphora Japonenſis*, or *Camphora Sinenſis*. This Subſtance is extracted from the Root of the Tree, in the following manner:

They cut the Root into ſmall Pieces, which they put into large Pans over a moderate ſlow Fire: They pour a ſmall Quantity of Water on the Root, and adapt a Head to each Pan, wove of Twigs, like a Bee-hive. The external Surface of this Head is ſmooth like a Mat, but its internal Surface is ſomewhat rougher, by reaſon of the ſmall Twigs of which it is made. By this means the Camphire is carried up or ſublimed, adheres to the Filaments, and, when cold, aſſumes a whitiſh Colour, and is taken off. *Boccone, Obſ. Nat.*

Seba gives us the following Method of obtaining it: The Inhabitants of *Japan*, ſays he, form elegant ſmall Cakes of the Roots of theſe Trees.

What remains of the Root or Wood, together with the ſmall Twigs, they cut down into Pieces about an Inch long. Theſe are put into an Iron or Braſs Kettle, full of Water, and boiled for forty-eight Hours. Upon theſe Kettles they fix Covers, which, like Alembics with riſing hollow Necks, receive the Camphire raiſed with the Vapours; and, when it is cold, it is taken out, and kept for Uſe.

The Furnaces in which theſe large and broad Kettles are lodged, ought to be built of hard Stone, to have a Vent for the Smoak at the Top, and, below, a Cavity for the Reception of Wood or Fire. The Camphire, thus prepared by Sublimation, is made up into large ſmooth orbicular Cakes, and tranſported into *Europe*. This is called the *Camphora rudis*, which, when more refined by a ſubſequent Sublimation, is called *Camphora elaborata*, or refined Camphire. This Kind, depurated and reduced to an orbicular Form by the *Dutch*, is what is commonly uſed in the Shops. This crude Camphire is depurated in two Manners, either by Water, or by highly rectified Spirit of Wine. The Method of doing it by Water, is,

To put the crude Camphire into a Still, pour Water upon it, adapt a Head to it, and a Receiver. In Diſtilling, the Camphire adheres to the upper Part, whilſt the Impurities remain at the Bottom.

By highly rectified Spirit of Wine it is thus depurated:

The Spirit of Wine, pour'd upon the crude Camphire, diſſolves it entirely, and leaves the Impurities in the Bottom; and this Spirit, impregnated with the Camphire, is to be diſtil'd from a Glaſs Cucurbit. The Camphire left in the Bottom is to be raiſed by increaſing the Degrees of the Fire, and ſo gather'd.

The ſame highly rectified Spirit of Wine ſerves very well again for the ſame Proceſs.

When the Camphire is thus depurated, it is reduced by Colliquation in a Sand-heat, in ſmall Phials cloſe ſtopp'd with Clay, and covered with the Sand, into orbicular Cakes, like thoſe ſold in the Shops; for when a due Degree of Fire is applied to it, it flows like Wax, and, when cold, coagulates firmly in the Bottom, and aſſumes the Shape convey'd to it by the inferior Part of the Glaſs: Then, having warm'd the Glaſs a little, the Cake of Camphire may be ſeparated.

If Camphire, when put upon hot Bread, becomes moiſt, it is a Sign of its being good and genuine; but if it becomes dry, it is a Proof of its being bad and ſpurious. When it is mark'd with reddiſh or blackiſh Spots, theſe are ſaid to be produced by handling it with impure Hands, or to be the Effects of Moiſture; but this is eaſily prevented by gathering it in a Linen Cloth, and immerſing it in warm Water, with an Addition of Soap and Lemon-juice. Thus, when it is well waſh'd, let it be dried in a ſhady Place, by which means it becomes white.

Formerly it was the Cuſtom, in order to prevent the Exhalation and Diminution of Camphire, to keep it in Lint-ſeed, the Seeds of Fleawort, or ſome others of a like Nature, which, by their large Quantity of Oil, might, as it were, entangle the volatile Parts of the Camphire, and prevent their flying off. Others think, that the ſame Effect is produced by Pepper; but what has induced them to entertain this Notion, is ſomewhat hard to determine. The beſt Method of preſerving Camphire is to anoint its Surface with freſh expreſs'd Oil of ſweet Almonds; for its Pores being by this means block'd up, its ſubtile and more volatile Parts will not ſo readily fly off, as they would otherwiſe do. But there is no great Neceſſity for Methods of this Kind, ſince it may be well enough kept in a Glaſs Veſſel cloſely ſtopp'd, in order to prevent the Action of the open Air upon it. *Act. Hafn. Vol.* 1. *Obſ.* 53.

Some Authors alſo make mention of a Species of Camphire called *Camphora Borneana*, which conſiſts of ſmall Pieces or Grains, and which *Salmaſius* called crude, natural, or ſimple Camphire, calling that artificial which was whiten'd by the Force of Fire, and made up into Cakes, like that of *Japan*. They alſo affirm, that, in the Iſland of *Borneo*, they gather it in two different Manners from the *Arbor Camphorifera*, which is there ſmaller than in *Japan*; for it either ſweats ſpontaneouſly from the Tree in Grains, or they take it from the Wood itſelf, eſpecially towards the Bark, in its proper and natural cryſtalline Appearance, as *Boerhaave*, in his *Chym. Vol.* 2. expreſſes himſelf. When they know, that a Tree abounds, and is, as it were, turgid with Camphire, they cut it down into ſmall Portions, which they cleave, and expoſe to the Sun, in order to be dried. When they are ſufficiently dried, they break them into ſmall Pieces, and, taking out the Camphire, paſs it thro' a Sieve, in order to purge it from its Sordes. If they find pretty large Pieces of the Camphire, they rub their Eyes gently with them. This *Bornean* Camphire is ſaid to differ very much from that of *Japan*, which is extracted by the Fire; for the former is more clear and tranſparent than the latter, nor does it evaporate and fly off like that of *Japan*. One Pound of the *Bornean* Camphire is ſold for an hundred times as much as an equal Quantity of the other; and, among the *Japaneſe*, *Bornean* Camphire is more eſteem'd than the Root *Genſing*; for they aſcribe the ſame Virtues to Camphire as to this precious Plant, and uſe it in all their Decoctions, *Boccone*. and *Valent. Muſ.* But *Neuman*, doubting whether Camphire can be obtain'd in any other Manner than by Diſtillation, ſuſpects the Truth of this Tradition about the Camphire of *Borneo*, and concludes, that this Species of Camphire is ſo rare, that no one hitherto has, nor perhaps ever will have, an Opportunity of ſeeing it. What we, therefore, know concerning the Virtues of Camphire, is to be underſtood of the common Camphire of the Shops, or the *Japan* Camphire.

Camphire, then, is applied to various Uſes; for it is employ'd in artificial Fires, not only becauſe it burns in Water, when kindled, but becauſe it ſends up a white and odorous Flame. It alſo ſerves for making a liquid Phoſphorus, if, to one Grain of *Engliſh* Phoſphorus, made of Urine, we add ten Grains of Camphire: After theſe are ſeparately well triturated in a Mortar, they are to be mix'd; by which means the entire Camphire becomes highly lucid, and, when diſſolved in Oil of Cloves, makes a liquid Phoſphorus, with which the Fleſh, the Skin, the Hairs, and Cloaths, may be anointed, without any Hurt or Fear of Inflammation. Camphire is alſo uſed by Painters in the Compoſition of their Varniſhes, which, when camphorated, defend the Pieces on which they are laid from Inſects. Furriers put Camphire between their Skins, in order to prevent their being ſpoiled by Moths. The *Indians* mix Camphire with acrid and aromatic Subſtances, of which they form Troches for promoting a Diſcharge of the Saliva, when chew'd. Becauſe Camphire was, in former Ages, thought to be poſſeſs'd of cold Qualities, it is ſaid to have been given to be chew'd, and ſmell'd to, by the Monks, in order to extinguiſh Inclinations to Venery. But the Falſity of this Opinion is now ſufficiently known, *Scalig. Exerc. Tachen. Hipp. Brown's Vulgar Errors.* For as Camphire conſiſts of highly volatile Parts, it is found to poſſeſs Virtues highly penetrating, diſcutient, reſolvent, ſtimulating, corroborating, alexipharmac, and proper for reſiſting Putrefaction; but it does not act in a ſtrong and draſtic manner, becauſe it does not remain long in the Parts into which it has penetrated, but is ſoon after exhaled. One Inſtance is ſufficient for proving the Truth of this Hypotheſis, and *Tralles* furniſhes us with a very memorable one in the Hiſtories of the *Breſlau* Diſeaſes, where we have an Account of "a Girl who "not only had her Skin deformed with ſcorbutic Blotches, but "had alſo a large red Tumor on her Hand, whoſe Roots ex"tended themſelves to her Arm. She had the Bezoartic Pow"der of *Wedelius* exhibited in a diaphoretic Portion, with "Nitre, and a little Camphire, as alſo Oil of ſweet Almonds, "with Camphire; upon which theſe terrible Symptoms abated "very conſiderably; her Inflammation, which tended to a "Gangrene, was diſcuſs'd; and, what is principally remarka"ble, the Sweat, excited by the Uſe of the camphorated Medi"cines,

" cines, ſmell'd ſtrong of the Camphire, from which Circum-
" ſtance we may eaſily infer its penetrating Virtue." As for its alexipharmac Quality, when uſed internally, againſt the Wounds of Serpents, ſee *Eph. N. C. D.* 2. *a.* 7. The Notion of its being poſſeſſed of a cold Quality may have poſſibly been owing to the Obſervation of its cooling Effects in Inflammations of the Eyes and Burns; for it is not only of ſingular Service in removing external Inflammations, but alſo ſuch as are internal, and which threaten a Sphacelus and Death, if they are ſevere, and eſpecially if they are ſeated in the membranous Parts. For anſwering theſe Intentions it is moſt happily exhibited with Nitre. For this Reaſon, in continued Fevers, which generally have ſomething of an inflammatory Nature in them, as alſo in other Kinds of Inflammations, in Pleuriſies, Phrenſies, Quinſeys, and Inflammations of the Uterus, the celebrated *Hoffman* made great and ſucceſsful Uſe of Camphire, with an Addition of Bezoardic Powders. Immediately after the Exhibition of this Medicine, the burning Heat, the Delirium, the Thirſt, and the Watchings, were greatly abated. *Stahl*, ſomewhere in his Works, calls Camphire the Subduer of all Inflammations. The learned *Werlhofius*, in acute Fevers, Phrenſies, and Deliriums, found very happy Effects ariſing from three or four Grains of Camphire, taken every two Hours, in nitrous Emulſions. *Com. Lit. A.* 1734. The learned *Tralles* has, in a Treatiſe wrote on Purpoſe, excellently demonſtrated the refrigerating and antiphlogiſtic Qualities of Camphire; and how efficacious it is, in Conjunction with Nitre, in a Pleuriſy, he informs us, in his Work *De Remediis Terreis*, in the following Words: " I have with Pleaſure and Surprize obſerved the happy
" Effects of this Medicine in Pleuriſies; and I am, from re-
" peated Proofs of its Succeſs, ſo convinc'd of its Efficacy, that
" after opening a Vein once, twice, or thrice, applying To-
" pics to the Side affected, ordering the Patient to take fre-
" quent Draughts of tepid Infuſions ſweetened with Honey,
" and injecting antiphlogiſtic Clyſters, I ſcarce uſe any other
" Medicine than twelve or fifteen Grains of Nitre reduc'd to
" Powder, with one, two, or three Grains of Camphire, and
" an Emulſion of Oil of ſweet Almonds, to be taken after
" each Doſe; and I am ſufficiently certain, that if theſe do
" not cure the Diſeaſe, it may be pronounced incurable."
According to *Capucciut*, an *Italian* Phyſician, the Virtues of Camphire are very great, both in curing and preventing petechial Fevers; and for this Purpoſe one or two Grains of it may be either chew'd and ſwallowed by itſelf three or four times a Week, unleſs the State of the Patient renders a more frequent Uſe of it neceſſary; or it may be made up with other Subſtances in the following manner:

Take of the Powders of Cretan Dittany, and yellow Sanders, each half a Scruple; of Camphire, two Grains; of Conſerve of Roſes, or of Borage, or ſome other Conſerve of a like Nature, as much as is ſufficient for making into a Bolus. Or,

Take of the Powder of Zedoary-root, one Scruple; five Lemon-ſeeds; and one Grain of Camphire: Mix them together, and let them be taken in any manner. *Portius de Militis in Caſtris Sanitate tuenda.*

Cruanen, a celebrated *Dutch* Phyſician, in a Phrenſy and Madneſs, recommends the following Powder:

Take of Sal Prunellæ, fifteen Grains; of Camphire, four or five Grains; of Laudanum Opiatum, half a Grain: Mix up into a Powder.

In a Pleuriſy and Peripneumony he alſo highly extols Camphire, with Spirit of Nitre, or Nitre itſelf, and the Water of red Poppies. In Inflammations of the Kidneys he recommends twelve Grains of Sal Prunellæ, mixed up with four Grains of Camphire. For allaying Thirſt in continued Fevers, he orders three Grains of Camphire to be added to proper Powders; which Medicine, with the *Bezoardicum Minerale*, he alſo commends in peſtilential Fevers. In the *Philoſophical Tranſactions* we have ſome Inſtances of Maniacs cur'd by half a Dram of Camphire exhibited in Form of a Bolus, Morning and Evening. *Sethi*, from *Rhaſes*, informs us, that Camphire cures the moſt acute Diſorders, Pains of the Head ariſing from Heat, and Inflammations, eſpecially thoſe of the Liver.

Tachenius informs us, that *Avicenna* was the firſt of the practical Phyſicians who obſerved the Virtues of Camphire in acute Diſorders, and call'd it the *Theriaca contra Venena Calida*, or the Theriaca againſt hot Poiſons.

Du Verney thinks Camphire exhibited in cordial Potions an excellent Remedy againſt the Head-ach in malignant Fevers, and tells us, that he himſelf frequently preſcrib'd it for that Intention. *Du Hamel. Hiſt.*

Mindererus, in his Work *De Peſte*, ranks Camphire among the ſtrongeſt Antidotes againſt the Plague; and affirms, that 'tis more efficacious than any of the Bezoardic Preparations, as it prevents Putrefaction, and expels the poiſonous Effluvia. He makes mention of a celebrated Powder aſcrib'd to *Heſſius*, which is ſucceſsfully uſed by many, and has acquir'd a great Reputation in the Hoſpitals. The Method of preparing this Powder is as follows:

Take of Sugar-candy, three Drams; of white Ginger, two Drams; and of Camphire, one Dram: Make up into a Powder.

The Doſe of this Powder is one Dram, to be taken in ſome proper Liquor, ſuch as Marigold-water, or the Waters of Scabious, or Nuts; or if 'tis wanted ſomewhat ſtronger, the compound Water of Burdock may be uſed. But it is moſt commodiouſly exhibited in a Decoction of Tanſy, prepared with equal Parts of Sorrel or Dandelion Water, and Vinegar: But I would ſubſtitute Zedoary or Burnet in the room of the Ginger. Theſe are the Words of *Mindererus*. *Follius* calls this Compoſition *Pulvis Pauperum*, or the Powder of the Poor, becauſe it may be prepared at a ſmall Expence, but poſſeſs uncommon Virtues. But the laſt-mentioned Author, inſtead of the Sugar-candy, uſes Sugar of Roſes, in the ſame Proportion. He alſo directs the Powder to be mixed with Wine, and ſuffer'd to ferment for a conſiderable time; he preſcribes, with *Mindererus*, one Dram in Roſe or Sorrel Water; but for Prevention, only half a Dram. *Riverius* thinks this Powder of *Mindererus* too hot, on account of the Ginger; for which Reaſon he compoſed the following, in Imitation of it; and aſſerts, that he uſed it with Succeſs in peſtilential Fevers.

Take of the Bezoardicum Minerale, three Drams; of Sal Prunellæ, two Drams; and of Camphire, half a Dram: Mix them together.

The Doſe is one Dram, to be exhibited with Water of Carduus Benedictus, or ſome other proper Liquor.

During the Plague which rag'd in the Year 1623. *Hartman* uſed the following antipeſtilential Water with great Succeſs.

Take of the beſt Spirit of Wine, one Pint; of Camphire, one Ounce; of oriental Saffron, one Scruple: When theſe are diſſolv'd in the Spirit of Wine, it aſſumes a Colour like that of Gold, and two or three Spoonfuls of it may be given for a Doſe.

Hoffman, in all putrid Diſorders, and in the Plague at its Acceſſion, and about its Criſis, recommends Camphire to be given in an acid Vehicle: For Inſtance,

Take of the Waters of Sorrel and Carduus Benedictus, each an Ounce; of the Bezoardicum Minerale, half a Dram; of Camphire, ſix Grains; of the Syrup of Lemon-Juice, one Ounce: Mix all together for one Doſe.

After the ſame Author has given the Preference to Camphire above all other Medicines, againſt that viſcid Putrefaction and Malignity conveyed by impure Coition to the Lymph and vital Juices, and afterwards to the ſolid Parts and Bones, he goes on thus: " This I can from Experience affirm, that in a Go-
" norrhœa, or beginning Lues, no Medicine affords a more
" preſent Relief than Camphire; for this Reaſon 'tis properly
" added to thoſe balſamic Eſſences and Elixirs againſt a Gonor-
" rhœa, which are prepared of Opobalſam, Balſam of Capivi,
" Balſam of Tolu, Reſin of Aloes-wood, and Gum Guaiacum,
" with tartaris'd Spirit of Wine; for the Camphire wonder-
" fully heightens the Virtues of theſe Ingredients, and is of
" ſingular Efficacy in ſtrengthening the Tone of the Glands,
" and carrying off dangerous Stagnations."

In dangerous and terrible Hæmorrhages, eſpecially ſuch as accompany malignant Fevers, as alſo in Spittings of Blood ariſing from internal Cauſes, ſuch as Spaſms of the Viſcera, Camphire is of ſingular Service. Upon this Account the Pulvis Raygeri has acquired a great Reputation. It is compoſed of

Choice Myrrh and Frankincenſe, each an Ounce; of Saffron, fifteen Grains; and of Camphire, one Dram and an half.

This Powder is to be ſprinkled twenty or thirty times with Frog's-ſpawn Water; but it is to dry ſpontaneouſly after each ſprinkling. The Doſe is one Scruple.

In Vomitings of Blood *Riverius*, after Veneſection, orders half a Scruple of Camphire to be exhibited in four Ounces of Oxycrate, or Plantain-water. *Joubert* affirms of his Maſter *Rondeletius*, that in all Vomitings of Blood, eſpecially thoſe proceeding from acrid Defluxions, he ſucceſsfully uſed Camphire, and ſometimes gave a whole Scruple of it diluted in a Glaſs of Spring-water, with a little Vinegar.

Heurnius, in his Notes to *Hippocrates*, *Aphor.* 50. *Sect.* 5. in immoderate Diſcharges of the Menſes, recommends the following Powder:

phlogiſtic Principle being diſentangled, and ſet at Liberty, by the Alcali, *Hoffm. Obſ. Phyſ.* We are confirm'd in the Truth of Camphire's being a pure inflammable Oil in a ſolid Form, by this Circumſtance, that in very hot Climates, and even ſometimes in *Europe*, aromatic Subſtances are often heated to ſuch a Degree, that their Oils are converted into Camphire, as happens in the Diſtillation of the Oil of Aniſe, Cardamoms, Caraway, Fennel, Laurel, Zedoary, Cinnamon, Southernwood, and Thyme. The ſame Phænomenon is ſometimes obſerved to happen, when theſe Oils, dropping thro' a long narrow or cold Worm, form themſelves into a ſolid kind of Maſs, which blocks up the Cavity of the Worm, but may be again diſſolved by Heat, *Boerh. Chym. Vol.* 2. But becauſe theſe camphorated Subſtances want either the Hardneſs, the Smell, or the other Properties of the common Camphire of the Shops, we ſhall only here treat of that Camphire which is produced by the *Arbor Camphorifera*, and which is called the *Camphora Japonenſis*, or *Camphora Sinenſis*. This Subſtance is extracted from the Root of the Tree, in the following manner:

They cut the Root into ſmall Pieces, which they put into large Pans over a moderate ſlow Fire: They pour a ſmall Quantity of Water on the Root, and adapt a Head to each Pan, wove of Twigs, like a Bee-hive. The external Surface of this Head is ſmooth like a Mat, but its internal Surface is ſomewhat rougher, by reaſon of the ſmall Twigs of which it is made. By this means the Camphire is carried up or ſublimed, adheres to the Filaments, and, when cold, aſſumes a whitiſh Colour, and is taken off. *Boccone, Obſ. Nat.*

Seba gives us the following Method of obtaining it: The Inhabitants of *Japan*, ſays he, form elegant ſmall Cakes of the Roots of theſe Trees.

What remains of the Root or Wood, together with the ſmall Twigs, they cut down into Pieces about an Inch long. Theſe are put into an Iron or Braſs Kettle, full of Water, and boiled for forty-eight Hours. Upon theſe Kettles they fix Covers, which, like Alembics with riſing hollow Necks, receive the Camphire raiſed with the Vapours; and, when it is cold, it is taken out, and kept for Uſe.

The Furnaces in which theſe large and broad Kettles are lodged, ought to be built of hard Stone, to have a Vent for the Smoak at the Top, and, below, a Cavity for the Reception of Wood or Fire. The Camphire, thus prepared by Sublimation, is made up into large ſmooth orbicular Cakes, and tranſported into *Europe*. This is called the *Camphora rudis*, which, when more refined by a ſubſequent Sublimation, is called *Camphora elaborata*, or refined Camphire. This Kind, depurated and reduced to an orbicular Form by the *Dutch*, is what is commonly uſed in the Shops. This crude Camphire is depurated in two Manners, either by Water, or by highly rectified Spirit of Wine. The Method of doing it by Water, is,

To put the crude Camphire into a Still, pour Water upon it, adapt a Head to it, and a Receiver. In Diſtilling, the Camphire adheres to the upper Part, whilſt the Impurities remain at the Bottom.

By highly rectified Spirit of Wine it is thus depurated:

The Spirit of Wine, pour'd upon the crude Camphire, diſſolves it entirely, and leaves the Impurities in the Bottom; and this Spirit, impregnated with the Camphire, is to be diſtil'd from a Glaſs Cucurbit. The Camphire left in the Bottom is to be raiſed by increaſing the Degrees of the Fire, and ſo gather'd.

The ſame highly rectified Spirit of Wine ſerves very well again for the ſame Proceſs.

When the Camphire is thus depurated, it is reduced by Colliquation in a Sand-heat, in ſmall Phials cloſe ſtopp'd with Clay, and covered with the Sand, into orbicular Cakes, like thoſe ſold in the Shops; for when a due Degree of Fire is applied to it, it flows like Wax, and, when cold, coagulates firmly in the Bottom, and aſſumes the Shape convey'd to it by the inferior Part of the Glaſs: Then, having warm'd the Glaſs a little, the Cake of Camphire may be ſeparated.

If Camphire, when put upon hot Bread, becomes moiſt, it is a Sign of its being good and genuine; but if it becomes dry, it is a Proof of its being bad and ſpurious. When it is mark'd with reddiſh or blackiſh Spots, theſe are ſaid to be produced by handling it with impure Hands, or to be the Effects of Moiſture; but this is eaſily prevented by gathering it in a Linen Cloth, and immerſing it in warm Water, with an Addition of Soap and Lemon-juice. Thus, when it is well waſh'd, let it be dried in a ſhady Place, by which means it becomes white.

Formerly it was the Cuſtom, in order to prevent the Exhalation and Diminution of Camphire, to keep it in Lint-ſeed, the Seeds of Fleawort, or ſome others of a like Nature, which, by their large Quantity of Oil, might, as it were, entangle the volatile Parts of the Camphire, and prevent their flying off. Others think, that the ſame Effect is produced by Pepper; but what has induced them to entertain this Notion, is ſomewhat hard to determine. The beſt Method of preſerving Camphire is to anoint its Surface with freſh expreſs'd Oil of ſweet Almonds; for its Pores being by this means block'd up, its ſubtile and more volatile Parts will not ſo readily fly off, as they would otherwiſe do. But there is no great Neceſſity for Methods of this Kind, ſince it may be well enough kept in a Glaſs Veſſel cloſely ſtopp'd, in order to prevent the Action of the open Air upon it. *Act. Hafn. Vol.* 1. *Obſ.* 53.

Some Authors alſo make mention of a Species of Camphire called *Camphora Borneana*, which conſiſts of ſmall Pieces or Grains, and which *Salmaſius* called crude, natural, or ſimple Camphire, calling that artificial which was whiten'd by the Force of Fire, and made up into Cakes, like that of *Japan*. They alſo affirm, that, in the Iſland of *Borneo*, they gather it in two different Manners from the *Arbor Camphorifera*, which is there ſmaller than in *Japan*; for it either ſweats ſpontaneouſly from the Tree in Grains, or they take it from the Wood itſelf, eſpecially towards the Bark, in its proper and natural cryſtalline Appearance, as *Boerhaave*, in his *Chym. Vol.* 2. expreſſes himſelf. When they know, that a Tree abounds, and is, as it were, turgid with Camphire, they cut it down into ſmall Portions, which they cleave, and expoſe to the Sun, in order to be dried. When they are ſufficiently dried, they break them into ſmall Pieces, and, taking out the Camphire, paſs it thro' a Sieve, in order to purge it from its Sordes. If they find pretty large Pieces of the Camphire, they rub their Eyes gently with them. This *Bornean* Camphire is ſaid to differ very much from that of *Japan*, which is extracted by the Fire; for the former is more clear and tranſparent than the latter, nor does it evaporate and fly off like that of *Japan*. One Pound of the *Bornean* Camphire is ſold for an hundred times as much as an equal Quantity of the other; and, among the *Japaneſe*, *Bornean* Camphire is more eſteem'd than the Root *Genſing*; for they aſcribe the ſame Virtues to Camphire as to this precious Plant, and uſe it in all their Decoctions, *Boccone*. and *Valent. Muſ.* But *Neuman*, doubting whether Camphire can be obtain'd in any other Manner than by Diſtillation, ſuſpects the Truth of this Tradition about the Camphire of *Borneo*, and concludes, that this Species of Camphire is ſo rare, that no one hitherto has, nor perhaps ever will have, an Opportunity of ſeeing it. What we, therefore, know concerning the Virtues of Camphire, is to be underſtood of the common Camphire of the Shops, or the *Japan* Camphire.

Camphire, then, is applied to various Uſes; for it is employ'd in artificial Fires, not only becauſe it burns in Water, when kindled, but becauſe it ſends up a white and odorous Flame. It alſo ſerves for making a liquid Phoſphorus, if, to one Grain of *Engliſh* Phoſphorus, made of Urine, we add ten Grains of Camphire: After theſe are ſeparately well triturated in a Mortar, they are to be mix'd; by which means the entire Camphire becomes highly lucid, and, when diſſolved in Oil of Cloves, makes a liquid Phoſphorus, with which the Fleſh, the Skin, the Hairs, and Cloaths, may be anointed, without any Hurt or Fear of Inflammation. Camphire is alſo uſed by Painters in the Compoſition of their Varniſhes, which, when camphorated, defend the Pieces on which they are laid from Inſects. Furriers put Camphire between their Skins, in order to prevent their being ſpoiled by Moths. The *Indians* mix Camphire with acrid and aromatic Subſtances, of which they form Troches for promoting a Diſcharge of the Saliva, when chew'd. Becauſe Camphire was, in former Ages, thought to be poſſeſs'd of cold Qualities, it is ſaid to have been given to be chew'd, and ſmell'd to, by the Monks, in order to extinguiſh Inclinations to Venery. But the Falſity of this Opinion is now ſufficiently known, *Scalig. Exerc. Tachen. Hipp. Brown's Vulgar Errors.* For as Camphire conſiſts of highly volatile Parts, it is found to poſſeſs Virtues highly penetrating, diſcutient, reſolvent, ſtimulating, corroborating, alexipharmac, and proper for reſiſting Putrefaction; but it does not act in a ſtrong and draſtic manner, becauſe it does not remain long in the Parts into which it has penetrated, but is ſoon after exhaled. One Inſtance is ſufficient for proving the Truth of this Hypotheſis, and *Tralles* furniſhes us with a very memorable one in the Hiſtories of the *Breſlau* Diſeaſes, where we have an Account of "a Girl who "not only had her Skin deformed with ſcorbutic Blotches, but "had alſo a large red Tumor on her Hand, whoſe Roots ex"tended themſelves to her Arm. She had the Bezoartic Pow"der of *Wedelius* exhibited in a diaphoretic Portion, with "Nitre, and a little Camphire, as alſo Oil of ſweet Almonds, "with Camphire; upon which theſe terrible Symptoms abated "very conſiderably; her Inflammation, which tended to a "Gangrene, was diſcuſs'd; and, what is principally remarka"ble, the Sweat, excited by the Uſe of the camphorated Medi"cines,

" cines, ſmell'd ſtrong of the Camphire, from which Circum-
" ſtance we may eaſily infer its penetrating Virtue." As for its alexipharmac Quality, when uſed internally, againſt the Wounds of Serpents, ſee *Eph. N. C. D.* 2. *a.* 7. The Notion of its being poſſeſſed of a cold Quality may have poſſibly been owing to the Obſervation of its cooling Effects in Inflammations of the Eyes and Burns; for it is not only of ſingular Service in removing external Inflammations, but alſo ſuch as are internal, and which threaten a Sphacelus and Death, if they are ſevere, and eſpecially if they are ſeated in the membranous Parts. For anſwering theſe Intentions it is moſt happily exhibited with Nitre. For this Reaſon, in continued Fevers, which generally have ſomething of an inflammatory Nature in them, as alſo in other Kinds of Inflammations, in Pleuriſies, Phrenſies, Quinſeys, and Inflammations of the Uterus, the celebrated *Hoffman* made great and ſucceſsful Uſe of Camphire, with an Addition of Bezoardic Powders. Immediately after the Exhibition of this Medicine, the burning Heat, the Delirium, the Thirſt, and the Watchings, were greatly abated. *Stahl*, ſomewhere in his Works, calls Camphire the Subduer of all Inflammations. The learned *Werlhofius*, in acute Fevers, Phrenſies, and Deliriums, found very happy Effects ariſing from three or four Grains of Camphire, taken every two Hours, in nitrous Emulſions. *Com. Lit. A.* 1734. The learned *Tralles* has, in a Treatiſe wrote on Purpoſe, excellently demonſtrated the refrigerating and antiphlogiſtic Qualities of Camphire; and how efficacious it is, in Conjunction with Nitre, in a Pleuriſy, he informs us, in his Work *De Remediis Tertiis*, in the following Words: " I have with Pleaſure and Surprize obſerved the happy
" Effects of this Medicine in Pleuriſies; and I am, from re-
" peated Proofs of its Succeſs, ſo convinc'd of its Efficacy, that
" after opening a Vein once, twice, or thrice, applying To-
" pics to the Side affected, ordering the Patient to take fre-
" quent Draughts of tepid Infuſions ſweetened with Honey,
" and injecting antiphlogiſtic Clyſters, I ſcarce uſe any other
" Medicine than twelve or fifteen Grains of Nitre reduc'd to
" Powder, with one, two, or three Grains of Camphire, and
" an Emulſion of Oil of ſweet Almonds, to be taken after
" each Doſe; and I am ſufficiently certain, that if theſe do
" not cure the Diſeaſe, it may be pronounced incurable."
According to *Capuccius*, an *Italian* Phyſician, the Virtues of Camphire are very great, both in curing and preventing petechial Fevers; and for this Purpoſe one or two Grains of it may be either chew'd and ſwallowed by itſelf three or four times a Week, unleſs the State of the Patient renders a more frequent Uſe of it neceſſary; or it may be made up with other Subſtances in the following manner:

Take of the Powders of Cretan Dittany, and yellow Sanders, each half a Scruple; of Camphire, two Grains; of Conſerve of Roſes, or of Borage, or ſome other Conſerve of a like Nature, as much as is ſufficient for making into a Bolus. Or,

Take of the Powder of Zedoary-root, one Scruple; five Lemon-ſeeds; and one Grain of Camphire: Mix them together, and let them be taken in any manner. *Portius de Militis in Caſtris Sanitate tuenda.*

Craanen, a celebrated *Dutch* Phyſician, in a Phrenſy and Madneſs, recommends the following Powder:

Take of Sal Prunellæ, fifteen Grains; of Camphire, four or five Grains; of Laudanum Opiatum, half a Grain: Mix up into a Powder.

In a Pleuriſy and Peripneumony he alſo highly extols Camphire, with Spirit of Nitre, or Nitre itſelf, and the Water of red Poppies. In Inflammations of the Kidneys he recommends twelve Grains of Sal Prunellæ, mixed up with four Grains of Camphire. For allaying Thirſt in continued Fevers, he orders three Grains of Camphire to be added to proper Powders; which Medicine, with the *Bezoardicum Minerale*, he alſo commends in peſtilential Fevers. In the *Philoſophical Tranſactions* we have ſome Inſtances of Maniacs cur'd by half a Dram of Camphire exhibited in Form of a Bolus, Morning and Evening. *Sethi*, from *Rhaſes*, informs us, that Camphire cures the moſt acute Diſorders, Pains of the Head ariſing from Heat, and Inflammations, eſpecially thoſe of the Liver.

Tachenius informs us, that *Avicenna* was the firſt of the practical Phyſicians who obſerved the Virtues of Camphire in acute Diſorders, and call'd it the *Theriaca contra Venena Calida*, or the Theriaca againſt hot Poiſons.

Du Verney thinks Camphire exhibited in cordial Potions an excellent Remedy againſt the Head-ach in malignant Fevers, and tells us, that he himſelf frequently preſcrib'd it for that Intention. *Du Hamel. Hiſt.*

Mindererus, in his Work *De Peſte*, ranks Camphire among the ſtrongeſt Antidotes againſt the Plague; and affirms, that 'tis more efficacious than any of the Bezoardic Preparations, as it prevents Putrefaction, and expels the poiſonous Effluvia. He makes mention of a celebrated Powder aſcrib'd to *Heſſius*, which is ſucceſsfully uſed by many, and has acquir'd a great Reputation in the Hoſpitals. The Method of preparing this Powder is as follows:

Take of Sugar-candy, three Drams; of white Ginger, two Drams; and of Camphire, one Dram: Make up into a Powder.

The Doſe of this Powder is one Dram, to be taken in ſome proper Liquor, ſuch as Marigold-water, or the Waters of Scabious, or Nuts; or if 'tis wanted ſomewhat ſtronger, the compound Water of Burdock may be uſed. But it is moſt commodiouſly exhibited in a Decoction of Tanſy, prepared with equal Parts of Sorrel or Dandelion Water, and Vinegar: But I would ſubſtitute Zedoary or Burnet in the room of the Ginger. Theſe are the Words of *Mindererus*. *Follinus* calls this Compoſition *Pulvis Pauperum*, or the Powder of the Poor, becauſe it may be prepared at a ſmall Expence, but poſſeſs uncommon Virtues. But the laſt-mentioned Author, inſtead of the Sugar-candy, uſes Sugar of Roſes, in the ſame Proportion. He alſo directs the Powder to be mixed with Wine, and ſuffer'd to ferment for a conſiderable time; he preſcribes, with *Mindererus*, one Dram in Roſe or Sorrel Water; but for Prevention, only half a Dram. *Riverius* thinks this Powder of *Mindererus* too hot, on account of the Ginger; for which Reaſon he compoſed the following, in Imitation of it; and aſſerts, that he uſed it with Succeſs in peſtilential Fevers.

Take of the Bezoardicum Minerale, three Drams; of Sal Prunellæ, two Drams; and of Camphire, half a Dram: Mix them together.

The Doſe is one Dram, to be exhibited with Water of Carduus Benedictus, or ſome other proper Liquor.

During the Plague which rag'd in the Year 1623. *Hartman* uſed the following antipeſtilential Water with great Succeſs.

Take of the beſt Spirit of Wine, one Pint; of Camphire, one Ounce; of oriental Saffron, one Scruple: When theſe are diſſolv'd in the Spirit of Wine, it aſſumes a Colour like that of Gold, and two or three Spoonfuls of it may be given for a Doſe.

Hoffman, in all putrid Diſorders, and in the Plague at its Acceſſion, and about its Criſis, recommends Camphire to be given in an acid Vehicle: For Inſtance,

Take of the Waters of Sorrel and Carduus Benedictus, each an Ounce; of the Bezoardicum Minerale, half a Dram; of Camphire, ſix Grains; of the Syrup of Lemon-Juice, one Ounce: Mix all together for one Doſe.

After the ſame Author has given the Preference to Camphire above all other Medicines, againſt that viſcid Putrefaction and Malignity conveyed by impure Coition to the Lymph and vital Juices, and afterwards to the ſolid Parts and Bones, he goes on thus: " This I can from Experience affirm, that in a Go-
" norrhœa, or beginning Lues, no Medicine affords a more
" preſent Relief than Camphire; for this Reaſon 'tis properly
" added to thoſe balſamic Eſſences and Elixirs againſt a Gonor-
" rhœa, which are prepared of Opobalſam, Balſam of Capivi,
" Balſam of Tolu, Reſin of Aloes-wood, and Gum Guaiacum,
" with tartaris'd Spirit of Wine; for the Camphire wonder-
" fully heightens the Virtues of theſe Ingredients, and is of
" ſingular Efficacy in ſtrengthening the Tone of the Glands,
" and carrying off dangerous Stagnations."

In dangerous and terrible Hæmorrhages, eſpecially ſuch as accompany malignant Fevers, as alſo in Spittings of Blood ariſing from internal Cauſes, ſuch as Spaſms of the Viſcera, Camphire is of ſingular Service. Upon this Account the Pulvis Raygeri has acquired a great Reputation. It is compoſed of

Choice Myrrh and Frankincenſe, each an Ounce; of Saffron, fifteen Grains; and of Camphire, one Dram and an half.

This Powder is to be ſprinkled twenty or thirty times with Frog's-ſpawn Water; but it is to dry ſpontaneouſly after each ſprinkling. The Doſe is one Scruple.

In Vomitings of Blood *Riverius*, after Veneſection, orders half a Scruple of Camphire to be exhibited in four Ounces of Oxycrate, or Plantain-water. *Joubert* affirms of his Maſter *Rondeletius*, that in all Vomitings of Blood, eſpecially thoſe proceeding from acrid Defluxions, he ſucceſsfully uſed Camphire, and ſometimes gave a whole Scruple of it diluted in a Glaſs of Spring-water, with a little Vinegar.

Heurnius, in his Notes to *Hippocrates*, *Aphor.* 50. *Sect.* 5. in immoderate Diſcharges of the Menſes, recommends the following Powder:

Take of the Seeds of white Henbane, and of white Poppy, each one Dram; of Blood-ſtone, and red Coral, each half a Dram; and of Camphire, half a Scruple: Let the Patient take half a Dram of this Powder, Morning and Evening.

The celebrated *Craanen*, in Hæmorrhages of the Noſe, highly recommends the following Powder:

Take of Sal Prunellæ, one Scruple; of Camphire, between three and five Grains; of Laudanum Opiatum, one Grain. Or,

Take of *Armenian* Bole, and Terra Sigillata, each fifteen Grains; and of Camphire, four Grains.

But Camphire, when mixed with Nitre, is of the greateſt Efficacy in all Hæmorrhages. Beſides, nothing is found more uſeful in promoting the accuſtomed Evacuations of Blood than Camphire, eſpecially when exhibited in Conjunction with balſamic and antiſpaſmodic Specifics.

Take, for Inſtance, of the freſh Eſſences of Myrrh and Amber, each half a Dram; of the Eſſences of Saffron and Caſtor, each two Drams; and of Camphire, half a Dram: Mix all together.

This Medicine frequently uſed about the time of Menſtruation is greatly extol'd by *Hoffman*, provided Veneſection and Purging are premiſed. In *Commer. Lit.* for the Year 1734. we are inform'd, that Camphire is of ſingular Service in a Suppreſſion of the Lochia. Camphire is alſo of Service in cold Fevers, if exhibited before the Paroxyſm, againſt the Flatuſes of hypochondriacal and hyſterical Patients, and in Caſes where the Tone of the Stomach and Inteſtines is deſtroy'd.

Take, for Example, of the Tincture of Tartar, of the Eſſence of Orange-peel, and of dulcify'd Spirit of Nitre, each two Drams; of Camphire, ten Grains: Mix all together, and give between fifty and ſixty Drops, every two Hours.

But if the Spaſms ſhould be very violent, a proper Quantity of the Eſſence or Extract of Caſtor may be added to it. Or,

Take of Crabs-eyes, diaphoretic Antimony, and depurated Nitre, each one Dram; of Camphire, half a Scruple; and of Oil of common Chamomile, or Yarrow, ſix Drops: Mix up into a Powder, the Doſe of which is half a Dram.

The Efficacy of Camphire againſt Spaſms we learn from a memorable Caſe in *Hoffman*. A Man ſubject to hypochondriac Diſorders, and their concomitant Spaſms, through Miſtake, took two Scruples of Camphire diſſolv'd in Oil of Olives. This Doſe was ſucceeded by a Vertigo, a Coldneſs of the Extremities, a ſmall and very languid Pulſe, Uneaſineſs about the Præcordia, a cold Sweat of the Head, Alienation of Mind, and a preternatural Drowſineſs. But, ſoon after, his Body became hot, a plentiful Sweat broke out, his Urine was more red, and his Pulſe became quicker; after this, by the Injection of an eccoprotic Clyſter, the Patient was freed from the ſpaſmodic Contractions of his Breaſt and Œſophagus, and recovered a perfect State of Health. Hence we may juſtly infer the antiſpaſmodic Virtue of Camphire, and conclude, that its heating Qualities are not ſo ſtrong as ſome repreſent them. The ſame *Hoffman* gives a Caution againſt taking too large Doſes of Camphire, and affirms, that two Grains of it are ſufficient for one Doſe, and can produce no bad Conſequences. The Uſe of Camphire is alſo recommended againſt Diſorders of the Urinary Bladder, ſuch as a Dyſury and Strangury. It is alſo of Service not only where a ſtrong, corroborating, and ſtimulating Medicine is required to remove a putrid Matter lodg'd in the Bladder or Urethra, but alſo in Caſes where there is a Stone form'd. For theſe Intentions Powder of Cantharides is exhibited with ſome Grains of Camphire, which corrects the violent cauſtic Quality of the Cantharides, and prevents dangerous Inflammations; for 'tis obſerv'd, that Camphire not only mitigates and corrects the Violence of the more draſtic Diuretics, which abound with a corroding Salt, but it is alſo a very proper Corrector to the ſtrong and acrid Purgatives, which act by a like cauſtic and acrid Salt; for all Cathartics, by the Addition of a little Camphire, ſome time before they are uſed, acquire a far more mild and gentle Nature than they formerly had. From what has been ſaid 'tis obvious, that Camphire may very properly be uſed internally in a great many Caſes. But we muſt not forget, that ſome Caſes entirely forbid its Uſe, or at leaſt demand great Reſtrictions and Limitations in its Exhibition; for it has been obſerved, that, by a liberal and conſtant Uſe of Camphire, fat People, and ſuch as abound with Serum, have been extenuated and rendered leaner. Camphire muſt therefore be of a drying Quality. Upon this drying Quality depends the Injury it does to the Senſe of Smelling, an Inſtance of which we have in an Apothecary, who, by frequently preparing and handling Camphire, firſt perceiv'd his Senſe of Smelling weaken'd, and at laſt entirely deſtroy'd. *Barthol. H. A. Cent.* 4. *Hiſt.* 91. Camphorated Medicines muſt of courſe be highly improper in dry Conſtitutions, for Diſorders where Dryneſs prevails, and in Caſes where the Patient is coſtive. Accordingly *Stenzelius de Ven. L.* 3. juſtly aſſerts, "That if Camphire is exhibited to a "Man labouring under a Penury of gelatinous Juices, and in "whom the Matter neceſſary for the Secretion of the Seed is "already defective, it is not to be wonder'd at, if after its Uſe "Venereal Abilities ſhould languiſh. But Camphire poſſeſſes "no ſpecific Power of preventing the Secretion of the ſeminal "Fluid, the Erection of the Penis, or the Powers of Generation and Conception, as is thought by many, who, for that "Reaſon call it the *Ligatura*, and the *Vinculum Veneris*." When the Veſſels of the Body are fill'd and diſtended with good Juices, which is call'd a Plethora, and eſpecially when the redundant Blood is carried in too large a Quantity to the Head, which is teſtified by the red and turnid State of the Face, a heavy Pain of the Head, a Vertigo, Torpor, and Drowſineſs; as in this Caſe all volatile and ſtimulating Subſtances are injurious, eſpecially when exhibited in large Doſes, it follows of courſe, that Camphire muſt be ſo too. For Experience has taught us, that by an unwary Uſe of it Oppreſſions of the Præcordia have been produc'd, Head-achs increaſed, and all the other Diſorders excited, which generally ariſe from the Humours being render'd too turgid, and thrown into violent Commotions, ſuch as Apoplexies, Convulſions, and Epilepſies.

Wedelius, de Medicam. Facultat. juſtly obſerves, that Camphire is of ſingular Efficacy in promoting the briſk and lively Motion of the Blood, and muſt conſequently be improper, when that Fluid is too much rarefy'd, or put into an Ebullition, ſince by that very Means the Watching, the Thirſt, and Heat, would be increaſed. *Mindererus* is of Opinion, that Camphire ought never to be exhibited to ſuch as have infirm Heads, or weak Stomachs. Hence it is, that ſtudious and ſedentary People, and Women of delicate Conſtitutions, who cannot bear ſtrong Smells, have a thorough Averſion to Camphire; and theſe latter, by the Uſe of it, fall into hyſteric Fits, to which, however, it puts a Stop in more hardy and robuſt Conſtitutions. With Women, therefore, of fine and tender nervous Syſtems, as alſo with the Studious, and thoſe whoſe Spirits are eaſily diſſipated, we muſt deal very cautiouſly, ſince for ſuch Conſtitutions Camphire appears to be too generous a Medicine, ſtrikes the Brain too forcibly, and throws the Spirits into too violent Commotions. *Etmuller. Alberti Diſputatio de Camphoræ circumſpecto Uſu Medico.* But where no Circumſtances contraindicate the Uſe of Camphire internally, it may be ſafely exhibited, provided the Doſe is not too large, and eſpecially when the Uſe of it is to be continued for ſome time. *Mindererus* ſeldom preſcribes above two or three Grains for a Doſe: And except it be in Caſes which require a great and ſudden Reſolution by an Increaſe of Motion all at once, in robuſt Bodies, which can bear a conſiderable Quantity, as are thoſe of Maniacs, a ſmall Doſe is always ſafer than a larger; the ſafeſt Way, however, of taking it is with Nitre. But becauſe it is difficult to pulverize, a Drop or two of Spirit of Wine is uſually added to it, inſtead of which may very well be ſubſtituted ſome ſimple Water; it may alſo conveniently enough be reduced to a Powder by means of a Grater. *Joh. Bohn Diſſertationes Chymico-phyſicæ.*

If it is to be taken in aqueous Mixtures, you are firſt to pound it, and work it with dry'd and blanch'd Almonds, which are to be more than equal in Quantity to the Camphire; or it may be beat up with the Yolk of an Egg, taking two Scruples of Camphire for one entire Yolk.

We now come to conſider the external Uſes of Camphire, and the Medicines named from it. Some put a Grain or two of it into a rotten Tooth, and even uſe it as a Gargariſm in the Tooth-ach. The famous *Seba* recommends the following as a moſt ſafe and approved Remedy in all Ambuſtions:

Make a Solution of Camphire in ſix times the Quantity of Spirit of Earth-worms made with highly rectify'd Spirit of Wine, and dipping therein a Linen Rag, apply it to the Part affected, continuing the Uſe thereof till the Pain ceaſes, and the Ulcers are dry'd up.

If the Ambuſtion has deeply penetrated, and laid the Place open, he orders a Pound of what they call Ointment of Ceruſs to be mixed with a Solution of two Ounces of Camphire, in Oil of St. John's-wort, and this Mixture to be apply'd. *Philoſoph. Tranſactions abridg'd, and Ephemerides Naturæ curioſorum, Vol.* 1. *App. p.* 13.

Camphire worn as an Amulet has been experienced an effectual Remedy againſt Fevers. See the *Miſcellanea Curioſa Medico phyſica Academiæ Naturæ Curioſorum. J. Boeclerus* gives the following Account of it: "Some hang Camphire about "their

" their Necks for the Cure of an intermittent Fever; the Cam-
" phire is ſure to fly away, but the Fever very often remains."
However, this I dare aſſert, that Camphire hung about the Neck in peſtilential Times, ſo as that the Effluvia may be received into the Noſtrils, is no improper Preſervative, becauſe it corrects the Atmoſphere of the Body, and ſo prevents the ill Effects of the contagious Air.

Camphire is an uſual Ingredient in Ointments and Plaiſters, for the ſake of its Stimulus, which is of Service in mollifying and diſcuſſing hard Tumors, and alſo opens a Way for the Virtues of the other Ingredients to penetrate deeper through the Pores of the Skin. *Freind.* When it is to be mixed for a Plaiſter, the beſt Way, as *Etmuller* adviſes, is to diſſolve it with Balſam of Peru, as you find it done, for Example, in the *Emplaſtrum Samaritanum vulnerarium domeſticum*, found among the Arcana Cnoffeliana, in the *Ephemerides Med. Phyſicæ Germanicæ, Decas* 1. *An.* 6. *App. p.* 179. But it is of no Service in ulcerous Diſorders, as *Hoffman* obſerves, though it be excellent for Tumors. " However," ſays that excellent Author, " ſome good Effect may be expected from a Mixture of equal " Quantities of Eſſence of Saffron, and camphorated Spirit of " Wine, poured upon a Linen Cloth, and, the Spirit being " evaporated, apply'd warm." He is ſpeaking of an Ulcer of a malignant Kind in the inner Parts of the Lip. See *Frid. Hoffmanni Conſultationes & Reſponſa, Tom.* 1. *p.* 381. Camphire externally apply'd, either in Powder, or diſſolv'd in Spirits impregnated with Saffron, has a noxious and repellent Effect in arthritic and eryſipelatous Affections, according to the ſame Author. That the external Uſe of Camphire is hurtful in the Tinea and Achors, we are inform'd in the *Ephemerides Germanicæ, Dec.* 3. *An.* 9. *App. p.* 18. The *Unguentum album camphoratum* is the *Unguentum album*, with an Addition of Camphire; it is of an emollient and diſcuſſive Virtue, and is apply'd where Heat is immoderate, or the Cuticle abraded, to prurigi-nous Tetters and Ambuſtions. *Hen. Schulzii Prælectiones.* An Ounce and an half of freſh Butter, waſhed ſeveral times with the Water of Eyebright, a Dram and an half of prepared Tutty, together with a Dram of Camphire, make a Compoſition which has been ſucceſsful againſt Redneſs and Puſtules of the Eyes. *Ephemerides Germanicæ, Dec.* 3. *An.* 5. *Ob.* 19. The *Emplaſtrum camphoratum Dni. Archiatri Stahl*, in the *Diſpenſatorium Regale et Electorale Boruſſo-Brandenburgicum*, is made of Oil of Olives, Red-lead, and Camphire, and is effectual for the ſame Purpoſes as the *Unguentum album camphoratum.* The *Emplaſtrum camphoratum* of the *Pharmacopœia Bateana* is compounded of three Parts of Camphire, two Parts of Balſam of Tolu, and ſix Parts of Galbanum; it is directed to be apply'd to the Navel in hyſteric Fits, the Vertigo, and ſuch-like Diſorders.

A Water of Camphire, according to the Account given us by the *Arabians*, diſtils from the Tree which produces the Camphire; but *Garcias* obſerves it to be a Fable. Others therefore call by this Name the Water in which kindled Camphire has been immerſed, and recommend it to be drank by Women labouring under Hyſterics. A Water of this Kind is preſcrib'd in the *Pharmacopœia Pauperum*, under the Title of *Julapium Camphoratum. Horſtius* relates, that ſome Virgins taken with a *Furor uterinus* met with moſt Relief by uſing for their ordinary Drink Water or Beer in which kindled Camphire had been quenched. *Bartholini Epiſtolæ medicinales, Cent.* 3. Camphorated Spirit of Wine is that in which Camphire has been diſſolved; half an Ounce of Camphire, to a Pint of highly rectify'd Spirit of Wine, is the common Proportion; but the *London* and *Edinburgh* Diſpenſatories direct an Ounce of Camphire. The Solution is promoted either by ſtirring the Veſſel, or by digeſting it a little. It is a very common Topic in Contuſions, Luxations, Rheumatiſms, and Caſes which require Diſcuſſion; for it readily diſſolves the Stagnations of the Humours in different Parts of the Veſſels, and cauſes them to exhale, or puts them in Motion; whence it is of extraordinary Service not only in all Pains and Tumors, but in all inflammatory and eryſipelatous Affections, reſtores Warmth to the Feet and Hands benumb'd with Cold, mitigates the Pain of the Hæmorrhoids, prevents a Gangrene, and is commonly apply'd in Caſes of a beginning or confirmed Putrefaction, a Sphacelus, fetid Ulcers, and Wounds, which are putrid, or inclining to Putrefaction; as alſo the Cholera Morbus, the Colic, and the Contraction or Reſolution of the Nerves conſequent thereon, and the like Affections both of the internal and external Parts. It may alſo be given internally to the Quantity of twenty Drops or more, where Diaphoretics are required. But as *Hen. Schulzius*, in his *Prælectiones*, well adviſes, " We " ought to be very cautious of abuſing ſo beneficial a Remedy by " an imprudent Application of it, which may be very perni-" cious; for the Spirit of Wine eaſily penetrates the Pores of " the Skin, and ſpeedily coagulates the Lymph, rendering it as " unfit for Motion, as the White of an Egg when harden'd by " Heat, whence an Exulceration muſt neceſſarily be the Con-" ſequence. Hence it follows, that this Spirit ought not to " be applied whenever there is a Collection of Humours juſt " under the Cuticle, as in the Eryſipelas, unleſs it be with " this Caution, that the Linen Cloths, moiſten'd with this Spi-" rit, be ſuffer'd to hang in the open Air, or near a Pan of " live Coals, till the Spirit being evaporated, nothing but the " Camphire, in the Form of little Flakes of Snow, be left " ſticking on the Cloths. It is improper alſo to apply this " Spirit where-ever the ſolid Fibres are too rigid and contracted, " and by that means are the Occaſion of Pain, as in Ambu-" ſtions and Combuſtions." Camphorated Spirit of Wine, with an Addition of Saffron, is called *Spiritus Vini Camphoratus Crocatus*, or *Elixir Camphoræ Hartmanni.* If Myrrh and Aloes be diſſolved in camphorated Spirit of Wine, or if the Eſſences of Myrrh and Aloes be ſaturated with Camphire, the Medicine is called, and really is, *Spiritus Vini camphoratus contra Gangrænam*, " camphorated Spirit of Wine againſt a Gangrene." Camphire precipitated from camphorated Spirit of Wine by Affuſion of Water is called *regenerated Camphire*, and, mixed with a little Oil of Roſes, makes an excellent Coſmetic againſt Freckles or Puſtules in the Face. *Tachenius* prepares it by pouring common Water upon a Solution of Camphire in Aqua-fortis. Alcohol of Wine diſtilled with Camphire is the moſt penetrating and volatile of all camphorated Spirits of Wine, being good againſt Gangrenes, antiſeptic, drying, diaphoretic, and, with reſpect to the Blood and Serum, a Styptic; but perhaps not ſo agreeable to the expoſed Nerves, as being too great a Drier. Upon an Affuſion of Water, the Camphire with which it was diſtilled ſeparates from the Spirit; but when the Camphire has been diſtilled with Alcohol of Wine, and an Addition of Salt of Tartar, the Spirit of Wine, however mix'd with Water, will not part with the Camphire. Hence it is, that it is of excellent Uſe in Phyſic and Surgery, becauſe it may be intimately mixed with aqueous Vehicles and Menſtruums without Precipitation, and is a very proper Ingredient in Collyriums, Epithems for the Head, Cataplaſms, and Gargariſms. A little of this Solution mixed with the Water of Elder-flowers, or of the Flowers of Sage or Roſe-water, and a Portion of Nitre, makes an excellent Gargariſm for an Inflammation of the Mouth and Fauces. *Fred. Hoffmanni Obſervationes Phyſico-chymicæ.* " A celebrated Phyſician," ſays *Schulzius*, in his *Prælectiones*, " often adminiſters this Spirit, mixed with two " Thirds of Tincture of Antimony, in malignant Fevers, and " he himſelf takes two Drams of it now-and-then for a Pre-" ſervative. I have ſeen the ſame given with Succeſs in an " obſtinate Sciatica, and Pain of the Os Sacrum. In this " Diſtillation the Camphire aſcends in cryſtal Flowers, which " this Phyſician often gives inwardly, being mixed with Pow-" ders ſuited to the various Intentions which are to be anſwer'd, " with very good Succeſs." Perhaps *Quercetan, Tom.* 2. *p.* 788. had in View this camphorated, tartariſated Spirit of Wine, when he ſays, that the Extract of Camphire is made with tartariſated Aqua Vitæ. In *Maets's Chemia Rationalis* it is called *Elixir Camphoræ*, or *Spiritus camphoratus*, which is thus deſcribed:

> Take of the moſt ſubtile Spirit of Wine, prepared with frumentaceous Grain, becauſe this is more of an anodyne Nature, twelve Ounces; Camphire, three Ounces; Salt of Tartar very well calcined, two Ounces: Mix and diſtil them in *Baleno Mariæ.* Pour the diſtilled Spirit again on the Camphire, which is left behind, and give it another Diſtillation, repeating it ſeven times, and keep the Spirit which comes off laſt for Uſe.

The Author thus deſcribes its Virtues. " It produces," ſays he, " ſtupendous Effects in the Tooth-ach, Head-ach, Palſy, " Apoplexy, wandering Gout, Gout in the Feet, and all cold " Affections. The following Liniment is made thereof:

> " Take of *Venetian* Soap, two Ounces; diſtilled Oil of " Caſtor, one Dram; Oil of Earth-worms, two Drams; " of the aforeſaid camphorated Spirit, three Drams: Mix, " and make them up to the Conſiſtence of a Liniment. " If it is required to be more penetrating, add a Dram or " two of Spirit of Sal Ammoniac, and make it into a Li-" niment for the Palſy, or Apoplexy, or ſuch-like Diſ-" orders.

" For Affections of the Head the following Preparation is " recommended:

> " Take of Spirit of Wine diſtilled upon cephalic Herbs, " one Ounce; of the aforeſaid camphorated Spirit, one " Dram; of the Water of Roſemary, three Ounces: " Mix them.

" Some Drops of this Mixture drawn up the Noſtrils will " give immediate Eaſe in the Head-ach or Tooth-ach. Ob-" ſerve that the Water of the Roſemary mitigates the other " Ingredients, and that its Strength is augmented or dimi-" niſhed in proportion to the Quantity of the Roſemary-water." Thus far *Maets.* In the *Collectanea chymica Leydenſia* you have the ſame things expreſs'd *verbatim*, under the Name of *Le Mort*, with

with an Addition of the following Words: "A Bit of Cotton "is to be moiſten'd with the cephalic Spirit of Wine, and the "Spirit of Camphire mixt as above, and put into the Ears; "taken up the Noſtrils, it cures Dimneſs of Sight; the Juice "of Daiſies being at the ſame time inſtil'd into the Eye." Beſides theſe, in the Places before quoted, there is another *Elixir Camphoræ*, which is thus prepared:

Take of Camphire, half an Ounce; highly rectify'd Spirit of Wine, three or four Ounces; Salt of Tartar, two Drams; Oil of Cloves, ſix Drops; Oil of Aniſe, ten Drops: Mix, and diſtil them to a Dryneſs. Return the Spirit upon the Fœces, and diſtil it off again; let the Spirit thus drawn off be tinctur'd with a Dram of Saffron, and reſerv'd for Uſe. Let the Spirit of Wine be very well rectify'd, that it may be qualify'd for the immediate Reception of the Camphire into its Pores. The oftener the Cohobation is repeated, the more is the Camphire volatilized, and the Elixir render'd the more penetrating.

It is diaphoretic and anodyne, and as ſuch is uſed in moſt cold or hot Diſeaſes with very good Succeſs; it promotes the Operation of all Sudorifics. Externally it is of wonderful Efficacy in all cold Affections; it cures the Head-ach, Tooth-ach, Pains of the Ears, and Vertigo, in a ſurpriſing manner, if ſome Drops of it be mixed with a double Quantity of Water of Marjoram, and taken up the Noſtrils. Internally it is given from two to eight Drops. *Le Mort*, in his *Chymia Medico-phyſica*, ſhews how to make an *Elixir Camphoræ* without Salt of Tartar, as follows:

Take two Ounces of Camphire, with twenty Ounces of Alcohol of Wine prepared of frumentaceous Grain: Mix them together, and diſtil them by a Retort *in Balneo Mariæ*; cohobate them four or five times upon the ſame Camphire, till the Camphire begins to be volatilized, and the Spirit is very much impregnated with it; to this Spirit add half an Ounce of Saffron; two Drams of Opium; and of Mace, and Nutmegs, each three Drams: Digeſt them in Horſe-dung for ſix or ſeven Days; after which, let the tinctur'd Spirit ſeparated from the Fœces be reſerv'd by the Name of an *Elixir*. If a milder Elixir be deſired, add to the Alcohol of the preceding Wine an Ounce or two of highly rectify'd Spirit of Nitre, with which the Camphire does not directly avoid uniting, but by its Mediation is reduced into a Liquor like an Oil, by a bare Affuſion, and a ſlight Maceration, in the following manner:

Take of Camphire, one Dram; of very ſtrong Spirit of Nitre, two or three Drams: Let them ſtand in a ſmall Degree of Heat for an Hour and an half, by which means all the Camphire is reduc'd to an oily Liquor, which ſwims on the Spirit of Nitre; this Liquor, being depriv'd of the nitrous Spirit, returns back again into Camphire. Repeated Cohobations are made upon the Camphire, that the Spirit may be very well impregnated with the moſt volatile Parts of the Camphire, and to avoid giving the Mixture ſo ungrateful a Taſte, as it would have had, if Camphire in Subſtance were only diſſolved in it. But if any ſhould think fit to digeſt Camphire in Subſtance with the other Simples, they may do as they pleaſe; but with this Caution, that they take no more than half at moſt of the Camphire which is required in Diſtillation, after the preceding manner. A very good Elixir may alſo be obtained from it thus:

Take of Camphire, Myrrh, Saffron, each half an Ounce; of Contrayerva-root, Cloves, each one Ounce; of Opium, one Dram; of Alcohol of Wine diſtilled upon Wood of Saſſafras, twenty Ounces: Mix, and digeſt them in Horſe-dung for ſix or ſeven Days; after which, ſeparate the Liquor which ſwims at the Top from the Sediment, and reſerve it for Uſe.

Both the preceding Medicines are excellent Anodynes and Sudorifics, give wonderful Relief in contagious and peſtilential Diſtempers, reſiſt Poiſons and Putrefaction, and take off the Senſe of Pain. The Doſe is from two to twenty Drops. Thus far *Le Mort*. A ſimple Solution of Camphire, made by a Digeſtion in eight times the Quantity of Spirit of Wine, is alſo called *Elixir camphoratum*, of which twenty Drops at moſt are a Doſe, being taken in Wine, or ſome cordial Water, with an Intention of provoking Sweat, of ſtrengthening, of reſiſting the Malignity of the Air, and Poiſons, of giving Relief under the Gout, or any Affections of the Brain. A few Drops of it upon Cotton are very proper to put into a hollow Tooth to eaſe the Pain. *Charas Pharmacopœia Regia, Galenica, & Chymica*. In *Schroeder*'s *Pharmacopœia*, and *Sala*'s *Opera Medico-chymica*, we meet with the *Eſſentia Camphoræ alexiteria Stenzelii*, which is made by diſſolving Camphire with Oil of ſweet Almonds by Digeſtion, then diſtilling the ſtrained Liquor, after it has been for ſome time circulated with Spirit of Wine, in order to draw off the Spirit of Wine, and at laſt giving the Reſiduum a Gold-colour, by an Addition of a ſufficient Quantity of Tincture of Saffron. It is recommended for preventing and curing the Peſtilence, and for Hyſterics and Fevers. The Doſe is one or two Drops. The Spirit drawn off, if uſed, will be found poſſeſs'd of as many Virtues as the other. *Frid. Hoffman*, in his *Clavis Schroederiana*, ſhews a Way to improve this Eſſence, thus:

Take of diſtilled Oils of Juniper-berries, one Ounce; of white Amber, one Dram; of Lemons, two Drams; of Angelica, half a Dram; of Camphire, a Dram and an half: Diſſolve them *in Balneo Mariæ*, and then add of liquid Extracts of Zedoary, and Angelica, each one Dram; of *Auſtrian* Saffron, half a Scruple: Mix them together.

The anti-colic Eſſence of Camphire he deſcribes as follows:

Take of the diſtilled Oils of Orange-peel, an Ounce and an half; of Zedoary, half an Ounce; of Camphire, one Dram: Diſſolve them *in Balneo Mariæ*, and then add of liquid Extracts of Zedoary, and Wormwood, each two Drams. Digeſt them, and keep them for Uſe.

Some call *Flowers of Camphire* that very ſubtile Subſtance, which firſt aſcends in the ſubliming of Camphire, and *compound Flowers of Camphire* what is obtained by ſubliming the Flowers of Benzoin, mix'd with eight times the Quantity of Camphire; and theſe perhaps may do good Service in diſſolving, upon Occaſion, a mucous tenacious Blood obſtructing the Bronchia.

Trochiſci de Camphora Meſuæ, in the *Pharmacopœia Auguſtana*, and the *Antidotarium Florentinorum*, and *Bononienſe*, are compoſed of refrigerating, heating, and mucilaginous Simples, mixed with a ſmall Quantity of Camphire. They are commended in burning Fevers, and where Heat requires to be moderated; and alſo for the Yellow-jaundice, Phthiſis, and hectic Fever. The Doſe is as far as two Scruples, in Clyſters two Drams. In the *Pharmacopœia Pariſienſis* theſe Troches are made of fewer Ingredients, with ſome Difference alſo in the Quantities. *Lemery*, in his *Pharmacopée Univerſelle*, recommends, to hyſteric Women, the *Trochiſci de Camphora reformati*, which are thus prepared:

Take of Camphire, one Ounce; of Myrrh, Aſa-fœtida, Caſtor, each half an Ounce; of Spikenard, three Drams; of Saffron, one Dram; of Opium, half a Scruple; of Oil of Amber, eight Drops: Pulverize what may be reduced to Powder, and, mixing them all together, make them into Troches, with a ſufficient Quantity of Mucilage of Gum Tragacanth, made with Water of Feverfew. The Doſe is from half a Scruple to half a Dram.

The *Electuarium Camphoratum*, in the *Diſpenſatorium Brandenburgicum*, aſcribed to *Keglerus* by *Schræder*, and *Lemery*, contains, beſides Camphire, Aromatics, Theriaca Andromachi, Nux Vomica, Abſorbents, Aſtringents, and Sugar. It is commended for its alexipharmac and antihyſteric Virtues; and the Doſe is from one to two Drams, but it is very ſeldom uſed. I ſhould rather chuſe the *Electuarium Camphoratum* of *Gemma*'s Preſcription, which he aſſerts, from his own and his Father's Experience, to be very effectual in the Cure of the Peſtilence. It is thus compounded:

Take of Camphire, one Part; white Ginger, two Parts; Sugar of Roſes, four Parts; Wine, as much as is ſufficient; mix them carefully, and make an Electuary. The Doſe is one Dram; and let the Patient be cover'd up, and ſweat after taking it. See *Diemerbroeck de Peſte*.

Many have endeavour'd to find out and make the true, genuine, ſimple Oil of Camphire, that is, ſuch an Oil as cannot be precipitated by Water, and ſo return to its former Subſtance of Camphire. Some, not without Reaſon, have doubted whether it could ever be obtained; for when Camphire is diſtil'd, it always riſes dry, and never comes to a liquid Oil: When it is burnt, it is converted into a black Soot. For this Reaſon *Hoffman* declares, how much he is ſurpriſed at the mighty Pains and Labour of ſome eminent Chymiſts to extract the Oil of Camphire by Diſtillation, and all to no Purpoſe. "Theſe cunning Torturers of Camphire, ſays he, were igno-"rant that it was itſelf already a volatile and diſtil'd Oil; and as "it is ridiculous to pretend to extract an Oil out of diſtil'd Oils, "ſince they are already ſuch; ſo it is no leſs a Paradox to ima-"gine, that a perfect Oil can be obtain'd from Camphire." Thus *Hoffman*, tho', in his Edition of *Poterius*'s Works, he had before ſaid, "That Camphire, after pretty often repeated "Trials by Fire, with a particular kind of Earth, did at laſt

"afford

" afford a ſmall Quantity of pure Oil." However, we ought to know by what Methods they have endeavour'd to diſcover this Oil, that we may not be ignorant of ſome celebrated Medicines, which thence take their Name. They diſſolve Camphire in four times the Quantity of Oil of Turpentine; then diſtil it in a Glaſs Retort luted; and the Liquor which comes off by this Diſtillation they call the Oil of Camphire, which indeed contains in its Subſtance a Solution of Camphire, but cannot properly be called its Oil. It is, however, a chirurgical Remedy, and uſeful in cleanſing Wounds and old Ulcers; and is alſo of Service in Cariofities of the Bones, cutaneous and ſcorbutic Affections, and the Scrophula; the Sciatica alſo, and Rheumatiſms. Internally it is commended againſt Vapours, or hyſteric Flatulencies. The Doſe is from four to fifteen Drops; but it ought to be thus uſed with Prudence, for it heats and dries to a very conſiderable Degree. Others, for a Medicine againſt the Peſtilence, diſſolve one Part of Camphire in three Parts of diſtilled Oil of Amber or Roſemary, and give from ſix to eight Drops. Thus *Etmuller* tells us, that *Henifius*, a Phyſician of *Verona*, had an *Oleum peſtilentiale*, of a Gold-colour, which was compounded of the diſtilled Oil of Camphire, Amber, and Lemon, which is good in peſtilential Diſtempers, and was uſed by *Henifius*, when the Peſtilence raged in *Verona*, with ſuch extraordinary Succeſs, that he had a triumphal Column erected to his Honour on this Account. From a Confidence in this Remedy, a certain Phyſician of *Norimberg* promiſes to cure any Perſon ſeized with the Peſtilence, with a few Drops of Oil of Camphire, provided they are taken the ſame Day the Diſeaſe attacks the Patient; and offers to forfeit his Life, if any Perſon who takes ſome Drops of Oil of Camphire in the Morning ſhould, during that Day, be viſited by any peſtilential Diſorder. Mixed with other Medicines, it is very much commended in hyſteric Caſes. Oil of Camphire, with Muſk, was uſed by *Prævotius*, a Phyſician of *Padua*, as a ſingular Remedy for Madneſs; and the following is recommended by *Paracelſus*, as a preſent Cure for the ſame Diſtemper:

Take of Oil of Camphire, one Dram; of Muſk, half or an entire Dram; mix, and give half a Dram at a time.

Oil of Camphire is principally in requeſt for its coſmetic Virtue; but inſtead of Oil of Camphire for external Uſes, the beſt Way is to take Oil of Almonds in which Camphire is diſſolv'd; it cannot, indeed, be radically diſſolv'd, but returns to Camphire again when mixed with Water; however, it is a fit Medicine for the Tooth-ach, if applied to an aching Tooth, or put into a carious and hollow one. Others for outward Uſe prepare a compound Oil of Camphire, principally for cold Pains in the Joints, and the Colic; they mix well together equal Parts of *Venice* Soap and Camphire, and then drive it out of a Glaſs Retort, by making a Fire above and under it; what comes off ſpontaneouſly, diſſolves into an Oil. See *F. Hoffman's Clavis Schroederiana*. A certain Perſon made a Secret of an Antipeſtilential Liquor of Camphire, prepar'd of one Ounce of Camphire, and ſix Ounces of Whites of Eggs; theſe two he diſtilled by a Retort, and cohobated the Liquor which came off with Spirit of Wine; and this ſerv'd him for an elegant antipeſtilential Remedy. *Etmuller*.

Whether Camphire diſtilled with the White of an Egg comes off in a liquid Form, I am not certain; but I doubt it, ſince I know of no other Menſtruums that will diſſolve Camphire, beſides oily and ſpirituous ones, and mineral Acids. In the *Diſpenſatorium Brandenburgicum*, the Method of obtaining Oil of Camphire by means of Whites of Eggs is as follows: The Whites, after they are well beaten, are diſtilled with the beſt Spirit of Wine, drawing off half the Spirit, and, to this adding the Camphire, they diſtil it over again. The extracted Spirit is in reality nothing but camphorated Spirit of Wine; ſo that it is juſtly ſaid, in *Schulzius*'s *Prælectiones*, that there is nothing of Art more than ordinary in this Prepation; its Virtues you have above. The Oil of Camphire, which ſome ſearch after (ſee *Pharmacopœiæ Antwerp. Aug. Arg.* and *Schroed.*) by diſtilling Camphire with triple its Quantity of Clay, or ſome bolar Earth by a Retort, with an open Fire, and which is ſaid to be the higheſt of Diaphoretics and Alexipharmacs in the Peſtilence, both for Prevention and Cure, if given only in a few Drops, and is alſo recommended as a Coſmetic, and for its Virtue againſt a Gangrene, ſeems to be nothing but ſome Portion of Camphire diſſolv'd in a vitriolic Acid, which is commonly found in bolar Earths. The Proceſs is ſaid to be invented by the famous *Sennertus*, and takes its Name from him. See *Sennerti Inſtitut. Med.* Nor have we any thing more than a Solution of Camphire in what is called the Oil of Camphire in the *Copenhagen Diſpenſatory*, which is prepar'd, by rubbing Camphire with common Salt, and Salt of Tartar, then with Milk reducing it to the Form of a Poultice, afterwards digeſting it, and then diſtilling it with *Malmſey* Wine by a ſlow Fire. For the Spirit of Wine which comes off tartariſated, is impregnated with the Solution of the Camphire; but ſcarce ſeems to participate of the Acid of common Salt; therefore it is a Kind of tartariſated camphorated Spirit, whoſe remarkable Virtues have been already ſpecified. Whether that Oil of Camphire which takes its Name from *Keſler*, in the ſame Diſpenſatory, and is directed to be prepar'd by Sublimation till it is converted into an Oil, be poſſible to be obtain'd, let thoſe anſwer who amuſe themſelves in the Search of an *Oleum Olei*. For my Part, I heartily agree in Opinion with the learned and moſt judicious *Charas*, who, in his *Pharmacopœia*, ingenuouſly profeſſes his Sentiments in the following Manner: " Thoſe Authors, *ſays* " *he*, who have written about the Diſtillation of Camphire, " have, I think, exerted themſelves to no Purpoſe; for having " had the Vanity to hope, that they could invent and prepare " ſomething more perfect than what Nature had preſented, " ſeeing their Time and Labour loſt, they endeavour'd to " draw others into the ſame Error, and to that End publiſh'd " ſuch Accounts of Diſtillations, as were contrary to Experience. It is better, in my Opinion, not to attempt the " Diſtillation of Camphire, ſince in its preſent State, as it is " imported to us, for Purity, Subtility, Volatility, and a " penetrating Virtue, it excels whatever can be got out of it by " Diſtillation, after all the Care, Study, and Induſtry, which " can poſſibly be uſed, and with all the Mixtures and Variety " of Veſſels that can be deviſed. Its Pellucidity, its Snow-" like Whiteneſs, its acrid and pungent Taſte, its highly pe-" netrating Smell, its Volatility, quick Diſſipation, remark-" able Propenſion to kindle into Flames, even in Water, and " entire Conſumption without leaving the leaſt Sign of Fœces " in the Veſſel where it was kindled, all evince its extraordi-" nary Purity, and Fineneſs of Parts. Hence we may boldly " aſſert, that whatever is produc'd from it by the Art of " Chymiſtry, tho' the beſt that can be expected, will fall " ſhort of that Purity and Perfection with which Nature has " endow'd it; and that no groſs Parts can be ſeparated from " it by chymical Means, but that it is upon all Accounts the " better Way to let it remain in its native State without any " Preparation, and not by violent Means to alter its good " Qualities. For ſuch will appear to be the Event of the " Diſtillations propoſed by the Chymiſts, if juſtly examin'd, " both on account of the neceſſary Diſſipation of the greateſt " Part of the Camphire, and from Reaſons drawn from the " Nature of the Thing itſelf, which is the Subject of the Ope-" ration, from the Veſſels, and even from the Fire which is " directed to be uſed; and if you ſhould propoſe to rectify " what is drawn off by Diſtillation, what you will obtain by " this means, will, in every reſpect, be inferior in Goodneſs to " the Camphire in the State it was in before Diſtillation. For " theſe Reaſons I thought it not proper to give a Deſcription " of this Oil, ſince it is enough to ſay, that if any one is de-" ſirous of obtaining Oil of Camphire, or any oily Liquor of " the ſame, he has no more to do than to diſſolve Camphire " in Oil of ſweet Almonds, or in Spirit of Wine, or in Spi-" rit of Turpentine. But ſimple Camphire alone, without " any Preparation, has more Virtue than all theſe Liquors. " Some make uſe of *Aqua-fortis*, or Spirit of Nitre, for the " reducing Camphire into an oily Subſtance ſwimming on theſe " Spirits. But ſuch a Preparation is not much to be valu'd; " for beſides the Acrimony imparted to the Camphire by thoſe " corroſive Spirits which diſſolve it, a conſiderable Quantity " of their Particles inſinuate themſelves into it, whoſe Vio-" lence is to be ſuſpected, eſpecially if this Spirit is to be ap-" ply'd to internal Uſes." At preſent what is moſt in requeſt for external Uſes, in Cariofities of the Bones, for deterging ſordid Wounds, for ſtopping the Progreſs of a Gangrene, and for eaſing the Tooth-ach, is the *Oleum Camphoræ vulgo dictum*, in the *Pharmacopœia Pariſienſis*, which is prepar'd by diſſolving Oil of Camphire in double the Spirit of Nitre, as mention'd from *Le Mort*. Some alſo recommend its internal Uſe in Obſtructions and hyſteric Flatulencies, given from ſix to ten Drops, eſpecially if it be mixed with equal Parts of Oil of Amber, and a very ſmall Quantity of the Eſſence of Caſtor. *Helvetius* uſes this Oil, that is to ſay, a Solution of Camphire in an equal Weight of Spirit of Nitre very well dephlegmated, in the Preparation of his Tincture of Gold. His Method is to pour this Oil on a Solution of Gold in *Aqua Regia*, by which the Gold is precipitated, and a Liquor is obtain'd, conſiſting of Camphire, the Acid of Nitre, and *Aqua Regia*; perhaps it may alſo contain a ſmall Quantity of Gold, if the Spirit of Nitre did not happen to be prepar'd of Nitre perfectly free from all common Salt, and conſequently could not precipitate all the Gold diſſolv'd in the *Aqua Regia*. He then ſeparates the oleous Liquor which ſwims at the Top, and is a Solution of Camphire, and mixing it with rectify'd Spirit of Wine, and Oil of Cloves, digeſts them together. By this Method, he ſays, he obtains a Medicine both internal and external, of extraordinary Efficacy in a Multitude of Diſeaſes. To ſave the Trouble of enumerating theſe, I ſhall call his Medicine a *Panacea*, a Title which the Modeſty of the Author prevented him from beſtowing on a Remedy which he com-

mends againſt ſo many and ſo great Diſeaſes. See *Helvetius*, *Traité des Maladies*. But ſome perhaps will ſay, that Camphire diſſolv'd in Spirit of Wine, and incorporated with ſome eſſential Oil, to which may be added on Occaſion ſome *Spiritus Nitri dulcis*, will be altogether as good a Medicine, eſpecially if prudent Regard be had not only to the State of the Diſeaſe, but to the Conſtitution of the Patient.'

Enough has been ſaid of the Nature and Virtues of Camphire, and of the various Medicines prepar'd of it. There remains only one Point to be conſider'd, which may poſſibly raiſe ſome Scruples in the Minds of thoſe who want Experience with reſpect to what has been deliver'd. We have ſhewn, that Camphire is not only qualify'd for curing external Inflammations, but that its Uſe is recommended in acute Diſtempers, for allaying the violent Heat and Orgaſm of the Humors. Beſides, the famous *F. Hoffman*, in his *Obſervationes Phyſico-chymicæ*, writes, That "a Scruple of Camphire diſſolv'd in Oil "of ſweet Almonds, or Spirit of Wine, and given to a "healthy Man, as we have often done, he ſays, by way of "Experiment, produces no ſenſible Eſtuation in the Body, "nor cauſes an Augmentation of the Pulſe, which is the "Evidence of a more intenſe Circulation of the Blood; but, "on the contrary, not a few who have taken it, have felt a "very ſenſible Refrigeration from it, eſpecially about the "Præcordia. And it neither occaſions a Thirſt, nor raiſes "the Colour of the Urine, which are the Effects of all other "hot Things. We may even go ſo far as to obſerve, that "one Ounce of pretty generous Spirit of Wine raiſes a "greater Eſtuation and Colour than one Dram of Cam-"phire." Hence, not without Reaſon, may ariſe a Doubt whether it was not ill judg'd to contradict the Opinion which formerly prevailed, that Camphire was of a cold Nature. But that we had very good Reaſons for excluding Camphire from the Claſs of Refrigerants, will appear, if we thoroughly conſider its ſtimulating and drying Qualities, and that its Effect in refrigerating the Body is only ſecondary, that is, ſo far as it remedies Spaſms of the ſolid Parts, by which Obſtructions are promoted: Hence the Humours being impelled forwards, their Motion is increaſed to ſuch a Degree as to overcome the Obſtacle in the obſtructed Place, and excite a Heat, which the ſame Motion allays by removing the Cauſe in reſolving the Matter of the Obſtruction. Mean while the Camphire, by virtue of the exceeding Fineneſs of its Parts, quickly makes its Way out of the Body through the Skin, and, by animating the inert and relaxed Fibres, opens a Paſſage for a free Courſe of the Blood, and reſtores Perſpiration in an extraordinary manner, thereby eliminating all foreign and peccant Matter; for which Reaſons Camphire deſerves to be accounted the chief of Alexipharmacs. *Hoffman* therefore cannot be thought, by what he ſays in the before-mention'd Paſſage, to favour the juſtly abrogated Opinion of the cold Nature of Camphire. For, as *Breynius* obſerves, though in many Affections, as Inflammations of the Eyes, Eryſipelas, feveriſh Heats, and other Diſorders, it has a refrigerating Virtue, even ſo far, as oftentimes to diſſipate the natural Heat, yet theſe are not the natural, but accidental Effects of Camphire, and are produced almoſt in the ſame manner, as the Inflammation of a burnt Part is reſolv'd by holding it near the Fire, or the Flame of a Candle; or as the natural Heat is expelled outwards, or weaken'd inwardly, by an exceſſive Uſe of Pepper; and by that means the Temperament of the Body changed into cold, tho' Fire cannot on that Account be reckon'd a cold Element, nor Pepper a cold Fruit, unleſs it be in this reſpect, that cold Effects may in Length of Time be produced by them: And in the ſame manner Ice and Snow may be accounted not cold, but hot; becauſe by frequent handling of them, the Hands are known to be inflamed. Thus *Breynius*. And therefore *P. Ammannus*, in his *Irenicum*, was in the right when he remarks on the old Saying, *Camphora per nares caſtrat odore mares*, "Camphire makes Eunuchs by its Smell;" that it was a *Cretan* Lye: But what he adds, "That thoſe Monaſtics, or "Religious, who daily chew it, uſe it rather for an Incen-"tive, than Extinguiſher of Luſt," has as little Appearance of Truth, as if he had ſaid, that thoſe Religious chew Camphire, that they might temper and allay too briſk a Motion of the Blood, and too high a Colour, occaſion'd by the Fervor of their Zeal in performing their Offices. But if we are reſolv'd to find out ſome way to bring off the Antients in their aſſerting the cold Nature of Camphire, we muſt of Neceſſity either ſay, that Camphire is an Enemy to Procreation, if it be taken in large Quantities, as *Lanzonius* ſays after *Rhaſis*, becauſe it is injurious to the Body by its drying Quality; or elſe we muſt agree with *Salmaſius* in affirming, that we are ignorant of the Camphire of the Antients. *Rieger*.

CAMPHORATA, Offic. *Camphorata hirſuta*, C. B. 486. Raii Hiſt. 1. 210. Hiſt. Oxon. 3. 614. *Camphorata Monſpelienſium*, J. B. 3. 379. Chab. 454. *Camphorata major Monſpelienſium*, Park. 568. STINKING GROUND-PINE.

It is ſometimes found in the Gardens of Botaniſts. The Herb, which is uſed, is of a drying and aſtringent Quality, ſtrengthening to the Nerves, and ſerviceable in the Gout, Convulſions, Palſy, Defluxions of the Eyes, and Catarrhs. The Plant is a Cephalic, is effectual for Wounds, according to *Lobelius*, and is preſcribed by ſome in Dropſies. *Dale*.

It bears a great many woody, and ſomewhat hairy Branches, cover'd with fine Leaves, like thoſe of Tamariſk, of a ſtrong Smell, ſomewhat reſembling Camphire. The Flowers are ſmall and ſtaminous, of four Leaves apiece, ſet on among the Leaves. It grows in the Southern Parts of *France*.

The Tops are uſed, though but rarely, and then only outwardly in Baths and Fomentations, for Diſorders and Swellings of the Joints, for Cramps, Palſies, and other Affections of the Nerves. *Miller's Bot. Off.*

CAMPTER, καμπὴρ, from κάμπω, to bend, ſignifies in general any Flexure, or Incurvation, but in a ſpecial Senſe is put for the Goal of a Race, and is ſo uſed by way of Metaphor in *Galen*, *Uſ. Part. Lib.* 7. *Cap.* 14. where he deſcribes the recurrent Nerves of the ſixth Pair, which arriving εἰς καμπῆρα, "at the Goal," which is ſome firm and ſmooth Part of the Clavicle or firſt Rib-bone, turn round the ſame, and perform a ſort of δίαυλος, "backward Race."

CAMPTON, καμπὸν, from the ſame Original with the precedent, ſignifies flexile, flexible, and that in general, from ſtrait to curve, or curve to ſtrait; or, in particular, it denotes only a Flexibility from ſtrait to curve, in which Senſe it is oppoſed to ἰνθυπὸν, which is applied to what is flexible from curve to ſtrait.

CAMPYLON, καμπύλον, from κάμπω, is expounded by *Erotian* on *Hippocrates*, τὸ μὴ ὀρθὸν, ἀλλὰ σκολιῶς συγκεκαμμένον, "what is not ſtrait, but bent into a curve Line." It is a Word often uſed by *Hippocrates*: Thus in *Prognoſt.* ἢν δὲ καμπύλον γένηται βλέφαρον, "if the Eyelid be retorted." *Celſus*, *Lib.* 1. *Cap.* 6. renders the Word by *perverſa*. So (*Lib.* περὶ ἄρθρ.) τὸ δ' ἄλλο ὀστέον βραχίονος ἐς τὸ ἔξω καμπύλον, "but the other Bone of the Arm is bent outwards." Again, in *Mochlico*, καμπυλοῦσθαι δὲ πλευραὶ ἀνθρώπου εἰσὶ, "the "Ribs of a Man are very much incurvated." Καμπύλα in *Heſychius* is expounded ἐπικαμπῆ, στρεβλὰ, "inflected, diſ-"torted."

CANABIL. A ſort of medicinal Earth. See ERETRIA. *Caſtel.*

CANADELLA. A Kind of Sea-fiſh. See CHANNA. *Caſtellus.*

CANALICULUS, or CANALIS ARTERIOSUS. A Veſſel between the pulmonary Artery and the Aorta in a Fœtus, which is obliterated in the Adult. Its Uſe is to convey the Blood, which in a Fœtus has no Paſſage through the Lungs, from the pulmonary Artery to the Aorta.

CANALIS, σωλὴν, a Canal, ſignifies in general a round, hollow, oblong Inſtrument for the Conveyance of Fluids; in which Senſe all the Veſſels of the human Body, which ſerve for tranſmitting of any Fluid, are called *Canals*.

CANALIS is alſo a round, hollow Inſtrument in Surgery for embracing and holding a broken Limb, as a Leg or Thigh. It is made of the Wood of the Linden-tree, according to *Galen*, or of Earth, as *P. Ægineta* ſays; it may alſo be made of Reeds and Linen. There are various Sorts repreſented in *Scultetus's Armamentarium*, *Part.* 1. *Tab.* 23. *Hippocrates* treats of the Uſe of the *Canalis*, in his Second Book of Fractures, and in his Book of the Office of a Phyſician. *P. Ægineta*, *Lib.* 6. *Cap.* 106. *Celſus*, *Lib.* 8. *Cap.* 10.

CANALIS, in Anatomical Writers, is the middle Cavity, or Perforation, which extends through the Vertebræ of the Neck, and through which the Spinal Marrow reaches from the Brain. *Gorræus*.

CANALIS ARTERIOSUS is the ſame as CANALICULUS ARTERIOSUS.

CANALISCULUS. A Notch in a Piece of Wood. *Rulandus*.

CANANGÆ OLEUM. *Hoffman*, in his *Obſervat. Phyſico-chym.* mentions this as a very ſcarce Oil brought from *India*. And in his *Medicina Rat. Syſt. Vol.* 1. *Sect.* 2. *Cap.* 6. he informs us, I think, that it is diſtilled in *India*, from the Flowers of the Lime-tree. The Paſſage is a little obſcure, and I am not certain, that this is his Meaning. I meet with no other Account of the *Oleum Canangæ*.

CANATION, κανάτιον. A Word in *Myrepſus*, *de Antidot. Cap.* 500. which *Fuchſius* renders *Menſura*.

CANCAMUM, Offic. κάγκαμον, Dioſc. C. B. Pin. 498. J. B. 1. 324. Raii Hiſt. 2. 1846.

Cancamum is the Tear of an *Arabian* Tree, in ſome meaſure reſembling Myrrh, of a very unſavoury Taſte, and uſed in Suffumigations; being mix'd with Myrrh and Styrax, it makes a Suffumigation for Cloaths. It is ſaid to be endued with the Virtue of extenuating immoderately fat Bodies, if half a Dram of it be taken in Water or Oxymel every Day for a conſiderable time. It is preſcrib'd in Diſorders of the Spleen, for the Epilepſy, and the Aſthma; and, taken in Hydromel, it provokes the Menſes. Macerated in Wine, it ſpeedily

ſpeedily exterges Cicatrices in the Eyes, and helps Dimneſs of Sight, and is as good a Remedy as any for putrid Gums, and the Tooth-ach. *Dioſcorides*, *Lib.* 1. *Cap.* 23.

At preſent we know not what the *Cancamum* was. Some take it for the *Lacca*. *Matthiolus* aſſerts the *Cancamum* of the *Greeks*, and the *Lacca* of the *Arabians*, to be the ſame thing; in which, ſays the learned *Ray*, he is miſtaken; for their Virtues are different. Others will have it to be *Benzoin*; *Garcias* and *Amatus* affirm it to be *Gum Anime*, ſo that, it ſeems, none can be ſure what it is. *Dale*.

Lemery gives the following Account of the *Cancamum*.

Cancamum is a very ſcarce Gum, which ſeems to be rather a Collection of ſeveral Kinds of Gums or Reſins, united or agglutinated one to another, than only one Gum. For it is in a manner divided into four different Subſtances, which have each a diſtinct Colour. The firſt is like Amber; it melts at the Heat of the Fire, and has the Smell of Gum-Lacca. The ſecond is black, melts alſo by the Fire, but emits a ſweeter Smell than the former. The third is like Horn, and has no Smell. The fourth Species is white, and is the ſame with *Gum Anime*.

Theſe Gums, they ſay, diſtil from a Tree of a moderate Height, with Leaves much like thoſe of the Myrtle. It grows in *Africa*, *Braſil*, and the Iſland of *St. Chriſtopher*.

Cancamum is proper to deterge and conſolidate Wounds, reſolves and ſtrengthens, and is good for the Diſtempers of the Teeth.

For entire *Cancamum* they ſubſtitute *Gum Anime*.

CANCELLUS *Aſtaci marini ſpecies*, Ind. Med. 26. *Cancellus*, Rondel. de Piſc. 1. 553. Aldrov. de Exang. 218. Geſn. de Aquat. 161. Bellon. de Aquat. 362. Jonſ. Exang. 24. *Cancellus quibuſdam Bernhardus Eremita dictus*. Charlt. Exer. 58. *Cancer in teſtis degens*. Mer. Pin. 192. The WRONG HEIR.

The Oil prepar'd from it is brought from *America*, and uſed for the Rheumatiſm. *Dale*.

The *Cancellus* is a very ſmall Species of Cray-fiſh, which the *French* call *Hermit*, or *Bernard the Hermit*; becauſe it ſhuns others, and retires into the firſt Shell it meets with. Its Body is ſomewhat long, but in general much reſembling a Spider, except that it is a little thicker. It has two ſmall, ſlender, reddiſh Horns; its Eyes are pretty much elevated, its Mouth ſurrounded with ſmall Filaments, which may be called a Beard. Its two upper Paws are forked, and ſerve inſtead of Hands to convey any thing to its Mouth on Occaſion, and it is not without Teeth. It is found in the Slime near the Rocks, incloſed commonly in a Shell as big as a Nut, of a conic Figure, thick, very hard, rugged, furrow'd, grey on the Outſide, but ſmooth and white within. This Shell is ſo well adapted to the Animal, that it is a hard matter to force it out of its Incloſure. Some waſh it, and then dreſs it and eat it. It contains abundance of volatile Salt.

It is aperitive, and good for the Stone.

In the *American* Iſlands they find a much larger Species of *Cancellus* than what we have been ſpeaking of, being three or four Inches long. They call it the *Soldier*, becauſe it poſſeſſes and fortifies itſelf in a Shell, which is not its own. They who have examin'd it, and among others Father *du Tertres*, ſay that half its Body is like a Sea-graſhopper, only his Shell is a little harder than a Graſhopper's. It has two Parts with which it bites, one whereof is pretty ſlender, but the other, which is above an Inch wide, and round, ſtops up the whole Paſſage into the Shell, and ſerves the Animal not only inſtead of a Hand, but for Defence; for it ſtreightly holds, and ſtrongly compreſſes whatever it ſeizes. Beſides theſe Parts, it has four ſlender Feet, pretty like thoſe of a Crab. The reſt of its Body is about half a Finger's Breadth in Length and Thickneſs, and cover'd with a pretty thick and rough Skin; and its Tail is compoſed of three ſmall Squamæ or Scales.

This little Animal comes once every Year to the Edge of the Shore to lay its Eggs, and change its Shell; for becauſe its natural Shell leaves its hinder Parts naked, it employs itſelf, as ſoon as it is ſtrong enough, in ſearching out another, which may be proportion'd to its Bigneſs. When it has found one to its Mind, it ſtuffs its Back-part within it, and adjuſts it to its own Dimenſions. Being thus habited in the Spoils of another, it goes among the Rocks, and the hollow Trees, and lives upon rotten Wood and Leaves as Crabs do. But as it grows, and the Shell with which it accommodated itſelf is not enlarged, it finds itſelf preſſed in ſuch a manner, as to be obliged to go in Search of another. Therefore it comes to the Edge of the Shore, and it is a Piece of Diverſion for thoſe who are curious, to obſerve how he ſtops at all the Shells he meets with to conſider them, and, when he has found one which he thinks fit for his Purpoſe, how he quits his own, and with great Precipitation ſtuffs his Backſide in his new Tenement, as if he were aſham'd of being naked. And if it happens, that two of theſe little Animals together are ready ſtripped to enter the ſame Shell, they beat and bite one another till the weakeſt gives Way, and leaves the Shell to the ſtrongeſt, who, taking Poſſeſſion, takes three or four Turns in it upon the Shore; and, if he does not find it convenient for his Habitation, he returns to his old Lodging, or goes in Search of another ſomewhere elſe, and ſometimes he changes five or ſix times before he can meet with one for his Purpoſe.

When it is taken, it ſends forth a ſmall Cry, and tries to ſeize with its biting Part what holds it, which if it does, you may ſooner kill it, than make it let go its Hold; mean while it cruelly ſqueezes the Hand, and cauſes a great Pain. The readieſt way to be deliver'd is to heat its Shell; for then it quits its Hold, and its Shell too. They are eaten, and accounted excellent Meat by the Natives of the Country, but they are pernicious to Strangers. They find in its Shell about half a Spoonful of clear Water, which is a ſovereign Remedy againſt the Bliſters which are raiſed upon the Skin by a Milk or Water which falls from the Branches of a Tree of the Country, called *Manchenille*.

The Inhabitants of the Iſland fiſh for them, and, as ſoon as they have taken them, ſtring them up by the Head, and expoſe them to the Sun, which diſſolves them all but the ſolid Parts: This diſſolved Subſtance is an Oil of the Thickneſs of Butter, and in Winter is white, inclining to yellow, and half liquefy'd; but in Summer it is reddiſh, of a fetid Smell, and a fiſhy, diſagreeable Taſte.

This Oil is eſteem'd excellent for Rheumatiſms, to which the *Savages* are very ſubject; and it cures them ſo ſpeedily, that thoſe who have felt its Effect, attribute it to a kind of Miracle. It is ſold very dear, which is the Reaſon why it is ſo ſcarce in *Europe*. Brother *Yon*, a Jeſuit, having been ſo kind as to ſend me ſome from *Martinico* to *Paris*, I made Trials of it; but could not perceive, that it produced better Effects than our Oils of Earthworms, Lizards, and Caſtor. A Remedy does not act always equally in different Climates: It is poſſible, that the *Savages* having their Pores more open than the People of our Country, the Rheumatic Humour may with more Eaſe and Speed perſpire thro' them, when rubbed with this Oil; perhaps too it might loſe Part of its volatile Salt, and of its Virtue in Tranſportation. *Lemery des Drogues*.

CANCER. The Crab, of which there are two Species, the Sea-crab, and River-crab. The former is thus diſtinguiſh'd.

Cancer, Offic. Schonef. Icht. 30. *Cancri marini maximi apicibus chelarum nigricantibus*, Ind. Med. 25. *Pagurus*, Bellon. de Aquat. 368. Aldrov. de Exang. 186. Jonſ. de Exang. 21. Geſn. de Aquat. 155. Mer. Pin. 192. Charlt. Exer. 57. *Cancer Mæas*, Rondel. 1. 560. *quoad Fig. & Deſcript. ſed nomina ſunt tranſpoſita*. THE SEA-CRAB.

The other Crab is thus diſtinguiſh'd.

Cancer fluviatilis, Offic. Jonſ. de Exang. 23. Charlt. Exer. 57. Bellon. de Aquat. 365. Rondel. 2. 208. Geſn. de Aquat. 137. Matth. 307. *Cancer fluviatilis Matthioli*, Aldrov. de Exang. 207. THE RIVER-CRAB.

Rieger, from whom the enſuing Account of the *Cancer* is taken, ſeems not to diſtinguiſh betwixt the Lobſter and Crab, but treats of both together under the Name of *Cancer*. See ASTACUS.

The *Cancer* of the *Latins* correſponds to the καρκῖνος, the ἀσακὸς, or the κάμμαρος of the *Greeks*, and to the *Crab* of the *Engliſh*. It is an Animal ſo well known, that an Attempt to deſcribe it might juſtly be look'd upon as ſuperfluous. Its Shell ſupplies the Place of Bones, and affords proper Origins and Inſertions for all its Muſcles. It is an exanguious Animal, of the oviparous and amphibious Kind. There are two Species of it, the *Cancer fluviatilis*, or Craw-fiſh, found in Rivers and freſh Water. This Species is diſtinguiſh'd from the other by the Name of *Cammarus*, or *Gammarus*. The other Kind is the *Cancer Marinus*, known among us by the Names of *Sea-crab*, or *Lobſter*. This Species is an Inhabitant of the Sea, and is diſtinguiſh'd from the former by the Name *Aſtacus*.

As the *Cancer fluviatilis*, or Craw-fiſh of the *Europeans*, is moſt generally uſed in Medicinal Intentions, we ſhall at preſent take it more particularly under our Conſideration. Theſe Animals, then, are greedy of Fleſh, and flock in great Numbers about Carcaſes thrown into the Water where they are, and never retire ſo long as any of the Fleſh is left; they alſo feed upon dead Frogs when they come in their Way. No Parts of theſe Animals are eatable, except their Claws and Tails, the Fleſh of which is ſweet and ſalutary; but that contain'd in the Claws is ſofter than that of the Tail. *Marſilii Danubius Pannonico-Myſicus obſervationibus illuſtratus*, Tom. 4. The Fleſh of theſe Animals is, with ſome Difficulty, digeſted by weak Stomachs: Hence many have been obſerv'd to complain of a violent Pain in their Stomachs, after eating Craw-fiſh over Night. *Eph. N. C. D.* 3. *a.* 3. *o.* 108. But, to others, Craw-fiſh boil'd proves an excellent and moiſtening Aliment, highly proper to be uſed in Summer, and by ſuch as labour under hot Diſorders. Hence we perceive, why *Etmuller* aſſerted, that the Broth or Decoction of Craw-fiſh render'd

der'd the Body ſoluble. The Fleſh of theſe Animals is accounted beſt in the Summer Months, and is commonly thought to be bad thro' the reſt of the Year.

There are various Methods of preparing theſe Animals; for they may either be boil'd or fry'd, and then taken out of the Shells, and made up in a great Variety of Diſhes. Preparations and Broths of the Craw-fiſh are chiefly celebrated, not only for a palatable Aliment, but alſo for anſwering ſome Medicinal Intentions, as they are of a moiſtening Quality, and ſheath up and correct Acrimony. The Broth is prepar'd of three, four, or five Craw-fiſhes, either alive, or ſuffocated in Milk or Water. After having cut off their Heads, and extracted their Inteſtines, they are to be bruiſed and boil'd in the Broth of Fleſh, or Poultry, till they become ſufficiently red; after which the Liquor is to be ſtrain'd off, and Salt, Butter, or Mace, added, as the Caſe ſhall ſeem to require. This Broth is to be drank by the Patient, and may be render'd ſtill more medicinal by the Addition of various Herbs and Animals, ſuch as Snails, and other Subſtances, according to the Intention of the Phyſician. *Portius* recommends three Preparations of them, for preſerving Soldiers from Dyſenteries and Diarrhœas. The firſt Method of preparing them is to boil them in Water, together with Parſley and Smallage; and to add Butter, Oil, or the Fat of an Ox, a Weather, a He or She Goat, or of any other Animal of a like Nature. The Craw-fiſhes thus prepar'd are to be eaten, with Bread ſoak'd in the Broth. The ſecond Method of preparing them is, by roaſting them on the Coals, and eating them with Bread. The third Method is, after they are render'd ſufficiently dry by the Heat of the Fire, to reduce the Whole of them, the Shells not excepted, to a Powder, of which two Drams are to be taken twice or thrice a Week in Broth, or in any Water that may ſeem a proper Vehicle. *Portius de Militis in Caſtris Sanitate tuenda.* According to *Rondeletius*, *Foreſtus*, affirms, that the Craw-fiſh is a very proper Aliment in Atrophies, and for ſuch as are phthiſical, or require a Stimulus to Venery. For anſwering theſe Intentions, they are firſt to be well waſh'd in common Water; but the Sea-crab is to be waſh'd in a Decoction of Barley, in order to remove the Salt which adheres to its Shell: After this, they are to be ſuffocated in new Milk, and long boiled either in it, or in the Broth of a fat Capon. When thus prepar'd, they are a Diſh much uſed by the Pope and Cardinals. We have a memorable Story of a certain Religious, who was ſo immoderate a Lover of Craw-fiſhes, that, upon ſeeing ſome of them among other Diſhes at Table, he was ſeized with ſuch a Difficulty of Breathing, and an Oppreſſion of his Senſes, that he would have probably fainted away, if he had not been forthwith help'd to ſome of his darling Diſh. *Eph. N. C. D.* 1. *a.* 3. *o.* 187. But as all Subſtances do not agree with every Conſtitution, either in Conſequence of ſome Peculiarity in the Conſtitution, which Phyſicians call Idioſyncraſy, or of their being too much uſed, ſo a certain Perſon who was a great Lover of Craw-fiſh, upon eating one or two, forthwith felt an Inflation of his Breaſt, Neck and Head, attended with a certain Uneaſineſs and Efflorescences, or red and ſerous Spots on his Breaſt and Head. *Eph. N. C. D.* 2. *a.* 3. *o.* 35. When ſuch a Peculiarity of Conſtitution does not forbid the Uſe of Craw-fiſh, they are highly conducive to correct the Acrimony of the Humours, as has been ſhewn by that celebrated *French* Phyſician, *Joan. Bapt. Gaſtalidis*, in diſcuſſing that Queſtion, *Whether the Craw-fiſh is proper in a ſaline State of the Blood? Journal des Scav. for the Year* 1714. Hence it is, that the Juice of the Craw-fiſh is very properly added to reſtorative and nutritive Broths, for ſuch as labour under a Conſumption, or a Phthiſis. This Juice is alſo of a moiſtening Quality, and, when mix'd with the Juice of Houſe-leek, is very proper for being apply'd to the Head, in order to remove thoſe violent Pains which threaten a Delirium. *Hoffman de Præſtantia Remediorum domeſticorum.* According to *Etmuller*, the expreſſed Juice of the Craw-fiſh, with that of Houſe-leek, makes an excellent Gargariſm in the Quinſey. In Burns and Scalds, ſcarce any Remedy is eſteem'd more effectual than newly expreſſed Juice of the Craw-fiſh, which *Grulingius* alſo highly extols againſt Redneſs of the Face. For the ſame Reaſon this Juice, with an Addition of that of Tobacco, proves an excellent Remedy, if pour'd or injected into ſordid Ulcers and Fiſtulas. Hence in Dyſenteries, where the large Inteſtines, or even the *Inteſtinum rectum*, are injur'd, Clyſters conſiſting of a Decoction, or of the Juice, of the Craw-fiſh, are very properly injected. In burning Pains, and Spaſms about the Region of the Kidneys, ariſing from the Stone or Gravel, there is ſcarcely any Remedy more efficacious than the Craw-fiſh bruiſed and applied to the Part affected. According to *Lanzonius*, *Rulandus* ſucceſsfully cur'd a Head-ach, accompany'd with a Delirium, by applying to the Patient's Forehead the expreſſed Juice of the Craw-fiſh, mix'd up with Opium and Saffron. *Etmuller*, Vol. 1. informs us, that ſome mix unſalted Butter with the Craw-fiſh bruiſed. Theſe they expreſs and inſpiſſate till the Moiſture is evaporated; ſo that what remains is the *Butyrum Cancrorum*, a Remedy of ſingular Efficacy againſt a Phthiſis, and Bruiſes from Falls ſince, upon account of the Craw-fiſh, it is an excellent Vulnerary, eſpecially in Exulcerations of the Kidneys, urinary Ducts, and other internal Parts. *Philippus Jacobus Sachs*, in his *Gammarologia*, gives us the following Receipt for the *Butyrum potabile Cancrorum*, which he wonderfully extols as an efficacious Remedy againſt Bruiſes from Falls.

> Take ſixty Craw-fiſh in the Month of *June*, bruiſe them in a Mortar till they are reduc'd to the Conſiſtence of a Poultice; then put them in a glaz'd Veſſel, and add a large Quantity of *May* Butter, or that which is made of the Milk of Goats; of Goats Lard, and Oil of Olives, each half a Pound; of Badgers Suet, which is not rancid, a ſufficient Quantity; of Goat's Blood, one Ounce; ſix Nutmegs reduc'd to Powder; of the Powder of the Roots of Madder, Tormentil, and Burnet, each an Ounce; and of Saracens Conſound cut ſmall, one Handful. Let them boil together for half an Hour, ſtirring them continually, in order to prevent their burning; then ſtrain them thro' a Cloth; then cleanſe the Veſſel, put the ſtrain'd Liquor into it, and let it boil over a moderate Fire: Take off the Froth which riſes during the boiling, and ſtrain it a ſecond time thro' a Cloth; when the Liquor is become cool, put it into a Glaſs to be kept for Uſe.

In Falls, or in Caſes where a Vein is burſt by any violent Motion, or carrying a heavy Burden, the Doſe of this Medicine is the Bulk of a large Filbert, to be exhibited for the firſt time in Vinegar; after which the Doſe is to be frequently repeated, chuſing warm Ale for a Vehicle. In the *Pharmacopœia Argentoratenſis*, the *Oleum Cancrorum* is prepar'd by boiling bruiſed Craw-fiſh in Linſeed-oil, and afterwards ſtraining off, and expreſſing the Liquor. This Medicine is recommended to be uſed externally in Burns, and for allaying and mitigating Pains. *Simeon Sethi* affirms for a Truth, that Oil in which Craw-fiſh have been boiled, is an efficacious Remedy againſt burning Pains of the Ears, if dropt into them. The *Aqua Cancrorum Simplex*, which in *Lemery's Pharmacopœia*, and that of *Schroeder*, is order'd to be diſtilled from bruiſed Craw-fiſh in *Balneo Mariæ*, ſeems to poſſeſs no more Virtues than common diſtilled Water, ſince nothing but an inſipid Phlegm paſſes the Helm; for which Reaſon *Etmuller* thinks, that the Water obtain'd from putrid Craw-fiſh is preferable to this, ſince the former is impregnated with a volatile urinous Salt, diſengag'd and ſet at Liberty by the Putrefaction. But whether this Water poſſeſſes extraordinary diuretic and antinephritic Virtues, and is an uncommonly efficacious Remedy againſt all Inflammations, the Bites of mad Dogs, Wounds, and Ulcers of the internal Parts, and eſpecially of the Breaſt and Lungs, are Points we ſhall leave to be determin'd by the Experience of others. This Water is, no doubt, of an alcaline Quality; and this Circumſtance probably induc'd the learn'd *Tralles*, who maintain'd that moſt Diſeaſes proceeded from an Acid, to believe that it might be of Service in the above-mention'd Diſorders. *Tralles de terreis Remediis.* For external Uſe, the *Aqua Cancrorum Quercetani* is prefer'd to the expreſſed Juice of the Craw-fiſh. This Water of *Quercetan's* is prepar'd by boiling Craw-fiſh in the Water of the greater Houſe-leek, in a cloſe double Veſſel, for the Space of a whole Day; after which this Water is to be diſtil'd, and what is yielded by Diſtillation is to be three times cohobated upon the *Caput Mortuum.* This is a Medicine highly recommended againſt Burns, Inflammations, and Cancers; but it might be render'd ſtill more efficacious for the Cure of Cancers, and phagedenic Ulcers, by extracting the Salt from the Aſhes of the *Caput Mortuum*, with its own Water. *Quercet. Tom.* 2. More ſeems here to be promiſed than can well be expected from an alcaline Liquor. Nor do the wonderful Virtues which *Faber* aſcribes to his *Quinta Eſſentia*, or *Arcanum Cancrorum*, ſeem to be leſs dubious. By a ſlow Fire he diſtils Water from the Fleſh of Craw-fiſh. The Water yielded in the Proceſs he rectifies ſeven times, and then, after incinerating the *Caput Mortuum*, he orders the Salt to be extracted from it with the Water of Reſt-harrow, Gromwel, or Saxifrage, and added to the Craw-fiſh-water. He wonderfully extols this Remedy for diſſolving and expelling the Stone in the Kidneys and Bladder, and for removing its efficient and antecedent Cauſes. When mix'd with the Spirit of Turpentine, he recommends it for the Cure of a Difficulty in diſcharging the Urine; as alſo for removing Dimneſs of Sight, Specks, Films, and Cataracts of the Eyes, if dropt into them thrice a Day. He orders it to be taken internally in common Broth, or in any proper Water; but does not aſcertain the Doſe, with reſpect to which he could not well have erred, ſince it is a Liquor of no Virtues, becauſe the inſipid Aſhes of the calcin'd *Caput Mortuum* yield no Salt in Elixiviation. This Medicine, when exhibited with Spirit of Turpentine, may, indeed,

deed, operate by the Virtue of that Spirit, but otherwiſe its Efficacy will not much ſurpaſs that of common pure Water. *Fabri Oper. T.* 2. The ſame may be affirmed of that Water, which, in *Lemery's Pharmacopœia*, is ordered to be prepared by Diſtillation, from bruiſed Craw-fiſh and new Aſſes-milk. The *Aqua Ophthalmica Mynſichti*, in *Lemery's Pharmacopœia*, is poſſeſſed of a detergent Quality, in conſequence of the Things ſubjected to Diſtillation along with the Craw-fiſh; tho' it muſt be owned, that ſome of them do not yield their Virtues during the Proceſs. When, therefore, Craw-fiſh are to be uſed for Medicinal Purpoſes, their Juice, or Broth prepared of them, is preferable to a Water diſtilled from them. From putrefy'd Crabs, indeed, as alſo from freſh ones diſtilled with an Alcali, an urinous Spirit and a volatile Salt are obtained; but *Etmuller* juſtly doubts whether theſe Preparations are ſuperior to other volatile Subſtances of a like Nature; ſo that nothing of a ſpecific Nature, or uncommon Excellence againſt Diſeaſes, can be expected from ſubjecting the Craw-fiſh to Chymical Proceſſes. The Antients recommended the Aſhes of the calcined Craw-fiſh, not only alone, but alſo in Conjunction with Gentian and Frankincenſe, for the Cure of ſuch as were bit by mad Dogs. *Dioſc. Lib.* 2. *Cap.* 10. But I ſcarce think, that a modern Phyſician can be perſuaded, that theſe Aſhes poſſeſs this remarkable Virtue, even tho' the divine *Hippocrates* himſelf had aſſerted it; for theſe Aſhes are no more than an earthy Subſtance, without Salt, or a pure inactive Calx, which *Ludovici*, in his *Pharmacopœia*, when talking of its diuretic Virtue, thinks to be of little Efficacy, except when heightened and exalted by an Addition of bitter Alexipharmacs. *I muſt, however, obſerve, that theſe Shells, calcined, are a ſort of Lime, and, as ſuch, may be endued with Medicinal Virtues.* Theſe Aſhes are at preſent exploded, tho' they ſtill retain a Place in the *Pharmacopœia Pariſienſis*. *Hoffman*, in *Off. Paralep. Cap.* 11. thinks theſe Aſhes ought to be prepared of that Species of Sea-crab which has a Tail lying flat upon the Body, and which he would have to be kept in the Shops, on account of the Encomium beſtowed on them by *Galen*, who aſſerts, that he never knew any, bit by a mad Dog, in Danger, provided they only knew how to make a proper Uſe of this Powder. But the Sea-crab, when calcined, does not afford a Powder of higher Medicinal Virtues than the Craw-fiſh, or River-crab; nor is it poſſible, as *Æſchrion*, from whom *Galen* had this Secret, believed, that they ſhould acquire any additional Virtues by being calcined under certain particular Aſpects of the Planets. To *Hoffman's* Authority we ſhall oppoſe that of *Helmont*, who owned this Powder of the Craw-fiſh to be void of Efficacy. For Medicinal Intentions *Etmuller* prefers the Craw-fiſh, gradually dry'd in the Mouth of an Oven, in an unglazed earthen Veſſel, and reduced to a Powder in a Mortar, to its Aſhes, in Caſes where Urine is to be provoked, or Ulcers of the Bladder and Kidneys to be cured; as alſo for reſolving grumous and coagulated Blood. He alſo affirms, that, in Conjunction with a certain fixed vegetable Salt, and a proper Water, it cures intermittent Fevers, by exciting a Diaphoreſis; and that between half a Dram and a Dram of it was *Poterius's* Specific againſt Abortion: But its ſpecific Virtues for this Purpoſe may juſtly be called in Queſtion; nor is it probable, that it is poſſeſſed of any beſides an abſorbent alcaline Quality, by which it becomes a Corrector of Acids. *Etmuller*, however, is of Opinion, that the Craw-fiſh, calcined by a ſtrong, or a long-continued Fire, approaches to the Nature of Quick-lime. "I took, ſays he, Craw-fiſh calcined to Whiteneſs, of a "ſtronger and more penetrating Taſte and Smell than that of "Lime. Upon pouring Water upon them, ſome Marks of "an Effervеſcence were exhibited, but without an Ebullition; "and, immediately after, a ſaline white Pellicle floated on the "Surface." *Helmont* informs us, that Swine are ſo fatal to Craw-fiſh, that thoſe who convey the latter in a Carriage, are obliged to watch, leſt any of the former ſhould chance to run under the Carriage, in which Caſe all the Craw-fiſh are found dead. Whether this be Fact or not, we ſhall not take upon us to determine; only of this we are certain, that if it is true, it is very ſurpriſing. We now come to conſider the *Lapides* or *Oculi Cancrorum*, or, as we call them, *Crabs-eyes*. Theſe were, by the Antients, thought to be found in the Brain; but there are two of them formed in each Crab immediately above the Stomach, which is placed in the Head, and ſurrounded on all Sides by a ſoft humid Matter, called *Mucus*, by many thought to be the Fœces of the Animal, and by *Bellonius* ſuppoſed to be its Liver. Theſe Stones lie under that Membrane which is to form a new Stomach for the Animal, one on each Side, when, in the Summer Months, the Craw-fiſh caſt their Shells and Claws, and have them gradually renewed, from the Skin's becoming more and more indurated; upon which theſe Stones, being converted into the Nouriſhment of the Animal, gradually diſappear, and are loſt. As *Helmont* was the firſt who taught the Manner in which theſe Stones were formed, and as his Account has ſince been confirmed by others, it will not, on this Occaſion, be improper to preſent the Reader with a Tranſlation of what he has ſaid on this Subject. His Words are as follows: "By repeated and accurate Diſſections of the "Craw-fiſh, I have diſcovered the following Particulars: Firſt, "that the Stomach is ſituated in the Head of the Craw-fiſh, "near the Crown. The Males begin every Year to grow ſick "about the Middle of the Month of *June*, and the Females in "*July*, before they caſt their Shells; for they are, as it were, "half-dead, and immoveable for nine Days and more. At this "Time a new Membrane is formed round their Stomach, be"tween which and the Stomach there is a certain milky Hu"mour, which, by Degrees, is contracted on both Sides into "a Concavity, and acquires the Form of a Stone, upon the ex"terior convex Globe of the Stomach, where it touches and "covers it. But neither at this time, nor for a great while "after, does the Crab eat any thing. What ſeems in"credible is, that the old or interior Stomach is converted into "an alimentary Mucilage, and the new Stomach ſucceeds in "its room. Round about that milky Subſtance, adhering to "the convex Part of the old Stomach, ſuch a Pellicle is formed "as is uſual on warm Milk; and this milky Subſtance in"creaſes between the two Membranes of the old and the new "Stomach. All theſe Circumſtances I have univerſally ob"ſerved with uncommon Pleaſure, in diſſecting about two "hundred Crabs. At laſt the remaining Part of the Milk "goes to the Nouriſhment of the Animal. Laſt of all, both "theſe Stones are alſo gradually diſſolved, and converted into "Aliment by little and little. The Crab eats nothing, or, at "leaſt, nothing is found in its Stomach, ſo long as theſe Stones "remain in it; and the Animal lives about twenty-ſeven Days "upon its old Stomach, which is gradually conſumed, and upon "the Stones, which are afterwards diſſolved." Such of theſe Stones as are taken from live Crabs are of a ſomewhat azure Colour, and are eſteemed better than thoſe obtained from boiled Crabs, which are of a whiter Colour. In Figure they reſemble half a Pea; they are hard, rough, and, on the flat Side, mark'd with a ſmall Pit; but they are more ſmooth on the convex Surface, and have an earthy Taſte, but no Smell. They are of a lamellated Contexture, like that of the Bezoardic Stone. By Calcination theſe Laminæ exfoliate, and yield an urinous Smell. When ſubjected to a Chymical Analyſis, they yield the ſame things that may be obtained from the ſolid Parts of other Animals, as *Etmuller* informs us in the following Words: "Theſe "Stones, ſays he, when diſtilled by a Retort, yield a Phlegm, "an urinous Spirit, and a volatile Salt, tho' not in a very large "Quantity. A highly fetid Oil is alſo, at the ſame time, "obtained from them. The Caput Mortuum, upon an Affu"ſion of Water, produced an Effervеſcence, eſpecially when "newly prepared, like Quick-lime." His other Experiments on Crabs-eyes are the following: "I diſſolved, ſays "he, Crabs-eyes in Spirit of Salt, which left a kind of light "earthy Subſtance, when the Solution was drawn off by the "Heat of a Lamp. Common Water, poured upon the Ca"put Mortuum, produced a conſiderable Heat, and afforded "conſpicuous Signs of an Ebullition and Effervеſcence; but "the Water, when again drawn off, afforded no Marks of a "volatile Salt. At laſt the Caput Mortuum, upon taking it "out of the Glaſs, and pouring Water upon it, did not yield "the ſmalleſt Sign of Heat." From the Experiments made by Mr. *Homberg* it appears, that an Ounce of the Spirit of Salt diſſolves three Drams of Crabs-eyes; whereas four Drams and nine Grains may be diſſolved in an Ounce of the Spirit of Nitre. *Mem. Acad. Reg. Sc. A.* 1700. From what has been ſaid we learn, that Crabs-eyes are among the Number of thoſe earthy Bodies which are commonly called alcaline or abſorbent, which are diſſolved by Acids, and which do not exhibit any Signs of their containing a volatile Salt, till they have received ſome kind of Change by the Fire. From the alcaline Nature of theſe Crabs-eyes, their apparent progreſſive Motion when thrown into Vinegar, or when Vinegar is only ſprinkled upon them, is commonly accounted for, becauſe alcaline Menſtruums receive and abſorb Acids. Theſe Stones, or Eyes, are kept in moſt of the Shops, and found in great Plenty in the *Budziac Tartary* of *Beſſarabia*, but eſpecially in the Deſart of *Wallachia*, not far from the Town of *Tegina* or *Bender*; as alſo in the *Ruſſian Ukrain*, about the Rivers *Boryſthenes* and *Tyra*, throughout *Podolia*, a Country watered with ſeveral Rivers. Hence they are carried for Sale thro' *Poland*, to *Conningsberg*, *Dantzick*, and *Breſlaw*.

Fictitious or adulterated Crabs-eyes, nearly reſembling thoſe of the genuine Kind, are ſometimes ſold by Impoſtors, who prepare them of Tobacco-pipe Clay. But the Fraud is eaſily detected, becauſe they not only want the lamellated Contexture of the others, which is diſcovered in calcining them, but are alſo heavier than thoſe of the genuine Kind. Several other Methods of diſtinguiſhing the ſpurious from the genuine may be ſeen in *Eph. N. C. D.* 3. *a.* 3. *o.* 147. 151. or, as we are taught in the *Acta Literaria Sueciæ*, we may pour upon them ſome acid mineral Spirit, ſuch as that of Nitre or common Salt; for, if the Stones are genuine, an Effervеſcence is immediately produced; and, after the Effervеſcence is over, the acid Liquor becomes ſweet. But, if they are factitious, or made of Clay, a ſmall Ebullition is, indeed, produced, but the Acidity of the

Spirit remains, and again produces a violent Effervescence, upon an Addition of the Powder of true Crabs-eyes. *Valentini* informs us, that this Experiment, made with acid Spirits, is deceitful, when the factitious Stones are prepared of Shells. But Art and Fraud have taught Mankind to counterfeit these so very well, that there is scarce a Possibility of distinguishing the spurious from the genuine. There is another Piece of Imposture highly prejudicial to Health. Those Crabs-eyes which are of a somewhat azure Colour are esteemed preferable to the others, and sold at a higher Price, under the Name of live Crabs-eyes. At *Ratisbon* a certain Person tinged counterfeited Stones of this Colour, probably with Smalt, which is made of Cobalt, and is of a poisonous Quality: For one Dose of the Powder of these factitious and high-coloured Stones killed a Woman in the Space of thirty Hours. *Buchneri Miscellanea*. But whether Crabs-eyes are a Medicine of such Importance, as that the Physician ought to be highly solicitous about their being genuine or not, we leave to others to determine. Their Use in Dentifrices is not certainly so great as is commonly thought, since such a Powder, by the Hardness of its Parts, can do no more than what is to be expected from other rough Substances. *Tralles de Remediis terreis* informs us, that *Sachs*, in his *Gammarologia*, ascribes uncommon, and even incredible Virtues to them, and seems surprised, that Physicians, who have read that Work, do not attempt the Cure of some Diseases by Crabs-eyes alone, without the Use of other Medicines. The celebrated *Hoffman* tells us, "That the Powder of Crabs-eyes alone, prepared "with Egg-shells, and mixed up with a fourth Part of Nitre, "is a Medicine of so great Efficacy, that one Dram of it pro- "duces very happy Effects almost in all chronical and acute "Distempers, especially those attended with immoderate Heat. "It is a Powder of very extensive Use, and highly serviceable for "absorbing the Acid of the Primæ Viæ in Hypochondriac and "Scorbutic Cases, and for allaying Heat in all kinds of Fevers. "It is also of singular Service where a Diaphoresis is required. "The Powder of these Stones, when exhibited with distilled "Vinegar, operates still more efficaciously, since it powerfully "resolves coagulated Humours, provokes Urine and a Diapho- "resis, and is used with singular Advantage in all Fevers, in "the Plague and other malignant Diseases, in Pleurisies, Pe- "ripneumonies, and in all Inflammations." Some affirm, that Crabs-eyes are possessed of Bezoartic Virtues, and, consequently, think them of Service in several very considerable Disorders. That, in many Cases, Physicians have been persuaded of their uncommon Efficacy, is obvious from the large Number of Recipes in the Pharmacopœias, in which Crabs-eyes make an Ingredient, unless we should say, that this is only done to increase the Number of the Ingredients without any other View; which is not probable. Singular Virtues are, therefore, ascribed to Crabs-eyes in correcting Acidity, allaying the Heat of the Blood in all kinds of Fevers, exciting a Diaphoresis, and provoking Urine to such a Degree, as even to cure the Dropsy by the plentiful Discharge made. But *Tralles* seems to be in the right, when he suspects, that "Insignificant Medicines "have often been extolled at random, in Imitation of others "who went before, to the great Detriment of the Art; since "this Practice proves a Stumbling-block not only to Students, "but to Practitioners of long standing." That we may, therefore, keep a just Medium, and neither attribute imaginary Virtues to this Medicine, nor destroy its real ones, we must allow, that it only acts as an Absorbent in the Primæ Viæ, by absorbing, and consequently subduing, the peccant Acid, or correcting its Acrimony. When levigated to a fine Powder, which, in the Shops, is called Preparation, these Eyes may be exhibited in any Dose which can be borne by the Stomach, to which they can only prove offensive by their Weight. So that they prove a proper Medicine not only for removing, but also preventing Diseases arising from an Acid in the Primæ Viæ. For this Reason *Portius*, in his Treatise *De Militis in Castris Sanitate tuenda*, recommends to the Soldiers, as a Preservative against Diarrhœas and Dysenteries, a Dram of the Powder of Crabs-eyes. Their absorbent Virtue is not conveyed to the Mass of Blood, nor, indeed, is there any Occasion for it there. But if they are mixed with an Acid, either without the Body, or within it, in consequence of a Property common to all other absorbent or alcaline Substances, they are transformed into a kind of neutral or indifferent Salt: So that they may by Accident, in consequence of the Acid they have admitted and absorbed, act like an Aperient or Resolvent; that is, excite a Diaphoresis, or Diuresis; and, consequently, as they now partake of the Nature of a neutral Salt, prove serviceable in many Diseases, where the Exhibition of an Absorbent does not in the least seem necessary. This *Tralles* himself owns in *Cap.* 8. From what has been said, we may see in what Sense manifold Virtues may be ascribed to Crabs-eyes. Hence we may also perceive, why, according to *Etmuller*, a Dram of the Powder of Crabs-eyes may be said to be an excellent Prophylactic, or Preservative, for hard Drinkers, and such as are subject to arthritic or nephritic Disorders; because it corrects and subdues the Acid of the Wine, and, by that means, prevents the bad Effects it might otherwise produce. But we must beware of falling into the Error of those who affirm, that Crabs-eyes are efficacious against any particular Disease, because an Acid is its immediate Cause; for these are things that cannot be subjected to a rigorous Examination, nor does the Action of Absorbents, as such, reach the Blood-vessels, and most remote Parts of the Body. *Helmont* himself, who makes an Acid the Cause of too many Disorders, when he asserts the diuretic Virtues of Crabs-eyes, does not believe, that their Energy reaches the Seat of the Disorder. "It is far," says he, "from being so, since they only "deprive what we drink of an acescent Quality, which alone, "however little of it is conveyed to the Urine, is sufficient to "produce Stranguries, Dysuries, and other burning Pains, "arising from the Stone." If we ascribe true and genuine, and not chimerical and imaginary Causes to Diseases, we shall not readily admit the over-strained Praises by many Authors bestowed on Crabs-eyes to be just; when, for Instance, they are said to be Correctors of the Acid of Wounds and Ulcers, and for that Reason are classed among Traumatics, and made an Ingredient in the *Pulvis conglutinans Cnoefelii*, together with the Sloughs of Serpents, or, in their stead, Earth-worms. *Etmuller*, *Vol.* 1. Nor, if we consider maturely, shall we attempt laborious Preparations of Crabs-eyes for Ulcers and Wounds, which, tho' they should answer the Intention by means of the other Ingredients, might still be prepared in a more easy Manner. Of this we have Instances in the *Essentia oculorum Cancri in Boetii de Boot Gammarum & Lapidum Historia*, *Lib.* 2. *Cap.* 176. But when *Helmont* affirms, that not only a fine diuretic, but also a vulnerary, and an antisebrile Medicine may be obtained from Crabs-eyes, provided they are resolved into their original Form of Milk; we can say nothing of this Medicine, because we know not whether it ever has, or ever can be used by any one. But we must not forget, that, according to the Experiments of Mr. *Homberg*, the same Quantity of the Spirit of Nitre, and of the Spirit of Salt, is required to saturate a smaller Quantity of other earthy alcaline Substances, such as Coral, Pearl, Mother of Pearl, oriental and occidental Bezoar, the human Calculus, Oyster-shells, calcined Hartshorn, Quick and Slak'd-lime, than of Crabs-eyes a larger Quantity of which is necessary to absorb and receive an equal Quantity of these acid Spirits. Hence it follows, that Crabs-eyes are possessed of a smaller Efficacy or Virtue of absorbing an Acid, than the now-mentioned Ingredients. What we call the *Oculi Cancrorum Præparati* are only Crabs-eyes, reduced to a Powder, and levigated on a Marble, with an Affusion of common Water, or any distilled Water, such as that of Roses or Baum, and afterwards made up into Troches. These Troches are prescribed in the same Cases where the Crabs-eyes are used. The *Pulvis absorbens citratus D. Sthalii*, in the *Dispensatorium Borusso-Brandenburgicum*, is prepared thus:

Take of Crabs-eyes, any Quantity; pour as much fresh Lemon-juice upon them as is sufficient to saturate them; then evaporate the Moisture, over a gentle Fire, in an Earthen or Glass Vessel, stirring it with a wooden Spatula; then let it be triturated, and passed thro' a Linen Sierce.

Because, in this Preparation, the Acid is mixed with the Alcali, we know why a Scruple of it comes to be recommended as a gentle Resolvent in continued and inflammatory Fevers. This Powder is also called *Lapides Cancrorum, acido citri saturati. Schutz. Præl.* The *Pulvis absorbens nitratus D. Sthalii*, in the same Dispensatory, consists of a Mixture of equal Parts of Crabs-eyes prepared, of the Shells of Fish prepared, and depurated Nitre. The *Pulvis absorbens tartarisatus D. Sthalii*, in the same Work, is prepared thus:

Take of Tartar, grosly pounded, two Ounces; of Crabs-eyes prepared, half an Ounce: Boil in a sufficient Quantity of common Water; then evaporate the Moisture.

It agrees in Virtues with the *Pulvis absorbens citratus*.

The *Pulvis absorbens D. Wedelii*, in his *Opiologia*, is prepared thus:

Take of the Vitriol of Mars, six Grains; of prepared Shells, of prepared Crabs-eyes, of Coral, of diaphoretic Antimony, and of native Cinnabar, each half a Scruple, or between fifteen and twenty Grains; of Laudanum Opiatum, one Grain; and of the Oil of Cloves, one Drop: Mix up into a Powder, for six Doses, to be taken in Cinnamon-water, that of Baum, or any other spirituous Water; or with domestic Vehicles, such as Wine or Ale. The Dose may be repeated every Hour, or less frequently, according as Circumstances require.

Wedelius, the Inventor of this Medicine, bestows singular Encomiums upon it in hypochondriac and hysterical Disorders, as also in Syncopes, and Palpitations of the Heart. The *Solutio Oculorum Cancrorum* is made by dissolving Crabs-eyes in distilled Vinegar, and filtrating them thro' a Paper. This Medicine may be prepared *extempore*, when Necessity requires. When this Solution,

Solution, after Filtration, is evaporated to Dryneſs, what remains is called the Salt of Crabs-eyes, which is nothing but the Acid of the Vinegar retain'd in the Powder; but this Medicine is now obſolete, and out of Date. If to the aforeſaid filtrated Solution we add Oil of Tartar per Deliquium, a very white Powder is precipitated, which, when edulcorated and dried, is the Magiſtery of Crabs-eyes; of which we may affirm, that it is only the Powder of Crabs-eyes, deprived of the Acid before pour'd upon it, and which might be equally well prepar'd without any previous Solution.

The Shells, and eſpecially the Claws of Crabs, are of the ſame Nature and Uſes with their Eyes. Theſe Shells, reduced to a Powder, and mixed with Oil of Roſes, are recommended againſt the Itch in Children. This Medicine ſeems to be recommended againſt the Itch, from a Perſuaſion, that this Diſorder ariſes from an Acid, which is indeed often the Caſe; but that ſuch a repellent Ointment conduces to the Cure of the Diſorder, is what we dare not aſſert. The black Points of the Claws are principally uſed in Medicine. The Claws are prepared in the ſame manner with the Eyes. The *Pulvis e Chelis Cancrorum compoſitus*, which is alſo call'd *Pulvis Bezoardicus Anglicus*, and *Pulvis Gaſconii*, *Gaſcoign*'s Powder, as in the *London Diſpenſatory*, is

> Made up of prepared Pearls, Crabs-eyes, red Coral, the whiteſt Amber, calcin'd Hartſhorn, and Oriental Bezoar, each an Ounce; and of the Powder of the black Points of Crabs-claws, a Quantity equal to all theſe. When theſe Ingredients are pounded and mix'd, they are made up into ſmall Balls, with a Solution of Gum Arabic.

In the *Pharmacopœia Pariſienſis* the ſame Number of Ingredients is retain'd, but the Proportion is alter'd; and, inſtead of the Gum Arabic, Jelly of Vipers is uſed. In the *Pharmacopœia Edinburg.* the Ingredients are the ſame, but the Proportion alſo varied; and they are kept in a Powder. In the *Pharmacopœia Leidenſis* the Form of a Powder is alſo retain'd; but, beſides the above-mentioned Ingredients, there is an Addition of Contrayerva-root, Troches of Vipers, and Leaf-gold. In the *Diſpenſatorium Brandenburg.* the Troches of Vipers and Leaf-gold are omitted; and to the other Ingredients are added *Lemnian* Earth, Ceruſs of Antimony, Ambergriſe, and Saffron, all which are made up into ſmall Balls, with Jelly of Vipers. In *Lemery's Pharmacopœia*, inſtead of the *Lemnian* Earth, the reguline diaphoretic Antimony, and the Ambergriſe, Contrayerva, or *Virginian* Snake-root, are ſubſtituted.

In the *Pharmacopœia Bateana* the Powders preſcribed in the *London Diſpenſatory* are retained, unleſs that the Occidental Bezoar is ſubſtituted in the room of the Oriental. There is alſo an Addition made of Contrayerva-root, white Coral, Cryſtal, Terra Lemnia, Ceruſs of Antimony, Ambergriſe, Muſk, and Saffron; all which are, with Jelly of Vipers, reduced to ſmall Balls, under the Name of *Pulvis Cantianus*; and if, to the above-mentioned Ingredients, Cochineal is added, the Preparation is called *Pulvis Cantianus ruber*; but if the Aſhes of Toads are added to them, it is called *Pulvis Cantianus niger*. The former Compoſitions are more ſimple than the latter, which retain the Ingredients of the other, but in different Proportions, and receive alſo other Ingredients. Becauſe it is eaſy to make Additions to Things before invented, the firſt ſimple Recipe of the Inventor probably received ſeveral Additions in Proceſs of Time. A certain *Gaſcoign* firſt brought this Powder into *England*, and made conſiderable Profit by it. In the *Diſp. Brandenburg.* he is ſaid to have ſold it to the Biſhop of *Worceſter* for three hundred Pounds Sterling. *Georg. Starkey* affirms, that it degenerated very much from its ſuppoſed Efficacy after it was publicly known; and obſerves, that the ſame has been the Fate of ſeveral other Arcana in Medicine. In Caſes of this Nature, the Credulity of Mankind unqueſtionably furniſhes Medicines with Virtues, which Nature has either abſolutely refuſed them, or at leaſt beſtow'd upon them in a very ſcanty Meaſure. The Doſe of this Medicine is from half a Scruple to half a Dram. *Schulzius*, in his *Prælectiones*, extols it as an efficacious Remedy againſt acute, exanthematous, and malignant Diſorders; as alſo againſt the Plague itſelf. Dr. *Slare*, in his Obſervations upon Bezoar-ſtones, upon examining the ſeveral Ingredients in the *London* Compoſition, thinks, that the Bezoar-ſtone, the Amber, and the Hartſhorn, are ſuperfluous and uſeleſs Ingredients in a Medicine intended to correct Acids: He is alſo of Opinion, that the other Four Powders are not preferable to others of the teſtaceous Kind. For this Reaſon he prefers Chalk, with Salt of Wormwood, to this coſtly Compoſition; ſince the former is a powerful Abſorbent of an Acid, and the latter a powerful Alcali, proper for correcting Acids, and of a diaphoretic and diuretic Quality. According to *Etmuller*, *Deodatus* recommends half a Dram, or a Scruple, of the Powder of Crabs-eyes, as an excellent Purgative.

I muſt remark, that the *European* Craw-fiſh are not the ſame with the River-crabs, which *Galen* means in his famous Receipt for the Bite of a mad Dog; for theſe laſt are a Species of River-crabs, properly ſo call'd, which are not found in the Rivers in our Part of *Europe*, but which are common in thoſe of *Greece*, *Crete*, and *Sicily*.

CANCER, καρκίνος.

By the Term *Cancer*, as appears from ſeveral Places of *Celſus*, the *Roman* Writers underſtood what the *Greeks* call'd *Gangrene*, or *Sphacelus*; and the Diſeaſe which now paſſes under the Name of *Cancer*, is the very ſame as what the *Greeks* and *Romans* meant by the Word CARCINOMA; to which the Reader is referr'd for an Account thereof.

CANCHRYS, CANCHRY. The ſame as CACHRYS, CACHRY, which ſee.

CANCINPERICON, Hot Horſe-dung. *Rulandus.*

CANCRENA. A Word commonly uſed by *Paracelſus* for *Gangræna*.

CANDELA, λύχνος, κηρός, a Candle, has its Uſes in Medicine, and is reckon'd among the Inſtruments of Surgery. Thus, in *Scultetus's Armamentarium Chirurgicum*, *Edit. Hagæ-Comitum*, 1656. *Tab.* 13. *Fig.* 9, 10. are repreſented two Candles, prepared of ſtrong Thread doubled, and white Wax, mixed with a little Turpentine, that they might not be ſubject to break; theſe, being rubb'd over with Oil of ſweet Almonds, are introduced into the urinary Paſſage in the Caſe of an Iſchury, occaſioned by an Obſtruction from Caruncles. One of theſe Candles appears with its Top broken, to hint to the Surgeon, that he is to cut off the Extremity of the Candle with his Sciſſars, before he introduces it; leſt, in extracting it, he ſhould leave a Bit of the Wax, through which the Thread or Wick might not reach, behind, and ſo increaſe the Iſchury. There is alſo a uterine Candle, which is a ſort of Peſſary; and Wax-candles are uſed in the Operation of Cupping. *Schroder*, *Pharmacop. Lib.* 2. *Cap.* 86. gives us Preparations of *Candelæ fumales*, or Candles for Fumigation, called alſo, from their Figure, *Baculi*, or Staves, compoſed of odoriferous Powders, made up with Mucilage of Tragacanth, Styrax, and the like. They are uſed to burn in peſtilential Times, or to purify the Air upon Occaſion. They are alſo called AVES CYPRIÆ, which ſee.

The *Latin* Word *Candela* correſponds to what, in *Engliſh*, we call Candle, which is a round cylindrical or conical Body, form'd, for the moſt part, of Tallow, and ſometimes of Wax, with what the *Greeks* call ἐλαύχνιον, or a Wick, running from one End of it to the other. *Baſilius Faber*, in his *Theſaurus Eruditionis Scholaſticæ*, and *Salmaſius*, in his *Exercitationes Plinianæ*, inform us, that the Antients, for *Wicks*, uſed the *Medulla*, or what we call the Pith of Bulruſhes, which, when immerſed in liquid Wax, conſtituted their Candles. But, at preſent, the *Wicks* are generally made of Flax or Cotton, ſo twiſted as moſt commodiouſly to anſwer the End. They who either conſult Conveniency, or ſtudy the Preſervation of Health, obſerve a Difference of Candles, both with reſpect to the Flame, and the Fumes or Exhalations emitted from it. The Flame ought not to be inconſtant and vibratory; ſince, in that Caſe, it is both prejudicial to the Eyes, and inſufficient for the diſtinct Illumination of Objects. This Fault is generally the Conſequence of the Wick's being impure, not ſufficiently dry, or not duly twiſted. The Quality of the Exhalations depends upon the Matter in which the Wick is immerſed, and which ſerves to feed and nouriſh the Flame of the Candle. Wax, which is adulterated with various foreign Subſtances, muſt, when burning, neceſſarily impregnate the Air with certain Qualities, which are not only ungrateful to the Smell, but prejudicial to the Health. Beſides, Verdegriſe, and other Subſtances, which are ſometimes mixed with Wax, in order to give it an agreeable Colour, cannot fail to produce very pernicious Conſequences. Every one, who deſerves the Name of a Phyſician, very well knows, that the Air may be impregnated with medicinal Virtues, which have a conſiderable Influence on the human Body; and that it may, in like manner, be contaminated with Effluvia or Exhalations, not only prejudicial to Health, but deſtructive of Life. The Phyſician, therefore, who has Patients of a delicate and tender Conſtitution committed to his Care, muſt give the ſtricteſt Orders, that every Thing of a noxious Nature, ariſing from Candles, be kept at the greateſt Diſtance, and avoided with the utmoſt Diligence. A large Cloud of fetid Smoak, tho' riſing from Candles made of white Wax, has, from Experience, been found prejudicial to many, as it not only creates Head-aches, but ſometimes proves offenſive and injurious to the Lungs. Candles made of old Tallow, and ſuch as, for the Profit of the Seller, is adulterated with various Mixtures, by their Fumes and Exhalations conſiderably impair and deſtroy Health. Thoſe prepared of the Tallow of Beef ſend forth a more diſagreeable Smell, than ſuch as are made of the Suet of Wethers or Sheep; and Tallow-candles in general are never obſerved to ſmell more diſagreeably, than when any Quantity of Hogs-tallow is mixed with that of which they are made: Hence it is, that in *France* a Law is enacted, by public Authority, injoining Candles to be made of a Mixture of the Tallow of Oxen, Wethers, and Sheep, and expreſly prohibiting the leaſt Admixture of Hogs-tallow. *Savary*, *Dictionair. univerſel de Commerce*. *Rammazini* adviſes "Literati, or Men "of a ſtudious Turn, to uſe Tallow-candles in their Studies

" as little as poſſible; and, if their Circumſtances will not " afford Wax-candles, to burn Olive-oil in Lamps, as the " antient Virtuoſos did." *Fortunatus Plempius* informs us, from *Pliny*, *Lib.* 7. *Cap.* 7. " That the Exhalations of Tal- " low-candles are as effectual for procuring Abortion, as the " Fumes of an extinguiſh'd Lamp." In *Eph. N. C. D.* 2. *a.* 9. *o.* 205. we have the Caſe of a ſleeping Man, who, in conſequence of the Fumes of an extinguiſh'd Candle, was ſeized with Convulſions, a Difficulty of Breathing, and at laſt with Death. *Valentinus*, in his *Pandectæ Medico-legales*, *Tom.* 1. gives us the Hiſtory of a Caſe exactly parallel with the former; and *Hoffman*, in his *Medicina Rationalis*, does not heſitate to claſs the Fumes, ariſing from an extinguiſhed Candle, among poiſonous Subſtances. In the *Acta Medica & Philoſophica Hafnienſia*, *Vol.* 5. *Obſ.* 86. we are ſupplied with a ſufficient Proof of the noxious Quality of the Exhalations of Tallow, in the Caſe of a Woman, who, in conſequence of her being employ'd in making Tallow-candles for Sale, in the Night-time, and in a ſmall Apartment, was ſeized with a violent Head-ach, a Vertigo, a Redneſs of the Eyes, and at laſt a moſt formidable Aſthma. *Olaus Borrichius* recovered this Patient, by firſt exciting a Vomiting, and afterwards exhibiting pectoral Waters, with Oxymel of Squills; by which means, as he expreſſes himſelf, he thought he had routed the Enemy: But, on giving over the Uſe of theſe Remedies, ſhe was ſoon after ſeiz'd with an Orthopnœa; however, ſhe was again reſtored to Health by their being repeated. This Circumſtance induced *Borrichius* to caution all Candle-makers to work in Shops that were large, and expoſed to a free and open Air. Whether, in Conſequence of what has been ſaid, it is not the Duty of the Magiſtracy in large Cities to prevent the Air of the Streets being contaminated by the Steams proceeding from the Shops of Tallow-chandlers, is a Point we leave to be determin'd by others. 'Tis not our Province to conſider thoſe Candles which are prepared for laſting an uncommon Time, for diffuſing a grateful Odour, or for bearing Wind and Water without being extinguiſhed. We ſhall refer the Reader, who wants Satisfaction in theſe Particulars, to *Petrus Moria Caneporius de Atramentis*, and *Chomel's Dictionair. Oeconomique*, in the Article CHANDELLE.

'Tis more properly our Buſineſs to conſider ſuch Candles as are uſed in the Shops for medicinal Intentions.

The *Candela fumalis*, then, or the *Candela pro ſuffitu odorata*, which is alſo called *Tæda* and *Avicula Cypria*, is a Maſs of an oblong Form, conſiſting of odoriferous Powders, mix'd up with a Third or more of the Charcoal of the Willow or Lime-tree, and reduced to a proper Conſiſtence, with a Mucilage of Gum Tragacanth, Ladanum, or Turpentine. This Species of Candle may alſo be prepared of reſinous Subſtances alone, mix'd up with Balſamics. It is intended to excite a grateful Fume or Smell, without any Flame, to correct the Air, to fortify the Brain, and to excite the Spirits. Theſe Candles are alſo, from their Form, called *Bacilli*, and *Maſſæ ad Fornacem*; becauſe they are uſually applied to a hot *Grate* or *Chimney*, in order to have the Smell, they are intended to diffuſe, excited. But we muſt take care, that none of their Ingredients conſiſt of Woods, Flowers, Roots, Herbs, or Barks; becauſe moſt Subſtances of that Kind, when ſet on Fire, diffuſe an empyreumatic and ungrateful Smell. The Powders, of which they are to be compoſed, may be choſen according to the Intention of the Phyſician, and the particular Caſe or Conſtitution of the Patient for whoſe Uſe they are deſigned. Examples may be ſeen in the *Cyſta Medica Hafnienſis* of *Thomas Bartholine*, under the Article *Trochiſci odorati*. They are rarely an extemporaneous Preſcription, but are kept ready for Sale in the Shops. The *Candelæ fumales Francofurtenſium*, in *Schroder's Pharmacopœia*, are prepared thus:

Take of Benjamin, ſixteen Ounces; of Aloes-wood, Roſe-wood, yellow Sanders, and Ladanum, each four Ounces; of Olibanum, Maſtich, and Cloves, each three Ounces; of white Sugar, two Pounds; and of the Coals of the Lime-tree, four Pounds and an half: Reduce all to a fine Powder, and, with Mucilage of Gum Tragacanth, made with Roſe-water, that of Marjoram and Lemon-peel, with the Addition of a little liquid Storax and Turpentine, form the Candles into any Shape.

The ſame Compoſition is in the *Diſpenſatorium Ratiſbonenſe*. The *Candelæ fumales* of the *Pharmacopœia Argentoratenſis*, which, in the *Pharmacopœia Auguſtana*, are called *Candelæ pro ſuffitu ſecundæ*, are prepared thus:

Take of Styrax Calamita, and Charcoal of the Willow, each two Ounces; of Benjamin, one Ounce; of Cloves, half an Ounce; and of Ladanum, ſix Drams; which, with *Cyprian* Turpentine, and Mucilage of Gum Tragacanth, made with Roſe-water, are to be reduced to a proper Form.

The *Candelæ pro ſuffitu*, in the *Diſpenſatorium Hafnienſe*, which, in the *Pharmacopœia Auguſtana*, are called *Candelæ primæ*, contain more Ingredients than thoſe already mentioned; but what, in the *Pharmacopœia Antwerpienſis*, are called the *Candelæ odoriferæ*, differ from them all, in having an Addition of Muſk and Camphire. To theſe we may add the *Candelæ contra Subitanea*, which *Ludovici*, in his *Pharmacopœia*, borrows from the *Collectanea Wurtemburgenſia Euphoriſta*, and ordered to be prepared thus:

Take of Male Frankincenſe, an Ounce and an half; of Female Frankincenſe, two Ounces; of white and yellow Amber, each an Ounce; of Camphire, half an Ounce; of Maſtich, two Drams; of red Myrrh, one Ounce; of Benjamin, Angelica, and Burnet, each half an Ounce; of raſped Hartſhorn, an Ounce and an half; of Wax, two Pounds. Let ſuch of the Ingredients as require pounding, be pounded, and added to the melted Wax; out of which Maſs let Candles of the common Form be made, upon Wicks conſiſting of three hempen, three ſilken, three gilt, and three ſilverized Threads, twiſted together: After which, for the ſake of Ornament, we ſometimes ſee ſmall Pieces of red Coral, Mother of Pearl, Entaglia, and Dentalia, fixed in their Surfaces.

CANDELARIA, or CANDELA REGIA. Names for Mullein, or VERBASCUM, which ſee.

CANDIDUS, CANDOR. The ſame as ALBUS, ALBEDO; but often uſed metaphorically to ſignify Sincerity of Mind. See ALBEDO.

Candidare, in *Theat. Chymic. Vol.* 5. is called the fourth Regimen, and aſcribed to the Sun. *Caſtellus.*

CANDISATIO. Candying, applied only to Sugar. See SACCHARUM.

CANDOU *Purchaſii*, Jonſt. Dendrol. *Arbor Maldivenſis.* A Tree much like the Cork-tree, as to its Wood, and of the Height of the Walnut-tree. The Trunk is fungous, and lighter than Cork, the Bark whitiſh, and it bears no Fruit. The Wood is cut into Planks, and ſerves for Fewel; and is very uſeful on another Account; for, by the Help of it, they will draw up a thouſand Weight from the Bottom of the Sea, which they do by firſt tying a Rope about what they want to have raiſed, which from thence paſſes thro' a perforated Piece of this Wood, or perhaps two or more Pieces, as they ſhall think ſufficient for the Purpoſe. *Raii Hiſt. Plant.*

CANDUM, or rather CANTHUM, Sugar-candy. *Blancard.* See SACCHARUM.

CANELA. A Word which, as *Fuchſius* ſays, *Myrepſus*, and other later *Greeks*, as well as *Averroes*, and the reſt of the *Arabian* Writers, uſe for what we now call *Cinnamon*, or rather *Caſia. Myrepſus.*

CANELLA. See CINNAMOMUM. *Blancard.*

CANELLA ALBA, Parkinſon. Theat. 1581. Raii Hiſt. 2. 1802. *Canella alba quorundam*, J. B. 1. 461. *Cinnamomum ſive Canella tubis minoribus alba*, C. B. Pin. 409. *Caſſia lignea Jamaicenſis, cortice acri candicante*, Pluk. Phytog. 81. *Caſſia lignea laurifolia Americana, cortice albo, valde acri & aromatico*, Pluk. Almag. 89. Tab. 81. *Arbor baccifera laurifolia aromatica, fructu viridi calyculato racemoſo*, Philoſoph. Tranſact. N°. 192. p. 465. Cat. Jam. 165. Sloan. Hiſt. 2. 87. Tab. 191. *Canella Cubana*, Jonſ. Dendr. 165. *Arbor Jucadice*, Nieremb. 294. *Arbor cujus cortex Gingiber æmulatur*, Laet. 24. THE WILD CINNAMON-TREE.

This is commonly, but falſly, call'd *Cortex Winteranus*; it has a Trunk about the Thickneſs of one's Thigh, riſing to about twenty or thirty Foot high, having many Branches and Twigs hanging downwards, making a very comely Top. The Bark conſiſts of two Parts, one outward, and another inward: The outward Bark is as thin as a mill'd Shilling, of a whitiſh aſh or grey Colour, with ſome whiter Spots here-and-there upon it; and ſeveral ſhallow Furrows, of a darker Colour, running variouſly thro' it, making it rough, of an aromatic Taſte. The inner Bark is much thicker than Cinnamon, being as thick as a mill'd Crown-piece; ſmooth, of a whiter Colour than the outward, of a much more biting and aromatic Taſte, ſomething like that of Cloves, and not glutinous like Cinnamon, but dry, and crumbling between the Teeth. The Leaves come out near the Ends of the Twigs, without any Order, ſtanding on Inch-long Foot-ſtalks; they are each of them two Inches long, and an Inch broad, near the End where broadiſh and roundiſh, being narrow at the Beginning, from whence it augments in Breadth to near its End, of a yellowiſh-green Colour, ſhining and ſmooth, without any Inciſures about its Edges; and ſomewhat reſembling the Leaves of Bay or *Laurocerasus*. The Ends of the Twigs are branched into Bunches of Flowers, ſtanding ſomething like Umbels, each of which has a Foot-ſtalk, on the Top of which is a Calyx, made up of ſome Foliola, in which ſtand five ſcarlet or purple Petala, within which is a large Stylus. To theſe follow ſo many calyculated Berries, of the Bigneſs of a large Pea, roundiſh, green, and containing within a mucilaginous pale-green thin Pulp four black ſhining Seeds, or Acini, of an irregular Figure.

All

All the Parts of this Tree, when freſh, are very hot, aromatic, and biting to the Taſte, ſomething like Cloves, which is ſo troubleſome as ſometimes to need a Remedy from fair Water.

It grows in the low Land, or *Savanna* Woods, very frequently, on each Side of the Road, between *Paſſage-fort* and the Town of St. *Jago de la Vega*, in *Jamaica*, in *Antigua*, and other the *Caribbee Iſlands*.

The Bark of this Tree is what is chiefly in Uſe, both in the Plantations of the *Engliſh*, between the Tropics in the *Weſt-Indies*, and in *Europe*; and is without any Difficulty cured, by only cutting off the Bark, and letting it dry in the Shade.

It is in Uſe in the *Weſt-Indies*, by the more ordinary ſort of People, in place of all other Spices; being thought very good to conſume the immoderate Humidities of the Stomach, help Digeſtion, and expel Wind.

It is likewiſe, as well there as in *Europe*, thought a very good Remedy againſt the Scurvy, and to cleanſe and invigorate the Blood; being, in *London*, at Druggiſts and Apothecaries Shops, uſed for thoſe Purpoſes, under the Name of *Cortex Winteranus*, which it is not, but may very well ſupply its Place. It is, in the *Weſt-Indies*, mixed and given with Steel, and other Medicines; but if the Patient be any way of a hot Conſtitution, it does more Harm than Good, being very warm.

Rum, a vinous Spirit drawn from Moloſſus, or bad Sugar fermented with Water, if it be mixed with ſome of this Bark, it loſes, in part, its loathſome empyreumatic Smell.

This Bark, if mixed with Water, and diſtil'd *per Veſicam*, yields an aromatic Oil, ſinking to the Bottom of Water like Oil of Cloves, with ſome ſmall Quantity of which it being mixed, has been ſold for true Oil of Cloves. *Peter Martyn* mentions it under the Name of *Cortex, Cinnamomi Saporem, Gingiberis Amaritudinem, & Caryophylli ſuavem Odorem, præ ſe ferens*. *Nic. Monardes* deſcribes it under the Name of *Lignum Aromaticum*; *Cluſius* calls it *Lignum, ſeu potius Cortex Aromaticus*; and I queſtion not but this is the ſame with the *white Cinnamon*, or the *Canella alba*, in ſome other Authors. *Linſchoten*, in his *Deſcription of America*, tranſlated into *French*, gives an Account of it under the Name of *Arbre ou les Pigeons nichent*. Dr. *Traphan* calls it *Winter's Bark*, or *Weſt-Indian Cinnamon-tree*; *Hernandez* and *Ximenes*, *Caminga*.

But it may be doubted, whether this be the *Aſcopo* of *Havot. Phil. Tranſ. Abr. Vol.* 2. *p.* 665. *per Sir* Hans Sloane.

This Bark is accounted a Specific againſt the Scurvy, and is a good nervous Medicine, and uſeful in Palſies and Convulſions. It is likewiſe of Service againſt Diſeaſes of the Stomach and Bowels. *Miller's Bot. Off.*

CANEON, κάνειον, κανέιον, κανοῦν, κανὸν, κανὶς, is a Baſket, according to *Heſychius*. Κανεῶν, in *Hippocrates*, *Lib.* 1. & 2. περὶ γυναικ. ſignifies the Cover of a Pot, thro' which, by means of a hollow Cane or Reed, the Vapour is convey'd in uterine Suffumigations.

CANICACEUS, πιθύεως. Furfuraceous or branny. It is derived from

CANICÆ. Bran, or rather coarſe Meal, ſo called from *Canis*, a Dog; becauſe it was Food for Dogs. Hence *Panis canicaceus*, very coarſe Bread. *Blancard.*

CANICIDA, *Cynoctonum*, κυνοκτόνον. The ſame as Aconitum.

CANICIDIUM. A Word uſed by ſome Anatomiſts for a Diſſection of living Dogs. *Caſtellus.*

CANICULA, κυνίδιον. A Diminutive of Canis. Alſo the Dog-ſtar; whence

CANICULARIS, applied to the Time when the *Canicula*, or Dog-ſtar, riſes and ſets with the Sun. The *Dies Caniculares* begin on the Nineteenth of *July*, and end the Twenty-ſeventh of *Auguſt*. *Hippocrates* pronounces it improper to purge during theſe Days. *Paracelſus* affirms, that theſe Days favour the Generation of Worms.

CANINA APPETENTIA. See Boulimos.

CANINA BRASSICA. See Mercurialis.

CANINI DENTES. See Dens.

CANINA LINGUA. See Cynoglossum.

CANINA MALUS. See Mandragora.

CANINA RABIES. See Hydrophobia.

CANINUS SENTIS. See Cynosbaton.

CANINANA, *(Jonſt.)* is a Serpent of *America*, a Foot and a half, or two Feet, in Length, green on the Back, and yellow on the Belly. It is accounted one of the leaſt venomous, creeps after Men, and ſuffers itſelf to be handled without doing any Harm. The *Americans* eat it, after cutting off the Head and Tail. It contains much volatile Salt and Oil.

It is uſed in the Antidotes of the *Indians*, as the Viper is in *Europe*, upon a Suppoſition, that it reſiſts Poiſon.

It is called *Caninana* from *Canis*, a Dog; becauſe it follows Men, and ſuffers itſelf to be taken in the Hands like a Dog.

CANIRAM, H. M. *Malus Malabarica, fructu corticoſo amaricante, ſemine plano compreſſo*, D. Syen.

It is a tall ſpreading Tree, with a Trunk as big as two Men can graſp, which, as well as the larger Branches, is cover'd with an Aſh-colour'd, blackiſh, or reddiſh Bark. The ſmall Branches are of a ſmutty Green, full of Joints, and covered with a bitter Bark. The Leaves grow by Pairs at the Joints, are of a round-oblong Form, and extremely bitter. The Flowers grow in Umbellas, at the Joints of the ſmall Branches, and conſiſt of four, five, and ſometimes ſix ſmall Leaves, of a watry-green Colour, cuſpidated, and of a faint, tho' not unpleaſant, Smell. The Fruit is a round, ſmooth, Gold-colour'd Apple, whoſe Pulp, when ripe, is white and mucilaginous, and covered with a thick and brittle Rind: This Pulp, and the Seed contain'd in it, are of a very bitter Taſte; and the whole Tree is remarkable for its Bitterneſs. It bloſſoms in the Summer, and bears Fruit in the rainy Seaſon.

The Root, in Decoction or Infuſion, is cathartic; and uſeful in pituitous Fevers, the Colic, Gripes, and Fluxes of the Belly: The Decoction alſo makes a good Fomentation for the Gout. The ſame, mixed with Cows Milk, if the Head is waſhed therewith, is beneficial in the Vertigo and Melancholy. The Bark, bruiſed and mixed with the Water in which Rice has been ſteep'd, repreſſes a Flux of yellow Bile. The expreſs'd Juice of the Leaves, given in a Decoction, eaſes Pains of the Head; but, drank in a large Quantity, has the Effects of Poiſon, and cauſes Death; againſt which the only Remedy is human Dung. One or two of the Seeds, eaten every Day for two Years together, as it is pretended, are of ſuch Virtue, as to render the venomous Bites of the Serpent, called *Cobra Capella*, of no Effect. *Raii Hiſt.*

CANIRUBUS, quaſi *Rubus Caninus*. The ſame as Cynosbatos, which ſee.

CANIS. The Dog, a well-known Animal, thus diſtinguiſhed:

Canis, Offic. Schrod. 5. 274. Ind. Med. 26. Schw. Quad. 73. Aldrov. de Quad. Digit. 482. Jonſ. de Quad. 122. Mer. Pin. 168. Charlt. Exer. 26. Raii Synop. A. 175. Geſn. de Quad. Digit. 213. THE DOG.

The *Latin Canis*, and the *Greek* κύων, correſpond to our *Engliſh* Word *Dog*, and *Catulus*, or *Catellus*, to what we call *Whelp*. As the Shapes, Natures, and Properties of theſe Animals are too well known to require any Deſcription, we ſhall only, on this Occaſion, conſider the ſeveral Uſes to which they are applied in Medicine. The Fleſh of Dogs, then, is not only uſed as an Aliment by the Inhabitants of *China*, but alſo look'd upon as a Delicacy by ſeveral Sorts of People in *Aſia*, *Africa*, and *America*. *Deſ. Marchais Voyage en Guinée, Tome* 2. *& Journal des Sçav.* That it was of old uſed by the *Greeks*, is obvious to any one who has read the Works of *Hippocrates*; for, in his ſecond Book *de Diæta*, when ſpeaking of the Qualities of ſeveral Sorts of Fleſh, he tells us, "That the Fleſh of "Dogs is of a heating, drying, and corroborating Nature, but "does not eaſily paſs off by Stool; whereas that of Whelps is "of a moiſtening lubricating Quality, and is eaſily diſcharged "that way." In his Book *de Morbo Sacro*, he informs us, That epileptic Patients were forbid the Uſe of Dogs Fleſh, becauſe it produces violent Commotions in the Inteſtines. In his Book *de internis Affectionibus*, he mentions Dogs Fleſh, as alſo that of Hares and Birds boil'd, among the Number of thoſe which are lighteſt, and of the moſt eaſy Digeſtion. In his Book *de Superfœtatione*, he recommends boil'd Whelps to be eaten by Women, in order to promote Conception. In his Treatiſe *de internis Affectionibus*, he alſo orders boil'd Whelps to be uſed, as common Food, by dropſical Patients; and in an *Hepatites*, after the Diſeaſe is come to a Criſis. *Pliny*, in the fourth Chapter of his twenty-ninth Book, informs us, that Whelps were not only uſed as other Aliments by the *Romans*, but alſo made a Part of their Sacrifices to the Gods. If we reflect upon the Nature and hot Conſtitution of Dogs, and conſider that their Food is generally ſuch as the Animal Kingdom affords, it ſeems highly probable, that their Fleſh, beyond that of all Fowls and Quadrupeds commonly uſed in Food, if we except thoſe of the ravenous Kind, and ſuch as feed on Inſects, affords what we commonly call a ſtrong Nouriſhment, or ſuch as is of a pretty alcaline Nature; and conſequently not improper for heating thoſe of cold phlegmatic Conſtitutions, and ſuch as abound with a peccant Acid. The *Europeans*, however, generally abſtain from Dogs Fleſh, till Neceſſity, and that Love of Life which is natural to Mankind, obliges them to uſe it. Live Whelps are ſometimes applied to the Abdomen, in order to allay Colic Pains, in Caſes where the Cauſe of the Diſorder may be removed by a kindly and cheriſhing Heat. *Bartholine*, in the *Acta Medica & Philoſophica Hafnienſia, Cent.* 6. *Hiſt.* 53. tells us, that a Dog, when applied to the Abdomen, after he became warm by the Heat of the Patient, vomited very violently; upon which the Patient's Colic Pains were immediately abated. *Borelli, Cent.* 3. *Obſ.* 28. informs us, that the Gout is ſurpriſingly relieved by Whelps lying in Bed with the Patient; and that they contract the Diſorder ſo as to be ſcarce able to walk; the afflicted Perſon receiving in the mean time a ſingular Relief. If the Words of this Author are founded upon real Facts, they ſuggeſt ſome Things of the greateſt Uſe and Importance to every Phyſician:

" For, says he, tho' we are ignorant of the internal Disorders " of some Patients, and know not the particular Part affected; " and tho' we want Windows, which *Momus* of old wished " for, in order to discover the disordered Part; yet this may " be discovered in other less noble Animals, for which Purpose " Whelps are to be used. When these have lain in Bed for " fifteen Days with the Patient, and lick'd up the Remains of " his Aliments and his Spit, they contract a Disease of the like " Nature; and, upon being opened, the Part affected in them " corresponds to that disordered in the Patient: Thus, when " the particular Seat and Nature of the Disease is known, pro- " per Remedies may be the more easily applied." *Bartholine*, in his *Hist. Anatom. Cent.* 3. *Hist.* 66. informs us, that *Fludd*, an *English* Physician, is said to have transplanted the Gout of a certain Patient to a House-dog who slept with him; and that the Dog was afterwards periodically rack'd with the Disorder, as his Master had formerly been.

That a Dog may be affected by the gouty Matter of a Man, I think highly probable, from a Case which happen'd in *December* 1742. within my own Knowledge. A Gentleman, terribly afflicted with the Gout, took a mercurial Purge, which affected the Salival Glands so as to make him spit a little. As he sat in his Chamber with a Bason in his Lap, in order to receive the Saliva, another Gentleman coming into the Room, he set the Bason aside, for the sake of Decency, and spit two or three times on the Floor. A small Spaniel in the Room lick'd up the Saliva thus discharged; the Consequence of which was, that the Dog was, in less than half an Hour, seiz'd with violent Convulsions, and died in about ten Hours.

That Dogs may catch the Diseases of those with whom they lie in Bed, is sufficiently confirm'd by a Case in the *Ephemerides Germanicæ Curiosæ*, *Vol.* 2. *o.* 183. where we read of a Dog's being infected with the Small-pox. But as a Man, who catches the Disease of another, does not by that means relieve the Patient; so it seems consonant to Reason, that when a Patient feels any Relief from the Application of a Dog, it must only be in those Cases, in which the fomenting Heat of the Animal attacks the Disease, by opening the Pores, procuring a free Transpiration, and thus giving Vent to the morbid Matter. In Cases of this Nature, it is by no means inconsistent with Reason, that the Dog, in consequence of the morbid Exhalations admitted into his Body, should be seized with that particular Species of Disorder from which he has freed the Patient. As we observe, that Dogs generally deterge, cleanse, and consequently promote the Consolidation of their Wounds by licking them; hence Dogs may, with great Advantage, be admitted to lick the Wounds and Ulcers of Men; by which they sometimes suffer, if the Matter they lick is retain'd in the Stomach, convey'd to the Vessels, and mixed with the Fluids of their Bodies. This is sufficiently proved by a Case in the *Ephemerides Germanicæ Curiosæ*, 1. *a.* 4. *o.* 51. where we have an Account of a Dog who became itchy by licking a scorbutic Patient, who, by that very means, got quit of his Disorder. Some time ago there lived near *Paris* a certain Man, who, from the Place of his Residence, was called the *Physician of Chaudrai*; and who, without the Use of any other Means, cured many inveterate Wounds. *Colonne*, *Histoire Naturelle de l' Univers. Tome* 1. Dogs, after their Death, afford a great many Things useful in human Life; but we shall only specify such as are most common. Thus, for Instance, the Skin is by some recommended as an excellent Covering or Wrapper for the Leg, in order to allay the Pains of the Gout. *Ephemerides Germanicæ Curiosæ*, *D.* 3. *a.* 2. *o.* 35. But, in order to prevent the Gout, the Dogs Skin ought, according to *Boeler*, to be prepared with some astringent Substance, such as Galls or Alum. All Leather is tan'd by means of some astringent Substance, that its Pores being contracted, it may become the thicker. If, therefore, tan'd Dogs Skin is sufficiently thick to resist the external Cold which excites the arthritic Pains, it may very properly be recommended to such as dread an Attack of the Gout. These Skins are commonly used for Gloves in the Summer-time, with a View to keep the Skin gratefully cool, and agreeably smooth; for, as the external Surfaces of these Gloves are very smooth, they do not admit the Rays of Heat, but reflect them as they fall upon them, as polish'd Bodies do, and consequently they prevent the Sweating of the Hands. The Fat of a Dog is recommended beyond that of other Animals, on account of its penetrating and vulnerary Quality. Many order it to be exhibited in Vinegar, spread upon Bread, or mix'd with the Aliments, as a proper Remedy against the Phthisis and Epilepsy. Others roast a Dog, and, with great Success, exhibit the Fat which drops from him, in a Phthisis. *Etmuller.* In vulnerary Decoctions and Potions it is of singular Service, where an acrid Quality is to be corrected, or a Rigidity of the Parts removed: But we must take care, that it be not old; in which Case it generates a rancid Acrimony in the Body. When it is fresh, it may be given from a Scruple to a Dram and an half. " I know, " says *Konigius*, that some People, by boiling nervous Plants in " Dogs Fat, prepare an excellent anodyne Ointment for Pains " and Luxations of the Joints; as also for Pains after Child- " birth, when mix'd up with *Peruvian* Balsam, and the distil'd " Oils of Cinnamon, Mace, and Mint."

Forestus (in *Obs. Med. L.* 10. *Obs.* 85. *in Scholiis*) informs us, that in a Palsy of the Feet, produced by Colic Pains, after Cupping, and the Use of Baths prepared of heating Substances, he successfully used, by way of Ointment, the Fat of brown Whelps, boil'd in Water till their Bones were separated from each other, taking the Fat off the Surface of the Water when cold. Authors of Note and Reputation have affirm'd, that the Brain of a Dog, if eaten, mitigates and allays a Mania, as we see in the *Ephemerides Germanicæ Curiosæ*, *D.* 3. *a.* 4. *o.* 125. Tho' we cannot comprehend what specific Virtues the Brain of this Animal can have, in lessening or removing the Cause of a Mania; yet we shall not dare flatly to contradict these Authors. We are, however, inclined to think, that the Effects, supposed to be produced by this Medicine, are in reality those of other proper Remedies used at the same time; and that it only acts as a Deobstruent, in consequence of the Aromatics, in Conjunction with which it is exhibited. The Dung of Dogs is called *Album Canis*, *Album Græcum*, and *Cynocoprus*, from a *Greek* Word signifying the Excrements of this Animal. That Species is best which is discharged in hot Weather by Dogs fed upon Bones, and such as have little or no Drink allow'd them. This Medicine is recommended for internal Use, not only in vulnerary Decoctions, intended for the Consolidation of Wounds, but also for exciting a Diaphoresis, resolving grumous Blood, and destroying an Acid in the *Primæ Viæ*. Concerning its antidysenteric and other Qualities, *Etmuller*, in *Tome* 2. speaks thus: " The Dose is from half a Dram to two Drams, " with the Addition of a little Sugar, in a Vehicle either of " simple or chalybeated Goats Milk; for this Dung, tho' easily " procured, is nevertheless a valuable and efficacious Remedy " in Dysenteries, and in all Hæmorrhages, those of the most " desperate Kind not excepted. *Franciscus Joel*, in his *Praxis* " *de Dysenteria*, *Forestus*, in his *Obs. Med.* and *Mendererus*, " in his *Medicina Militaris*, highly recommend it on several " Accounts: And I myself, says he, by means of this Dung " alone, happily cured a Country Woman, who had been " afflicted with an Uterine Hæmorrhage for more than four " Weeks." When mix'd with Gargarisms, it is recommended as a Specific in the Cure of Quinseys, and Inflammations of the Tonsils. According to *Etmuller*, " It was used in the Days " of *Galen*. Sometimes the Powder of it is blown into the " Throat: Sometimes the Dung itself is mixed with Honey, " and applied to the Parts affected; and at other times it is " mixed with Cataplasms and Ointments, prepared with an " Intention to discuss and maturate. It discusses, maturates, " and breaks Abscesses, prepares a Way for the Discharge of " Pus; and heals Ulcers of the Rauces, when applied to the " Part affected in the above-mentioned manner." The *Cataplasma Cynanchicum*, in *Bate's Dispensatory*, is prepared thus:

> Take of *Album Græcum*, one Ounce; of the Conserve of red Roses, two Ounces; and of the *Syrupus de Meconio*, a sufficient Quantity: Make into a Cataplasm, to be applied under the Chin from Ear to Ear, after Venesection.

That the Fragments of half-corrupted Bones, separated from *Album Græcum*, often prove an excellent Remedy for the Toothach, we are informed by *Andreas Elias Buchner*, in his *Miscellanea Medico-physico-mathematica*. In the *Pharmacopœia Parisiensis*, the *Album Græcum præparatum* is made first by drying it, then levigating it on a Marble, and forming it into Troches, with Water of Shepherds-purse. Whoever considers the hot and active Nature of Dogs, must readily perceive, that their Excrements are more hot and acrid than those of most other Animals, especially of the domestic Kind: Hence its Effects seem to be produced by a stimulating, corroding, resolvent, and aperient Acrimony. To this acrimonious Quality all the above-mentioned Effects are owing; as also its Efficacy in internal Hæmorrhages, in which Resolvents often prove useful, by restoring a free Circulation to the Blood, by whose Stagnation spasmodic Contractions, and the Effusions of Blood depending on them, are produced. Concerning the Effects of this Medicine in Dysenteries, we cannot help entertaining a Doubt, since no one has as yet dared to affirm, that acrid Substances are proper in this Case: But when *Album Græcum* is exhibited with Sugar and Milk, in the room of which may be substituted some Oil or Fat, and mild Broth, it can no longer exert its acrid Qualities; but, if exhibited in a moderate Dose, is gently saponaceous and abstergent, and consequently proper to dispose the acrid Water, which irritates the Intestines, to a Discharge of Blood, for Evacuation. And perhaps such an oleous Medicine, impregnated with *Album Græcum*, received into the Vessels, may, by resolving Obstructions, and restoring a free Circulation to the Blood, be said to cure that Species of Hæmorrhage which happens in a Dysentery. But we cannot admit, that *Album Græcum* is proper to be exhibited in every Species of Dysentery; when, for Instance, the Blood is too much resolved

by

by an Admixture of ſomething acrid and putrid; ſince, in this Caſe, even the moſt gentle Stimulus does Harm. The acrid and corroſive Quality of Dogs Excrements is ſufficiently atteſted by thoſe who, often treading among them, have the Soles of their Shoes ſooner deſtroy'd than thoſe who walk in Ground ſtain'd with the Dung of Cattle. From what has been ſaid, I think we may comprehend with what View ſome order *Album Græcum* to be put in Draughts, intended to promote the Eruption of the Small-pox; becauſe every acrid ſtimulating Subſtance generally produces that Effect. *Philoſop. Tranſ.* We do not aſſert, that this Medicine is proper in all Caſes of this Nature; our Intention is only to point out by what Quality theſe Excrements promote the Eruption of the Small-pox. Powder of *Album Græcum* is, for the ſame Reaſon that other acrid Subſtances are uſed, applied to cleanſe and abſterge Ulcers, become foul and ſordid by the prepoſterous and unſkilful Uſe of pinguious Subſtances. In conſequence of the powerfully reſolvent Quality of *Album Græcum*, a Spoonful of it, diluted in Wine or Brandy, was the Secret of a certain Soldier againſt quartan Fevers. *Ephemerides Germanicæ Curioſæ, Decad.* 2. *a.* 5. We ſee no Reaſon why *Album Græcum* ſhould be recommended as a Specific in Quinſeys, unleſs becauſe Dogs are frequently afflicted with this Diſorder; or becauſe, in a Quinſey, the Patients breathe with open Mouths, and, like Dogs out of Breath, hang out their Tongues. The *Oleum Catellorum*, in the *Pharmacopœia Pariſienſis*, is Oil of Olives, in which very young Whelps are boiled to a Diſſolution of the Compages of their Bones; and in which, after it is ſtrain'd and expreſs'd, the Tops of Origanum, Penyroyal, Mother of Thyme, St. John's-wort, and Marjoram, are put, and the Whole is expoſed to the Sun. *Foreſtus, Obſ. Med. L.* 10. *Obſ.* 82. informs us, that, in paralytic Caſes, he has known happy Effects produced by the Oil in which live Whelps, without any other Ingredient, have been boiled. This Medicine is intended for external Uſe, in Caſes of Contractions, and in Caſes where Rigidity is to be relax'd, or Obſtructions opened. In the *Pharmacopœia Bruxellenſis*, and that of *Lemery*, young Whelps are order'd to be boil'd in Oil, with Earth-worms; and to the Liquor, when ſtrain'd off, pure Turpentine, and Spirit of Wine, are added; by which means the Medicine is render'd more reſolvent, corroborative, nervous, and proper for diſcuſſing Tumors, and removing Rheumatiſms. *Konigius* alſo highly recommends it in violent Pains ariſing from Gun-ſhot Wounds. The *Unguentum de Catello*, in *Lemery's Pharmacopœia*, beſides the Whelp and the Earth-worms, has alſo for its Ingredients emollient and aromatic Vegetables, which are boil'd in mild Oils, and *Spaniſh* Wine, to a Conſumption of the ſuperfluous Humidity; after which the Oil is ſtrain'd off, and a proper Quantity of Stags Marrow, and Goats Suet, is added.

This Medicine is recommended for external Uſe, as a Reſolvent; and in Caſes where the Intention is to corroborate the Nerves. The *Balſamum e Catulis compoſitus*, in *Schroder's Pharmacopœia*, is prepared of live Whelps, ſuffocated in White-wine, and boil'd to a Balſam, with nervous Herbs, Oils, and Reſins. This Medicine is recommended againſt Contractions of the Limbs, and Sciatic and Arthritic Pains.

CANIS CARCHARIAS, Offic. Charlt. Piſ. 7. Aldrov. de Piſc. 383. Bellon. de Aquat. 60. *Canis Carcharias ſeu Lamia*, Geſn. de Aquat. 173. Raii Icht. 47. Ejuſd. Synop. Piſc. 18. *Canis Ariſtoteli ſeu Carcharias*, Jonſ. de Piſc. 13. *Canis Galeus*, Salv. de Aquat. 132. *Lamia*, Rondel. de Piſc. 1. 390. THE WHITE SHARK.

This Animal is found both in the *Mediterranean*, and in the main Ocean. The Teeth of the Serpent, and alſo of this Fiſh, when petrified, are the *Gloſſopetræ* of the Shops. Its Teeth are eſteem'd good againſt Poiſons. Women hang them about the Necks of Children, becauſe they are commonly thought to aſſiſt Dentition, and prevent Frights. *Rondeletius.* The *Gloſſopetræ* are by ſome thought to poſſeſs an alexipharmac Quality. *Dale.*

CANITIES, πολιότης, πολίωσις, Greyneſs of the Hairs; which is either ordinary, as in old Age; or extraordinary, as in Youth.

CANNA. The ſame as ARUNDO.

CANNA FISTULA. The ſame as CASSIA FISTULA. *Rieger.*

CANNA INDICA. The ſame with CANNACORUS. *Rieger.*

CANNA SEPIARIA. The ſame as the *Arundo vulgaris*. See ARUNDO.

CANNABINA, *Baſtard-hemp.*

The Characters are:

It is a Genus, whoſe Flowers have no Petals, but conſiſt of a Number of Threads, and are barren; for the Seed is produced on Female Plants, which have no viſible Flower, but have membranaceous Seed-veſſels, which incloſe triangular Seeds, which are, for the moſt part, oblong. *Miller's Dict.*

Miller, and *Boerhaave, Ind. Alt. Plantarum, Vol.* 2. *p.* 105. enumerate two Species of this Plant: The *Cannabina Cretica floriferа*: And the *Cannabina Cretica fructiferа.*

But *Boerhaave*, in the ſame Work, *Vol.* 1. *p.* 159. ſpecifies ſome other Plants under the Name of *Cannabina.*

The Characters are:

It has a hollow upright Galea, with a Beard divided into three Parts, the middle Segment being the largeſt. The Flowers grow in Whorles, and reſemble thoſe of the Lamium. The Flower-cups are large, aculeated, and cloſely ſet together, as in the Clinopodium; the Segments of the Cup, or Calyx, ending in ſharp Prickles or Aculei; the Leaves reſemble thoſe of Hemp.

Of this he enumerates three Species.

1. *Cannabina flore purpuraſcente, Galeopſis procerior, caliculis aculeatis, flore purpuraſcente*, T. 185. *Urtica aculeata, foliis ſerratis*, C. B. Pin. 232. *Cannabis ſylveſtris quorumdam, urticæ inerti ſimilis*, J. B. 3. App. 854. *Lamium annuum procerius, urticæ folio, verticillis ſpinoſis*, M. H. 3. 386. *a.*

2. *Cannabina, flore albo. Galeopſis procerior, caliculis aculeatis, floribus candidis*, T. 185. *Urtica aculeata, foliis ſerratis, floribus candidis*, C. B. Pin. 232. *a.*

3. *Cannabina flore magno luteo, labiis purpureis. Galeopſis anguſtifolia, flore variegato*, T. 185. *Cannabis ſpuria anguſtifolia, variegato flore, Polonica*, Barrell. Ic. 1158. Obſ. 241. *Lamium annuum procerius, urticæ foliis, flore luteo amplo, labio purpureo*, M. H. 3. 386. *Lamium cannabinum aculeatum, flore ſpecioſo luteo, labiis purpureis*, Plukn. Ph. 41. 4. *a. Boerhaave's Index alter Plantarum, Vol.* 1. *p.* 159.

CANNABIS, Offic. Chab. 478. Ger. 512. *Cannabis ſativa*, MANURED HEMP. Park. 597. C. B. 320. Hiſt. Oxon. 3. 433. Raii Hiſt. 1. 158. Synop. 53. Boerh. Ind. A. 2. 104. Tourn. Inſt. 535. Buxb. 53. *Cannabis mas & fœmina*, J. B. 3. 447. Ger. Emac. 708. HEMP. *Dale.*

Hemp is a very uſeful Plant for making Cordage, and all Things of that Kind. It bears a Leaf much like the Aſh, but of an ungrateful Smell, on a long empty Stalk. The Seed is round, which, if eaten too freely, cauſes Impotence. The Juice of the green Plant, inſtil'd into the Ears, mitigates the Pains therein. *Dioſcorides, Lib.* 3. *Cap.* 165.

Wild Hemp ſhoots forth twiggy Stalks like the Althæa, but blacker, rougher, and ſmaller, a Cubit high. The Leaves are like thoſe of the common or cultivated Hemp, only rougher and blacker. The Flowers are reddiſh, and like thoſe of the Lychnis; and the Seed and Roots are like thoſe of the Althæa.

The Root boiled, and applied by way of Cataplaſm, mitigates Inflammations, diſcuſſes Tumors, and diſſolves tophaceous Concretions about the Joints. The Bark thereof is alſo twiſted into Cordage. *Dioſcorides, Lib.* 3. *Cap.* 166.

The Stalks of *Hemp* grow to be five or ſix Foot high, angular, and covered with a ſtrong tough Bark; and cloath'd with many digitated or finger'd Leaves, each Leaf compoſed of five, ſix, or ſeven Parts, long and narrow, ſharp-pointed, and ſerrated about the Edges, the middlemoſt being longeſt, ſet together upon one long Foot-ſtalk; they are green above, and hoary underneath, and rough in handling. The Flowers grow toward the Tops of the Stalk, in that they call the Male, in Bunches, ſmall and ſtaminous, which periſh without bringing any Seed; that being produced by the Female only, without any previous Flowers.

The Seed of *Hemp*, which is the only Part uſed in Phyſic, being boiled in Milk till it cracks, is accounted good for old Coughs, and a Specific to cure the Jaundice. It has been formerly believed to render Perſons unactive in Venereal Affairs; but that is not at all likely, for it not only cauſes Hens to lay Eggs in Plenty, if given moderately; but the famous *Bangue*, ſo much uſed by the *Perſians* and *Indians* to promote Venery, is a Species of Hemp. *Miller's Bot. Off.*

CANNACORUS *latifolius vulgaris*, Pit. Tournefort. *Arundo Indica latifolia*, C. B. J. B. *Harundo florida*, Ger. *Calamacorus*, Lob. *Arundo Indica florida*, Lob. *Cannacorus quorundam Canna Indica*, Geſ. Hor. Cluſ. Hiſp. *Cui & Flos Cancri nonnullis*, Camp. THE INDIAN REED.

This Plant ſends forth ſeveral Stalks, about four Feet in Height, of a Finger's Thickneſs, and jointed at Intervals like other Reeds. The Leaves are broad, large, fibrous, pointed at their Extremity, of a pale-green Colour, and of an herbaceous Taſte, mix'd with a little Acrimony. The Flower grows at the Top, and is ſomewhat like that of the *Gladiolus*, being of a beautiful red Colour. This Flower is a Funnel, divided by deep Jaggs into ſix or ſeven unequal Parts; ſo that, before it is thoroughly open, it ſeems to repreſent the Parts of a Crab, whence it is called Crab-flower. After the Flower ſucceeds a membranaceous Fruit, rounded at three Corners, of the Size of that of the Ricinus, and divided into three Cells, containing ſpherical Seeds, of a dark or blackiſh Colour. The Root is full of Joints, and ſurrounded with big Fibres. This Plant grows only in warm Places, the Cold being very injurious to it. It is ſuppoſed, that the Leaves which are wrapp'd about the Gum

Gum Elemi, belong to this Reed. Its Root is deterſive and aperitive. *Lemery des Drogues.*

Miller takes Notice of five Species of Cannacorus: And there is a ſixth. This is the ſame as the CURCUMA, which ſee.

CANNI. A Sort of Fiſh uſually fry'd, condemn'd by *Oribaſius, Med. Coll. Lib.* 2. *Cap.* 58. as unfriendly to the Stomach, ſubject to fluctuate, and eaſily corrupted.

CANNULA. A Diminutive of CANNA; alſo a Name for ſeveral Inſtruments in Surgery, of various Figures, according to the different Uſes made of them in Operations. A Cannula is a Tube made of different Metals, principally Silver and Lead, but ſometimes of Iron. They are introduced into hollow Ulcers, in order to facilitate a Diſcharge of Pus, or any other Subſtance; or into Wounds, either accidental or artificial, of the large Cavities, as the Thorax, or Abdomen. They are uſed in the Operation of Bronchotomy; and, by ſome, after cutting for the Stone, as a Drain for the Urine. Other Cannulas are uſed for introducing Cauteries, either actual or potential, into hollow Parts, in order to guard the Parts, adjacent to that intended to be cauterized, from Injury. They are of various Figures, as may be ſeen, Table 23.

CANON, κανών. A Canon or Rule, according to which any thing is made. *Paracelſus*, when he oppoſes the *Canons of Phyſicians* to his Arcana, or ſecret Remedies, ſeems to mean by *Canons* a Medicinal Method; and therefore, *de Caducis, par.* 4. he ſays, that a *canonical* Caſe does not take place in all Diſtempers. Purges, Syrups, and Paregorics, according to him, are *canonical* Remedies.

CANONIAI, κανονίαι, in *Hippocrates, Lib. de Aere, Locis & Aquis*, ſignifies thoſe who have ſtrait and not prominent Bellies, but diſpoſed, as it were, by a *Canon* or ſtrait Rule; or as *Galen*, in his *Exegeſis*, explains the Word, ὀρθοὶ καὶ πεσσοσαλμένοι τὰς γαστέρας, "ſtrait, and of contracted Bellies." To theſe are oppoſed corpulent Perſons, who, according to *Hippocrates*, never increaſe in Height, or become *canoniai*; but are augmented in Bulk or Thickneſs. *Canoniai*, κανονίαι, then, ſeem to be ſuch as are ſtrait, and tall of Stature, and are fit to be a *Canon* or Standard for the reſt.

CANOPICON, κανοπικόν. A Name in *Dioſcorides, Lib.* 4. *Cap.* 166. for the *Pityuſa*, a Sort of Spurge.

CANOPITE. The Name of a Collyrium for the Eyes in *Celſus, Lib.* 6. *Cap.* 6.

CANOPUM, in *P. Ægineta, Lib.* 7. *Cap.* 3. & 5. ſignifies both the Flower and the Bark of the Elder-tree.

CANSCHENA POU. A Species of MANDARU, which ſee.

CANSJAVA. See BANGUE.

CANTABRICA. An Herb, diſcover'd, as *Pliny* ſays, *Lib.* 25. *Cap.* 8. in the Time of *Auguſtus*, in the Country of the *Cantabri* in *Spain*, whence it takes its Name.

CANTABRICA, *Convolvulus minimus*, Offic. Mont. Ind. 39. *Convolvulus minimus, Spicæ foliis*, Ger. 713. Emac. 862. Mer. Pin. 28. Phyt. Brit. 30. *Convolvulus ſpicæ foliis*, Park. Theat. 172. Raii Hiſt. 1. 726. *Convolvulus Linariæ folio*, C. B. Pin. 295. Hiſt. Oxon. 2. 17. *Convolvulus Linariæ folio, aſſurgens, & humilior*, Tourn. Inſt. 83. Boerh. Ind. A. 247. *Volvulus terreſtris Dalechampii*, J. B. 2. 160. LAVENDER-LEAVED BIND-WEED.

It grows wild in the Fields, flowers in *June*, and is by ſome recommended as good againſt Worms.

CANTABRUM, in *Cælius Aurelianus, Acut. Morb. Lib.* 3. *Cap.* 8. and other Places, ſignifies *Bran.*

CANTACON, Garden-ſaffron. *Rulandus.*

CANTARELLI. A kind of Worms, called alſo *Vermes Maiales*, "May-worms," which, being macerated in Oil, are ſaid to endue it with the Virtues of Oil of Scorpions. They are reckoned among the Species of Beetles, and are diſtinguiſh'd by the Epithet of *unctuous*, becauſe, when they are touched, they emit an unctuous, acrimonious, and ſtrong-ſcented Liquor, which, as *Glauber* ſays, provokes Vomiting, and purges by Stool and Urine. *Caſtellus.*

CANTERBURY WATERS.

About twelve Years ago, a *Mineral Water* was accidentally diſcovered here. In digging the Ground, they firſt met with a fat, black Mould, reaching three Foot deep, and gradually changing into another ſort of Earth, very fat, and like Butter. This ſecond Layer was too Foot thick, the Colour yellow, ſomething mixed, its Odour ſtrong and mineral; and a Piece of it being for ſome time expoſed to the Sun, it ſmelt like burning Sulphur. After this they found a Quick-ſand, of a darker Colour than the firſt Earth, mixed with ſeveral little Stones, and the Smell ſtill ſtronger that before. Two Foot farther, under the Quick-ſand, a hard Rock appeared, out of which Water guſhed with ſome Violence. They dug five Wells, about ſeven Foot Diſtance from each other; one about eight or nine Foot deep from its Surface, and twelve from the Surface of the Ground about it, and reaching the Rock; the other is not ſo deep by two Foot, and only touches the Sand. This laſt is ſomething ſtronger of the Sulphur; but the other is ſtronger of the *Mineral Spirit* and *Irony Parts.*

Two Drams of the ſecond Layer of Earth, found in Digging, being put into four Ounces of *Spirit of Vinegar*, there preſently aroſe a conſiderable Ebullition; and, ſoon after, the Spirit was tinged with a yellow-browniſh Colour, which ſuffered no Alteration with the Infuſion of Logwood, nor with Galls; but, with Oil of Tartar *per deliquium*, it turned greeniſh; and, with the Infuſion of *Lignum Nephriticum*, of a pale Red.

The Water, taken up at the Spring, is extremely limpid, but grows ſomething whitiſh in a Quarter of an Hour, and in half an Hour the Spirit is loſt; and the *Mineral* hangs firſt on the Sides of the Glaſs, and then falls gradually to the Bottom. It will not keep quite ſo well as the *Spaw* or *Tunbridge* Water. Its Taſte is harſh and auſtere, the Smell ferruginous and ſtrong, ſomething upon the Sulphur; People ſay it ſmells like Gunpowder. It will make the Root of the Tongue of the Drinker blackiſh. Linen waſhed in it turns yellow. It will not lather with Soap. The Glaſſes the Water is dipped with grow yellow, which no Scouring can take off, and are apt to fly. In froſty and cold Weather 'tis ſo warm as to melt Ice and Snow; in other Seaſons 'tis cold, tho' not ſo cold as ſome Spring-waters are.

The Weight of this Water varies greatly, according to the Seaſons and Weather. In *May* 1704. it weighed three Grains lighter than common Water, in the Quantity of a Pound. In the Spring 1705. it was equal in Weight to common Water; but was ſtill heavier in the *Auguſt* following, becauſe of the exceeding dry Weather that Summer. But in general, about Midſummer, if the Weather is no ways extraordinary, 'tis nearly equal in Weight to common Water. A ſingle Grain of good *Galls* will inſtantly turn a Pint and a half of this Water to a deep Red; *Syrup of Violets* turns it of a Graſs-green; with the *Infuſion of Brazil*, it gives a deep lively Blue; with that of *Lignum Nephriticum*, firſt a light Green, then a light Yellow; with the *Infuſion of Logwood*, a blue Black; with that of *Fuſtic-wood*, a duſky Yellow; with the *Flowers of Pomegranate*, a fair Violet; with *Tea-leaves*, a fine purpliſh Blue; with good *Nantz Brandy*, an elegant Sky-colour. It inſtantly turns a *Solution of Sugar of Lead* milky; and a *Solution of Sublimate* alſo in ſome ſmall time. *Oil of Tartar per deliquium*, and *Spirit of Vitriol*, make no ſenſible Alteration.

In calm Weather, in Winter eſpecially, a thick *oily Film* covers the Surface of theſe Waters with as great a Variety of Colours as the Rain-bow. A Spoonful of this oily Matter, drank, has the Effect of, and compoſes as much to Sleep as, a moderate Doſe of *Opium*. Some of this Scum, being dried by Evaporation, taſted very ſat, and felt ſo between the Fingers. Some of the Powder being caſt upon a red-hot Iron, moſt of it immediately burnt away with ſome Sparkling, and what remained was of the Colour of Ruſt of Iron, and taſted partly ſtyptic and earthy, and partly ſaltiſh.

The *Water* itſelf, being gently evaporated, yields a yellowiſh Sediment, more or leſs according to the Seaſons. Laſt Spring a Quart yielded ſix Grains of it; but, in *September* following, the ſame Quantity afforded nine Grains; whereas a Pound of *Tunbridge-water* gave but a ſingle Grain of Sediment to Mr. *Boyle*, as appears by his *Memoirs of Mineral Waters.* This Sediment, being boiled in common Water, made a ſtrong *Lixivium*, with which *Acids* cauſed no ſenſible Fermentation; but *Syrup of Violets* turned it green. This *Lixivium*, being evaporated, yielded a fat ſulphureous Salt, which would not coagulate into Cryſtals. I can get but three or four Grains of it out of ten Grains of Sediment; but, from the Colour and Taſte of the *Lixivium*, I ſuſpect that there is a larger Proportion of ſaline Particles, which, I conceive, being volatile, evaporate with the Water.

As for *Medicinal Virtue*; from the many and wonderful Cures they perform, I believe them one of the moſt excellent Waters of this kind yet diſcovered in *England*. The *little Well* is very uſeful in Diſeaſes of the Breaſt, as Aſthmas, Coughs, Rheums, and Catarrhs. It has cured ſeveral that were given over in Conſumptions of the Lungs. Moſt Diſorders of the Stomach are cured by this *Water*. It ſeldom fails in Rheumatic and Gouty Pains of the Limbs or other Parts; in the Scurvy, Melancholy, Jaundice, Vapours, all ſorts of Stoppages, Scabs, Itch, &c. But in the Gravel, Colic, and Green-ſickneſs, 'tis a true Specific, as alſo in inward Ulcers, if not too far gone.

A *Potter* in *Bolton*, who had ſpent his Subſtance on Doctors, and was laſt Spring diſcharged out of St. *Thomas's* Hoſpital as an *Incurable*, was cured of an Ulcer in the Bladder this Summer, by drinking of this Water for three Months together. In Agues 'tis beyond the Bark: I have ſeen ſome rebellious ones, that could not be removed by the Bark, perfectly cured by this Water; and ſome Conſtitutions, quite worn out by frequent Relapſes of this Diſtemper, reſtored. This is alſo remarkable, that it agrees both with old, decayed, and weak Conſtitutions. The Water ſits pleaſantly upon the Stomach, works off by

Urine

Urine very briſkly, cauſes a good Appetite, chears the Spirits, and procures Sleep. 'Tis not binding, as ſome other Chalybeats are, but keeps the Body open in moſt People; and upon ſome it brings now-and-then a gentle Looſeneſs, which carries off the Diſtemper. For theſe four Years I have preſcribed it to many ſorts of People every Seaſon, and I could never obſerve any Inconvenience, or ill Symptom, ariſe from the drinking of it. Dr. *Scipio des Moulins*, in *Philoſ. Tranſ.*

CANTERIUM, CANTHERIUS, κανθὸς, καντήριον. A Croſs-beam between two Poſts, in the Machine contrived by *Hippocrates*, *Lib.* περὶ ἄρθρων, for replacing the diſlocated *Os Humeri*. *Gorræus*, *Caſtellus*. See AMBE.

CANTHARIDES. Offic. Schrod. 5. 339. Mouff. Inſect. 144. Charl. Exer. 47. *Cantharis major*, Jonſ. de Inſect. 76. Aldrov. de Inſect. 476. *Cantharides vulgares officinarum*, Raii Inſect. 101. SPANISH FLIES. *Dale*.

Cantharides are Inſects of the flying Kind, and a Species of ſhining Beetle, of a golden, azure, or greeniſh Colour, and of a fetid Smell. Theſe Flies are found not only on Aſh-trees, Roſes, Elders, Walnut-trees, Privets, and other Plants, but alſo among the Corn, which they corrode and deſtroy. They are alſo moſt numerous in the warmer Climates, ſuch as *Spain*, *Italy*, and *France*; but, in *Germany*, they are rarely found in great Numbers. The Vulgar fooliſhly believe, that in their Country they only become plentiful once in ſeven Years; for ſometimes larger Swarms of them appear, and ſeem to have Impulſe of the Air. Their Appearance is attended with been drawn from ſome other Quarter of the World by the a very remarkable and ungrateful Stench. *Ephemerides Germanicæ curioſæ*, *Decad.* 1. *a.* 4. *o.* 186. In Bulkand Colour they ſometimes differ very conſiderably from each other. *Mouffeti Inſectorum Theatrum*. The common *Cantharides* of the Shops are about three Fourths of an Inch long, everywhere of a greeniſh Colour, and having *Antennæ* conſiſting of ſhort Articulations. *Raii Hiſtoria Inſectorum*. With reſpect to the Anatomy of this Inſect, the Curious may conſult the *Ephemerides Germanicæ curioſæ*, *Decad.* 2. *a.* 2. *o.* 20.

Powdered Cantharides, applied to the *Epidermis* or *Scarf-ſkin*, not only exulcerate it, but alſo frequently excite a Heat of Urine, Stranguries, plentiful Diſcharges of Urine, Thirſt, a Fever, and ſometimes a Piſſing of Blood, and a fetid cadaverous Breath. When uſed internally, they alſo excite all the above-mentioned Symptoms. But Authors have obſerved them to be in a ſingular manner prejudicial to the urinary Bladder. *Bartholini Hiſtoriæ Anatomicæ Cent.* 5. *Hiſt.* 21. A few Inſtances, among the many that might be given, will ſufficiently confirm the Truth of this. A Girl of ſix Years old, after being cured of an Incontinence of Urine, for a Fluxion and Pain of her Eyes, had a Veſicatory of Cantharides applied to the Nape of her Neck, by which a Diabetes, which put an End to her Life, was brought on. *Ephemerides Germanicæ curioſæ*, *Decad.* 2. *a.* 7. *o.* 86. Another Inſtance we have in the Caſe of *Braccus* of *Padua*, who, by the Advice of *Montagnana*, then a celebrated Phyſician, applying Cantharides to his Knees, voided more than five Pounds of Blood by way of Urine. *Jo. Lindeſtolpe de Venenis*. A certain Quack gave two Drams of Cantharides, with an Addition of the Sea Scinck, and Satyrion-root, to a certain Man of Diſtinction, as an aphrodiſiac Medicine, which proved fatal to him; for, beſides an inſatiable Deſire of Venery, a Tumor appeared in the Scrotum; and the ſeminal Matter being exhauſted, Blood was diſcharged in its ſtead, and the Patient died on the eleventh Day after the Exhibition of the Medicine. *Ephemerides Germanicæ curioſæ*, *Decad.* 1. *a.* 9. *o.* 148. According to *Lanzonius*, *Paré* informs us, that a Courtezan treated a young Man with a ſplendid Supper, dreſs'd with Sauces in which Powder of Cantharides had been ſprinkled. But, next Day, her unfortunate Gueſt, diſcharging Blood from his Anus, and his perpetually erected Penis, died in ſpite of all the Medicines that could be exhibited for his Relief. A certain Man, upon uſing Powder of Cantharides mixed with Tobacco, was forthwith ſeized with a violent Pain of the Head, and a Diſcharge of bloody Urine. According to *Pliny*, in the fourth Chapter of his twenty-ninth Book, *Coſſinus*, a *Roman* Knight, and noted for the Friendſhip which ſubſiſted between him and *Nero*, was ſeized with the Ring-worm; but, unluckily, a Phyſician, called from *Egypt* for the Cure of his Diſorder, by *Cæſar*, killed him by a Draught prepared of Cantharides. *Langius* ſuſpects, that *Coſſinus* was rather killed by the external Application of Cantharides, which, by their cauſtic Quality, extirpate Ring-worms, Scurfs, Leproſies, hard and callous Excreſcences on the Soles of the Feet, and Palms of the Hands, than by the internal Uſe of Cantharides, which can contribute nothing to the Cure of the Ring-worm. *Langius*, *Lib.* 1. *Epiſt.* 47. *Fabricius ab Aquapendente*, in his *Opera Chirurgica*, informs us, that he ſaw a Suppreſſion of Urine brought on by the Application of Cantharides to the Head; not becauſe theſe Inſects have of themſelves a Quality or Power by which they ſuppreſs the Urine, but becauſe they promote ſo plentiful a Secretion of it, that the urinary Bladder, being too much diſtended by it, loſes its expulſive Faculty, by which means an accidental Suppreſſion of Urine is produced. *Hildanus*, *Obſ. Med. Vol.* 1. informs us, that, by the Application of a Cataplaſm made of Cantharides to a ſwelled Knee, beſides other terrible Symptoms, a Pain of the Loins, Kidneys, and whole Abdomen, was excited, with ſo great a Heat of Urine, that the Patient could not, without violent Pain and Shrieks, diſcharge one Drop of Urine, which, at the ſame time, was evacuated Drop by Drop, and mixed with Blood. But, which is ſtill more ſurpriſing, *Boyle* informs us, that Authors of unqueſtionable Veracity have affirmed, that ſome particular Perſons, by only holding dry'd Cantharides in their Hands, have felt a conſiderable Pain about the Necks of their Bladders, and had ſome of the other Parts, ſerving for the Secretion of the Urine, remarkably injured. Either the Hands muſt have been warm, and Bliſters or Exulcerations raiſed on them, before we can ſuppoſe that any of the ſubtile Particles of the Cantharides could have penetrated ſo far as to injure the urinary Ducts; or, which is more probable, their Effluvia muſt have entered the Mouth in Reſpiration, and, being ſwallowed with the Saliva, have exerted their Virtues within the Body. Hence *Rammazini*, in his *Opera Medica & Phyſiologica*, adviſes Apothecaries, when pounding theſe Inſects, to take care, that the flying Duſt does not enter their Mouths; and previouſly, or at the very Time they are at work, to guard themſelves by liberal Draughts of an Emulſion of Melon-ſeeds, of Whey, or of Milk, in order to prevent or mitigate the Heat of Urine commonly produced on ſuch Occaſions. *Caldera*, in his *Illuſtrationes & Obſervationes practicæ*, *T.* 2. tells us, that a certain Druggiſt of *Carmona*, happening, when at *Seville*, to carry ſome Cantharides under the Breaſt of his Coat, was forthwith ſeized with a violent Heat of Urine, and a Piſſing of Blood. More Inſtances of this kind may be ſeen in *Santanellus*'s *Lucubrationes Phyſico-mechanicæ*. But the judicious Dr. *Freind* thinks Relations of this kind entirely chimerical, and tells us, that, in the ſixteenth Century, ſo fooliſh and ill-grounded a Dread of Cantharides prevailed, that *Adolphus Occo*, who flouriſhed about the Year 1560. would not conſent to their being carried in the Pocket, upon hearing that a certain Perſon, who had done ſo, diſcharged Blood inſtead of Urine. From what has been ſaid it appears, that Cantharides are poſſeſſed of a cauſtic Quality, which corrodes the Fibres, colliquates and putrefies the Humours, and is of ſo highly volatile a Nature, that a very ſmall Quantity of it exerts its Influence. Now, as every Subſtance, which entering the Body in a ſmall Quantity, ſuddenly and vehemently attacks both the internal and external nervous Parts, and, by its active and penetrating Principle, ſoon produces great and dangerous Changes, is generally called a Poiſon; ſo 'tis obvious, that, with reſpect to our Conſtitutions, Cantharides juſtly come under that Denomination. *Hoffman de Veſicatoriorum præſtanti in Medicina Uſu*, and *Caſpar Hoffman*, in his Work *De Medicamentis officinalibus*, calls them "a vio-"lent ſeptic Poiſon, highly deſtructive of the urinary Parts." The learned *Stenzelius*, in his *Toxicologia*, *Lib.* 1. informs us, "That Men of profligate and wicked Characters prepare what "he calls *Venenum Temporaneum*, or a temporary Poiſon, of the "Powder of Cantharides, which they mix with Honey, and "form into Troches or Electuaries, by the frequent Exhibition "of which various Diſorders are brought on, and, at laſt, the "Death of the miſerable Patient is procured. Others," ſays the ſame Author, "produce the like terrible and fatal Effects by "Pills, which, as *Benedictus Sinibaldus* informs us, from "*Fallopius*, they prepare of pounded Cantharides, in Conjun-"ction with Pepper, Cinnamon, and Cloves, as if the acrid "Poiſon of Cantharides were not ſufficient of itſelf. Theſe "Pills they exhibit ſeveral times. Of the like Nature I take "the *Morſuli Pappenheimiani* to be, which have Cantharides "for an Ingredient; and by which, Convulſions of the Penis, "Diſcharges of bloody Urine, and other Diſorders, are brought "on, as *Paulus Ammanus* informs us in his *Irenicum*." Cantharides are claſs'd among thoſe Poiſons, to which Vomits, diluting aqueous Liquors, emollient oleous Subſtances, and Acids reſiſting Putrefaction, are oppoſed. *Boerhaav. Inſtit. Med.* 1144. "A certain Man had Cantharides exhibited to him, and was "forthwith ſeized with the following Symptoms: All the Parts "from his Mouth to his Bladder, to him, ſeem'd to be corroded; "his Breath ſmell'd like the Roſin of the Cedar, or ſome ſuch "Subſtance; the Præcordia on the Right Side were inflamed; "he diſcharged his Urine with Difficulty, and a Mixture of "Blood was now-and-then evacuated along with it. By Stool "he evacuated juſt ſuch Dregs as Dyſenteric Patients do; he "loath'd his Food, became ſubject to fainting Fits, was ſeiz'd "with ſo violent a Vertigo, that he dropp'd down, and at laſt "loſt the Uſe of his Reaſon in ſome meaſure. This Patient "had Oil of ſweet Almonds, newly expreſs'd, and mix'd with "Butter, exhibited, with an Intention to vomit him: Soon "after Cremor of Ptiſan, and a Decoction of Mallows, Lin-"ſeed, Fenugreek, and Marſhmallow-roots, were injected by "way of Clyſter; and an Emulſion of the Four cold Seeds "was exhibited in Milk. Soon after, upon the Exhibition of "Water

" Water and Honey, and fat Broth, prepared with Fowls, " the Patient became better." *Foreſtus*, *Obſ. Med. L.* 30. *Obſ.* 6. *Wedelius*, in his Book *de Medicamentorum Compoſitione extemporanea*, informs us, " That he knew a certain Man, " who, in order to excite a Stimulus to Venery, uſed an Infu- " ſion of Cantharides in Chocolate; in conſequence of which " he was afflicted with an intolerable Dyſury, and a violent " Heat and Pain of his Penis; but by liberal Draughts of new " Milk his Diſorder, with all its Symptoms, were removed." *Jo. Lindeſtolpe de Venenis* informs us, " That nothing is more " effectual againſt Cantharides, whether drunk in any Vehicle, " or convey'd into the Body, in conſequence of the Applica- " tion of a Veſicatory, and by this means lacerating the tender " Neck of the Bladder, and conſequently a Heat of Urine, " and the Priapiſm produced by it, than ſaline Acids of an op- " poſite Nature, drunk in a proper Quantity, and alſo applied " externally. The beſt of theſe, for external Uſe, is warm " Wine-vinegar; and, in the Caſe of a Priapiſm, the Lees of " generous Wine. But, for internal Uſe, ſimple Oxymel is " the moſt proper, as I myſelf, ſays he, have found from Ex- " perience." By inadvertently eating a Paſte, made up with Cantharides, for a Veſicatory, violent Pains were excited, an Excoriation of the Tongue and Fauces induced, and the Patient was hereby reduced to the moſt imminent Danger. By immediately exhibiting a large Quantity of Milk, and proper refrigerating Waters, the Patient was forthwith vomited. Violent Pains were, in the mean time, excited about the Region of the Bladder, in conſequence of the Cantharides corroding that Organ. For removing theſe Pains refrigerating Clyſters ſeem'd moſt proper: At laſt a proper Quantity of the Theriaca, exhibited with Sorrel-water, procured Sleep. After which the racking Pains continued the whole Night, together with a plentiful Diſcharge of Blood inſtead of Urine; but by proper Anodynes, and the Uſe of refrigerating and cordial Syrups and Emulſions, the Patient was freed from the Tyranny of his Diſorder, and reſtored to perfect Health. *Bartholin. Hiſtoriæ Anatomicæ Gent.* 3. *Hiſt.* 16. A certain Perſon, upon taking eight or nine Cantharides in a Cheeſe-cake, was afflicted with a Heat of Urine, which was mixed with Blood, with violent Pains in his Back, and a burning Heat in his Stomach; but was cured by proper Doſes of the Powder of the Seeds of Biſhops-weed, and Sal Prunellæ, together with Emulſions, and Frogs-ſpawn Water. *Philoſoph. Tranſ. abridged*, *Vol.* 5. A certain Lady of Diſtinction, by the Application of a Veſicatory of Cantharides to the Nape of her Neck, was ſeized with an Inflammation of her Bladder, a Heat of Urine, and at laſt with a Diſcharge of Blood inſtead of Urine; all which Symptoms were removed, and the Patient reſtored, by Emulſions of the Seeds of Fennel, Mallows, and ſweet Almonds. *Ephemerides Germanicæ curioſæ*, *Decad.* 1. *a.* 2. *o.* 105. A certain Phyſician, intending to make Trial of the Effects of an Aphrodiſiacal Electuary, which contained Cantharides, by taking about the Bulk of a Cheſnut of it, was firſt ſeized with a Heat in his Penis, and afterwards with a continual Inclination to make Water, but with the moſt violent and ſcarce tolerable Pain. His Symptoms were, however, removed by a Potion made up with Turpentine, Diacodium, and Syrup of Marſhmallows. *Ephemerides Germanicæ curioſæ*, *Decad.* 2. *a.* 10. *Append.* Theſe Inſtances teach us what Meaſures are moſt proper to be taken in Caſes of a like Nature. The Method by which Cantharides act upon the human Body, or whence it is they derive their cauſtic Quality, are Points much controverted by the Learned. *Borrichius* obtained from one Ounce of Cantharides, put in a Glaſs Retort, increaſing the Fire gradually, a Dram and ſomewhat more of a thick, yellowiſh, fetid Oil, with a very ſmall Portion of a yellow Water, and of volatile urinous Salt about half a Dram. After he had obſerved, that this Oil and Salt, when rubbed on a Man's Hand, produced no Appearance of Bliſters, he had recourſe to the Microſcope; and becauſe, by its Aſſiſtance, he perceived that the Body and Legs of this Inſect were rough with a thouſand Spiculæ, he aſcribes their cauſtic Quality to the Entrance of theſe Spiculæ into the Cuticula or Scarf-ſkin, juſt as the Leaves of Nettles, which are armed with the like Spiculæ, produce a Senſation of Burning, when applied to the Hands. Hence he concludes, that the cauſtic Quality of Cantharides is not lodged in the Wings and Heads, but in their Legs, and the other Parts of their Bodies; and that, when the Bodies of theſe Inſects are powdered very ſmall before they are applied to the Cuticula, 'tis probable they operate more ſlowly for that very Reaſon, ſince their Spiculæ are, in a great meaſure, broken and deſtroy'd by the ſtrong Trituration. He imagines, that when Cantharides are either externally apply'd, or internally exhibited, theſe Spiculæ remaining in the Serum, and being conveyed to the urinary Ducts, by their Pungency produce thoſe Effects which are obſerved to ſucceed the Uſe of theſe Inſects. He thinks it not improbable, however, that the Force and Energy of theſe Spiculæ is augmented and increaſed by the volatile Salt contain'd in the Inſect. *Acta Medica & Philoſophica Hafnienſia*, *Vol.* 4. *Obſ.* 80. and *Vol.* 5. *Obſ.* 89. But it may be juſtly doubted, whether theſe Spiculæ do in reality account for the cauſtic Quality of Cantharides, ſince a great many other Inſects, which, by the Aſſiſtance of the Microſcope, are obſerved to be covered with like Spiculæ, are not, at the ſame time, found to be Eſcharotics. Beſides, ſome of the more mucilaginous Vegetables, ſuch as Squills, Garlick, and Onions, act as Veſicatories, when applied to the Cuticula. *Ephemerides Germanicæ curioſæ*, *Decad.* 1. *a.* 10. According to *Hoffman*, in his *Medicina Rationalis*, the Virtues of Cantharides are to be aſcribed to nothing but a certain ſubtile cauſtic Salt, by which they act upon our Bodies. *Lewenhoeck*, as he himſelf informs us, *Epiſt.* 70. obſerved ſeveral ſaline Concretions in theſe Inſects, when triturated, infuſed in Water, and dried in the Air. He alſo obſerved like ſaline Concretions in the Oil and Spirit of Cantharides, chymically extracted, diluted with an Addition of Water, and evaporated; as alſo in the Caput Mortuum, when lixiviated, Dr. *Cockburn* diſtilled eight Ounces of Cantharides from a Retort placed in a gentle Sand-heat; and, from that Quantity, obtained not only a volatile Salt, but alſo a Spirit and an Oil, two Ounces and five Drams being only left for a Caput Mortuum. He then ſeparated the Oil by the Aſſiſtance of Brick-duſt, and by that means obtained a Spirit which did not produce an Efferveſcence with Salt of Wormwood, Spirit of Hartſhorn, and Sal Ammoniac; but, when added to Spirit of Vitriol, a violent Efferveſcence was produced, and a ſtill more violent one with Spirit of Nitre; but the Efferveſcence was obſerved to be more gentle, and ſhorter, when Spirits of Hartſhorn and Sal Ammoniac were added to theſe Acids. Hence 'tis obvious, that the Spirit of Cantharides is a ſtronger Alcali than the laſt-mentioned Spirits. *Philoſophical Tranſactions abridged*, *Vol.* 3. According to *Vigani*, in his *Medulla Chymiæ*, Cantharides are obſerved to contain a larger Quantity of volatile Salt than any other Animal whatever. The Steam of that volatile urinous Spirit obtained from Cantharides by Diſtillation, happening to fly into the Noſe of a certain Perſon, who ſuddenly opened a Phial in which it was kept, in a few Hours after excited Pains in his Back, brought on a Diſcharge of bloody Urine, and affected his Head. This Spirit, when added to Blood as yet warm, rendered it ſo fluid, that no Fibres were any longer to be obſerved in it. *Ephemerides Germanicæ curioſæ*, *Decad.* 2. *a.* 1. If it ſhould be aſked why, or in what manner, Cantharides, whether internally exhibited, or externally applied, attack the urinary Bladder in a particular Manner, exulcerate that Organ, and bring on a Diſcharge of Blood inſtead of Urine; *Kircher*, in his *Mundus Subterraneus*, informs us, that it is the virulent, ſubtile, and ſpirituous Exhalation of the hot Salts contained in the Cantharides, and excited by Heat, which, by a wonderful kind of Magnetiſm, flows to the ſalſuginous Humour of the Bladder, as a Body analogous, and of a like Nature with itſelf. But, becauſe this Exhalation is of greater Efficacy than the ſalſuginous Humour of the Bladder, the former ſo taints and contaminates the latter, that a Corroſion enſues, by which means a Diſcharge of Blood muſt neceſſarily be produced. *Cæſalpinus*, in his *Speculum artis Medicæ Hippocraticum*, *Lib.* 3. *Cap.* 11. informs us, " That Cantha- " rides are conveyed to the Kidneys, becauſe, like Nitre, they " are eaſily diſſolved by the Urine; and becauſe, ſmelling like " the Roſin of the Cedar, they are attracted by the Kidneys." But *Lindeſtolpe*, in his Treatiſe *De Venenis*, ſeems to put this Matter in a clearer Light, when he tells us, that he does not think the Bladder affected, becauſe the cauſtic alcaline Salt of the Cantharides is more directly applied to it than to the other internal Parts, but becauſe the Cantharides being diſſolved in Water, following, like other Salts, the more aqueous Parts of the Blood, and at laſt being conveyed to the Bladder, eaſily excite a Pain in that highly nervous, and exquiſitely ſenſible, Part. Beſides, the Inteſtines, in conſequence of that Mucus, or pituitous Matter, with which they are covered, eaſily elude the Action and Force of acrid Subſtances of this kind; but they would, no doubt, be corroded by them, if they were exhibited in large Doſes. *Stentzelius* thinks, that beſides the Laxity of the Inteſtines, and the large Quantity of Phlegm lodged in them, we are alſo to conſider the Nature of the Serum which lubricates the Stomach and Inteſtines; for, according to him, this Serum partakes of the Nature of an Acid, by which means the exceſſive Acrimony of the alcaline Salt, contained in the Cantharides, is not only diluted, but alſo obtunded and blunted, by a Salt of an oppoſite Nature, to ſuch a Degree, that they are deprived of a Power of doing any Injury. Before we come to ſpeak of the ſeveral Uſes to which Cantharides are applied in Medicine, it will not be improper to conſider what Effects they produce when infuſed or injected into the Blood of live Animals, and when mixed with human Blood juſt taken from the Veins. *Baglivi* made the following Experiments, with a View to diſcover the Effects of Cantharides. At *Rome*, ſays he, in the Month of *May*, I opened the Right Jugular of a Maſtiff Dog fixed to a Table, and, by the Aſſiſtance of a Syringe, injected two Ounces of the Tincture of Cantharides; and this Tincture conſiſted of two Drams of Cantharides reduc'd to a Powder, and ſix Ounces of the Water of Carduus Benedictus digeſted for three Days on hot Aſhes. After the firſt Injection

jection the Dog vomited an aqueous and viſcid Subſtance, and diſcharg'd a viſcid Saliva from his Mouth, till at laſt two Ounces being injected, the Orifice was ſtitch'd up, and calcin'd Vitriol ſprinkled on it. No ſooner was this Operation perform'd, than the Dog dropt to the Ground, as if he had been dead. He would eat no more during the remaining Part of his Life, but had a violent Drought, for which Reaſon a Servant, prompted by a Principle of Compaſſion, without my Knowledge, gave him about twelve Pints of Water, by drinking which he diſcharg'd a large Quantity of yellow Urine. In the mean time he howl'd, and his inſatiable Thirſt continu'd, but we gave him no more Water. Before his Death he was ſeiz'd with Convulſions, and, on the fourth Night after the Injection was made, died howling in the moſt lamentable manner. Upon opening his Body, we found that Part of his Neck where the Injection had been made, entirely ſphacelated and fetid. In the Right Ventricle of the Heart, a large Quantity of very black Blood, little or not at all coagulated, fluctuated, and on the Surface of this Blood, ſome ſmall Drops, as it were of Oil, floated. In the ſame Ventricle we alſo found a ſmall Polypus, ſurrounded with ſome grumous Blood. In the Left Ventricle of the Heart were found two long ſlender Polypuſes, and the Blood contain'd in it was highly black and colliquated. The Lungs, and other Viſcera, were entirely ſound, but that mucous Subſtance with which the urinary Bladder is naturally livid, was entirely deſtroy'd, perhaps by the Acrimony of the Cantharides. The Bile in the Gall-bladder was become ſomewhat blackiſh. The Blood which flow'd from the open'd Veins or Viſcera, was highly black, but not at all coagulated, and had ſmall Drops, as it were, of Oil floating on its Surface. At *Rome* in the Month of *July*, I injected two Ounces of the Tincture of Cantharides into the right Jugular of a young middle-ſized Dog fixed to a Table. After the Wound was ſtitch'd up and dreſſed, as in the former Caſe, the Dog forthwith vomited, and dropt down, as it were, half dead. Two Hours after, he hung out his Tongue with the greateſt Signs of an inſatiable Thirſt. He would eat nothing, and, notwithſtanding his Thirſt, I would allow him no Water. Six Hours after, he died howling in the moſt terrible manner. Upon opening his Carcaſe, all his Viſcera were found to be ſound. His Blood, however, was highly black and colliquated, and had, as in the former Caſe, as it were, ſmall Drops of Oil floating on its Surface. This Dog was young, of a ſmall Size, and had drunk no Water; 'tis therefore no Wonder, if the Humours being ſuddenly diſſolv'd and colliquated by the cauſtic Salt of the Cantharides, he ſhould die in ſix Hours after the Experiment was made. In both Dogs I obſerv'd, that after injecting the Tincture into the Jugular, no Part was ſo ſoon affected as the Head, which immediately nodded, and hung down; neither could the Animal ſtand with a ſtrait Neck. The former of theſe Dogs immediately hung down his Head, and could ſcarce raiſe it up; but upon drinking twelve Pounds of Water, he immediately ſtarted on his Feet, mov'd his Head freely, kept his Neck ſtrait, and became more briſk and chearful than before. But he had ſcarce ſooner diſcharg'd the Water by Urine than he dropt down to the Ground, raiſed his Head no more, but died on the fourth Night half ſtupid, and nodding his Head. Hence it may be inferr'd, that Cantharides are principally prejudicial to the Head, and conſequently highly improper in acute and inflammatory Diſorders of that Part. But this Aſſertion muſt rather be confirm'd by Experience, than eſtabliſh'd by Conjecture and Hypotheſis. At *Rome*, in the Month of *April*, I took eight Ounces of Blood newly taken from a certain Patient; this Blood I divided into two Veſſels; immediately after its Extraction I mixed a Scruple of powder'd Cantharides with the Blood contain'd in one of the Veſſels, and left that in the other without any Mixture at all. The Blood mixed with the Cantharides coagulated before that left without any Mixture; but afterwards aſſum'd a livid blackiſh Colour, and a ſlender blackiſh Pellicle appear'd on its Surface. At laſt over the whole Surface of the Blood appear'd a large Number of Veſicles, which, when broken, diſcharg'd a blackiſh Serum, and ſoon after the Whole of the Blood was diſſolv'd into a black and ſomewhat livid Serum. The Blood in the other Veſſel, and which remain'd without the Addition of any thing, did not undergo the like Changes. In the ſame Month, after taking Blood from a certain feveriſh Patient, I ſeparated the Serum from the Blood, and mix'd with the former a Scruple of the Powder of Cantharides. A little after the Mixture I obſerv'd, that the Powder was precipitated to the Bottom of the Veſſel without communicating any Colour to the Serum, which only became more liquid, thin, and ſcarce afterwards to be coagulated. Thus *Baglivi*.

What Effects Cantharides are capable of producing on the Humours of an animal Body, we have already ſeen; but, according to *Pliny*, in the fourth Chapter of his twenty-ninth Book, Authors are not agreed in what particular Part of the Inſect the Poiſon is lodg'd. Some think it is contain'd in the Head and Legs, but this is deny'd by others. But it is agreed upon, that their Wings contribute to the Production of their Effects, in whatever Part the Poiſon is lodg'd. Theſe Inſects themſelves are form'd of a ſmall Worm, hatch'd for the moſt part in a ſpongious Subſtance in the Trunk of the Dog-roſe-tree, but more plentifully in that of the Aſh. Thoſe produc'd in the white Roſe-tree are leſs efficacious. The moſt efficacious are thoſe which are very plump, and variegated with pale Streaks, running in tranſverſe Directions along their Wings. Thoſe which are ſmall, flat and hairy, are leſs active; and thoſe all of one Colour, and extenuated, are, of all others, the moſt mild. Theſe Inſects are preſerv'd for ſome time in an unglazed earthen Veſſel, after which they are tied up in a Cloth with freſh Roſe-leaves, ſuſpended over boiling Vinegar and Salt till they are moiſten'd thro' the Cloth, after which they are again to be put in the Veſſel. They are of a cauſtic Quality, and ſerve to induce Cicatrices. They are ſaid to be effectual againſt the Leproſy and Ring-worm, and to provoke the Menſes and Urine; for which Reaſon *Hippocrates* exhibited them to dropſical Patients. Theſe are the Uſes to which, according to *Pliny*, the Antients applied Cantharides. *Dioſcorides*, *Lib.* 2. *Cap.* 54. and *Paulus Ægineta*, *Lib.* 7. *Cap.* 3. inform us, that thoſe Cantharides which are found among the Corn, and have their Wings mark'd with pale or yellow Streaks, were in their Days eſteem'd the moſt proper for medicinal Purpoſes. *Hippocrates*, in his Treatiſe *de Victu in Acutis*, for a dropſical Patient preſcrib'd the Bodies of three Cantharides triturated, without the Heads, Feet, and Wings, to be taken in three Glaſſes of Water. For anſwering the ſame Intention he alſo order'd five of the ſame Inſects without the Heads and Feet, to be put into the Pudenda of Women mixed up with Frankincenſe, Myrrh, Honey, Oil of Roſes, or *Egyptian* Oil, *de Morbis Mulierum*, *Lib.* 1. A little after, in the ſame Work, he recommends five Cantharides without the Heads and Feet, to be taken in mild ſweet Wine, for expelling the Secundines; but, for expelling the Fœtus, he orders ten Grains of *Ethiopic* Cumin and Caſtor, together with a little Cantharides, to be taken in Wine. But why, in the ſame Paſſage, *Hippocrates* ſhould recommend triturated Cantharides made up with Wine to be applied to the Pudenda of Women, as a Method of trying their Fecundity, is what we cannot well comprehend. In his Book *de internis Affectionibus*, he, in the Jaundice, recommends four Cantharides without the Heads and Feet, to be triturated, and exhibited twice or thrice a Day, in a Quarter of a Pint of White-wine, with the Addition of a little Honey. For promoting the menſtrual Diſcharges, he exhibited four Cantharides without the Heads, Feet and Wings, in ſome proper Liquor. *Lib. de Natura Muliebri*. But *Galen*, if we may believe *Matthiolus ad Dioſcor.* uſed to mix all the Parts of Cantharides with his Medicines. Theſe Inſects, according to the learned Doctor *Freind*, are often recommended by *Hippocrates* for internal Uſe, but no-where with an Intention to excite Bliſters, tho' at the ſame time he ſeems not to have been entirely ignorant of their Effects when applied to the Skin; ſince in the Book *de Superfœtatione*, of which he is generally ſuppoſed to be the Author, they are order'd to be mixed with other irritating Subſtances, and form'd into a Peſſary, with an Intention to purge the Uterus.

Aretæus was the firſt who order'd theſe Inſects to be rubb'd on the Skin of the Head in order to excite Veſicles. This Author recommends Cantharides in the Cure of an Epilepſy, and orders the Patient to uſe Milk for three Days before their Exhibition, to prevent the Injury the Bladder otherwiſe might ſuſtain. The ſame Method of curing this Diſeaſe, and Palſeys, was, according to *Aetius*, follow'd by *Archigenes*, whom we may reaſonably ſuppoſe to have been of the ſame Sect with *Aretæus*. *Galen* informs us, that Plaiſters made of theſe Flies may very properly be uſed for the Cure of Baldneſs, the Itch and Ring-worm; but according to *Le Clerc*, he either diſregarded this Medicine in the Cure of moſt other Diſeaſes, or, as appears from his own Writings, rarely uſed it, as being attended with dangerous Conſequences. As the *Greeks* who came after *Galen* advanced very little new upon any Subject, ſo they have been no leſs indolent with reſpect to this Particular. The *Arabians* alſo are in vain conſulted in this Affair, who, tho' ſtrongly addicted to compoſing new Forms of Medicines, yet in this Particular, as in moſt others, follow'd the Footſteps of the *Greeks*. Among the *Latins*, Cantharides ſeem to have been in very little Repute; and *Celſus* himſelf who deals very much in Sinapiſms, makes no mention of them ſo far as we know, except when, in Imitation of *Mico*, he recommends them for deterging and removing Pimples. *Pliny* informs us, that anointing the Parts affected with Cantharides is good againſt the Leproſy, the Ring-worm, and for extracting Darts. And *Scribonius Largus* is the only Author who extols them, when mixed with proper Cerates, for removing Scars. Theſe are almoſt all the Caſes in which the Antients apply'd Cantharides to the Skin, which was very rarely, and only

only when cold Humours were to be remov'd, and when the Diſorder was become inveterate. Long after the Reſtoration of Learning, Cantharides were alſo as ſcantily uſed: For *Fernelius* only preſcrib'd them in Blindneſs, and in Dropſies; but tells us at the ſame time, that their Uſe requires the higheſt Caution and Prudence. *Hollerius*, a Contemporary of *Fernelius*, an Author of a fine Taſte, and a Man well acquainted with the Writings of the Antients, orders Cantharides to be mixed in ſtimulating Topics for removing a Lethargy; tho' *Duretus*, who wrote the *Adverſaria* to the Works of *Hollerius*, diſſuades the Uſe of ſtimulating Topics in this Diſorder, becauſe it is accompanied with a Fever, in which Caſe hot Subſtances are highly improper. It is however, a memorable Cure which *Paré* and *Hollerius* perform'd by Cantharides. They adviſed a certain Lady of Diſtinction, whoſe Face was all over deform'd with burning Pimples, as if ſhe had labour'd under an Elephantiaſis, to apply a Veſicatory of Cantharides all over her Face, by which means ſhe was afflicted with ſuch racking Pains, and ſeized with a Fever ſo violent, that no Hopes of her Life ſeem'd to be left: However, when by the joint Care and Skill of theſe two ſhe was reſtor'd to Health, the Deformity of her Face diſappear'd, and never created her any Trouble for the future. The ſame *Hollerius*, when ſpeaking of Cauſtics, affirms, that ſciatic and arthritic Pains, Hemicranias, and Head-achs, are often reliev'd in conſequence of the Bliſters or Veſicles raiſed by Cantharides. He alſo tells us, that the Viſcera are purg'd, the Body entirely freed of recrementitious Sordes, and a large Number of old and obſtinate Diſorders cur'd, by means of Cantharides. We muſt not forget to mention, that the Whole of this Encomium on Cantharides is wanting in the Chirurgical Inſtitutions of *Hollerius*, firſt publiſhed with the Works of *Tagaultius*, in the Year 1540. which Edition *Geſner* and *Uffenbachus* have follow'd. From this Circumſtance we may reaſonably ſuſpect, that after this Time Cantharides began to be more frequently uſed than before. *Freind.*

From what has been ſaid we learn, firſt,

That the internal Uſe of Cantharides is more antient than the external Applications of them, at leaſt that they were more frequently preſcrib'd in the former, than in the latter Caſe.

Secondly, That theſe Inſects were uſed in Caſes where the Body was thought to require a great Stimulus; or where the Intention was to purge it. What we have above quoted from Dr. *Freind* ſufficiently ſhews, that almoſt till our own Times the external Uſe of Cantharides was a Piece of Practice which had not only its Abettors, but alſo its Enemies, as indeed all efficacious Medicines generally have, provided they are uſed by Men of Note. In our own Times theſe Inſects are uſed as the Baſis or principal Ingredient in Veſicatories, which are commonly prepar'd by mixing Powder of Cantharides with Leaven, or with a proper Plaiſter. But the Quantity of Cantharides ought to be ſpecified by the Phyſician, according as the Caſe requires an Application more or leſs acrid. By ſtimulating the Veſſels, and reſolving the Juices, external Applications of Cantharides certainly produce very happy Effects in all Diſeaſes ariſing from a ſpontaneous Glutinoſity; in the Rickets, for Inſtance, they are of ſingular Service by ſtimulating the languid Veſſels, and reſolving the mucous Concretions. *Boerhaave Mater. Med.* and *Aphor.* 1489.

As for the Effects they produce on the Skin, they are ſo obvious, that medicinal Writers ſeem to have adverted to them alone, and accounted for the good Effects of Veſicatories, from the Evacuation of Serum occaſion'd by them. This Evacuation they will have to be produc'd by the Stimulus of the Veſicatory, and the Fuſion of the Humours; ſo that when the Skin is, as it were, prick'd with ſmall Needles, the Serum is pour'd out. It muſt indeed be confeſſed, that, in conſequence of the Force of this Stimulus, the Humours flow more plentifully to the Part than at other Times: Yet we are not for this Reaſon to believe, as they do, that, whilſt the reſt of the Blood is retain'd in the Veſſels, the Serum is in a particular manner imbibed or attracted by the Particles of the Cantharides; for, when the common Coat of the Veſſels is a little corroded, the Serum is diſcharg'd merely in conſequence of its Thinneſs, whereas the Globules, which give a red Colour to the Blood, being larger than the Pores thro' which the Serum paſſes, cannot be diſcharg'd. This is obvious in thoſe Bliſters raiſed by the Fire, by which the Cuticula, which covers the Mouths of the Veſſels, being torn in the ſame manner as in caſe of Veſicatories, a Paſſage is made for the Serum.

Since then Veſicatories not only excite Pain, but eliminate and diſcharge the Serum, they muſt be of ſingular Service in the Cure of Diſeaſes, and the Evacuation of the Serum may be look'd upon as a kind of Prognoſtic; for, unleſs it is diſcharg'd, we rightly conjecture, that the Caſe will not terminate ſo happily, as otherwiſe it might be expected to do. But the Virtues of Cantharides ſeem not to be confin'd within theſe Bounds; for their Effects are ſo ſurpriſing and extenſive, that we cannot poſſibly account for them, unleſs we could comprehend the particular Manner in which they affect, not only the Skin, but alſo the Maſs of Blood; for, if they only prov'd beneficial by drawing away the Serum, the ſame Quantity of Serum diſcharg'd along with the Urine would produce equally happy Effects. But tho' in almoſt all Diſeaſes as much Serum may be diſcharg'd from the urinary Paſſages, as could be taken off by the Application of a Veſicatory; yet 'tis obvious from Experience, that the former Diſcharge in no Diſeaſe produces ſo good Effects as the latter. It ſufficiently appears how great the Virtues of Cantharides, taken internally, are, in evacuating Humours, removing Obſtructions, and promoting a briſk Circulation of the Blood. For this Reaſon they were uſed by the Antients with an Intention to provoke the Menſes, to cure the Dropſy, to expel the Fœtus, to diſlodge Worms, to ſubdue the Poiſon of mad Dogs, and to open the cutaneous Ducts in inveterate Ring-worms. It is alſo probable, that, when Cantharides are applied to the Skin, they penetrate farther, and put the Humours into the like Commotions; otherwiſe how could their external Application prove ſo beneficial in Pleuriſies, Peripneumonies, Defluxions, and Convulſions? How could they cure inveterate ſciatic Pains, or open Obſtructions? How could they diſpoſe the Humours for Perſpiration, make the Sweat flow more eaſily, and produce a ſpeedy Eruption of all Kinds of Puſtules on the Skin?

Thoſe who either neglect or overlook this internal Energy of Veſicatories, when accounting for the racking Pains and Exulceration of the urinary Ducts produc'd by them, are oblig'd to confeſs, that the Particles of the Cantharides have penetrated into the Maſs of Blood; and that their highly acrid Salts, uniting with thoſe of the Urine, act theſe painful Tragedies. Thus the Man who obſtinately adheres to an Opinion implicitly taken for granted, involves himſelf in inextricable Difficulties, and is oblig'd to run into the moſt glaring and palpable Inconſiſtencies.

If in Parts ſo far remote from the Skin, as the Bladder and urinary Ducts, they produce ſo conſiderable Effects, what Reaſon have we to doubt of their exerting their Energy in other Parts? What ſhould hinder them from inducing a certain Change on the Humours circulating thro' all the Veſſels? 'Tis certain the Diſadvantages ſometimes attending the Application of Veſicatories cannot be accounted for, but by ſuppoſing the Cantharides to act upon the Blood in the manner now ſpecified. Upon this Principle we can eaſily underſtand, why in hectic Caſes, eſpecially accompanied with colliquative Sweats, as alſo in bilious Conſtitutions, and thoſe conſtitutionally inclin'd to feveriſh Heats, Cantharides are ſometimes prejudicial, and, if we may believe ſome Authors, highly dangerous in a Plethora, unleſs a Vein be previouſly open'd; for ſince they greatly attenuate the Maſs of Blood, and accelerate its Circulation, they conſequently produce Fevers, Inflammations, and Deliriums; or, as happens in hectic Caſes, too profuſely diſſipate the Stores by Nature deſtin'd for the Support of Life; in ſlow Fevers alſo, where the Pulſe is weak and languid, if Veſicatories are ſucceſsfully apply'd, we immediately perceive it to become ſtronger, which Effect we can by no means ſuppoſe the Detraction of a very ſmall Quantity of Serum capable of producing.

Bellini, who maintains that the whole Efficacy of Veſicatories conſiſts in their ſtimulating Quality, aſſerts, that by this very means the Pulſe is raiſed, and render'd ſtronger. But I would aſk, Whether other ſtimulating Applications produce the ſame Effects? Whether, for Inſtance, Cauſtics, Fontanels, Setons, or even Veſicatories, which have not Cantharides for an Ingredient, are capable, by their Stimulus, not only of raiſing the Pulſe for a time, but alſo of reſtoring it ſo, as that it ſhall remain in its natural State? Purgatives, which ſcarce enter the Blood-veſſels, prove a Stimulus to the Inteſtines, but the Pulſe is not by that means render'd in the leaſt ſtronger than it was before; they indeed ſomewhat accelerate the Circulation of the Blood at the Mouths of the Glands, but do not appear ſo to affect the common Maſs of Humours, as to impart any Vigour to the Pulſe.

Boiling Water, in like manner, and live Coals, excite both an Itching and Bliſters on the Skin, but yet in ſuch a manner, as to convey no new Degree of Motion to the Blood. Since, then, ſo ſpeedy and unexpected Relief is in many Diſeaſes, eſpecially thoſe of the Head, afforded by Veſicatories, theſe ſeem to produce their Effects, not ſo much by Revulſion, Irritation, or Evacuation, as by ſome other Quality or Virtue. Now, if we carefully advert to this Virtue or Energy exerted internally, we ſhall underſtand the whole Nature of Veſicatories, and be able to judge in what manner they may be moſt happily accommodated to the Cure of Diſeaſes. If we were but careful in this Particular, we might at leaſt, receive ſome Aſſiſtance in executing a Deſign hitherto neglected by the Phyſicians, which is the laying down accurate, clear, and infallible Rules, with reſpect to the Uſe of Veſicatories in chronical Diſorders.

But to return to our Subject: In acute Fevers, the ſafeſt and moſt ſpeedy Relief is afforded by Veſicatories, which, tho' they powerfully derive the febrile Matter from the Brain,

yet

yet they often aſſiſt and promote the other Diſcharges, eſpecially that of the Sweat and Urine, at leaſt they never ſuppreſs them in any Caſe or Degree whatever. Nor are we to be too ſcrupulous about accommodating Veſicatories to the Conſtitution of the Patient; for whatever his Habit of Body is, whether hot in conſequence of a Redundance of Bile, or a preternatural Attenuation of the Blood, or whatever his State is, if the Fever rages beyond meaſure, the ſlight Inconveniencies of a Veſicatory are rather to be endur'd, than the Life of the Patient to be riſqu'd; for many Caſes are of ſo dangerous a Nature, as that the only Hopes of Relief are placed in Veſicatories. Inſtances of this kind occur in Gouty Patients, when the Matter which uſed to flow to the Extremities of the Body, is convey'd to the Head, and produces a Fever.

The good Effects of Veſicatories are confirm'd by daily Experience in the Small-pox, Meaſles, Scarlet and Eryſipelatous Fevers, in which Diſorders, tho' the Blood is preternaturally hot, and its Motion too much accelerated, we nevertheleſs uſe Veſicatories with Confidence and Succeſs. We are not therefore to liſten to thoſe who with *Baglivi*, in his Treatiſe *de Veſicantibus*, reject the Uſe of Veſicatories in nervous Diſorders, in burning and continued Fevers, even tho' attended with Drowſineſs, and a Delirium.

It may juſtly be aſſerted, that more have been cur'd of Fevers by the Uſe of Veſicatories, than by any other Method of Cure; and I myſelf, ſays *Freind*, can atteſt, that by this Method alone more have been ſav'd, than by all other Means in Conjunction. *Sydenham* judiciouſly uſed Veſicatories for the Cure of the Epidemical Fevers, which rag'd in the Years 1674, 1675, 1679, and 1685. But why in other Fevers he did not uſe the ſame Method, I am at a Loſs to underſtand, ſince the other Years he mentions brought in no Fevers, in which Veſicatories would not have been equally beneficial.

Dr. Freind's *Surprize at* Sydenham's *Neglect of Bliſters, in the Fevers here meant, would have ceaſed, if he had reflected, that* Sydenham's *Experience had taught him a more eaſy, and not leſs effectual Method of curing them, without frequent Bliſters.*

The Method of Evacuation by Veſicatories has this to recommend it above all others, that it may be ſafely uſed at all Times: The Effects of other Evacuations are, in violent Diſorders, ſo precarious and uncertain, that it is dangerous to attempt them, as we often experience in Veneſection. But what Patient is not more afraid of a Veſicatory than of Veneſection, tho' attended with more Danger? This Circumſtance, however, is owing to the Cowardice of the Patient, who, prompted by Nature, flies from Pain, and ſhuns, if poſſible, a Medicine which can ſcarce produce any happy Effects without exciting ſome Degree of it. But it would be a culpable Compaſſion in the Phyſician, in this Caſe, to liſten to the Suggeſtions of the Patient, and deſtroy his Life, for fear of exciting a ſmall, but ſalutary Pain in his Body.

Many Fevers are cured by Evacuations alone, without the Uſe of any other Means; but ſcarce any of the more violent Kind can be removed, without thoſe Evacuations procured by Veſicatories. *Freind de Veſicantibus.*

We now come to conſider their internal Uſe; and in what Caſes the Antients exhibited them in this way, we have in ſome meaſure ſeen, from what has been already ſaid. But whoever will be at the Pains to conſult the Paſſages of *Hippocrates* before quoted, will find, that he guarded againſt the bad Effects of Cantharides, from their Acrimony, by preſcribing them with a ſufficient Quantity of Water or Wine. *Vallisneri Comment. in Hippocr. de Victu in Acutis.* In what Caſes the Moderns recommend the internal Uſe of Cantharides, may be ſeen in many different Authors. *Baglivi* informs us, "That theſe Inſects, "taken internally, either againſt a deſperate Iſchury, or with "a View to excite Venery, or to remove a virulent Gonor-"rhœa, produce the worſt and moſt diſmal Symptoms; for, "firſt, the Bladder and Urethra are exulcerated, then the "Liver is gradually inflamed, the Inteſtines corroded, and vio-"lent Pains are excited in the Hypogaſtrium; and theſe Pains "are ſucceeded by Loſs of Reaſon, and Death, unleſs the "Cantharides be forthwith evacuated, or the Violence of "their Action broken and impaired." It is highly proper for thoſe who intend to follow the Practice of Medicine, to know in what Caſes, upon the Authority of ſkilful Phyſicians, who have gone before them, they may ſafely, and without Diffidence, preſcribe Cantharides as an internal Medicine. *Capivoccius*, then, a celebrated Phyſician in the ſixteenth Century, in his *Medicina practica*, affirms, that whole Cantharides may be ſafely and ſucceſsfully exhibited internally in Dropſies, and all Suppreſſions of Urine; and aſſerts, that, by the Uſe of Cantharides, he has ſeen Patients of this Kind reſtored, after their Lives were deſpaired of. But he lays down ſome Cautions with reſpect to the Uſe of this Medicine: Firſt, then,

When the Urine is ſo totally and ſtrongly ſuppreſs'd, that the Diſorder will yield to no other Medicines, the Phyſician is, in this Caſe, to have recourſe to Cantharides, as the moſt powerful Remedy, ſince the Life of the Patient is immediately threaten'd.

Secondly, The Phyſician is to have recourſe to Cantharides when the Urine is ſuppreſs'd, not thro' any Defect in the Bladder, for in that Caſe the Patient may be relieved by a Catheter; but thro' a Fault of the Kidneys, as generally happens in a Dropſy.

Thirdly, He adviſes their Exhibition in ſmall Quantities, and in Conjunction with other Medicines; eſpecially ſuch as have a Tendency to defend the Bladder from the Injury they may do it. Thus, for Inſtance,

Take one entire *Spaniſh* Fly, together with a Scruple of the Powder of Rue or Lavender, or ſome other Powder of a like Nature; giving the Patient four or ſix Ounces of ſome pinguious Liquor, ſuch as fat Broth made of Fowls, to be drank after it.

Langius, in his *Epiſtolarum Medicinalium Miſcellanea*, affirms, that he had found, from his own Experience, that the Powder of torrefied Cantharides, with an Addition of Cherry-tree Gum, was more ſalutary, and leſs noxious, in diuretic Electuaries, when diſſolved in an Apozem ſuited to the Nature of the Diſtemper. *Thomas Bartholine*, for virulent Gonorrhœas, Suppreſſion of Urine, and the Stone, has taught us the following Method of preparing them ſafely, by way of Infuſion:

Let one Scruple of Cantharides, reduced to Powder, be infuſed in three or four Ounces of *Rheniſh* Wine, or Spirit of Wine: Let them ſtand in Infuſion for ſome Days; then let the Liquor be filtrated thro' coarſe Paper, ſo that none of the Subſtance of the Cantharides may be mixed with it. Mix one Spoonful of the ſtrain'd Liquor with ſeven Spoonfuls either of Wine or Ale; and of this Mixture let the Patient take one Spoonful the firſt Day, two the ſecond, which let him continue the ſubſequent Days.

Many Authors have atteſted the happy Effects produced by this Potion. According to *Ettmuller*, the happy Effects it produces are owing to this, that the Force of the volatile cauſtic Salt is corrected by the Acid of the Wine, as it may be by Vinegar, by which means it is transform'd into a temperate and leſs corroſive Salt. Thus, at *Leyden*, a certain Phyſician ſucceſsfully cured a virulent Gonorrhœa only by the Uſe of Cantharides, macerated in *Rheniſh* Wine; but he corrected the Infuſion with ſome mild Liquor before he exhibited it, as we are told in *Bartholine's Epiſtolar. Medicinal. Centuriæ, Cent.* 4. Dr. *Martin Liſter*, in his *Exercitationes Medicinales*, informs us, that he found happy Effects, in the Cure of a Gonorrhœa, from the following Tincture or Eſſence, prepared with Cantharides:

Take of highly rectified Spirit of Wine, half a Pound; of Gum Guaiacum, half an Ounce; of Cantharides, one Dram; of Cochineal, two Ounces; of the Juice of Hypocyſtis, two Drams; of the Spirit of Sulphur, one Scruple: Digeſt the Whole in warm Aſhes for twelve Hours, and filtrate thro' a coarſe Paper.

Dr. *Liſter* gave forty Drops of this in warm Ale in the Morning, and as many at Night, each Day. *Garidellus*, for a Gonorrhœa, highly extols a Medicine prepared in the following Manner:

Take of entire Cantharides, half a Dram; of the inſpiſſated Juice of Hypocyſtis, and of the Gum or Extract of Guaiacum, each one Dram; and of Cochineal, one Ounce: Let them infuſe in *Balneo Mariæ* for twenty-four Hours, in one Pound of Spirit of Wine. Let the Liquor, when ſtrain'd, be kept for Uſe. The Doſe is between half an Ounce and an Ounce, to be taken in the Morning faſting, and at Bed-time, in a Draught of the Decoction of Guaiacum.

In *Dunquien*, a Province of the *Eaſt-Indies*, they generally uſe the following Method of curing a Gonorrhœa:

They take one Handful of the Flowers of St. John's-wort, and of Crabs-eyes half an Ounce: Theſe they boil in two Pints of Wine, which leaks from the Caſks. After this they digeſt two Drams of Cantharides in one Pint of Spirit of Wine. This they mix with the Wine, and give a little of the Mixture internally, with a few Spoonfuls of Plantain-water. *Ephemerides Germanicæ Curioſæ, Decad.* 1. *a.* 1.

The celebrated *Werlhofius*, in a total Suppreſſion of Urine, when no other Remedies were of any Effect, and when the Patient laboured under the moſt terrible Symptoms, ſuch as a Delirium, a convulſive Twitching of the Tendons, a cold Sweat on the Face, a hard Tumor of the Abdomen, an irregular, weak, and frequent Pulſe, upon giving a Grain of the

Powder of Cantharides in an Emulſion, every fourth Hour, after the Exhibition of the third Doſe, obſerved, that Urine, a little grumous and bloody, began to flow; afterwards a pituitous Urine was diſcharged; and laſtly, it appeared limpid, with a Dyſury. Becauſe the Symptoms were forthwith mitigated, he continued the Uſe of this Medicine till the ninth Doſe, by which means the Patient gradually diſcharg'd a larger Quantity of Urine, which at laſt was evacuated limpid, to the Quantity of ſeveral Pints a Day, with a Diminution of all the Symptoms: Thus, by little and little, the Man recovered a perfect State of Health by the Uſe of this Medicine alone. In obſtinate Gonorrhœas *Werlhofius* alſo exhibited, with Succeſs, one, two, or three Grains of Cantharides in Subſtance, with a Dram of the Bone of the Scuttle-fiſh; which Medicine he continued for ſeveral Days, according to the Effects it produced. This Preparation he thought leſs troubleſome than infuſing the Cantharides in Wine, according to the Directions of *Bartholine*, *Liſter*, and others; tho' he confeſſes, that he found the Medicine, prepared in their Manner, attended with Succeſs. *Commercium Literarium*, *A.* 1733. But *Aſtruc*, in his Book of *Venereal Diſorders*, aſſerts, that the ſmalleſt Doſe of Cantharides, exhibited internally, in a Gonorrhœa, is not only a precarious and unſafe, but alſo a prejudicial Medicine.

That the draſtic Force of Cantharides, by which they ſtimulate the urinary Bladder, may be corrected and ſubdued by Camphire, we have already obſerved under that Article. *Cockburn*, in the *Philoſophical Tranſactions abridged*, *Vol.* 5. aſſerts, that Camphire does by no means produce this Effect; but Experience has confirmed the Falſhood of his Aſſertion; for four Grains and an half of Cantharides, without the Heads, Feet, and Wings, with an equal Quantity of Camphire, exhibited in any Conſerve, in the Form of a Bolus, happily, and without any Trouble or Pain, removed a Dyſury in a Woman, who laboured under a Dropſy. But, without an Addition of Camphire, alſo in obſtinate Obſtructions of the Lochia and Menſes, in difficult Births, and Retentions of the Secundines, very happy Effects have been produced by a Bolus, made up of

Three Cantharides, prepared; Troches of Myrrh, half a Scruple; Seeds of Biſhops-weed, ſix Grains; and Rob of Hips, a ſufficient Quantity. Small Ale, Water-gruel, or any Emulſion, may be uſed as a Vehicle. *Philoſophical Tranſactions abridged*, *Vol.* 5.

In Hyſteric Fits, and the moſt violent Suppreſſions of Urine, *Philippus Hoechſtetterus* gave Cantharides in a Potion of the Juice of Mercury, with Eſſence of Cinnamon, and an Elæoſaccharum of Cardamoms. He alſo put Cantharides in a Peſſary, for the ſame Intentions. *Velſchii Hecatoſteæ* 2. *Obſ.* 72. In a Dropſy *Konigius* recommends a Powder compounded of

Six Grains of Cantharides; of Crabs-eyes prepared, of vitriolated Tartar, and Salt of Reſt-harrow, each one Scruple: Of this a third Part is to be exhibited for a Doſe.

For the ſame Diſeaſe ſome order four Ounces of the Decoction of the diuretic Roots, with an Addition of three Drams of Linſeed, and two Cantharides; but the Liquor muſt be ſtrain'd before it is uſed. *Wieri Obſervat. Medic.* In *Upper Hungary*, beyond the River *Teis*, the Inhabitants are often ſeized with an extraordinary Diſeaſe, in which their Neck ſuddenly ſwells; after which a violent Heat in their Head ſucceeds, which diffuſes itſelf all over the Body. Thoſe who do not immediately apply a Remedy, die within four Days. This Diſeaſe is ſomewhat like the Hydrophobia. The Method of Cure they uſe is this:

They take, for one Doſe, ten Cantharides, reduced to Powder, which, when drank off in a proper Liquor, ſometimes excites a profuſe Sweat, and ſometimes a plentiful Diſcharge of Urine, without any manner of Pain.

This Remedy could ſcarcely be ſafely uſed in any other Nation; but the *Hungarians* beyond the River *Teis* are of very hardy and robuſt Conſtitutions, and imagine, that they may ſafely take the Cantharides whole, becauſe they think their Feet prove an Antidote to the poiſonous Quality lodged in their Bodies. *Ephemerides Germanicæ Curioſæ*, *Decad.* 1. *a.* 1. *o.* 133. Theſe *Hungarians* gather the Cantharides, for the moſt part, from the Aſh-tree, in the Month of *May*, or in the Summer, and preſerve them in ſtrong Vinegar, againſt the Poiſon of mad Animals. If a Man, a Horſe, a Cow, or a Sow, are bit by any mad Creature, to the Man they give one, two, three, or five Cantharides; but to Animals a greater Number. They exhibit them entire, with the Wings, Head, and Feet, in Brandy, or with *Venice* Treacle, or Bread. Thoſe who take two or three of theſe Cantharides, are neither afflicted with a Dyſury, nor a Diſcharge of bloody Urine; but the Urine is only diſcharged in a larger Quantity, during both the whole Day and Night. *Proſper Alpinus*, in the laſt Chapter of his fourth Book *de Medic. Ægyptiorum*, informs us, that, in *Egypt*, ſome Phyſicians preſcribed to their Patients the Heads and Wings of four Cantharides, reduced to Powder, and exhibited in three Ounces of Endive-water; by which Medicine, they affirm, the peccant Matter is diſcharged, either by profuſe Sweats, or plentiful Diſcharges of Urine. According to *Ettmuller*, theſe Inſects are, by Women of profligate Characters, applied to the baſeſt of Purpoſes; that is, expelling the Fœtus, before it has arrived at Maturity. Their Exhibition, in order to rouſe the languid Inclinations to Venery, may alſo be juſtly reckoned among the Abuſes of this Medicine. *Stenzelius*, in his third Book *de Venenis*, ſays, that it is well known, that Cantharides, diſſolved in Eſſence of Amber, excite an inſatiable Deſire of Venery in both Sexes. From what has been ſaid, it is obvious, that Cantharides, however poiſonous a Quality they are of, prove a Medicine againſt ſeveral Diſeaſes: But it is no eaſy Taſk to lay down a fixed and ſtated Rule for the ſafe internal Uſe of Cantharides, ſince one Phyſician preſcribes them entire, and another without the Head, Wings, and Feet, accordingly, as he believes, that the Corrector of that Poiſon, which is lodged in their Body, is ſituated in the Extremities or otherwiſe. One Phyſician thinks, that they may ſafely be exhibited, when their deleterious Quality is corrected; and another embraces the contrary Opinion. All of them claim the Teſtimony of Experience in their Favour, which teaches, that even the external Application of Cantharides to the Body ſometimes excites great internal Diſorders; whereas at other times no ſuch Effects are produced.

That the external Application of Cantharides only produces bad Effects on the more ſenſible Parts, eſpecially the Urinary Bladder, and in others only when the Quantity is too large, is obvious; ſince numberleſs Inſtances occur daily of Patients, who ſuſtain no manner of Injury by the Application of Veſicatories compoſed of Cantharides. Theſe Inſects may be more ſafely exhibited internally, and applied externally, with proper Correctors, than without them; for we ſeldom obſerve them uſed either for internal or external Purpoſes, without an Addition of ſome acid or oleous Subſtance, or perhaps both; and that theſe are Correctors of Cantharides, is ſufficiently obvious. If, then, any unexpected bad Effects are produced by a Medicine prepared of Cantharides, the Patient, to whom it is exhibited, muſt either be very delicate, or the Doſe too ſtrong. For internal Uſe the ſafeſt way is to begin with a very ſmall Doſe at firſt; half a Grain, for Inſtance, increaſing it gradually where the Nature of the Caſe calls for its Repetition. There is a Difference of Strength and Energy in theſe Inſects, according as they are old or recent; for the volatile Salt they contain exhales and evaporates in time, for which Reaſon the recent muſt be the more efficacious of the two. From what has been ſaid 'tis obvious, that great Caution is required, in order to render the Uſe of Cantharides ſafe; and that, on account of the many terrible Effects they have been obſerved to produce, they ought to be claſs'd among the Medicines not to be tamper'd with. In *France* a Law is enacted, diſcharging Apothecaries from ſelling them indiſcriminately to every one who aſks for them; and permitting them only to ſell them to thoſe they are acquainted with, and that too for external Uſe. *Pomet*, *Lib.* 2.

The Obſervation of ſome, that the Extremities of Cantharides render their Operation ſomewhat milder, is not altogether without Foundation; ſince the *Hungarians*, taught by Experience, affirm it to be Truth. *Bartholine*, in *Epiſtol. Medicin. Cent.* 4. tells us, in expreſs Words, that, in order to render Cantharides mild for internal Purpoſes, they are to be uſed entire; and that, when Bliſters are to be raiſed on the Skin, the Extremities, as being of a milder Nature, are to be thrown away. *Boerhaave*, in his *Materia Medica*, for a Veſicatory preſcribes Cantharides without Wings, theſe being of a milder Nature, and therefore leſs proper for Veſicatories. Hence *Benancius*, in his *Declaratio Fraudum apud Pharmacopœos commiſſarum*, blames thoſe Apothecaries, who, running into the common Error, reject the Wings of the Cantharides, contrary to the Preſcription of the Phyſician, who intends they ſhould be retained for the Advantage of the Medicine; for theſe Inſects are ſometimes to be ſold in the Shops without their Wings, their Heads, and Feet, and after they have been impregnated with the Steam of boiling Vinegar, dried, and kept for two Years. Thoſe found among the Corn, of a changeable Colour, with tranſverſe yellow Streaks on their Wings, and oblong Bodies, are eſteem'd the beſt.

Fifteen, twenty, or thirty Drops of the Tincture of Cantharides, prepared with the Tincture of Salt of Tartar, are, by *Willis*, in his *Pharmaceutice Rationalis*, commended as an excellent diuretic Medicine. *Ettmuller* directs this Tincture to be prepared in the following manner:

Take of Cantharides, half an Ounce; Salt of Tartar, ſix Drams; ſprinkle a ſufficient Quantity of Water upon them; and, when reduced to the Form of a thin Poultice, put them in ſome moderately hot Place, continuing to ſprinkle

ſprinkle Water upon them, if they ſhould become dry. When they have ſtood eight or ten Days and Nights, let tartarized Spirit of Wine be pour'd upon them, to extract the Tincture, which, for the ſake of a beautiful Colour, may be tinged with the Powder of Cochineal, which are alſo a Species of Cantharides, and poſſeſs'd of a highly diuretic Quality.

The Tincture of Cantharides, in *Fuller's Pharmacopœia*, is thus prepared:

Take Powder of Cantharides, half an Ounce; the beſt Spirit of Nitre, one Ounce: Digeſt for twenty-four Hours; then add of camphorated Spirit of Wine, three Ounces, and digeſt for ſome Days; afterwards filtrate the Liquor.

This Medicine is uſed for provoking Urine, for Ulcers of the Kidneys and Bladder, for a Gonorrhœa, and for the wandering ſcorbutic Gout. The Doſe is from four to twenty-two Drops twice a Day, in a Draught of the Decoction of Mallows, edulcorated with Syrup of Violets. In the *Collectanea Chymica Leydenſia*, this Tincture is ordered to be thus prepared:

Take of Cantharides, one Ounce; pour upon them of the ſtrongeſt Spirit of Nitre, two Ounces: Digeſt for twenty-four Hours. Thus the Cantharides will be diſſolv'd, and the Spirit acquire a reddiſh Colour. To this Tincture add ſix Ounces of Spirit of Wine; digeſt together; and the longer the Digeſtion is continued, ſo much the better; for a ſtated Time cannot be ſpecified. Then let the Liquor be filtrated, and kept for Uſe.

This Medicine is lithontriptic and nephritic, cures a Gonorrhœa, and is of Service in the Gout, the Rheumatiſm, and the Jaundice. The Doſe is from two to twenty Drops at moſt, twice a Day. If an antinephritic Powder is deſired of this Solution made with the Spirit of Wine, we are to proceed in the following manner:

We are to add to this Solution two Parts of common Water; and afterwards to drop into the filtrated Solution a ſufficient Quantity of the Oil of Tartar *per Deliquium*, till the Effervеſcence ceaſes. Thus there will be precipitated to the Bottom of the Veſſel a Powder of a yelloviſh-red Colour, which is to be ſeparated from the Liquor, edulcorated, and afterwards dried in the Shade. The Doſe of this Medicine is from one Grain to four. If the remaining Liquor, when ſeparated from the Salt, is evaporated till only a third of it remains, it will yield Cryſtals of a highly antinephritic Quality; the Doſe of which is from two to twelve Grains.

The Tincture of Cantharides, in the *Edinburgh Diſpenſatory*, is prepared thus:

Take of Cantharides, two Drams; of rectified Spirit of Wine, half a Pound: Digeſt for two Days in a very gentle Heat; then pour of the ſtrained Tincture upon one Ounce of Balſam of Capivi; of Gum Guaiacum, half an Ounce; and of Cochineal, half a Dram: Digeſt in a Sand-heat for four or five Days; ſtrain the Tincture, and add to it of Camphire, two Drams; and of diſtilled Oil of Juniper, one Dram.

This ſeems to be a good Remedy againſt a Gonorrhœa; and fifteen or a few more Drops of it may be exhibited for a Doſe, in a proper Vehicle.

In the *London Diſpenſatory* the Tincture of Cantharides is prepared thus:

Take of Rhubarb, three Drams; of Gum Guaiacum, a Dram and an half; of Gum Lac, one Dram; of pounded Cantharides, two Drams; and of Cochineal, half a Dram: Infuſe in a Pound and half of rectified Spirit of Wine, and ſtrain off the Tincture.

But *Wedelius* obſerves, that common Spirit of Wine is more proper for extracting the Virtues lodg'd in the Salts of Cantharides, than that which is rectified. It is alſo to be obſerv'd, that Cantharides may be more conveniently preſcrib'd by their Number than their Weight, ſince they are ſo very light, that fifty of them ſcarce weigh a Dram.

The Magiſtery of Cantharides is the Powder of theſe Inſects diſſolved in Spirit of Nitre, and precipitated by an Addition of Oil of Tartar *per Deliquium*. This Medicine is poſſeſſed of a diuretic Quality, according to *Ludovicus*, in his *Pharmacopœia*; but, according to *Ettmuller*, the diuretic Virtue is rather deſtroy'd by the Precipitation. *Langius* informs us, that theſe Inſects are by ſome uſed, in order to ſecure the Fruit of their Orchards from being ſtolen. A little of the groſs Powder of Cantharides is put upon Apples, Plums, Figs, or Peaches, that grow on the loweſt Parts of the Trees. When theſe are ſtolen and eaten by the Thieves, they are ſufficiently puniſh'd for the Theft, by an intolerable Heat of Urine, and a Stillicidium: So that by this Medicine Thieves are more effectually baniſh'd from Gardens, and diſcover'd, than by *Priapus* the God of the *Lampſaceni*. But it is a monſtrous Abuſe of this Medicine, when poor People, of a fraudulent Turn, raiſe Bliſters on themſelves with it, in order to move Compaſſion, and extort an Alms, which the charitable and well-diſpoſed Part of Mankind think their counterfeit Miſery deſerves. *Rieger.*

The Eſſence or Tincture of Cantharides, directed in *Quincy's* Diſpenſatory, is thus prepared:

Put four Ounces of bruiſed Cantharides into a Cucurbit, and pour upon them, by a little at a time, of Spirit of Nitre, twelve Ounces, and let them ſtand in Digeſtion twelve Hours; then with a Glaſs Spoon or Spatula take off the black Scum from the Surface of the Spirit, which caſt away; pour gradually upon them of tartariz'd Spirit of Wine, one Pound: Mix them well by ſhaking, and place them in a Sand Furnace; lute on a Head and a Receiver; kindle the Fire, which gradually increaſe to the ſecond Degree; and in that Heat draw off a Pound and an half of Spirit, which keep for Uſe.

To that which remains in the Cucurbit, put, by a little at a time, ſo much Nitre as will ſatiate its Acidity, which may be known by the Ebullition ceaſing; then put that Mixture into a Glaſs or Marble Mortar; put to it of Camphire, one Ounce, and grind them till they are well incorporated, and return them again into the Cucurbit; rince out the Mortar with ſome Spirit of Wine, which was drawn off from them, and pour into the Body, with the remaining Part of the Spirit of Wine; ſhake them well, and ſet them into a digeſtive Heat; make the Cucurbit a Circulatory; lute the Joint cloſe, and let them ſtand in that Heat eight or ten Days, ſhaking them well every Day; then let it cool, and ſtand to ſettle; pour off the Tincture into a clean Cucurbit; and in a very gentle Heat draw off one half or more of the Spirit, which again put upon the Mixture, to extract more Tincture; and when that Spirit is again ting'd, draw off two Thirds, which put the third time to extract more Tincture, and diſtil as before, ſtill putting the Tincture remaining after Diſtillation of the Spirit to the firſt Tincture. Then take of Ambergriſe, one Dram; Muſk, half a Dram; white Sugar-candy, two Drams: Grind them well together, with a little of the Spirit laſt drawn off; pour them into a Matraſs, and to them put four Ounces of the aforeſaid Spirit; cloſe the Matraſs well, and ſet it to digeſt for four or five Days more; then put it to the Tincture of Cantharides, (alſo in a Matraſs) and let them circulate together four or five Days more; then pour it into a clean dry Bottle, which keep well ſtopt for Uſe.

The Materials muſt be put together, ſo as to prevent the Fume's being offenſive in every Part of the Proceſs. This may be pronounced a moſt excellent Medicine, in many Caſes, where we have not its Succedaneum, nor any thing tending that way. It is a moſt ſtimulating Cordial, and cannot fail to excite to conjugal Intercourſes, where a Conſtitution, by any Misfortune, has fallen into a Coldneſs or Indifference that way; for (if the Expreſſion may be allow'd) where there is Fuel, it will infallibly kindle it. The Satyrion, and all of that Tribe, are not to be compar'd to it. In many Caſes alſo, where ſloughy and cold Humours have clogg'd the Reins and Genital Parts, and thereby occaſioned other Miſchiefs, beſides an Inability to Coition, this Medicine is of mighty Service, and will anſwer where the moſt efficacious Balſams and Turpentines fail. It may be given from ten to an hundred Drops, in a Glaſs of Canary, or any other Liquor which a Patient may like better. But notwithſtanding theſe Commendations of this Medicine, which indeed cannot be greater than it deſerves, yet none but the truly Skilful muſt dare to meddle with it; for, by an injudicious Adminiſtration, it may occaſion Stranguries, Eroſions, Excoriations, and even Convulſions: Such is the Difference of an efficacious Medicine in the Hands of a good Phyſician, and an Empiric! This, therefore, as well as all the beſt Remedies, will for ever continue a Secret in the Hands of the Learned, notwithſtanding its Preparation is in the Knowledge and Power of every Perſon. *Quincy's Diſpenſatory.*

I muſt not diſmiſs the Subject of Cantharides without taking ſome Notice of a memorable Hiſtory relative to theſe Inſects.

In the Year 1693. Dr. *Groenevelt* was cited before the Preſident and Cenſors of the College of Phyſicians, on account of preſcribing Cantharides in Subſtance to a Woman in *Southwark*, before whom he vindicated his Practice; but a few Years after, upon ſome trifling Quarrel betwixt one of the Cenſors at that Time and the Doctor, he was again ſummon'd before Sir *Thomas Millington*, Preſident; Dr. *Burwell*, *Torleſſe*, *Dawſ*, and *Gill*, Cenſors; and after ſome Proceedings not altogether juſtifiable, as the Dr. complains, he was taken up by a Warrant, ſign'd by the Preſi-

dent

dent and Cenſors, and committed to *Newgate* for bad Practice. The Doctor had the good Fortune to be acquitted upon a Point of Law, which determines that bad Practiſe muſt be accompanied with a bad Intention, in order to make it criminal. And, indeed, if it was otherwiſe, no one could practiſe Phyſic without being in perpetual Danger of incurring the Cenſure of the Law, unleſs he was infallible, which, in the preſent frail State of human Nature, I believe very few pretend to be; and even Infallibility would be a very precarious Guard againſt Malice, Envy, and the intereſted Views of open Enemies, or treacherous Friends.

This Affair ruin'd the Doctor to ſuch a Degree, that it is ſaid he was buried at the Expence of the Pariſh; but I cannot aſſert that this laſt Particular is true. Ruin'd, however, he was, with this ſingular Advantage accruing to Phyſic from his Perſecution, that the Reputation of Cantharides in Subſtance, as an internal Remedy, was eſtabliſh'd by it, inſomuch that all Phyſicians, whoſe Obſtinacy or ill Will did not hinder them, came immediately into the Practice of exhibiting them. The Diſtempers in which Dr. *Groenevelt* principally recommends them are Ulcers of the Bladder, Gravel, or mucous Obſtructions in the urinary Paſſages, Suppreſſion of Urine, and Dropſy, particularly in Women. His Manner of preſcribing them was uſually thus:

> Take of Cantharides dry'd and powder'd, twelve Grains; Camphire, diſſolv'd with Oil of ſweet Almonds, fifteen Grains: Of this make two Boles; one of which is to be taken three Hours after the firſt, Evacuations ſuited to the Caſe being premiſed.

At Night let half a Scruple of *Matthew*'s Pills, with eight Grains of Camphire, be taken by way of Paregoric. Mean time let the Patient drink copiouſly Emulſions, Broths, Milk, or emollient Decoctions, with or without Gum Arabic. The Phyſician alone who has an Opportunity of obſerving the particular Circumſtances of the Caſe, and the Effects of the Remedies taken, is able to determine how long all, or any of theſe Medicines ought to be continued.

It muſt, however, be confeſs'd, that Cantharides ought not to be given in this manner, without the utmoſt Prudence and Caution; becauſe, otherwiſe, they may prove highly pernicious.

CANTHI, *κανθοί*. The Cavities at the Extremities of the Eyelids, commonly called the Corners of the Eye; the greater of them, or the great *Canthus*, is next to the Noſe; the leſſer or little *Canthus* lies towards the Temple. *Ruffus Epheſius*, *Lib.* 1. *Cap.* 4.

CANTIANUS PULVIS. A cardiac Powder, which goes by the Name of *The Counteſs of Kent's Powder*. See the Preſcription of it under CANCER.

CANTION, *κάνθιον*. in *Myrepſus*, *Antidot.* 35. and 94. is an Epithet of *σάκχαρ*, or *σάκχαρον*, *Saccharum*, Sugar, ſignifying in Conjunction with it Sugar-candy. This is doubtleſs his Meaning, ſays *Fuchſius*, becauſe all the *Latin* Copies tranſlate it *Saccharum Candi*. He obſerves alſo, that the Word is corruptly written *κάνθιον* for *κάνδιον*, and that *Myrepſus* curtails the Word in Imitation of the *Latins*, who read *Candi* inſtead of *Candidum*.

CANTRICES. Singing-women. Thoſe Women who are Singers or Dancers, according to *Aetius*, from *Rufus* and *Aſpaſia*, *Tetrab.* 4. *Serm.* 4. *Cap.* 51. have no menſtrual Purgations, becauſe whatever is ſuperfluous in them is conſumed by their too violent Exerciſe.

CANTUM, CANTIUM, *κάνθον*, *κάνθιον*. A Word in Uſe among the *Greeks* of the middle Ages, who had degenerated from the antient Purity of their Language, to ſignify *angulous*, and apply'd to cryſtallized Sugars. This *Vander Linden* endeavours to prove out of *Salmaſius* and *Meurſius*'s Gloſſary, and criticizes on thoſe who write *Saccharum Candum*, when it ſhould be written, as he ſays, *Cantum*, or *Cantium*. *Caſtellus*.

CANUM CERASA, Dog-cherries. A Species of *Periclymenum*, the ſame as *Xyloſteum*. See PERICLYMENUM.

CANUTUM, CANNUTUM. A Reed or Cane. *Rulandus*.

CANZE, CARNIT, CANNA, CUSANUM. Several kinds of Veſſels. *Rulandus*.

CAOPOIBA *Braſilienſibus*, Marcgrav. *Pomifera Braſilienſis*, *Fructu Cupulæ inſidente*, *Seminibus ſingulis duplici Pelliculæ involutis*. It is alſo ſpelt *Coapoiba*.

A Tree growing in *Braſil*, of the Height and Shape of a Beech. Its Bark is of an Aſh-colour intermix'd with Brown, like water'd Stuffs. The Leaves are ſolid and oblong, the Pedicles of which being broken, yield a milky Liquor. The Flowers ſtand each on its Pedicle, and are as big as a Roſe, and conſiſt of white Leaves like thoſe of Roſes, with fine red Ungues, and, in the Place of an Umbilicus, have a yellow reſinous Globule, of the Bigneſs of a Pea, which yield a Reſin as clear as Turpentine, glutinous and yellow, but of an unpleaſant Smell. The Fruit is ſeated in a Capſule much like an Acorn; and being cut lengthwiſe before it is ripe, ſhews many Rows of Seed of the Size and Shape of Apple-kernels. Every Seed is incloſed in a red Pellicle, which is ſurrounded with another of the Colour of Vermilion. The Pulp of the Fruit is yellow, and yields a yellow Juice. The Bark, tho' thick, is eaſily ſeparated from the Wood, which is brittle, and contains a Pith which is eaſily extracted, and leaves the Wood hollow like a Tube.

There is another Species of this Tree, which has a grey Bark, with oblong carinated Leaves, like thoſe of the *Mureci*, but not downy. The Fruit is round, and of the Size of a Tennis-ball; when ripe, green on the Outſide, but red within, and full of ſmall Grains like a Fig, dry, taſteleſs, and eaten by ſome, but not valued. I find no Medicinal Virtues aſcribed to theſe Trees. *Raii Hiſt. Plant.*

CAOVA, COAVA. A Drink, the ſame as COFFEE. *Raii Hiſt. Plant.*

CAOUP. A Tree in the Iſland of *Maragnan*, in *America*, with Leaves like an Apple-tree, but broader; the Flowers red mix'd with yellow. The Fruit is not unlike an Orange in Shape and Taſte, and full of Kernels. *Raii Hiſt. Plant.* 1693.

CAPELLA. A chymical Veſſel the ſame as *Capitellum*, or *Alembicus*, which ſee. Others by *Capella* underſtand the ſame as *Cupella*, which ſee. *Rieger.*

CAPER, Offic. Schrod. 5. 275. Mer. Pin. 166. Aldrov. de Quad. Biſul. 619. Chalt. Exer. 9. Johnſt. de Quad. 46. Geſn. de Quad. 265. Schw. de Quad. 98. *Capra domeſtica*, Raii Synop. A. 77. THE GOAT.

The Blood, the Marrow, the Suet, the Milk, the Whey, the Stones in the Stomach, the Dung, the Urine, the Bladder, the Omentum, the Skin, and the Gall of the Goat are all uſed in Medicine.

The Blood is accounted alexipharmac, deobſtruent, proper in Dyſenteries, and calculated for reſolving coagulated Blood, and diſſolving the Stone. *Dale from Schrod.*

The He-goat's Blood, and eſpecially, if we believe *Van Helmont*, that which is taken from his Teſticles, being dry'd in the Sun, is good againſt Poiſon, for provoking Sweat, Urine, and the Catamenia; and is proper in a Pleuriſy. The Doſe is from twenty Grains to two Drams. *Lemery on Foods.*

The Marrow of the Goat is more acrid and dry, and conſequently more efficacious, than that of other Animals. *Dale from Schrod.*

The Fat and Marrow of the He-goat are of a ſoftening, diſſolving, and qualifying Nature, and are alſo reputed to be good for ſtrengthening the Nerves. *Lemery on Foods.*

Goats Suet is a powerful Diſcutient, relieves thoſe afflicted with arthritic Pains, removes Stranguries, and allays hæmorrhoidal Pains.

Goats Milk is of a nutritive and abſtergent Quality, and eſteem'd proper for hectic and phthiſical Patients, and ſuch as are conſumptive or emaciated.

Goats Whey is preferable to that obtained from the Milk of any other Animal, as it is aperient, abſtergent, attenuating, and laxative; and for that Reaſon it is frequently uſed in Infuſions for purging Melancholy.

The Stones found in the Stomachs and Gall-bladders of Goats are ſaid to be poſſeſs'd of a reſolvent and diaphoretic Quality. See BEZOAR. *Dale.*

We ſometimes meet with ſmall Stones in the Gall of a Goat, which are very like the true Bezoar-ſtone. They are good againſt Poiſon, and promote Sweat. *Lemery on Foods.*

Goats Dung is of a heating, drying, abſtergent, digerent, aperient, and acrid Nature; for which Reaſon it is principally uſed in hard Tumors of the Spleen and other Parts, Swellings of the parotid Glands, Buboes, and for conſolidating deſperate Ulcers, as alſo in Dropſies, and ſciatic Pains. When calcined, it makes a fine Powder, proper in all Caſes where the Uſe of Detergents is indicated, ſuch as Alopecia and Ring-worms. Internally it is properly exhibited in Diſorders of the Spleen, Jaundice, Obſtructions of the Menſes, and other Diſeaſes of a like Nature. *Dale from Schrod.*

Goats Dung contains much volatile and ſharp Salt, which makes it to be of a diſſolving, deterſive, drying, and digeſting Nature, fit to remove Obſtructions of the Bowels; and good for the Stone, if inwardly taken. They alſo apply it outwardly for diſſolving cold Tumors, and other Diſtempers, wherein it is uſed for attenuating the Humours. *Lemery on Foods.*

Goats Urine is recommended above that of all other Animals for diſſolving the Stone, and promoting a Diſcharge of Urine; for which Reaſon it is proper in the Dropſy.

The urinary Bladder of a Goat dry'd and reduc'd to a Powder is ſaid to be a Medicine of peculiar Efficacy in an Incontinence of Urine.

The Omentum of a Goat, apply'd hot, allays and checks turbulent Motions of the Spirits, for which Reaſon it is very properly uſed in Colic Pains and a Mania.

The Skin of a Goat relieves Diarrhœas, ſtops Hæmorrhages, and eſpecially that of the Noſtrils.

The Gall of a Goat is ſaid to cure Quotidian Fevers. *Dale from Schrod.*

They

They mix the Gall of a Goat with Bread, the Whites of Eggs, and Oil of Laurel; and thus 'tis looked upon to be good for a Quotidian Ague, if apply'd by way of Cataplasm to the Navel. *Lemery on Foods.* See CAPRA.

CAPETUS, κάπη, a Pit, Ditch, or Trench, in *Hippocrates, de Articulis*, signifies those Holes or Niches which are cut in the *Bathron* or *Scamnum*, (a Machine for restoring Luxations) for the Strengthening and better Management of the Axes. *Hippocrates* directs these *Capeti*, or Niches, to be made in the lower Part of the Scamnum, at Intervals of four Fingers Breadth, three Fingers Breadth in Depth, and as many wide. Thus *Galen*, on this Place; with whom agree *Erotian* and *Paulus Ægineta*. *Foesius*, *Gorræus*.

CAPHORA, CAPHURA. The same as CAMPHORA.

CAPICAGTINGA, *aliis Jacarecatinga*, *Acori Species*. Pison.

A Species of Acorus growing in the *West-Indies*, much like the *European* in the Shape of the Root and Leaves, tho' not so large; but is as much superior to it in Virtue, as exceeded by it in Size, especially the Root, which is hot and dry, and of a grateful bitterish and aromatic Taste. Taken alone, or mixed with other things, it is not only an effectual Incisive of cold peccant Humours, but is successfully used as an Antidote against Poison received inwardly both by Natives and Foreigners. It does not always grow in watery Places like the Iris, but thrives in other Places of a flat Situation, and glebous Soil.

CAPILACTEUM, ἀφρόγαλα. See APHROGALA.

CAPILLAMENTA, Capillaments, in Botany, signify, first, those slender sort of Filaments which spring up within the Leaves of a Flower, and are more usually called *Stamina*, whence a *capillaceous* Flower is the same as a *staminous*; and, secondly, by *Capillamenta* are meant those slender Parts or Filaments which resemble Hairs, and are produced from Vegetables; as, for Instance, from Seeds, *Columel. R. R. l. 4. c. 11.* and Roots, *Pallad. R. R. l. 11. c. 12. Rieger.*

CAPILLAMENTUM, τρίχωμα, τριχωμάτιον, properly signifies any hairy or villous Integument belonging to Animals, as πτέρωμα is put for the pennous or feathery Integument of Birds; in this Sense *Capillamentum* is the same as *Capillitium*. See the preceding Word.

CAPILLARIS, τριχώδης, τριχοειδὴς, is applied in general to any thing that resembles Hair, particularly to the smallest and extreme Parts of the Veins and Arteries; it is also an Epithet of Distinction for such sorts of Plants, as, according to *Ray*, have no main Stalks, but bear their Seed on the back Side of their Leaves, and are called *Capillares*, he says, because they are supposed to remedy all Defects belonging to the *Capillus* (Hair); or they are called Capillary, because they grow close to the Ground, as the Hair grows to the Head.

Capillares Vermiculi with some signify those small Worms in Infants, which are otherwise called *Crines*, *Crinedones*, and *Dracunculi*. *Castellus.*

CAPILLATIO. A Capillary Fracture of the Cranium. See TRICHISMOS.

CAPILLITIUM. Properly the same with *Capillamentum* (see before); but is sometimes used for TRICHIASIS, which see.

CAPILLORUM DEFLUVIUM. The same as ALOPECIA.

CAPILLUS signifies properly the Hair of the Head, but is also used to signify any sort of Hair in general. *Castellus.*

CAPILLUS, the Hair, in *Rulandus*, is called LAPIS REBIS.

The Hairs are observed by the Microscope to be hollow, and furnished with a Multitude of Vessels; and, however they appear to us to be simple and equal, the Microscope shews them to be knotted like some sorts of Grass, and to send out Branches at the Joints. Their Cavity has been otherwise proved by the Distemper called the *Plica Polonica*, in which the Blood itself has drop'd through the Hairs. But I have never seen this Case, and am inclined to doubt, whether the Blood that issues be not sent from other Vessels, and only runs externally from the Root of Hair to the Extremity.

As for the Branching of the Hair, 'tis pretty visible at the Extremities with a Microscope; for it is very apt to split (as the Hair-cutters call it) especially if it be worn long, and kept dry. This Division of the Extremity (which, to the naked Eye, seems to consist but of two or three Hairs) by the Microscope appears to be a Brush of Hair.

Each of these Hairs has a little bulbous or oval Root in the Skin, which sometimes adheres to it so as to be plucked away with it.

They are commonly reputed an Excrement, and esteemed to be nourished by such; but, whatever the Matter of their Nourishment is, it seems to be more simple than the other Humours of our Bodies. For long after Death, when all the other Parts and Humours are putrefied and corrupted, the Hair will vegetate and increase, which it appears to do so long as any Moisture remains in the Part. *Drake's Anatomy.*

Those that have by Nature soft, thin, and short Hair, which, with great Difficulty, receives or retains a Buckle, and those who readily run into Baldness, or Shedding of the Hair, towards the Spring, are certainly of a loose, flabby, and relaxed State of Nerves: For the Hair seems to be only some of the fleshy Fibres lengthened outwards, and hardened; at least they seem to be of the same Kind and Nature with the other Fibres, consist of a great many lesser Filaments, contained in a common Membrane, and are solid, transparent, and elastic: And as the Hairs are in Strength, Bulk, and Elasticity, so generally the Fibres of the Body are; and those whose Hair sheds, turns thin, lank, or refuses Buckle, if it does not happen to them after recovering from an acute Distemper, ought to take care they fall not into nervous Disorders, which anointing their Hair with sweet Oils, or washing their Hands with Honey-water, will scarce prevent.

Other things being equal, those of the fairest, clearest, and brightest coloured Hair, are of the loosest and weakest State of Fibres and Nerves, not only because the fairest and lightest is the most rare, transparent, and fungous, but because Bodies of the lightest Parts consist of Parts of a weaker Union, which adhere with less Force, and consequently are less elastic, firm, and springy, than those of the darker, and more opake Colours. We generally observe, that People of very fine and white Hair, especially if so after they are come to Maturity, are of weak, tender, and delicate Constitutions: And those who deal in making artificial Covers for the Men or Women, find that such Hair will never, with any Credit to them, serve these Purposes, and seldom honestly employ it for that End. *Cheyne's English Malady.*

CAPILLUS CANADENSIS. The same as ADIANTHUM CANADENSE.

CAPILLUS VENERIS. See ADIANTHUM.

CAPIPLENIUM. A barbarous Word, used by some for a Catarrh. *Baglivi* makes use of it to signify that continual Heaviness, or Disorder in the Head, which the *Greeks* called καρηβαρία, *Carebaria.*

CAPISTRATIO. The same as PHIMOSIS, which see.

CAPISTRUM, φιμὸς, φίμος, κημὸς, besides its common Signification, a *Bridle*, is a Name for some sorts of Chirurgical Bandages used about the Head. *Castellus.*

CAPISTRUM *Auri*. Borax. *Rulandus.*

CAPITA, Heads in Plants, are either those Receptacles of the Seeds, which by their globous Figure represent a Head; as the Heads of Poppy, for Instance; or else they are the same as *Bulbi*, Bulbs.

CAPITALIA. The same as CEPHALICA, which see.

CAPITATÆ *Plantæ* are Plants whose Seeds, with their Down, being included in a squamous Calyx, are conglobated into a roundish Figure resembling a Head. *Raii Hist. Plant.*

CAPITELLUM, in *Johnson*'s Lexicon, is soapy Water; in *Libavius*, and some other Authors, it signifies a Lixivium; it is also taken for an Alembic. *Castellus. Rieger.*

CAPITILUVIUM. A Bath or Lotion for the Head. *Rieger.*

CAPITIS DOLOR. See CEPHALALGIA.

CAPITIS VENA. See VENA CEPHALICA.

CAPITO. The Surname of *Artemidorus* the Physician, who published the Works of *Hippocrates*, and is often mentioned by *Galen.*

CAPITO ANADROMUS. A Fish which lives both in the Sea, and in Rivers. It has a great Head, large, beautiful, white Eyes, a thick Snout, a long Body, covered with small Silver Scales, mixed with a little Blue. It weighs about two Pounds when at its full Bigness, lives upon small Fishes and Insects, and is very good to eat.

It is thought to be proper for purifying the Blood, and to provoke Urine. *Lemery des Drogues.*

CAPITULUM. The botanic Signification of *Capitulum*, or *Capitellum*, is given under the Article BOTANY; in Chymistry they are the same as ALEMBICUS, for which see that Article; in Anatomy they signify a smaller Process or Protuberance of a Bone, received by another Bone.

CAPIVARD, in *Portuguese*, signifies a Water-dog, which is described to be an amphibious Animal, with a Body like a Hog, and Head like a Hare, and without a Tail. It keeps itself almost continually on its Posteriors, like an Ape. It is found in *Brazil*. It lives all the Day in the Sea, and at Night comes on Shore to ravage the Gardens, and root up the Trees. Its Flesh is wholsome Food. *Lemery des Drogues.*

CAPNELÆUM, καπνήλαιον, in *Galen*, *Lib. 2. C. M. S. L.* is a Resin which flows spontaneously; "of which he says there "is Plenty in *Lacedemon*; in *Cilicia* they call it καπνήλαιον, "*Capnelaion*, [from καπνὸς, Smoke, and ἔλαιον, Oil] smoaky "Oil." And in *Lib. 3. C. M. S. G.* he says, that in *Lacedemon*, and some other Places, they call these sorts of Resins πρωτόφυτα, "the first Product." It seems to be called *Capnelaion*, says *Foesius*, from the Smoak it gives when placed nigh the Fire, or because it is more liquid than all other liquid Resins, as well as hotter and thinner, and consequently comes nearer the Nature of Oil.

CAPNIAS, καπνίας, from καπνὸς, Smoak; a ſort of Jaſper, of a ſmoaky Colour. *Aetius, Tetrab.* 1. *Serm.* 2. *Cap.* 36. Alſo a kind of Vine which bears part white and part black Grapes. *Theophraſtus de Cauſis Plant. Lib.* 5. *Cap.* 3.

CAPNISTON, καπνιστὸν, is an Epithet of a ſort of Oil, prepared of ſeveral ſorts of Spices and Oil, by kindling the Spices, and ſuffumigating the Oil.

CAPNITIS, καπνῖτις. See CADMIA.

CAPNOIDES, καπνοειδὴς, (from καπνὸς, *Fumaria*, Fumitory, and εἶδος, a Reſemblance, on account of its Likeneſs to Fumitory) Podded Fumitory.

The Leaves and whole Face of this Plant reſemble Fumitory; but the Style of the Flower becomes a long taper Pod, which contains many round ſhining Seeds. *Miller's Dictionary.*

CAPNORCHIS, *Indian* bulbous-rooted Fumitory.

This has the whole Face of Fumitory: The Root is ſometimes tuberous, ſometimes ſcaly, and at other times bulbous. The Flower conſiſts of two Leaves, is of an anomalous Figure, and hangs downward. The Pods are like thoſe of Shepherd's-pouch. *Idem.*

CAPNORCHIS *Americana*, Boerh. Ind. *American* bulbous-rooted Fumitory. The Flowers of this Plant are ſomewhat like thoſe of Fumitory. *Idem.*

I find no medicinal Virtues aſcribed to the three foregoing Plants.

CAPNOS, καπνός. The ſame as FUMARIA, which ſee.

CAPO, *Capus*, *Gallus Spado*, *Gallus Eviratus*, and the Ἀλεκτρυὼν ἐκτομίας of the *Greeks*, are ſo many different Names for that Animal we call a Capon, or caſtrated Cock. The Deſign of performing this Operation is to tame and deſtroy the Luſt of the Animal, to render him a fit Leader for the other Poultry, but principally to put his Fleſh in a Capacity of becoming more fat and nouriſhing than it was before. *Martial* reckons their Fleſh one of thoſe delicate Foods ſought after by Gluttons and Epicures. But tho' the Fleſh of the Capon is allowed to be highly nutritive, and to generate a large Quantity of laudable Blood, yet ſome celebrated Authors, among whom is *Joannes Crato*, a Man of great Judgment and Learning, have forbid the Uſe of them, eſpecially to gouty Patients, becauſe they obſerved, that this Fowl was itſelf ſubject to arthritic Diſorders; as if thoſe who eat the Feet of Capons ſhould, for that Reaſon, be afflicted with the Gout, or as if, when eaten, their Quality was not altered by the concoctive Powers of the Stomach. Capons are not therefore to be condemned, becauſe they are ſometimes ſeized with the Gout, ſince that Diſorder is in them produced by a Defluxion of Humours, and an Imbecillity of the Parts which receive them, which Accidents can never be produced in our Bodies by eating their Fleſh. But if it ſhould happen, that any one ſhould, by eating the Fleſh of this Fowl, be afflicted with the Gout, this is rather owing to theſe Capons being fed in Cages by the Poulterers; by which means their Fleſh is rendered moiſt and recrementitious, and conſequently fit for generating and increaſing Obſtructions in the Body. For this very Reaſon *Galen* condemns all Fowls fed by the Poulterers. It may juſtly be aſked, whence it happens, that a Capon, which is a Eunuch, and free from Venereal Inclinations, ſhould be ſubject to the Gout; ſince, according to the twenty-eighth Aphoriſm of the ſixth Book of *Hippocrates*, *Eunuchs are not afflicted with the Gout*; and that a Cock, which is highly ſalacious, ſhould not in the leaſt be ſubject to that Diſorder! *Scaliger*, in his *Exotericæ Exercitationes*, anſwers this Queſtion, by ſaying, that Capons are ſeized with the Gout, becauſe their Heat is ſmall, and their Appetite great; whereas in Cocks the Heat is great, and the Appetite little. The Heat, ſays he, of the Capon is ſmall, in conſequence of his Virility being deſtroyed by Caſtration. Hence, by the Voracity and Weakneſs of the Heat, many ſuperfluous Humours are generated in the Body of the Capon, which falling to the Feet, theſe more ignoble Parts, which are weak in conſequence of their cold and exſanguious Nature, produce a Gout. On the contrary, as a Cock eats more ſparingly, and abounds in natural Heat, his Body muſt be free from Crudities, and ſuperfluous Humours, and conſequently not ſubject to the Gout. And tho' it may be objected here, that a Cock weakens his Feet by exceſſive Venery, and ſo diſpoſes them for the Reception of foreign Matter, yet we may anſwer, from *Galen*, that the bare Weakneſs of the Feet is not ſufficient for the Generation of the Gout, but there is required alſo an Influx of the Humours into thoſe Parts, without which a Gout can never be formed. But there can be no Influx without an antecedent Coacervation, which can never happen whilſt the Heat is of ſufficient Strength to digeſt the Food, and to conſume or expel ſuperfluities; and if the Animal be moderate in Eating, and be frequently exerciſed. This being the Caſe with reſpect to Cocks, it is no wonder that they are free from the Gout, tho' frequent in the Uſe of Venery. *Sebizius de Aliment. Facult.* The antient Phyſicians ſcarce ever mention Capons, but univerſally agree in pronouncing all Aliments, if caſtrated in Seaſon, to be the beſt in their kind for Food. *Caſtellanus de Eſu Carnium.* And it is now the univerſal Opinion, that the Fleſh of Capons, eſpecially cram'd and young, is not only ſavoury, but eaſy of Digeſtion, and highly nutritive. On theſe Accounts it is not only preſcribed as a Reſtorative to Perſons on their Recovery from Sickneſs, being variouſly prepared, as roaſted or boiled, and eſpecially ſeaſoned with Lemons or Oranges; but Jelly-broths made of the ſame are recommended in chronical Diſtempers as a Strengthener, and are thought to be of excellent Service, particularly in a Hectic Fever and Phthiſis. The way of Preparation in theſe Caſes is thus:

They bruiſe the Capon, Bones and all; and then incloſing it in a Pot, with a little Cinnamon and Salt, clap it into a Copper Veſſel full of boiling Water; and when it has boiled a ſufficient Time, take it out, and ſerve it up to the Sick as a Strengthener.

Some, for Oſtentation, or out of Ignorance, add Gold Coins, eſpecially thoſe of *Hungary*, in the Boiling. *P. Hermanni Boecler Cynoſura Mat. Med. Tom.* 2.

As it is Labour loſt to ſearch after nouriſhing Virtues in diſtilled Waters, ſo it is a ridiculous Piece of Vanity to expect Nutriment from the nauſeous diſtilled Water of the minced Fleſh of a Capon. *Boerhaave's Chymiſtry, Vol.* 2. Wherefore thoſe Capon-waters, which are compounded with an Addition of Powders which yield forth their Virtues in the Diſtillation, would have the ſame Virtues, were there nothing of a Capon uſed in the Proceſs; ſo that the Apothecary does no Injury neither to his Patient, nor the Reputation of the Phyſician who adviſed ſuch Capon-water, if he turns the Bird out of the Diſtiller's Laboratory into his Kitchin to be dreſſed. Hence we may form a Judgment of the *Aqua Caponis Quercetani*, which is diſtilled from a Capon with Aromatics and Wine, and is recommended for recruiting the Strength, and abating continued Fevers. *Quercetani Pharmacopœia. Mynſicht's Aqua Caponis* is ſtill a leſs elegant Compoſition, ſince it has fewer Aromatics, with an Addition of mucilaginous and refrigerating Subſtances, which, in Diſtillation, yeild none of their Virtues, not to mention the Species Diamargariti frigidi, in the room of which *Quercetan* ordered prepared Coral, equally ill calculated for Diſtillation. *Mynſicht's Theſaurus.* The *Aqua Caponis*, in the *Diſpenſatorium Brandenburgicum*, and the *Pharmacopœia Auguſtana*, is prepared of the Broth of a Capon, with the diſtilled Waters of Borrage and Bugloſs, and an Addition of the Four cordial Flowers, and Cinnamon. This Water is recommended as an Analeptic. But *Zwelfer*, in his *Animadverſiones ad Pharmac. Auguſt.* has juſtly obſerved, that "Conſumptive "Patients, and ſuch as are extenuated by chronical Diſorders, "might be more effectually recruited by the Exhibition of "Capon-broth, mixed with the beſt Cinnamon-water, and "other Cordials, without Diſtillation, than by the Water "diſtilled from a Capon, which is poſſeſſed of none, or at "leaſt a very ſmall reſtorative Virtue." In *Lemery's Pharmacop.* the Proportion of theſe Species for Diſtillation is, indeed, ſomewhat varied, and an Addition of Crums of Bread made: But the Water does not ſeem to derive any Excellence from that, or to be rendered leſs ſubject to *Zwelfer's* Cenſure. The Fat of the Capon, when recent, and not rancid, is proper both for internal and external Purpoſes, where pinguious, emollient, and lenitive Subſtances are indicated. Some arthritic Patients make a Cock or Capon lie in Bed at their Feet, with an Intention, by that means, to communicate the Diſorder to the poor Animal. *Boecler. Cynoſura Mat. Med.* They may poſſibly be of Service in this Caſe, by cheriſhing the Part affected with their Heat. Whether Beans, macerated in Capons Blood before they are ſown, are, by that means, rendered Proof againſt the Injuries of Herbs that have an Antipathy to them, as the Antients thought, according to *Palladius R. R. L.* 12. *Tit.* 1. is a Point we leave to be determined by Experience. *Rieger.*

CAPOLLIN *Mexicanorum Hernandez, ſeu Ceraſus dulcis Indica.*

It is a Tree of a moderate Bigneſs, with Leaves like thoſe of an Almond, or our Country Cherry-tree. The Flowers hang down in Bunches, which are ſucceeded by Fruit, which reſembles our Cherries in Shape, Colour, Bigneſs, Stones, and Kernels; and are alſo ſomewhat acid and aſtringent, when green, but ſweet, and very grateful to the Taſte, when ripe. It bloſſoms in the Spring, and bears Fruit all the Summer. It requires a temperate Climate, and grows in Gardens and Fields in *Mexico*, as well ſpontaneouſly, as by Cultivation.

The Juice of the young Buds mollifies the Tongue when parched with Heat, the Decoction of the Bark being expos'd to the Sun fifteen Days, and the Weight of a Dram of it, taken, cures the Dyſentery. The Powder helps Inflammations. In a time of Dearth they make Bread and Drink of the

the Fruit; but it affords an Aliment inclining to Melancholy; and the frequent Uſe of it cauſes a Rankneſs of Breath, and makes the Teeth black, which, however, may be remedied by Dentifrices. There are three Species of this Tree, which differ only in Fruit; for the *Xitoma Capollin* bears a Fruit about the Bigneſs of a *Damaſcen* Plum, the *Helocapollin* one ſomewhat leſs, and the *Tolacapollin* the leaſt; but all of them hanging in Cluſters. *Raii Hiſt. Plant.*

CAPOTES. The ſame as *Cydonia exotica*, C. B. which ſee. *Raii Index.*

CAPPARIS, Offic. Κάππαεις, Dioſcoridis. *Capparis rotundiore folio*, Ger. 748. Emac. 895. *Capparis ſpinoſa, folio rotundo*, Park. Theat. 1023. Raii Hiſt. 2. 1629. *Capparis ſpinoſa, fructu minore, folio rotundo*, C. B. Pin. 480. Jonſ. Dendr. 274. Tourn. Inſt. 261. Elem. Bot. 228. Boerh. Ind. A. 2. 71. *Capparis ſpinoſa*, J. B. 2. 63. Chab. 110. CAPERS.

This is a Buſh, having many running trailing Branches, full of ſharp crooked Thorns, growing at the Joints, with the Leaves, which are ſet in an alternate Order on the Branches, about an Inch long, and as much broad, a little pointed at the Ends, on ſhort Foot-ſtalks. The Flowers grow among theſe, on pretty long Stalks, conſiſting of four red Leaves, full of curl'd Apices in the Middle; and are ſucceeded by long roundiſh Fruit, containing a great Number of ſmall Seeds.

The *Caper* Buſh grows in the Southern Parts of *France*, and in *Italy*, in ſandy and ſtony Places.

Pliny, in the fifteenth Chapter of the twentieth Book of his *Natural Hiſtory*, delivers the Sentiments of the Antients, with reſpect to the Uſe of this Plant, in the following Words: "'Tis reported, that thoſe who eat it daily are in no Danger "of being ſeiz'd with the Palſy, or Pains of the Spleen. Its "Root, when bruiſed, removes the white Leproſy, if the "Patient is rubb'd with it in the Heat of the Sun. Two "Drams of the Bark of its Root, drank in Wine, make a "Medicine beneficial to ſplenetic Patients, provided they abſ-"tain from the Uſe of Baths. 'Tis alſo reported, that, by "the Bark of the Root, the whole Spleen may be diſcharged "by Urine and Stool, in the Space of thirty-five Days. It is "drank in Pains of the Loins, and Palſies. A Decoction of "its triturated Seeds in Vinegar, or its Roots chew'd, relieve "the Tooth-ach. A Decoction of its Seeds, in Oil, is inſtil'd "into the Ear, for Pains of that Part. Its recent Leaves and "Root, made up with Honey, cure phagedenic Ulcers; and "the Root, when boil'd in Water, diſcuſſes ſtrumous Swell-"ings, cures a Parotis, and expels Worms: It alſo removes "Diſorders of the Liver. It is alſo uſed againſt ſcald Heads, "with Vinegar and Honey. A Decoction of it, in Vinegar, "cures Exulcerations of the Mouth; but it is agreed upon, by "Authors, that it is prejudicial to the Stomach." To this Account of *Pliny*'s, we ſhall add that given by *Dioſcorides*, in the 204th Chapter of his ſecond Book. "The Trunk and "Fruit are pickled for Food. They produce Commotions in "the Belly, are prejudicial to the Stomach, and create Thirſt; "however, they agree better with the Stomach when boiled, "than when crude. Two Drams of the Fruit, drank in Wine "for forty Days ſucceſſively, conſume the Spleen, and occa-"ſion a Diſcharge of Urine, and bloody Excrements. It is "drank with Advantage in ſciatic Pains, Palſies, Ruptures of "the muſcular Parts, and Convulſions. It alſo provokes the "Menſes, and purges the Head. A Decoction of its Seeds, "in Vinegar, relieves the Tooth-ach, if the Mouth is waſh'd "therewith. The dried Bark of the Root is beneficial in the "ſame Caſe, and deterges all old ſordid and callous Ulcers: It "is uſed, in Conjunction with Barley-meal, for anointing thoſe "who labour under Diſorders of the Spleen." *Hippocrates*, in his third Book *de Morbis*, recommends the Bark of the Caper-tree Root, mix'd with proper abſtergent Potions, as a Medicine adapted to promote the Expectoration of Matter in peripneumonic Patients. According to *Simeon Sethi*, "Capers are "poſſeſs'd of different Qualities; ſuch as Bitterneſs, by which "they abſterge, cleanſe, and incide; Acridneſs, by which "they heat, diſſipate, and attenuate; and Acidity, by which "they inſpiſſate, and prove aſtringent: For this Reaſon they "are beneficial in Hardneſſes of the Spleen, whether they are "eaten, or applied, by way of Plaiſter, with Vinegar or Oxy-"mel. They provoke the Menſes, and allay the Tooth-ach "when boiled either in Wine or Vinegar. The Bark is the "moſt efficacious Part of the Plant: The Trunk and Fruit "are leſs powerful in their Operation. They ſoften ſcrophu-"lous Tumors, and their Juice kills Worms ingender'd in the "Ears. Capers, pickled with Vinegar, open Obſtructions of "the Liver and Spleen. By a Quality peculiar to themſelves, "they are beneficial in Diſorders of the Spleen, and ſciatic "Pains; but are hurtful to the Bladder and Kidneys." From what has been ſaid, 'tis obvious that the Antients were acquainted with the aperient Nature of its Root, and alſo of its corroborating Quality, in conſequence of its Aſtringency. But it is carrying the thing too far, to aſſert that its Energy is ſo great as to conſume and carry the whole Spleen out of the Body. In conſequence of its Bitterneſs, it ſeems well calculated to deſtroy Worms. Beſides, that it is ſo prejudicial to the Stomach, the Kidneys, and the Bladder, does not appear from the Capers in Uſe among the Moderns; for what *Paulus Ægineta* ſays of them, *Lib.* 1. *Cap.* 74. ſeems rather to be true. "The Caper, ſays he, procures an Appetite, opens the "Paſſages of the Liver and Spleen, and ſubdues Phlegm; but "it is to be uſed before Meals, with Oxymel, or with Oil and "Vinegar." The Author here means the green Flowers, pickled before they blow, and which are commonly ſold in the Oil-ſhops. They gather the full-grown Buds of the Flowers before they blow, and leave them ſpread in a Shade for three, four, or five Hours, till they begin to grow flaccid, in order to prevent their Opening. Then they put them in a Veſſel, add Vinegar to them, cover the Veſſel with a Board, and let them remain in that State for eight Days: Then, taking them out of the Veſſel, they ſqueeze them gently; and, adding freſh Vinegar, let them ſtand in that Condition for eight Days more. This Operation they repeat a third time, gently preſſing the Capers, and adding freſh Vinegar. This done, they are put into a Caſk with Vinegar; to which ſome add Salt.

The leaſt are by ſome thought the beſt, and thoſe brought from *Genoa* are generally preferr'd to the other Kinds. But *Pomet* and *Savary* aſſert, that they are rarely imported into the Northern Countries from any other Part than *France*, under ſuch Names as may beſt pleaſe the Purchaſers. Thoſe brought to *Venice* from *Alexandria*, tho' larger than the *Italian* Capers, are eſteemed the beſt of all others; and, according to *Hoffman de Medicamentis Officinalibus*, *Lib.* 2. *C.* 47. the largeſt are the beſt, as being the moſt entire. Their auſtere bitteriſh Taſte ſufficiently convinces us of their aſtringent and corroborating Virtues; and, if we conſider the Qualities they derive from the Vinegar and Salt, we may eaſily conceive, that they are of a reſolvent and inciding Nature: For this Reaſon they are recommended as Pickles with Food, in order to ſtrengthen a languid Appetite; and are principally beneficial to thoſe whoſe Stomachs abound with groſs pituitous Humours, who have weak Stomachs, and want a due Appetite. They are alſo good for Obſtructions of the Viſcera, eſpecially thoſe of the Spleen, for the Palſy, and Convulſions ariſing from a Superfluity of peccant Humours. They are alſo highly recommended in long and chronical Fevers. *Proſp. Alpin. Hiſt. Nat.*

Laurentius Joubert, in the Plague, recommends them ſeaſon'd with Salt, gently boil'd in Water, and eaten with Vinegar; "for, ſays he, they excite an Appetite, and open Ob-"ſtructions, if there are any in the Body." For this Reaſon they ought not only to be allow'd in peſtilential Caſes, but alſo recommended, becauſe they reſiſt Putrefaction. *Benivenius de abditis Morborum Cauſis*, *Cap.* 105. informs us, that he cured a Patient, labouring under Diſorders of the Spleen, only by the Uſe of Capers, ordering him to drink Forge-water for a Year; after he had been harraſs'd with his Diſtemper for ſeven Years, conſulted many Phyſicians, and tried many Remedies, to no Purpoſe. "Externally, ſays *Ettmuller*, the Pickle of Capers "is applied to the Side, under the Left Hypochondrium, with "Linen Cloths, or a Spunge, for diſcuſſing Swellings of the "Spleen. If, to this, Muſtard-ſeed is added, that the Vinegar "may be impregnated with its volatile Salt, it is an excellent "Remedy in Diſorders of the Spleen." In ſome Places of *Holland* and *Germany* the Buds of the Flowers of the *Cytiſogeniſta Scoparia vulgaris, flore luteo*, pickled in Vinegar and Salt, are ſubſtituted in the room of Capers; nor are they leſs agreeable to the Palate, or leſs proper for exciting a languid Appetite, opening Obſtructions of the Liver and Spleen, and killing Worms. *Hoffman*, according to *Konigius*, affirms, that the round Buds of the *Caltha Paluſtris* may be very properly ſubſtituted in the room of Capers. The Root of the Caper-tree is one of the Five leſſer opening Roots. But, in a particular manner, the Bark of the Root, brought from *Egypt* and *Apulia*, dried in ſmall Tubes like the Cinnamon, but ſhorter, and rough, thick, of a cineritious Colour, and of an auſtere bitteriſh Taſte, is celebrated for its aperient and ſubaſtringent Virtues; for which Reaſon it is claſs'd among the Splenetic Medicines, and uſed in Decoctions for Diſorders of the Spleen. This Bark is alſo uſed in Splenetic Plaiſters, according to *Bauhine*. *Bayrus* took Caper-roots, and boiled them, in Aſſes Milk, to a Conſumption of the third Part of the Milk, with which he anointed the Hairs of the Head over Night, which, when comb'd, become black by that means. Simple Oil of Capers, obtain'd by boiling the Bark of the Root in Olive-oil, is, by *Ettmuller*, recommended for external Uſe in Diſorders of the Spleen. The Method of uſing it is to anoint the Left Hypochondrium with it. The *Emplaſtrum de Cicuta*, generally uſed in Tumors of the Spleen, is ſometimes moiſten'd with this Oil: But in its room the Oil of Amber may be ſubſtituted, as being of a more penetrating Nature. In ſome Diſpenſatories there is an *Oleum Capparum Compoſitum*, prepared of the Bark of the Root, with an Addition of ſome aperient Powder, ſprinkled with Vinegar, and boil'd in Oil of Olives. Some alſo add Wine. *Joannes Du Bois de Methodo miſcend. Remed. topic.*

topic. In the *Pharmacopœia Parisiensis* the Vinegar is omitted, and, in its room, Capers pickled with Vinegar, and White-wine, are substituted. It is an antient Custom, tho' we know not the Author of it, to anoint the Hypochondria of People afflicted with hypochondriac Disorders and Inflations, with Oil of Capers, which is possess'd of an attenuating and gently corroborating Quality. *Schulzii Prælectiones de Viribus Medicamentorum.* In *Lemery's Pharmacop.* this Oil has more Ingredients than it is commonly prepared with; but the Composition may possibly not have a great deal added to its Efficacy by that means. *Zwelfer*, in the *Pharmacop. Regia*, in order to render the Composition more effectual, to the other Aperients adds Sal Ammoniac, Tobacco, Camphire, and distil'd Oil of Gum Ammoniac; and thinks, that, in order to heighten the Virtues of the Medicine, the distil'd Oils of Soot and Tobacco may be added. The *Trochisci de Capparibus*, of *Mesue*, are prepared of the Bark of the Root, and several aperient Powders, triturated very fine, and made up with Gum Ammoniac dissolved in Vinegar. *Mesue* recommends this Preparation for removing Hardnesses, and dispelling Flatulencies of the Spleen. He orders a Dram and an half of it to be given for a Dose, with Wine, in which Caper-tree Root, the Bark of the Ash, the Bark of Willows, and that of the Tamarisk, or the Points of its Branches, have been boiled. Upon which *Jacobus Sylvius* observes, that the Willow bark is ill calculated for answering the Intention, because it is astringent. *Mesue de Re medica.* The *Extractum Capparum*, in the *Dispensatorium Hafniense*, is prepared of the Roots and common Water, with an Addition of little or no Spirit of Wine.

CAPRA ALPINA, Offic. *Capra Alpina sive Rubicapra*, Schrod. 5. 276. *Rupicapra*, Bellon. Obs. Ed. Clus. 57. Jonst. de Quad. 52. Gesn. de Quad. 292. Charlt. Exer. 9. Raii Synop. A. 78. *Dorcas sive Rupicapra*, Aldrov. de Quad. Bisul. 725. THE CHAMOIS, or GEMS.

It is frequently met with among the *Alps* belonging to *Switzerland*, and the Country of the *Grisons*, being a sort of wild Goat, in Shape and Size resembling the tame one, with short Horns, the Extremities of which are hook'd.

The Parts used in Medicine are the Blood, Fat, Liver, Gall, Dung, and the Stone found in his Stomach, call'd *Ægagropila*, and *Bezoar Germanicum.* See ÆGAGROPILA, and BEZOAR.

The fresh Blood is a Cure for the Vertigo; the Fat is good for the Phthisis, and Exulceration of the Lungs; the Liver stops a Looseness; the Gall clears the Eye of an Albugo, and helps a Nyctalops (*an Affection of the Eyes, which causes the Patient not to see in the Night, tho' some take the Word in a contrary Sense.* See NYCTALOPS); the Dung wastes and expels the Stone: And the Ægagropila, or Bezoar, besides its Virtues in almost all manner of malignant Diseases, is thought to procure an easy Delivery. *Dale.*

CAPREOLARIS, *sive Hederarius Anfractus*, κισσοειδὴς, ἑλικοειδὴς, is the Connection of spermatic Veins and Arteries, which descend to the Testicles, not by a strait Passage, but winding and twisting about in manner of the Tendrils of a Vine or Ivy. *Galen de Semine, Lib.* 1. *Cap.* 12.

The other Names for it are *Vasa præparantia*, *Corpus varicosum*, *pampiniforme*, and *pyramidale.* *Castellus.*

CAPREOLATA, *Bryoniæ nigræ folio Brasilienſis tricocca*, Margg.

It creeps and twines about other Plants: The Leaves stand on Pedicles two, three, or four Fingers Breadth in Length, and are shaped like a Heart. The Flowers grow on Pedicles two or three Fingers Breadth in Length, which, in the upper Part, are branched into four or five Divisions, each bearing a Flower. The Flowers resemble those of the Smilax, are white, but mix'd with a faint Purple on the outer Half.

In the midst of the Flower stands up a white purplish Stamen, and on its interior Circle is a lively Representation of a Star with five Rays, as tho' impress'd, and of a white Colour like the Flower itself. The Flowers are succeeded by a dark-colour'd, roundish, triquetrous Body, divided into three Capsules, in each of which is a brown Seed, of the Shape and Size of an ordinary Pea, unequally cut. The Flower is without Smell, and the Plant insipid. *Raii Hist. Plant.*

CAPREOLUS, or CLAVICULA, in Botany, is that long smooth Production in Plants which is like a String, and grows out of the Stalk. It consists of rough Vesicles, and Bundles of small Fibres, of an elegant and orderly Contexture, and is the Instrument with which some Plants of weak Stalks are furnish'd, that they may not creep on the Ground, but use it to lay hold of, and by that means twine themselves about the neighbouring Plants. *Varro, R. R. l.* 1. *c.* 31. describing the Capreolus of a Vine, says, it is a little curled Tendril, which, in order to lay hold of the neighbouring Vines, creeps along, *ad capiendum Locum*, as it were, to chuse a Place; whence it is called *Capreolus a capiendo.* Wonderful is the Nature of the *Capreolus* produced by the *Vitis Canadensis quinquefolia Tournefortii*, whose extreme Part ends in a Cotyledon, consisting of a Multitude of Papillæ, from whence issues a Resin, which serves as a Glue to fasten the Vine to the Wall. In some Plants, as in Ivy, the *Capreolus* is not only assistant to the Plant in climbing, but serves instead of a Root; whence such Plants are called *scandent.* *Rieger.*

CAPREOLUS, in Anatomy, is the *Helix*, or exterior Compass of the Ear, so call'd because of its Tortuosity. *Castellus.*

CAPREOLUS, in Zoology, is an Animal thus distinguish'd.

Capreolus, Offic. Schrod. 5. 278. Schw. de Quad. 78. Mer. Pin. 166. *Caprea Plinii*, Jonst. de Quad. 54. *Capreæ Plinii*, *Capreolus*, Aldrov. de Quad. Bisul. 738. Raii Synop. A. 89. *Caprea sive Capreolus*, Gesn. de Quad. 296. *Dorcas*, *Capreolus*, Charlt. Exer. 12. THE ROE-BUCK.

It is found in *Scotland.* The Parts used in Medicine are the Rennet, Liver, Gall, and Dung: The Rennet is good for a Diarrhœa and Dysentery; the Liver is supposed to sharpen the Sight, and stops an Hæmorrhage, especially at the Nostrils; the Gall clears the Face of Spots, the Eyes of Albugines, Films, or other Defects, helps the Ringing in the Ears, and mitigates the Tooth-ach: The Dung cures the yellow Jaundice. *Dale*, from *Schroder.*

CAPRICALCA, *Jonston.* A Kind of wild Goose, or Bird, a little bigger than a Raven, of a black or leaden Colour, but cross'd over the Neck, Breast, and Belly, with broad obscure Stripes. Its Tail is very short and black. It makes a Noise in flying, lives in Fens, and is excellent Food.

Its Fat is emollient, and very resolvent. *Lemery des Drogues.*

CAPRICERVA. A Name for two different Species of Animals in the *East* and *West-Indies*, whence two Kinds of Bezoar are taken. It is so called from its resembling partly a Goat, and partly a Stag. See BEZOAR.

CAPRICORNUS, Lead. *Rulandus.*

CAPRIFICUS, Offic. Ger. 1327. Emac. 1510. Aldrov. Dendr. 432. Park. Theat. 1493. J. B. 1. 134. *Ficus sylvestris Dioscoridi*, C. B. Pin. 457. Raii Hist. 2. 1433. *Ficus sylvestris sive Caprificus*, Jonst. Dendr. 47. THE WILD FIG-TREE.

It grows in *Greece*, and other warm Countries. The Fruit is used in Medicine, and agrees in Virtues with that of the Garden Fig-tree. See FICUS.

CAPRIFOLIUM, *Periclymenum*, *Matrisylva*, Offic. Mont. Ind. 39. *Caprifolium*, Ind. Med. 26. *Caprifolium Germanicum*, Tourn. Inst. 608. Elem. Bot. 480. Boerh. Ind. A. 2. 226. Raii Synop. 3. 458. Jen. *Periclymenum non perfoliatum Germanicum*, C. B. Pin. 302. *Periclymenum non perfoliatum*, J. B. 2. 104. *Periclymenum sive Caprifolium vulgare*, Park. Theat. 1460. Raii Hist. 2. 1490. *Clymenum*, *Periclymenum*, *Caprifolium*, Chab. 113. HONEYSUCKLE, or WOOD-BIND.

The Trunk or Body of this Tree or Bush is seldom much thicker than the Wrist, shooting out long, twining, slender Stalks, which twist about any thing they meet with; the Leaves grow together at the Joint, of a long round Form, pointed at the End, of a bluish-green Colour: The Flowers are made of several long slender Tubes set together, open at Top, with broad Lips, turn'd back with several Stamina in the Middle, of a pale-red Colour, and of a most pleasant grateful Scent, succeeded by small round red Berries. It grows every-where in the Hedges, flowering good Part of the Summer.

The Leaves, which are the only Part used, are sometimes put into Gargarisms for sore Throats; tho' others affirm, they are not so proper for that Purpose, by reason of their great Heat. Some commend a Decoction of them for a Cough and Asthma, and to open Obstructions of the Liver and Spleen. The Oil, made by Infusion of the Flowers, is accounted healing and warming, and good for the Cramp, and Convulsions of the Nerves. *Miller's Bot. Off.*

Its Leaves are insipid, styptic, stink like a Dog-kennel, and give a faint-red Colour to blue Paper: The Roots give it a deeper. Their Bark is acrid, saltish, styptic, and stinking: Its Salt resembles Sal Ammoniac, but is united with some fetid Oil and Earth. The Decoction of *Honeysuckle* Leaves is vulnerary and detersive, good for Diseases of the Throat, and Wounds of the Legs. The bruised Leaves cure Diseases of the Skin: The distil'd Water of the Flowers assuages Inflammations of the Eyes, and strengthens Women in Labour. Three Ounces of it are given to drink, mix'd with one Ounce of Orange-flower Water. *Rondeletius*, on these Occasions, prescribed the Water of Honeysuckle, with Lavender-seed. *Martyn's Tournefort.*

CAPRIMULGA. A large Species of Viper, not poisonous. *Castellus.*

CAPRIZANS, σφυγμὸς καπριζων. So *Herophilus* call'd a sort of irregular and unequal Pulse, when the Motion of the Artery is, as it were, disturb'd and interrupted; but is soon renew'd with more Swiftness and Vehemence, after the manner of Goats, who seem, in their Leaping, to make a double Motion. *Galen. de Diff. Pulf. Lib.* 1. *Cap.* 29.

CAPSA,

CAPSA, κάψα, (κιβωτὸς, *Dioscorid. Lib.* 3. *Cap.* 26.) in general signifies a Receptacle for Books, Cloaths, Eatables, or any Portables; in *Rulandus* and *Johnson*, it means something whose Bottom is a Contexure of Iron Wire.

CAPSELLA. A Name in *Marcellus Empiricus*, *Cap.* 20. for *Echus*, that is *Echium*, or Vipers Bugloss.

CAPSICUM, *Piper Indicum*, Offic. *Capsicum vulgare*, Elem. Bot. 127. *Capsicum siliquis longis propendentibus*, Rupp. Flor. Jen. 37. Tourn. Inst. 152. Boerh. Ind. A. 2. 68. *Capsicum longioribus siliquis*, Ger. 292. Emac. 364. *Capsicum majus vulgatius, oblongis siliquis*, THE MOST ORDINARY GUINEA PEPPER WITH LONG HUSKS. Park. Theat. 355. *Piper Indicum vulgatissimum*, C. B. Pin. 102. Raii Hist. 1. 676. *Piper, Capsicum*, Chab. 297. *Piper Calecuticum, sive Capsicum oblongius*, J. B. 2. 943. *Solanum Capsicum dictum vulgatissimum*, Hort. Lugd. Bat. 574. *Solanum urens Capsicum dictum, sive Piper Indicum vulgatissimum*, Hist. Oxon. 3. 528. *Piper Indicum, siliquâ flavâ vel aureâ*, Comm. Flor. Mal. 215. *Capo-Molago*, Hort. Mal. 2. 109. *Quiya, sive Piper Brasilienſe*, Pis. 225. *Quiya Brasilienſibus*, Marcg. 39. *Lada Chilli*, Bont. 131. *Chilli, Piper siliquosum Mexicanum*, Hern. 135. GUINEA PEPPER.

The Stalks of *Guinea* Pepper grow to be about a Foot and a half high, thick and angular, on which are set Leaves of a full green Colour, in Shape like the Leaves of Nightshade, but longer and narrower. The Flowers grow single, at the Division of the Stalks, of one Leaf divided into five Parts, white and Star-fashion, with a yellow Umbo in the middle, bigger than Nightshade-flowers. After these are fallen, come long, round, taper Pods, of a green Colour at first, but, when ripe, of a lively, shining Red, like polish'd Coral, in which are contain'd a great many flat, round, yellow Seeds. This Fruit is of a hot, fiery, biting Taste, hotter than the strongest Pepper.

It is sown every Year in Gardens, and flowers in *August*, producing its red Pods towards the latter End of *September* and *October*, perishing with the first Frosts.

Guinea Pepper is more used as a Sauce, and in Pickle, than in Physic, being frequently put into Fish Sauce, or into any thing that is flatulent and windy, being order'd divers ways, either green or ripe, pickled or rubb'd to Powder with Salt. A Decoction of it, with Peny-royal, is commended by some to expel a dead Child. The Skins boiled, and used as a Gargle, help the Tooth-ach. A Cataplasm of the Seeds powder'd, and mixed with Honey, apply'd to the Throat, is good for the Quinsey. It is not much used. *Miller's Bot. Off.*

CAPSULA, properly a Box, or any Receptacle of that kind, in Botany, is the seminal Vessel, or Repository, in which are inclosed one or more Seeds, such as you see in siliquous or Pod-bearing Plants, whose Pods, from the Number of their Capsules or Cells, are called Unicapsular, Bicapsular, and so on. *Rieger.*

CAPSULA CORDIS is the same as PERICARDIUM, which see. *Blancard.*

CAPSULA COMMUNIS, *Glissonii*, is a Production of the Peritonæum, including the Vena Porta and biliary Duct in the Liver. *Blancard.*

CAPSULÆ ATRABILARIÆ, *Glandulæ suprarenales*, *Renes succenturiati*, are glandulous Bodies lying on the upper Part of the Kidneys. See RENES SUCCENTURIATI.

CAPSULÆ SEMINALES are the extreme Parts of the *Vasa deferentia*, which have their Cavities dilated in manner of Capsules. Their Use is to transmit the Semen from the *Testes* to the *Vesiculæ seminales*. *Blancard.*

CAPSULATE *Pods* [from *Capsa*, a Chest] are the little short Seed-vessels of Plants. *Miller's Dictionary.*

CAPSULATED, is inclosed in any thing as a Walnut is in its green Husk. *Miller's Dictionary.*

CAPULUM, from κάμπτω, to bend; a Contorsion of the Eyelids, or other Parts. *Blancard.*

CAPUR. The same as CAMPHORA.

CAPUS. The same as CAPO.

CAPUT, in Botany, imports the Head of a Plant. See CAPITA, and CAPITATA.

CAPUT GALLINACEUM. The same as ONOBRYCHIS, which see.

CAPUT MONACHI. A Name for the TARAXACUM, which see.

CAPUT MORTUUM, called otherwise *Terra Mortua*, or *Terra damnata*, in Chymistry, imports the dry Fœces left in a Vessel, after the Moisture has been distilled from it.

CAPUT. The Head.

The Antients divided the Body into three great Cavities, which they term'd *Bellies*, and into four Extremities. They called the Head the upper *Belly*, the Thorax the middle *Belly*, and the Abdomen the lower *Belly*. The Neck was by some joined to the Head, by others, to the Thorax.

The most natural and plainest Division of the Body is into the Head, Neck, Thorax, Abdomen, Arms, and Legs.

The Head view'd on the Outside is divided into the hairy Scalp, and Face.

The hairy Scalp covers the upper Part of the Os Frontis, the Ossa Parietalia, the Os Occipitis, and the upper and lower Portions of the Temporal Bones.

The uppermost Part of the hairy Scalp is termed the Vertex or Fontanella; the back Part, Occiput; the lateral Parts, the Temples. The Vertex is distinguished from the Occiput by a contorted Border of Hair, and the Temples are terminated below by the Ears.

For the Arteries of the Face, see ARTERIA.

For the Veins, see VENA.

For the Nerves, see NERVUS.

The Face comprehends all that Portion of the Surface of the Head which lies between the hairy Scalp, and the Neck, that is, the Forehead, Eye-brows, Palpebræ, Eyes, Nose, Mouth, Chin, Cheeks, and Ears.

The external Parts of the Eyes are these, the anterior Portion of the Globe of the Eye, the Membrana Conjunctiva, the Cornea Lucida, Iris, Pupilla, Caruncula Lachrymalis, Angles of the Palpebræ, and the Cilia, or Hairs of each Palpebra. The internal Parts are, the Globe of the Eye, the Tunica Sclerotica, or Cornea Opaca, the Choroides and Arachnoides; the Crystalline, vitreous and aqueous Humours; the anterior and posterior Chambers; the Muscles, and the optic Nerve. See OCULUS.

For the Parts of the Ear, see AURIS.

The external Parts of the Nose are these; the upper Extremity of the Nose, the Arch or Back, the Sides of that Arch, the Tip of the Nose, the Alæ, the Nares, and the Septum Narium. The internal Parts are, the Cavity and Bottom of the Nares, the Convolutions, the maxillary, sphenoidal, and frontal Sinuses.

The external Parts of the Mouth are these; the Lips, one upper, the other lower, the Angles or Commissures of the Lips, the Border or Edge of each Lip, the Fossula which runs from the Septum Narium to the Edge of the upper Lip, and the transverse Fold which separates the under Lip from the Chin. See LABIA.

The internal Parts of the Mouth are these; the Palate, the Septum Palati, the Uvula, the Amygdalæ, Gums, Fræna of the Lips, the Tongue, its Apex, Root, Sides, and Frænum.

The Cheeks are the lateral Parts of the Face, reaching downward from the Eyes and Temples, between the Nose and Ears. The upper prominent Part of the Cheek is commonly termed *Mala*.

The Chin is the anterior Protuberance, by which the lower Part of the Face is terminated, from whence it runs all the Way to the Neck. The under Part of the Chin is termed the Basis, and it is distinguish'd from the Throat by a transverse Fold, which reaches from Ear to Ear. In the middle of the Chin there is sometimes a Fossula, Depression, or Dimple.

The Coverings of the Head are, first, the Hair. See CAPILLUS.

Secondly, The Skin. See CUTIS, and CUTICULA.

Thirdly, The Membrana Cellulosa. See CELLULOSA MEMBRANA.

Fourthly, The Muscles. See MUSCULUS.

Besides the external Integuments of the Head, there is an Aponeurotic Expansion which covers the Head like a Cap, and is spread round the Neck, and on the Shoulders, like a Riding-hood; and for this Reason *Winslow* gives it in general the Name of *Coif*, and calls the superior Portion of it the Aponeurotic Cap.

This Aponeurosis is very strong on the Head, and it appears to be made up at least of two Strata of Fibres crossing each other. As it is spread on the Neck, it becomes gradually thinner, and ends insensibly on the Clavicles. It sends out a Production on each Side, from above downward, and from without inward, which, having passed over the superior Extremity of the Musculus Mastoidæus, runs behind that Muscle toward the transverse Apophyses of the Vertebræ of the Neck, where it communicates with the Ligamenta Intertransversalia.

The external Surface of all the Bones of the Head, as well as of all the other Bones of the human Body, except the Teeth, is cover'd by a particular Membrane, of which that Portion which particularly invests the Cranium is named Pericranium, and that which invests the Bones of the Face is simply term'd Periosteum.

The Pericranium is made up of two Laminæ closely united together. The internal Lamina, which has by some been taken for a particular Periosteum, covers immediately all the bony Parts of this Region; and the external Lamina has been looked upon as a Membrane distinct from the internal, and named Pericranium particularly.

The external Lamina of the Pericranium parts from the other, at the semicircular or semioval Plane, surrounding the Temples, and becomes a very strong Aponeurotic or Ligamentary Expansion, which covers the temporal Muscle, and is afterwards fixed in the external angular Apophysis of the Os Frontis,

Frontis, in the poſterior Edge of the ſuperior Apophyſis of the Os Malæ, and in the ſuperior Edge of all the Zygomatic Arch, as far as the Root or Baſis of the Maſtoide Apophyſis.

In the Interſtice between the two Laminæ at this Place, lies a large Portion of the Temporal Muſcle, being inſerted in each Lamina in the manner mention'd below under this Article. The reſt which is not attach'd to this Muſcle, is filled by a reticular and adipoſe Subſtance, in the Interval betwixt the inferior Portion of the temporal Muſcle, and the Zygomatic Arch.

At this Place, the Aponeurotic Coif ſeems to join the external Lamina of the Pericranium, and they both communicate with particular Aponeurotic Expanſions of the neighbouring Muſcles, as the Maſtoidæus, Maſſeter, Zygomaticus, *&c.*

The Head is compoſed of ſeveral bony Pieces, ſome of which, connected together, form a kind of oval Cavity, properly called the Skull. The other repreſent a complicated Piece of Sculpture, which partly ſupports the anterior Half of the Skull, and, as it forms the greateſt Part of the Face, it is called by that Name.

Before we examine particularly each Bone of the Head, it is neceſſary, in order to prevent Repetitions and Obſcurity, to conſider the Head in general, that is, as conſiſting of all the Bones which belong to it. In this View, ſeveral Eminences and Cavities come to be taken Notice of, the Formation of which is owing to more Bones than one; and conſequently, in examining each Bone by itſelf, we can ſee but an imperfect Portion of them.

In the Language of Anatomiſts, theſe Parts may be called common, and thoſe that belong to ſome one Bone, may be term'd proper. The common Parts ought firſt to be diſtinctly known, before we go on to the proper ones; if we would ſhun an Inconvenience otherwiſe inevitable, of explaining one unknown thing by another equally unknown.

The bony Head being conſider'd as one Piece, the following Particulars may be taken Notice of in it. 1. Its Situation in general. 2. The Size. 3. The Figure. 4. The external Parts. 5. The internal Structure. 6. Its Situation in particular. 7. The Connection. 8. The Uſes. I ſhall follow the ſame Order nearly, through the Whole of this Expoſition.

The Head is the higheſt or moſt ſuperior Part of the whole Skeleton.

The whole Head of the Skeleton is Spheroidal, compoſed, as it were, of two Ovals, a little depreſſed on each Side. One of them is ſuperior, the Extremities pointing forward and backward; the other is anterior, the Extremities being turn'd upward and downward in ſuch a manner, as that one Extremity of each Oval meets and is loſt in the other, at the Place particularly known by the Name of the Forehead.

This complex Figure, being view'd ſidewiſe, repreſents a Spheroidal Triangle; and we ought farther to obſerve, that the Oval of the Skull is broader behind than before, and that of the Face broader above than below.

The upper Region is term'd the Crown of the Head, the lower the Baſis; the lateral Regions, the Temples, the Anterior, the Forehead, the Poſterior, the Occiput, the lower Part of which is called the Nape of the Neck.

Some of the Eminencies, Cavities, and Inequalities are external, being viſible in an entire Head; others are internal, and can only be diſcover'd by opening the Skull. Both theſe Kinds are either proper, belonging only to ſome one Piece; or common to more Pieces than one.

The external Eminences are ten in Number, two Maſtoide, two Styloide, two Condyloide, two Pterygoide, and two Arches called Zygomata. Of theſe five Pairs, the three firſt are ſimple or proper; the other two, that is, the Zygomata and Pterygoides, are compound or common, being form'd by the Connection of more Bones than one; the Zygomata by the Oſſa Temporum, and Oſſa Malarum; the Pterygoide Eminences by the Os Sphenoides, and Oſſa Palati. To theſe may be added, the Tubercle and external Spine of the Occiput, and the Condyloide and Coronoide Apophyſes of the lower Jaw.

The ſimple external Cavities are, the Parietal Holes, the Superciliary Holes, in the Place of which there are ſometimes only Notches; the ſuperior orbitary Slits, the optic Holes, the external, or rather inferior orbitary Holes, the Holes in the Oſſa Naſi, the Holes in the Oſſa Malarum, the Maxillary Foſſæ, the oval Holes in the Baſis of the Skull, the Spinal Holes, the Orifices of the Paſſages of the internal Carotides, the Maſtoide Grooves, the Stylomaſtoide Holes, the poſterior Maſtoide Holes, the large occipital Hole, the anterior and poſterior Condyloide Holes, the Glenoide Cavity and Fiſſure for the Articulation of the lower Jaw, the external auditory Hole, the ſmall poſterior maxillary Holes, the Sockets in both Jaws, the internal and external Orifices of the Canal of the lower Jaw, which laſt may likewiſe be named the Holes of the Chin.

The compound external Cavities are the Orbits, the Edges of which are divided into two lateral Parts, improperly called Angles, one internal toward the Noſe, the other external toward the Temples; the temporal Foſſæ, the Zygomatic and Naſal Cavities, which laſt are alſo called Noſtrils, which have anterior and poſterior Openings, and are parted by a middle Septum, the Vault of the Palate, the anterior Hole of the Palate, the poſterior Holes of the Palate, the Pterygoide Foſſæ, the inferior Orbitary, or Spheno-maxillary Slits, the interior orbitary Holes, one anterior, and one poſterior, the Naſal or Lachrymal Duct, the Duct of *Euſtachius*, called the Tuba Euſtachiana, the ſmall Foſſæ for the internal jugular Veins, and the Foramina Spheno-palatina, and Lacera.

The internal Eminences are the frontal or coronal Spine, Criſta Galli, the Sella Turcica, or Sphenoidalis, the Clinoide Apophyſes, Apophyſes Petroſæ, the internal occipital Spine, the crucial Tubercle, and two tranſverſe Creſts.

Of the internal Cavities, one is ſimple or proper, the Cavity of the Sella Turcica, called Foſſa Pituitaria. The reſt are compound, and are eight large Foſſæ in the Baſis of the Skull, two anterior, two middle; and, on the back Side, two upper, and two lower: The Grooves of the ſuperior Longitudinal, and of the lateral Sinuſes, and the Sulci of the Arteries of the Dura Mater.

The external Inequalities are, two large ſemicircular Planes ſurrounding the Temples, one on each Side, at which it has been obſerv'd above that the two Laminæ of the Pericranium ſeparate, the Edge or Circumference of which begins by a Sort of Criſta or Spine above the external Angle of the Orbit, and ends in two Arches, one on the fore Side, the other on the back Side of the maſtoide Proceſs; two occipital Arches, one ſuperior, the other inferior, which are both divided into two Portions by the occipital Criſta or Spine; the external Traces of the Sutures.

The internal Inequalities are the undulated Impreſſions in the Baſis of the Skull; the internal Traces of the Sutures.

The compact or ſolid Subſtance of the Bones of the Skull is called Tables, of which one is external, and another internal, called alſo the vitreous Table, as being more brittle than the former, becauſe it is of a more cloſe Texture.

The ſpungy or cellulous Subſtance between the two Tables is called Diploe, the Quantity of which is proportionable to the Thickneſs of the Bones. In ſome Places it is wanting, and there the Tables uniting are ſomething tranſparent, as in the temporal Bones. In the internal Table, there are ſeveral Depreſſions, ſome of them near a Quarter of an Inch in Depth, which run thro' the Diploe, and even reach the outer Table. Theſe Depreſſions deſerve to be taken Notice of in relation to the Operation of Trepanning.

By the Situation of the Head in particular, I underſtand the natural Poſture of it, when a Man ſtands, or ſits, without inclining his Head either backwards or forwards, to one Side or the other, or drawing it down upon the Neck or Shoulders. Particular regard ought to be had to this Situation in examining the Head, either in general, or in particular; and eſpecially in conſidering the lower Parts of the Baſis of the Skull, and Arch of the Palate.

The common Method of ſhewing theſe Parts in a Skull turn'd upſide down, has often occaſion'd even expert Anatomiſts to miſtake the upper Parts for the lower, and the lower for the upper. It is therefore very neceſſary for Beginners often to hold the Skeleton of a Head raiſed in its true Poſture, and to view it from below upwards, that they may frame to themſelves a juſt Idea of it.

In order to this, whether the Head be held in our Hands, or ſet upon any thing, the beſt Way is to place the two Zygomatic Arches in a Plane exactly parallel to the Horizon. An Head, ſaw'd down the Middle into two equal lateral Parts, is likewiſe of great Uſe in determining the true Situation of the Parts I have mention'd, and of thoſe which lie near them.

The Connection of the Head with the Trunk is by Ginglymus, the Condyloide Proceſſes of the Os Occipitis being receiv'd in the ſuperior Cavities of the firſt Vertebræ of the Neck. The Connection of the particular Bones of the Head with each other is partly by Diarthroſis, as in the Articulation of the lower Jaw; partly by Synarthroſis, which obtains in the Articulation of all the other Bones.

The principal Uſes of the Bones of the Head are to contain the Brain, to be the Seat of the Organs of Senſation, and to ſerve for Maſtication, Reſpiration, and the Formation of the Voice.

The Bones of the SKULL *in particular, and firſt, the* Os FRONTIS.

The eight principal Bones of the Skull are uſually divided into common and proper. By proper Bones, Anatomiſts mean thoſe which are wholly employ'd in forming the Globe of the Skull; and of theſe they reckon ſix, the Os Frontis, two

two parietal Bones, the occipital Bone, and two temporal Bones. The common Bones are thoſe which contribute to form the Face, as well as the Skull, which are the Os Ethmoides, and Os Sphenoides.

This Diviſion is not juſt; for the Os Frontis and Oſſa Temporum deſerve as much to be call'd common, as the two which are reckon'd ſo; and thus, inſtead of ſix, there would be only three proper Bones, the Oſſa Parietalia, and the Os Occipitis; and inſtead of two, there would be five common ones; the Os Frontis, two temporal Bones, the Os Ethmoides, and Os Sphenoides.

The Os Frontis is ſituated in the anterior Part of the Skull, and forms that Part of the Face which is call'd the Forehead, from whence it takes its Name.

Its Figure is ſymmetrical, reſembling a large Cockle-ſhell almoſt round; ſo that two frontal Bones of the ſame Size join'd together, repreſent this ſort of Shell-fiſh pretty exactly.

Before we ſpeak of the Parts of this Bone, we muſt take Notice, that though it is always look'd upon as one Bone, it is ſometimes to be divided into two equal Parts by a Continuation of the ſagittal Suture; and this Diviſion is common to both Sexes equally.

When we conſider it as one Bone, it may be divided into an upper Part, which belongs to the Crown of the Head; a lower Part, which belongs to the Baſis of the Skull; an anterior Part, which is the Forehead; and two lateral Parts, at which the Temples begin.

It has two Sides, one external, which forms the Forehead, the greater Part of it being convex; and one internal, which is concave in Proportion. By external I here mean what appears when the Skull is entire; and by internal, what cannot be ſeen till the Skull is open'd.

On the Outſide we obſerve the following Eminences; two ſuperciliary Arches, which form the upper Edges of each Orbit, or the Supercilia; three Riſings not always equally apparent, one between the two Arches, and the other two above the Arches, which may be call'd the Knobs of the Forehead; five Apophyſes, one at the Extremities of each Arch, one between the Orbits which ſuſtain the Oſſa Naſi, and which, in ſome Subjects, makes a Part of the bony Septum of the Noſe. This laſt *Winſlow* calls the Naſal Apophyſis; and the other four, the angular Apophyſes.

The external Cavities are theſe: Two orbitary Arches or Vaults, forming the upper Portions of the Orbits; a remarkable Depreſſion in each of theſe Vaults, above the external Angle, which contains the lachrymal Gland; a ſmall Depreſſion above the internal Angle, to which is fix'd the cartilaginous Pulley of the great oblique Muſcle of the Eye; two Portions of the temporal Foſſæ; two little Criſtæ, which form the anterior Extremity of the great ſemicircular Plane of the Temples on each Side, at the Edge of the ſuperciliary Arches, near the external Angle; two ſuperciliary Foramina, which are ſometimes double, and ſometimes only Notches; and, laſtly, two Holes, or Portions of Holes, call'd the internal orbitary Holes.

On the Inſide of this Bone we ſee a ſharp perpendicular Eminence, call'd the frontal or coronal Spine, directly oppoſite to the Middle Riſing on the Outſide already mentioned. Above this Spine is a Portion of the Groove for the longitudinal Sinus, which, when the Spine is wanting, runs down lower. Below the Spine, a conſiderable Opening, call'd the Ethmoidal Opening, becauſe it contains the Os Ethmoides; the Sides thereof are always more or leſs cellulous. Between this Opening and the coronal Spine, a blind Hole, which in ſome Subjects is wholly in the Os Frontis, in others common to that Bone, and to the Os Ethmoides, and which ſeems to open into the Frontal Sinuſes near the Noſe. The anterior Foſſæ of the Baſis of the Skull, which receive the anterior Lobes of the Brain, and which, by jutting out forwards, form the Riſings on the Outſide already taken Notice of; towards the lower Part they are uneven, anſwering the Inequalities of the Lobes; and they are alſo a little rais'd to make Room for the Orbits; Sulci or Furrows for the Arteries of the Dura Mater, and ſometimes indeterminate Depreſſions already mention'd.

This Bone is compos'd, as has been already obſerv'd in general, of two Tables and a Diploe, except the orbitary Vaults, which are very thin, and without any Diploe. About the Middle of the lower Part of the Bone, where the middle Riſing is commonly ſituated, the two Tables are parted, to form two Cavities, call'd the Frontal or Superciliary Sinuſes; and the ſeparated Portions are each of them, in ſome meaſure, compoſed of two Tables, or, at leaſt, have two Surfaces, which makes in all four Surfaces or Tables.

The frontal Sinuſes are extended on the Edge of the Supercilia, on each Side, more or leſs, all the Way to the ſuperciliary Perforations: Below they are open, and communicate with the Cells of the Os Cribroſum. They are commonly parted by a bony Partition, which is often more to one Side than to the other, and more or leſs uneven. Sometimes it is perforated; and ſometimes Part of it, and ſometimes the Whole, is wanting.

In different Subjects theſe Sinuſes are obſerv'd to vary extremely, both with reſpect of their Extent, which in ſome is very ſmall; and their Form, which is often very irregular, and cellular. Sometimes they are entirely wanting; and in ſuch Subjects the internal Cavity of the Noſe is larger than ordinary. It has likewiſe ſometimes been remark'd, that one of them does not open into the Noſe, but only communicates with the other.

To have a juſt Idea of the true Situation of all the Parts of this Bone, we ought, in examining or demonſtrating it, to hold it in the ſame manner as it is ſituated in an entire Head, placed as has been already directed. For thus we ſhall ſee, that the upper Part of it is a little inclined backward, and that its Circumference or Edges are in an inclined Plane.

The Os Frontis is articulated by Suture with ſeven other Bones; the Oſſa Parietalia, Os Ethmoides, Os Sphenoides, Oſſa Lachrymalia, Oſſa Naſi, Oſſa Maxillaria, and Oſſa Malarum.

It contains the anterior Lobes of the Brain, and a Portion of the longitudinal Sinus. It forms the Forehead, the upper Part of the Orbits, and a Portion of the Temples.

Ossa Parietalia.

The parietal Bones are two in Number, one on each Side, ſituated on the ſuperior, lateral, and a little on the poſterior, Parts of the Skull.

They are of a larger Extent than any other Bone of the Skull; their Figure is nearly that of an irregular convex Square.

They have each two Sides, one external and convex, the other internal and concave; four Edges, one ſuperior or ſagittal, one inferior or temporal, one anterior or frontal, and one poſterior or occipital. The ſuperior Edge is the longeſt, the inferior the ſhorteſt, in which there is a very large ſquamous Slope, which *Winſlow* calls the temporal Slope. The upper and poſterior Edges are indented through their whole Length. The anterior Edge is likewiſe indented, except at the lower Part; all the lower Edge is ſquamous, except a ſmall Portion next the Os Occipitis.

It has four Angles, one anterior and ſuperior, one anterior and inferior, one poſterior and ſuperior, and one poſterior and inferior. The anterior and inferior Angle ends in a ſquamous Production, which, from its Situation, *Winſlow* calls the temporal Angle or Apophyſis.

On the Outſide, above the temporal Slope, we obſerve the moſt conſiderable Portion of the ſemicircular Plane of the temporal Muſcle. Near the upper Edge, towards the poſterior Angle, is a ſmall Hole call'd the parietal Hole, which is ſometimes found only in one of the Bones, ſometimes in the ſagittal Suture, and ſometimes it is wanting. In ſome Bones it goes only to the Diploe; in others, it perforates both Tables.

The Inſide is ſomewhat uneven; and many Furrows are remarkable upon it, anſwering to the Ramifications of the Artery of the Dura Mater, the Trunk of which is lodg'd ſometimes in a Groove, ſometimes in a very ſhort perfect Canal running through the Subſtance of the Bone near the anterior and lower Angle. Near that, another ſuch Canal is ſometimes, tho' rarely, met with, for another Artery of the Dura Mater.

Along the upper Edge of this Inſide we ſee one Half of the ſagittal Groove for the longitudinal Sinus; and at the poſterior and lower Angle, we meet generally with a ſmall Portion of another Groove for the lateral Sinus. Laſtly, the ſame ſort of irregular indeterminate Depreſſions are ſometimes obſervable in this Bone, which we took Notice of in the Os Frontis.

Theſe Bones are the weakeſt of the eight that compoſe the Skull. The Diploe is found between the Tables, through the whole Length of the ſagittal and occipital Edges, and through the upper Half of the coronal Edge.

To place or demonſtrate this Bone in its true Situation, we need only obſerve what has been ſaid concerning its Edges and Angles, remembering only that the poſterior and inferior Angle reaches further down than the anterior.

Each Parietal Bone is join'd to that on the other Side, by the ſagittal Suture; to the Os Frontis, by the coronal Suture; to the Os Occipitis, by the lambdoidal Suture; and to the temporal Bones and Os Sphenoides, by the ſquamous Suture.

Its Connection with the Os Frontis, below the ſemicircular Plane, is by the ſquamous Suture; and the ſame is to be ſaid of its Articulation with the Sphenoidal Bone, as well as with the temporal Bone. The ſquamous Portions of the Os Frontis are cover'd by thoſe of the Oſſa Parietalia; the ſquamous Slopes in theſe laſt are cover'd by the temporal Bones; and the ſquamous Apophyſis of the temporal Bone is cover'd by a Proceſs of the Os Sphenoides.

Theſe Bones contain a large Portion of the Brain, form Part of the Temples, and ſerve for the Inſertion of the temporal Muſcles.

Os Occipitis.

The occipital Bone is ſituated in the poſterior and lower Part of the Cranium.

It repreſents a kind of Lozenge irregularly indented, and yet ſymmetrical, convex on the Outſide, and concave on the other. Sometimes, though very rarely, it is divided into two Pieces by the Continuation of the ſagittal Suture.

It conſiſts of an external and internal Side; of the upper, lower, lateral, and middle Parts; of four Edges, two ſuperior, which are indented, and two inferior, which are more or leſs unequal.

The Outſide is convex, near the Middle of which the occipital Protuberance or Riſing is obſervable. Under this Protuberance are two ſuperficial tranſverſe Arches, more remarkable in ſome Subjects than in others; one ſuperior and largeſt, the other inferior and leaſt, and both reaching to the Maſtoide Proceſs on each Side. The inferior Arch is cut at right Angles by a perpendicular Line, call'd the external occipital Spine or Criſta. Under the ſuperior Arch are two rough Planes, one on each Side of the Spine; and between the Extremities of the two Arches are two other ſuch Planes, one on the Right, the other on the Left. We ſee likewiſe two Condyles, or condyloide Apophyſes, cruſted over with Cartilages, a little convex, of an oblong oval Figure, and ſituated obliquely, their poſterior Extremities being at a greater Diſtance from each other than the anterior; alſo a large cuneiform Production, which, from the Condyles, is directed upwards, and in Adults is often join'd inſeparably to the Os Sphenoides; it may be term'd Apophyſis Baſilaris, or the great Apophyſis of the occipital Bone. Laſtly, ſome unequal Tubercles on the lower Part of this Apophyſis, and two little angular Productions in the Edge of the Bone, over againſt the Condyles.

We are likewiſe to take Notice of two large Notches under the lateral Angles, which receive the poſterior Apophyſes of the temporal Bones; two ſmall Notches or Portions of the Jugular Foſſæ, and of the Foramina Lacera, each of which is often divided by a ſmall bony Production; the great occipital Hole, on the anterior Edge of which there is an Impreſſion for the Inſertion of a Ligament; two anterior and two poſterior condyloide Foſſulæ; two anterior condyloide Holes for the ninth Pair of Nerves, which are ſometimes double; two poſterior condyloide Holes for ſmall Veins, which are ſometimes wanting.

The Inſide of this Bone is concave, and there we are to take Notice of a crucial Groove, the Edges of which are a little rais'd; the upper Branch contains Part of the great longitudinal Sinus of the Dura Mater; the lateral Branches receive the lateral Sinuſes; and the lower Branch is more often a Spine or Criſta, than a Groove; it is ſituated oppoſite to the external Spine, and may be call'd the internal occipital Spine. It happens often that the Groove for the longitudinal Sinus is more to one Side than the other. We ſee alſo the Place where theſe Grooves croſs each other; a conſiderable Tubercle oppoſite to the external Protuberance; four Foſſæ ſeparated by the four Branches of the crucial Groove, two of which contain the poſterior Lobes of the Brain, and the other two the Cerebellum; a very broad Groove in the Apophyſis Cuneiformis, for the Medulla Oblongata; two ſmall Portions of Grooves lower down, which complete the Grooves for the lateral Sinuſes of the Dura Mater. Along the inner Edge of the large occipital Hole there is a kind of Groove more or leſs perceivable.

The upper Part of this Bone is very thick, as being much expoſed to Blows; the lower Part of it is thin, but well guarded by Muſcles. The thickeſt Part of the whole Bone is at the occipital Protuberance, between which and the Tubercle of the crucial Groove there is a large Quantity of Diploe.

To ſet the occipital Bone in its true Situation, the great Foramen is to be turn'd downward, and placed horizontally; the Apophyſis Cuneiformis forward, and a little rais'd.

This Bone is join'd on the upper Part to the Oſſa Parietalia, by the lambdoidal Suture; on the lower and lateral Parts to the temporal Bones, by the Continuation of the lambdoidal Suture; on the lower and anterior Part to the Os Sphenoides, by the Apophyſis Cuneiformis, both which in Adults make commonly but one Bone. It is likewiſe join'd by a kind of Suture to the ſupernumerary Bones, when there are any ſuch.

The Os Occipitis forms the back Part of the Head; ſerves for the Articulation of the Head with the Trunk; contains a Part of the Brain, and almoſt all the Cerebellum; gives Paſſage to the Medulla Oblongata, and to a great many Veſſels and Nerves; and gives Inſertion to a great many Muſcles.

Os Sphenoides.

The ſphenoidal Bone is ſituated in the lower Part of the Cranium a little toward the fore Part, making the middle of the Baſis of the Skull, from whence it acquir'd the Name of Os Baſilare. It is call'd Sphenoides or Cuneiforme, becauſe it is in a manner wedged in between the other Bones.

It is of a very odd Figure, and yet ſymmetrical. Its greateſt Extent is tranſverſe, and it may, in ſome meaſure, be ſaid to repreſent a Bat, with its Wings ſpread.

It conſiſts of a great Number of Parts. The poſterior and thickeſt Part, by which it is join'd to the Apophyſis of the Os Occipitis, may be call'd its Body. The reſt is wholly made up of Eminences and Cavities; and in order to examine theſe methodically, the Bones muſt firſt be divided into two Sides, one external, the greateſt Part of which may be ſeen in an entire Skull; the other internal, which does not appear till the Skull is open'd.

The Eminences on the Outſide are theſe: Two temporal Apophyſes, which are the largeſt of all the Proceſſes of this Bone, and at the greateſt Diſtance from each other, called by *Ingraſſias* the great Wings of the Os Sphenoides; and they are ſometimes, though very rarely, ſeparated from the reſt of the Bone, by tranſverſe Sutures; two orbitary Apophyſes, which form a conſiderable Portion of the Orbit, next the Temples; a ſmall ſharp Proceſs ſhaped like a Bird's Bill, in the middle Space between the two orbitary Apoyhyſes; two pterygoide Apophyſes, each of which is divided into two Alæ, one external, which is the largeſt, the other internal, the lower End of which is in the Shape of a Hook; each Ala is again divided into two Sides, one external, towards the Temples, and one internal, towards the Palate; two ſpinal Apophyſes; a little anterior Eminence above the ſharp Proceſs, for the Articulation of this Bone with the Os Ethmoides. In ſome Subjects, inſtead of this Eminence there is a little Notch.

The external Cavities are as follow: Two Portions of the temporal Foſſæ; two Portions of the orbitary Foſſæ; two pterygoide Foſſæ, the lower Ends of which are divided by an irregular Notch or Slit, which may be term'd Fiſſura Palatina; a little oblong Foſſula at the Root of the internal Ala; two ſuperior orbitary or ſphenoidal Fiſſures; a little Notch at the End of each Fiſſure, for the Paſſage of an Artery of the Dura Mater; two temporal Notches; two maxillary Notches, the Edges of which help to form the inferior orbitary Fiſſures, which *Winſlow* calls Spheno-maxillary Fiſſures; theſe Edges are likewiſe ſometimes conſiderably groov'd; two Holes for the ſuperior maxillary Nerves; two other Holes by the Side of the former, call'd Pterygoide, which in an entire Skull are hid by other Bones; two oval Holes, for the inferior maxillary Nerves; two little round Holes, call'd ſpinal Holes, each of which tranſmits an Artery of the Dura Mater; ſometimes they are only Notches; another little Hole between the two maxillary Holes; a little Groove on one Side of the ſpinal Apophyſis, which forms Part of the Euſtachian Tube.

The internal Eminences are two thin ſharp tranſverſe Apophyſes, which form the ſuperior orbitary Fiſſures, call'd by *Ingraſſias* the little Wings of the ſphenoidal Bone; a little Proceſs in ſome Subjects, in the middle Space, between theſe thin Apophyſes, for the Articulation with the Os Ethmoides, which, in other Subjects, is a Notch; four Clinoide Apophyſes, two anterior, and two poſterior, which laſt are ſometimes united in one, and ſometimes they run forward all the Way to the anterior Proceſſes, forming a kind of Bridge, under which the internal carotid Artery paſſes at its laſt Curvature; this Paſſage has likewiſe been found divided in two by a middle bony Septum, beſides many other Varieties: one or two ſmall Productions, where the internal Carotid enters the Cranium; two little ſtyloide Proceſſes or Hooks, which, in ſome Subjects, join the Extremity of the Os Occipitis before the perfect Union of theſe two Bones.

The internal Cavities are two Portions of the large middle Foſſæ of the Baſis of the Cranium; two ſuperior orbitary or ſphenoidal Fiſſures; two optic Holes; a ſmall ſuperior orbitary Hole near the End of each ſphenoidal Fiſſure, which is often no more than a Notch; a ſmall Groove at the Extremities of the ſame Fiſſures; a Depreſſion between the Clinoide Apophyſes, called Sella Sphenoidalis, Sella Turcica, and Foſſa Pituitaria. We ſee likewiſe almoſt all the Holes taken Notice of in the Outſide; and in particular, that the ſuperior maxillary Hole ought more juſtly to be call'd a ſhort Canal.

Beſides the Cavities hitherto mention'd, there are two very conſiderable ones, call'd the ſphenoidal Sinuſes, ſituated in the thick Portion of this Bone, under the anterior Part of the Sella Turcica, and middle Space between the two optic Holes, reaching as far as the ſharp Proceſs or Bill already deſcribed; they are commonly divided by a bony Septum, and they open before, on each Side of the ſharp Proceſs, juſt behind the ſuperior Conchæ of the Noſe, or Oſſa convoluta ſuperiora. Their Figure, Size, Openings, and Septum, vary conſiderably; ſometimes one of them is wanting; ſometimes one opens only into the other; ſometimes they are both wanting; ſometimes there are ſeveral Cells without any Septum; and ſometimes the Septum is placed more to one Side than to the other.

The Subſtance of this Bone is compact for the greateſt Part, having very little Diploe, and what Diploe there is lies in diſtinct Parts of the Bone, that is, in the thick Portion behind the

the Sella Turcica, towards the Symphyſis with the Occipital Bone, and in the Orbitary Apophyſes in a ſmall Quantity.

To ſituate the Sphenoidal Bone right, the Sella Turcica muſt be turned upward, the ſharp Proceſs forward, and the Pterygoide Apophyſes downward.

It is articulated with all the other Bones of the Cranium, with the Oſſa Malarum, Oſſa Maxillaria, Oſſa Palati, and Vomer.

The Uſes have all been mentioned in the Courſe of the Deſcription.

Os Ethmoides.

The Os Ethmoides is ſituated internally in the fore Part of the Baſis of the Skull.

The Figure of the whole Bone taken together is very particular: it may be ſaid, however, in ſome meaſure, to be cubical.

The Diviſions of this Bone are perfectly arbitrary; that which *Winſlow* makes Choice of is, into a middle and two lateral Portions; in the middle Portion we diſtinguiſh three Parts, an upper, middle, and lower.

The upper Part of the middle Portion is an Eminence, call'd Criſta Galli, which is often ſolid; ſometimes, however, it has been found hollow more or leſs, and perforated by a ſmall Opening, which communicates with the Frontal Sinuſes: A Groove is ſometimes found in its anterior Edge, which leads to the Spinal or blind Hole in the Os Frontis.

The middle Part of this Portion is a ſmall horizontal Plate, perforated by ſeveral Holes, called Lamina Cribroſa, and in the back Part it has a little Notch for its Articulation with the Sphenoidal Bone. This Lamina may be reckoned the Body of the Bone, as being what principally ſupports all the other Parts thereof.

The lower Part is a perpendicular Lamina, which makes Part of the Septum Narium. Its Edge is rough and uneven, for its better Connection with the Vomer.

The lateral Portions of the Ethmoidal Bone are by far the moſt conſiderable, if we regard the Size only. *Winſlow* divides each of them in two; one ſuperior, which is the largeſt, and which he terms the Labyrinth of the Noſtrils, it being full of Turnings and Windings, and irregularly cellulous; and one inferior, in the Shape of a Shell.

The Labyrinth has four Sides, and two Extremities. The upper Side is partly covered by the Cells of the Frontal Sinus, and large Opening already deſcribed. The lower Side is partly joined to the Cells of the Os Maxillare, and partly left expoſed and free. It ſends backward ſeveral Productions more or leſs conſiderable, which, in Skeletons, are often broken. Theſe Productions ſometimes join the Root of the ſharp Proceſs in the Sphenoidal Bone, being there fixed in lateral Grooves. The Inſide is ſomething convex and rough. It is turned toward the Septum, and fixed only to the Edge of the Lamina Cribroſa. The Outſide is flattened, and very ſmooth, from whence it acquired the Name of Os Planum. It makes Part of the Inſide of the Orbit, and at its upper Edge there are often one or two ſmall Notches, being Parts of the internal Orbitary Holes, already mentioned in the Deſcription of the Os Frontis.

The anterior Extremity of the Labyrinth is unequally cellulous. It is partly covered by the Cellulæ in the large Opening of the Os Frontis, and partly by the Os Unguis; and, by a kind of Funnel, it communicates with the Frontal Sinus. The poſterior Extremity is covered partly by the Sphenoidal Bone, and partly by the Os Palati.

The inferior Part of each lateral Portion reſembles, in ſome meaſure, an oblong Shell, ſuch as that of a Muſcle. *Winſlow* calls it the Concha Narium ſuperior, or upper Shell of the Noſtrils. It is very rough and porous, its convex Side being towards the Septum, and the concave Side towards the Os Maxillare. One End of it is turned backward, the other forward; and there the upper Part of it joins the Labyrinth, by means of the Funnel already mentioned. This inferior Part is diſtinguiſhed from the ſuperior or Labyrinth, by a remarkable lateral Groove.

What has been ſaid is ſufficient to direct us in ſituating this Bone; remembering only, that the Head of the Criſta Galli ought to be turned forward.

It is of a very delicate and tender Structure, tho' compact, and without any Diploë, being almoſt all compoſed of very thin bony Plates. It is joined to the Os Frontis, Os Sphenoides, Oſſa Naſi, Oſſa Maxillaria, Oſſa Unguis, Oſſa Palati, and Vomer.

The Uſes of it are to be a principal Part of the Organ of Smelling, and to give a very great Extent to the Pituitary Membrane in a ſmall Compaſs.

Ossa Temporum.

The Temporal Bones are two in Number, ſituated in the lower and lateral Part of the Skull.

The Figure of each is partly ſemicircular, reſembling the Scale of a Fiſh, partly like a ſhapeleſs Rock, ending in ſeveral Points.

Each of them is divided into two Portions; one ſuperior, termed ſquamous from its Figure; the other inferior, called Apophyſis Petroſa, or the Rock, not ſo much from its Figure, as from its Hardneſs. This Portion is eaſily ſeparable from the former in Children, and ſome Marks of this Diviſion ſtill remain in Adults, as *Riolanus* has obſerved.

They are likewiſe divided into two Sides; one external and convex, the other internal and concave: And thus the Eminences and Cavities in them may likewiſe be divided into external and internal.

The external Eminences are the Maſtoide Apophyſis in the lower and poſterior Part of the Bone: The Zygomatic Apophyſis is in the anterior Part; the Styloide Apophyſis under the Bone, which ſeems originally to have been an Epiphyſis. In one Subject *Winſlow* ſaw this Apophyſis three Inches in Length; and, in another, a Styloide Appendix joined to the ordinary Apophyſis by a Ligament, and ſtretched along the Stylo-Pharingæus Muſcle; the capſular Apophyſis, in which the bony Stylet ſeems, as it were, to be ſet; the articular Eminence of the Zygomatic Apophyſis; the Lambdoidal Angle; the lower Side of the Apophyſis Petroſa.

The external Cavities are, the articular Cavity immediately behind the Eminence of the ſame Name, which both together ſerve for the Articulation of the lower Jaw; the Crack in the articular Cavities; the Maſtoide Notch or Groove, in which the Digaſtric Muſcle is inſerted; the Opening of the external Meatus Auditorius; the anterior indented Border of that Opening; the Stylo-maſtoide, or anterior Maſtoide Hole, which is the Orifice of the Paſſage of the Portio Dura of the auditory Nerve; *Fallopius* termed this Paſſage the Aqueduct, not becauſe of its Uſe, but becauſe of the Reſemblance it bears to a kind of Aqueduct in his Country; the Orifice, or inferior Hole of the Carotid Canal in the Apophyſis Petroſa, which alters its Direction upward and forward, and ends at the Point of the Rock near the Sella Sphenoidalis; a Portion of the Jugular Foſſa; and a Portion of the Foramen Lacerum.

Among the external Cavities we are likewiſe to reckon a Portion of the Ductus Palatinus of the Ear, called commonly the Tuba Euſtachiana. This Duct, which muſt not be confounded with the Aqueduct of *Fallopius*, follows pretty much the Direction of the articular Crack; the Zygomatic Notch; the Parietal Notch, which receives the poſterior and lower Angle of the Os Parietale; the Sphenoidal Notch, which receives the ſpinal Apophyſis of the Os Sphenoides; one or more little Sulci for the Ramifications of the temporal Artery; the Groove in the Apophyſis Petroſa, by which it is connected to the great Apophyſis of the Os Occipitis; we may likewiſe add the poſterior Maſtoide Hole, thro' which a ſmall Vein paſſes, that empties itſelf into the lateral Sinus; this Hole is ſometimes formed between this Bone and the Os Occipitis; ſometimes it is wanting in one of the Bones, and ſometimes in both. There is likewiſe, in ſome Subjects, a ſmall ſuperior Maſtoide Hole, which loſes itſelf in the Subſtance of the Bone.

In examining the internal Eminences and Cavities, we muſt diſtinguiſh the ſquamous Portion from the Apophyſis Petroſa. In the former we ſee the radiated Indentations of the ſemicircular Edge, which, with the Parietal Bone, forms the ſquamous Suture: A Portion of the middle Foſſa of the Baſis of the Skull on the ſame Side, and ſeveral Inequalities in that Foſſa.

The Apophyſis Petroſa, or Rock, is a ſort of pyramidal Body with three Sides, ſituated obliquely, ſo as that its Baſis is turned backward and outward, and its Apex forward and inward, toward the Sella Turcica. Of the three Sides, one is ſuperior, and inclined a little forward; the ſecond poſterior; and the third inferior. This laſt belongs to the Outſide of the whole Bone, which has been already deſcribed.

The upper Side aſſiſts in forming the middle Foſſa of the Baſis of the Skull, being uneven, in the ſame manner as the Inſide of the ſquamous Portion. We obſerve here a ſmall irregular Hole, appearing to be double, and partly to be covered by a ſmall bony Plate. This Hole is a kind of Break or Interruption in the Duct, thro' which the Portio Dura of the auditory Nerve paſſes.

In the back Side of the Rock we ſee the internal auditory Hole, and a Portion of the Foſſa for the Cerebellum. Sometimes ſmall indeterminate Depreſſions are obſervable in it, pretty deep in Children, but gradually obliterated as they advance in Years. At the Baſis of this Apophyſis we ſee a Portion of the Groove for the lateral Sinus, formed partly in this Baſis, and partly in the Lambdoidal Angle; alſo a Portion of the Foramen Lacerum; and a ſmall Point, which, as it were, divides this Hole in two, and diſtinguiſhes the Paſſage of the Jugular Vein from that of the Eighth Pair of Nerves.

As this Apophyſis has three Sides, ſo we may obſerve in it three Angles; the firſt ſuperior, between the upper and back Sides; the ſecond poſterior, between the back and lower Sides; and the third anterior, between the lower and fore Side. The ſuperior Angle, which is the moſt apparent, has a Groove for a ſmall Sinus of the Dura Mater; the poſterior Angle is in a manner interrupted near the Middle of the Foramen Lacerum, and from it proceeds the little bony Point which divides this

Hole. At the End of it is a Groove, by which it is connected with the great Apophyſis of the Os Occipitis. Between the Apex of the Apophyſis Petroſa, and the ſuperior Opening of the Carotid Canal, we often meet with a ſmall Bone of the Seſamoidal kind, mentioned long ago by *Riolanus*.

To ſet any one of the Oſſa Temporum in its true Situation, the Zygomatic Apophyſis muſt be placed horizontally, and turned forward, and the Maſtoide Proceſs directly downward.

Almoſt the whole Subſtance of the Oſſa Temporum is compact: The ſquamous Portion is thin and tranſparent: The Maſtoide Apophyſis is hollowed by conſiderable Cells: The Subſtance of the Apophyſis Petroſa is very hard and ſolid, with ſeveral internal Cavities for the Organ of Hearing contained in it.

Each Os Temporis is joined above to the Os Parietale by a ſquamous Suture; behind and below, to the Occipital Bone, partly by a true Suture, and partly by Harmony; before, to the great Alæ of the Os Sphenoides, by a ſquamous Suture; and below, to the ſpinal Apophyſis of that Bone. It is likewiſe joined before to the Os Malæ, by the Zygomatic Suture.

The chief Uſes of theſe Bones are to complete the Globe of the Skull, to ſerve for the Articulation of the lower Jaw, and for the Inſertion of many Muſcles; and, laſtly, to contain the Organ of Hearing. See AURIS.

The Supernumerary BONES *of the* HEAD.

Winſlow calls by the Name of Supernumerary Bones ſeveral Pieces found in ſome Skulls, principally between the Parietal and Occipital Bones. They form Breaks in the Lambdoidal Suture, and are joined by true Sutures to the Bones already mentioned.

Their Figure, Number, and Size, vary very much. They are ſometimes, in ſome meaſure, triangular, but more frequently of no regular Figure. In ſome Subjects they encroach on the Occipital Bone, in others on the Parietal Bone, and ſometimes they extend themſelves every Way. They are commonly indented, and broader on the Outſide of the Skull than on the Inſide, in which they are without any viſible Indentations, and ſometimes are ſcarcely to be ſeen, when they are ſmall on the Outſide.

They have been termed Keys, a Name given by Joiners to the Pieces which ſerve to ſtrengthen the Joints of Boards, but which can agree to them only with reſpect to their Situation, and not to their Uſes in the Cranium, or other Bones of the Head. They ſerve to multiply the ordinary Sutures.

Some ſuch Bones have likewiſe been found in the Joints between the Bones of the Head and Face, and between thoſe of the Bones of the Face with each other; and to theſe might be added the ſupernumerary Teeth, placed out of the Rank of the reſt.

The BONES *of the* FACE: *And, firſt, The*

OSSA MAXILLARIA.

The Oſſa Maxillaria, or great Bones of the upper Jaw, are two in Number, ſituated one on each Side, in the anterior and middle Part of the Face.

Their Conformation is very irregular, and they are of a very conſiderable Extent.

Each of them may be divided into two Sides, one external, the other internal. By the external Side I mean all that appears in an entire Skull, without taking in the Arch of the Palate; and by the internal Side, that which makes Part of the Arch of the Palate, and all that is turned, to the Septum Narium.

The external Eminences are the Naſal Apophyſis, which makes the lateral Part of the Noſe; the Orbitary Apophyſis, which makes the inferior Portion of the Cavity of the Orbit, and, by a ſort of Criſta, forms the internal Portion of its Edge; this Proceſs is likewiſe called Apophyſis Malaris, becauſe of its Connexion with the Os Malæ; the Apophyſis Palatina, which, together with that on the other Side, forms the Arch of the Palate; the Apophyſis Alveolaris, which is in the Shape of an Arch, and contains the Teeth; the Maxillary Tubercle, or the poſterior Extremity of the laſt-named Arch; the Spine of the Nares, which is a ſmall pointed Eminence above the anterior Extremity of the Apophyſis Alveolaris.

The external Cavities are theſe: A Portion of the Orbitary Foſſa, where there is a ſmall Foſſula, in which the inferior oblique Muſcle of the Eye is inſerted, near the Lachrymal Duct, and a Fiſſure or Crack; a Portion of the Zygomatic Foſſa; a Portion of the Foſſa Palatina, or Arch of the Palate, in which many Inequalities are obſervable, more or leſs pointed, and often little pointed Hooks.

The Lachrymal Opening alſo, which receives the Os Unguis; a ſmall Lachrymal Groove, which, together with the Os Unguis, forms the ſuperior Part of the Lachrymal Duct; the Opening of the Nares; a Portion of the inferior Orbitary Fiſſure, or Fiſſura Spheno-maxillaris; the Opening which receives the Os Palati; a very ſmall Notch at the anterior Extremity of the Arch of the Palate, which forms the anterior Foramen Inciſorium, ſo called from its Situation behind the Inciſors; an oblique Groove in the poſterior Part of the Maxillary Tubercle, which contributes to the Formation of the poſterior Foramen Maxillare.

Alſo the Orbitary Canal, which runs from before backward, immediately under the inferior Portion of the Orbit; an anterior Orbitary Hole, or the anterior Orifice of the Orbitary Canal; the poſterior Orbitary Hole, or the poſterior Orifice of the Orbitary Canal, by which that Canal ends at the Edge of the Spheno-maxillary Fiſſure; the Crack or Fiſſure of the Orbitary Canal, which appears more or leſs in the Orbit, and is often a little open backward; the ſmall Holes of the Maxillary Tubercle; the ſmall Holes near the Orbitary Canal, and thoſe of the Apophyſis Naſalis, vary, and are ſometimes wanting; the Sockets of the Teeth.

The internal Eminences and Cavities are as follow: The greateſt Part of the Foſſa Naſalis; the anterior Criſta of the Nares, which is high and narrow; the poſterior Criſta of the Nares, which is low and broad; theſe two Criſtæ are a Continuation of the Spine of the Nares, and are ſo diſpoſed as to form a long Groove for the Reception of the Septum Narium, when the two Maxillary Bones are joined together; a perpendicular and pretty hollow Groove, wide towards the upper Part, narrow towards the lower, which makes the inferior Portion of the Lachrymal Duct.

The anterior Ductus Palatinus, alſo, on one Side of the anterior Criſta, and near the Spine of the Nares; this Duct, in its Courſe downwards, joins that of the other Jaw, and both together form the anterior Foramen Palatinum, or Inciſorium, which is often very complex; a ſmall anterior Eminence, or tranſverſe Line, between the Naſal Opening, and the lower End of the Lachrymal Duct, which ſuſtains the fore Part of the Concha Narium inferior; a rough broad Impreſſion on the Maxillary Tubercle, on both Sides of the Paſſage of the Foramen Palatinum, by which this Bone is joined with the Os Palati; a ſmall poſterior Eminence, or tranſverſe Line, covered with a Lamina of the Os Palati, which ſuſtains the Inequalities of the poſterior End of the Concha Narium inferior, by the Intervention of a Lamina of the Os Palati.

Laſtly, the Maxillary Sinus, which is a large Cavity under the Orbit, in the Orbitary Apophyſis. It extends to the Suture of the Os Malæ, to the Spheno-maxillary Fiſſure, to the inferior Orbitary Hole, and below to the Sockets. Towards its upper Edge there are ſometimes Cells, which communicate with the Os Ethmoides. It opens between the two Conchæ Narium, behind the Lachrymal Duct, by one or more Orifices, formed partly by a Portion of the Os Unguis. Theſe Openings are all much higher than the Bottom of the Sinus.

I ſay nothing here of the Separation of this Bone by a ſmall tranſverſe Suture, behind the Foramen Inciſorium, becauſe it is ſeldom found but in young Subjects, before the Oſſification is completed.

The Maxillary Bone is almoſt all compact, and without Diploë, except in the Alveolary Arch, and at the Point of the Orbitary Apophyſis.

To put this Bone in its true Situation, the Naſal Apophyſis muſt be turned upward, the Alveolary Arch downward, and the Spine of the Nares forward.

The Maxillary Bones are connected with the Os Frontis, Os Ethmoides, Os Sphenoides, Oſſa Unguis, Oſſa Malarum, Oſſa Naſi, Oſſa Palati, Vomer, Conchæ Narium Inferiores, and with each other.

They aſſiſt in forming the Organ of Maſtication, the Arch of the Palate, the Cheeks, the Orbits, and the Noſe.

OSSA MALARUM.

The Oſſa Malarum, called alſo Oſſa Zygomatica, and Malaria, are two in Number, ſituated in the lateral and middle Parts of the Face. They are, in ſome meaſure, triangular, or irregularly ſquare.

They are divided into two Sides, the external a little convex, the internal unequally concave.

The Eminences in each Bone are the ſuperior or angular Orbitary Apophyſis, which joins by Suture with the external angular Apophyſis of the Os Frontis, and aſſiſts in forming the external Angle of the Orbit. From this Apophyſis another ſubaltern Proceſs runs inward on the Inſide of the Bone, one Side of which forms a Portion of the Orbit, the other a Portion of the Zygomatic Foſſa; the inferior or Maxillary Orbitary Apophyſis, which, with the angular Apophyſis, forms the inferior external Portion of the Orbit; the Apophyſis Malaris, which is in ſome meaſure the Baſis of the reſt, and, together with the Apophyſis Maxillaris, joins the Orbitary Apophyſis of the Os Maxillare; the Zygomatic Apophyſis, which makes a Part of the Zygoma, and alſo of the Zygomatic Foſſa.

The Cavities are the great Orbitary Slope, which makes the inferior external Portion of the Edge of the Orbit; the Zygomatic Notch above the Zygoma; one or more little Holes on the Outſide, and in the Orbitary Apophyſes.

Each Bone is compoſed of two pretty compact Tables, with a ſmall Quantity of Diploë between them, except in the anterior Part of the Apophyſis Malaris.

The

The true Situation will be eaſily fixed, by conſidering what has been ſaid about the Sides and Apophyſes of this Bone.

The Os Malæ on each Side is joined to the Os Frontis by the angular Apophyſis, to the Os Sphenoides by the ſubaltern Apophyſis, to the Temporal by the Zygomatic Apophyſis, and to the Os Maxillare by its Baſis.

Theſe Bones make the prominent upper Part of the Cheeks, moſt remarkable in lean Perſons. They form likewiſe a Portion of the Orbit, and complete the Zygomatic Arches.

Ossa Nasi.

The proper Bones of the Noſe are two in Number, joined together, and ſituated below the Forehead, between the two Naſal Apophyſes of the Oſſa Maxillaria.

Each of theſe Bones comes near the Figure of an oblong Square, the upper Extremity being narrow and thick, the lower oblique and thin, the middle Part bent inwards near the upper End in ſome Subjects, in others almoſt ſtrait. The two Bones joined repreſent a ſort of Saddle.

Each of them is divided into two Sides, one anterior or external, the other poſterior or internal; two Extremities, one upper, the other lower; and two Edges, one external, the other internal.

The anterior Side is convex, tho' a little depreſs'd or hollow'd above the Middle. The poſterior Side is a little concave. The upper Extremity is very thick, full of Pits or Depreſſions: The lower Extremity is thin, unequally indented, and cut obliquely in ſuch a manner, as that the two Bones, join'd together, form an acute Slope. The inner Edge, contiguous to the ſame Edge, of the other Bone, is even, except near the upper Part, where they are united by a kind of Suture: From this Edge a little Eminence runs inward or backward (which is ſometimes wanting in one of the Bones); and, when they are joined, theſe Eminences repreſent a ſort of Criſta, or prominent Line, anſwering to the Septum Narium. About the Middle of the Outſide, ſometimes higher, ſometimes lower, there is a Hole, which is ſometimes wanting in one of the Bones, and ſometimes there are ſeveral Holes in each.

The Subſtance is compact; ſometimes, however, we meet with a ſmall Quantity of Diploë at the upper End.

The particular Situation of theſe Bones is eaſily underſtood by the Deſcription.

They are join'd to each other, partly by Suture, and partly by Harmony. They are join'd above to the Naſal Apophyſis of the Os Frontis, laterally to the Naſal Apophyſes of the Oſſa Maxillaria, and internally or poſteriorly to the anterior Edge of the perpendicular Lamina of the Os Ethmoides, by means of the prominent Line already mentioned.

They form the anterior and upper Portion of the Noſe, and Part of the Septum Narium.

Ossa Unguis.

The Oſſa Unguis, or Lachrymalia, are two in Number, each being ſituated in the Orbit, at the lower Part of the internal Angle. They are the leaſt Bones of the Face, very thin, and tranſparent.

They are longer than they are broad, reſembling, in ſome meaſure, the Nail of a Finger, from whence they have their Name, eſpecially when undivided from the other Bones of the Head; for, being taken out of the Skull, their Figure is more irregular.

Each of them is divided into two Sides, one external, the greateſt Part of which appears in the Orbit, in an entire Skull; the other internal, which is hid; two Extremities, one upper, the other lower; and two Edges, one anterior, the other poſterior.

The Outſide is ſmooth, and a little concave. Towards the anterior Edge is a Groove full of ſmall Holes, like a Sieve, call'd the Lachrymal Groove. It begins at the upper Extremity, and runs down lower than any other Part of this Side of the Bone, the lower Extremity of it being hid by the Os Maxillare. It is diſtinguiſh'd from the reſt of the Outſide by a very ſharp prominent Edge.

The Inſide is rough, and unequally convex, with a perpendicular Depreſſion, anſwering to the ſharp Prominence on the Outſide. On the upper Part of this Inſide ſmall Portions of cellulous Laminæ are ſometimes obſervable, which communicate with the Entry of the Frontal Sinus. There are likewiſe ſome about the Middle, which complete the anterior Ethmoidal Cells; and others towards the lower End, which communicate with the rugged Portions of the upper Border of the Sinus Maxillaris. Theſe often vary, and are ſometimes wanting.

Theſe Bones are altogether without Diploë.

What has been ſaid about the two Sides, and Lachrymal Groove, ſufficiently determines the Situation.

They are connected with the Os Frontis, with the Os Ethmoides, covering a Part of the Cells in that Bone, with the Naſal Apophyſis of the Os Maxillare, and with the Groove of that Bone, in ſuch a manner, as that the two Grooves, joined together, form an entire Tube, call'd the Lachrymal Duct. They alſo cover a little the Opening of the Maxillary Sinuſes, and join the inferior Conchæ of the Nares, of which they appear to be only a Continuation, in an advanced Age.

The Uſes of them are to complete the internal Sides of the Orbit, to cover the fore Part of the Labyrinth of the Noſe, and to form the Lachrymal Duct.

Ossa Palati.

The Bones of the Palate are two, ſituated in the poſterior Part of the Arch of the Palate, between the Pterygoide Apophyſes and the Oſſa Maxillaria; and running up, on the Sides of the Naſal Foſſæ, all the Way to the Bottom of each Orbit.

The Figure of theſe Bones is not ſquare, as is ſaid by thoſe who have only ſeen that Portion of them which belongs to the Palate, and from thence have named them Oſſa Palati. The entire Bone is crooked, hooked, pointed, and uneven, though but of a ſmall Size.

Each of them may be divided into four Portions, one ſuperior, one middle, and two lower, whereof one is anterior, the other poſterior.

The lower and anterior Portion, which *Winſlow* calls Portio Palatina, is the Baſis or Body of the Bone, and the only Part of it which the antient Anatomiſts have obſerved, *Vidus Vidius* excepted. It completes the Arch of the Palate, and the Bottom of the Naſal Foſſa. The inner Edge of it is raiſed, and that, join'd to the like Edge of the other Bone, forms a Groove, which ſupports Part of the Septum Narium, in the ſame manner as the other Part of it is ſupported by a like Groove of the Oſſa Maxillaria. The poſterior Edge is gently ſloped, and ends inwardly in a Point, which joins a like Point in the other Bone.

The lower and poſterior Portion, which *Winſlow* names Pterygoide, is pointed and hollow'd on each Side, to join the Pterygoide Apophyſis, of which it completes the Foſſa, being fix'd like a Wedge in the irregular Notch of that Proceſs: Exteriorly it is uneven, the better to be connected with the Os Maxillare. This Portion is diſtinguiſh'd from the Portio Palatina, and alſo from the middle Portion, by an oblique half Canal, which, with the half Canal in the Maxillary Tubercle, forms an entire Canal; the lower End of which is the poſterior Foramen Palatinum.

The middle Portion, to which *Winſlow* gives the Name of Naſal, is very thin, and is ſituated laterally. It has an internal and external Side: The internal Side is a little concave, being turn'd toward the Nares; and at the lower Part of it there is a tranſverſe Eminence, or bony Line, which diſtinguiſhes this Portion from the Portio Palatina. The Outſide is a little convex, and partly covers the Opening of the Maxillary Sinus. At the lower Part of it is a tranſverſe Groove, anſwering to the Eminence on the other Side, and moulded, as it were, by the poſterior tranſverſe Eminence of the Os Maxillare.

The upper Portion, which *Winſlow* calls orbitary, is diſtinguiſh'd from the Naſal Portion by a Notch, which, together with the Pterygoide Apophyſis of the Sphenoidal Bone, forms an Opening more or leſs conſiderable, which may be call'd Foramen Spheno-palatinum, or Pterygo-palatinum. This Portion has five little Sides, three of which are rather Cavities; one ſuperior, which completes the Extremity of the Bottom of the Orbit, and is more or leſs flat, very ſmall, ſmooth, and triangular; one anterior, which is a little hollow, covering the upper Part of the Maxillary Tubercle, and, by a ſmooth raiſed Edge, completing the Fiſſura Spheno-maxillaris; the third Side is likewiſe anterior, more hollow than the former, joining the back Part of the Labyrinth of the Os Ethmoides; the fourth is poſterior, more or leſs hollow, anſwering to the Sphenoidal Sinus; the fifth is lateral and external, covering the poſterior and upper Part of the Maxillary Sinus. It muſt be obſerved, that theſe Sides and Cavities vary, being ſometimes ſingle, ſometimes complex.

There is very little Diploë in theſe Bones, except in the Palatine and Pterygoide Portions.

By conſidering the Diviſion of theſe Bones already mention'd, it is eaſy to put them in their true Situation.

They are join'd to each other by the Portio Palatina; to the Vomer by the common Groove form'd by their raiſed Edges; to the Maxillary Bones before, and laterally to the Sphenoidal Bone behind; to the inferior Shells of the Nares by their tranſverſe Eminences; and, laſtly, by their Orbitary Portions to the Os Ethmoides, Oſſa Maxillaria, and Os Sphenoides.

They complete the Arch of the Palate, the Pterygoide and Naſal Foſſæ, and the Orbit: They aſſiſt in ſupporting the Vomer, and Conchæ Narium inferiores.

Vomer.

The Situation of the Vomer is perpendicular, between the two Naſal Foſſæ backward.

The Figure of it is nearly that of an oblique Square, having ſome Reſemblance to a Plough-ſhare, from which it has its Name.

It is divided into two Sides, one to the Right, the other to the Left, both of them unequally flat; and into four Edges, the ſuperior, inferior, anterior, and poſterior.

The upper Edge is an horizontal Groove, which receives the ſharp Proceſs, or Roſtrum of the Os Sphenoides. This Groove is broad, and a little notch'd backward; the fore Part of it is narrower, and ends in a ſtrait Canal, which runs downward and forward in an oblique Direction, dividing the Bone, as it were, into two Laminæ.

The anterior Edge is oblique, and very unequal. It may be divided into two Parts, one anterior and poſterior. The poſterior Part is ſmall and thin, and ſupports the perpendicular Lamina of the Os Ethmoides. The anterior Part is larger, with a pretty deep Groove, continued from the Canal in the upper Edge, which ſuſtains the Cartilaginous Septum of the Nares.

The lower Edge is likewiſe unequal; and near its anterior Extremity is an Angle, which divides it into two Parts; one anterior, very ſhort, which is ſet in the Criſta Narium; the other poſterior, and much longer, ſet in the common Groove of the Oſſa Maxillaria and Oſſa Palati: The Angle which diſtinguiſhes this Edge into two Parts, lies in the Notch form'd by the Criſta Narium, and the Groove of the Maxillary Bones.

The poſterior Edge is oblique and ſharp, becoming inſenſibly more obtuſe, as it approaches to the large Groove in the upper Edge.

This Bone has but very little Diploë.

To ſituate it right, we need only attend to the Deſcription of its Parts.

It is connected with the Os Sphenoides, Os Ethmoides, Oſſa Maxillaria, and Oſſa Palati, in the manner already ſaid.

Its Uſe is to form the poſterior Part of the Septum Narium.

Conchæ Narium Inferiores.

The inferior Conchæ of the Nares are two in Number, ſituated in the Naſal Foſſæ, under the Openings of the Maxillary Sinus, and immediately above the inferior Orifices of the Lachrymal Ducts. They cover theſe Orifices much in the ſame manner as the ſuperior Conchæ of the Ethmoidal Bone cover the Maxillary Openings. They are likewiſe term'd the inferior ſpungy Laminæ of the Noſe.

Their Figure is very much like that of the ſuperior Conchæ.

Two Sides are diſtinguiſhable in each of them, one internal, and one external; as likewiſe two Extremities, the anterior and poſterior; three Edges, two ſuperior, one ſmall, the other great, and one inferior; and, laſtly, two Apophyſes, one ſmall or ſuperior, the other large or lateral.

The Inſide is a little convex, being turn'd towards the Septum Narium: The Outſide is proportionably concave, turn'd toward the Maxillary Sinus. Both Sides are rough and uneven.

The Extremities are pointed, but the poſterior more than the anterior.

The inferior Edge, the moſt conſiderable of the three, is rough, thick, a little rounded, and turn'd outward, that is, toward the Os Maxillare. It is ſuſpended like the Ethmoidal Concha, without reſting on any thing.

Of the ſuperior Edges, the ſmall or anterior Edge is thin, uneven, and of the ſame Length with the anterior tranſverſe Eminence of the Ox Maxillare, to which it is join'd. The large or poſterior ſuperior Edge is longer than the other, and is join'd backward to the ſmall tranſverſe Eminence of the middle Portion of the Os Palati. Theſe two ſuperior Edges are diſtinguiſh'd by an obtuſe Angle, form'd by them. The great Edge has a large thin Apophyſis in the Shape of a Nail, which runs down on the inner or concave Side of the Bone. This Apophyſis, which is the greateſt of the two already mention'd, is ſometimes ſmooth, ſometimes uneven, divided and notched. It partly covers the Maxillary Sinus, and helps to make the Opening thereof.

The ſmall or ſuperior Apophyſis is a thin Plate, which divides the two upper Edges: It is, as it were, a ſmall Portion of a Groove, which, join'd to the lower End of that in the Os Unguis, completes the Lachrymal Canal; and, in Adults, it has appear'd to be a true Continuation of the laſt-named Bone, as if the inferior Concha of the Nares and Os Unguis were both one Piece.

The true Situation of theſe Bones is ſufficiently ſhewn, in what has been ſaid about their Sides, Extremities, and Edges.

They are connected with the Oſſa Maxillaria, Oſſa Palati, Oſſa Unguis, and ſometimes with the Os Ethmoides, of which they appear'd, in one Subject, to be a true Continuation. In moſt Skeletons theſe Connections are but very ſlender, and therefore theſe Bones are eaſily loſt, which is the Reaſon why the Antients have not obſerved them.

They complete the bony Structure of the Noſe, augment its Surface, and render it proportionable to the Extent of the Organ of Smelling, and of the Pituitary Membrane. See Nasus.

Maxilla Inferior.

The lower Jaw is but one Bone in Adults, and makes the lower Part of the Face.

It bears ſome Reſemblance to a Bow, with the Ends bent upward.

It may be divided into a Body and Branches. The Body is that Portion which repreſents a Bow: The Branches are the Extremities bent upward. In the Body we diſtinguiſh an anterior Portion, call'd the Chin; two lateral Portions; two Sides, one internal, and one external; and two Edges, one ſuperior, which is the Alveolary Arch of this Jaw, and one inferior, call'd the Baſis, and divided into an external and internal Labium. This Baſis ends poſteriorly in a crooked Portion, term'd the Angle of the lower Jaw.

In the Middle of the anterior Side of the Chin is a perpendicular Eminence or Line, which marks the Place where this Bone is divided in Children, and for that Reaſon it is named the Symphyſis of the lower Jaw. On each Side of the Symphyſis are two Muſcular Impreſſions, one high, the other low, more or leſs excavated, and in ſome Subjects diſtinguiſh'd by a ſmall tranſverſe Eminence. The external Labium of the Baſis of the Chin is a little prominent, and border'd on each Side by Eminences more or leſs conſiderable, by which the Chin appears to be diſtinguiſh'd from the lateral Parts of the Body of the Bone.

The Backſide of the Chin is concave, and Inequalities are ſeen in it through the whole Length of the Symphyſis. From the upper Edge to the Middle of the Symphyſis, or thereabouts, runs a ſuperficial Aſperity, broader below than above, and more remarkable in the Symphyſis than on either Side. Immediately below this Aſperity there are ſeveral Tuberoſities, more or leſs raiſed, and rough, the loweſt of which is on the internal Labium of the Baſis. On each Side of the uppermoſt Tuberoſity is a large ſhallow Impreſſion. At the very loweſt Border of the internal Labium of the Baſis, on each Side of the Symphyſis, there is a pretty large muſcular Impreſſion, with a tranſverſe Aſperity between them, which in a manner joins them to each other. We ſometimes meet with ſmall Holes in the upper Part of the Symphyſis, and near it.

The Outſide of each lateral Portion of the Body of this Bone is a little convex. On each Side of the Chin is a pretty large Hole, which is the anterior Orifice of a Canal. There is alſo a long Eminence or Elevation, which, beginning at the Baſis, near the before-mentioned Hole, runs obliquely upward and backward toward the Branch of the Jaw, growing more prominent as it aſcends. The lower End of this Side ſometimes juts out a little.

In the Inſide of this lateral Portion, a little below the Alveolary Edge, there is likewiſe a long Eminence, leſs oblique, but more prominent, which runs upward and backward, much in the ſame manner with that on the Outſide.

The poſterior curve Portions are the flatteſt of all, and repreſent a ſort of oblong Square, irregular, and a little oblique. In each of theſe Branches two Sides are to be taken Notice of, one internal, and one external; alſo two Apophyſes in the upper Part of them, one anterior, call'd the Coronoide Apophyſis, and one poſterior, call'd the Condyloide Apophyſis; a large Opening between the two Apophyſes; and, laſtly, an Angle, by which the poſterior and lower Part or Baſis of the Branch is terminated.

The anterior or Coronoide Apophyſis is flat, ſharp at the upper End, broad at the lower, ſomething uneven on the Outſide, and a little prominent about the Middle of the Inſide, by the Continuation of the internal oblong Eminence of the lateral Portion. The anterior Edge of this Apophyſis is a Continuation of the oblique external Eminence of the ſame Portion.

The poſterior Apophyſis is term'd Condyloide, becauſe it ends in a Head reſembling a Condyle, ſet upon a kind of Neck. This Condyle is oblong, and ſituated almoſt tranſverſly, the internal Extremity of it being only turn'd a little backward, and the external forward, which Direction anſwers to that of the articular Eminence and Cavity of the Os Temporis, with which this Condyle is articulated. It advances more toward the Inſide than toward the Outſide of the Bone, and the Neck is bent a little forward. This Neck is convex on the Back, and on the fore Part there is a muſcular Foſſula immediately under the Condyle.

The great Opening between the Apophyſes has a ſharp Border, which is, as it were, a Continuation of the poſterior Edge of the Coronoide Apophyſis. It is in the Shape of a Creſcent, and ends at the outer Extremity of the Condyle, on the Outſide of the Foſſula in its Neck.

The Outſide of the Branch is very full of ſuperficial Inequalities, or muſcular Impreſſions, eſpecially near the Angle. This Angle is blunt, uneven, and turn'd more or leſs toward the Outſide.

The Inſide has the ſame ſort of Inequalities towards the Angle. About the Middle of this Side is a very irregular Hole, being the internal Orifice of a large Canal, which, after having

run

run down a little Way in the middle Subſtance of the Branch, changes its Direction, continuing its Courſe thro' the Middle of the lateral Portion, all the Way to the Hole near the Chin, which is its external Orifice, and then loſes itſelf in the Subſtance of the Chin. The internal Orifice of this Canal is broad above, oblique, flat, more or leſs notched, and in ſome meaſure lacerated. A little below this Orifice are ſometimes found two little Holes, one above, and at ſome Diſtance from the other, which are the Orifices of a very ſmall Canal, running immediately under the Surface of the Bone. This Canal is the Continuation of a ſmall Groove, which begins at the Edge of the Orifice of the great Canal, and from thence runs a very little Way down. In ſome Subjects we find only this Groove, without any Canal.

The upper Edge of the Body of the lower Jaw is pierced by ſixteen Holes or Foſſulæ, call'd Sockets, which contain the like Number of Bones, call'd Teeth. See DENS.

This Bone appears to have a larger Share of Diploë, in proportion to its Size, than any other Bone of the Face, eſpecially near the Alveolary Arch. The Tables are very ſolid, and not equally thick in all Parts.

There is no Difficulty in determining the Situation of the lower Jaw.

The lower Jaw is connected with the Oſſa Temporum by a very ſingular kind of Articulation, partaking of the Nature both of a Ginglymus and Arthrodia, and therefore *Winſlow* terms it Amphidiarthroſis. Its principal Motions are upward and downward, and in all the different Degrees thereof; we can thruſt it forward, pull it backward, and turn it to either Side; and in the ſame manner, in any Degree of Motion, forward, backward, or laterally, we can raiſe or depreſs it. The Mechaniſm of this Articulation, and the Motions thereof, depend alſo on a Cartilage, to be deſcribed hereafter.

Recapitulation of the FORAMINA *or Holes in the Head, as repreſented by* Keill.

They are either external or internal. The external Holes are,

1. The two in the Coronal Bone above the Orbit, through which a Vein, Artery, and a Nerve, from the Ophthalmic Branch of the Fifth Pair, paſs, for the Brow and Frontal Muſcles. This frequently appears only as a Notch.

2. The *Orbiter internus*, in the ſame Bone within the Orbit, a little above the Os Planum, for another Branch of the Fifth Pair of Nerves, which goes to the Noſe.

3. The third is between the *Os Unguis* and the *Os Maxillare*, in the great *Canthus*, thro' which the Lachrymal Duct paſſes to the Noſe.

4. The *Orbiter externus* in the *Os Maxillare*, below the Orbit, thro' which the Nerves and Veſſels, which come from the Teeth, paſs to the Cheek.

5. One ſingle Hole in the ſame Bone, behind the fore Teeth, which comes from the Noſe.

6. Two in the *Oſſa Palati*, through which a Branch of the Fifth Pair of Nerves paſſes to the Palate, Uvula, and Gums.

7. In the Temporal Bone, between the Maſtoide and Styliform Proceſſes, thro' which the *Portio Dura* of the Auditory Nerve paſſes.

8. The *Ductus Auditorius externus.*

9. The *Ductus Auditorius internus.*

10. The Conduit for the Carotid Artery.

11. Another in the ſame Bone, thro' which a Vein paſſes from the external Teguments to the lateral Sinuſes. This is behind the Maſtoide Proceſs.

12. In the Occipital Bone behind its Apophyſis, thro' which the Vertebral Veins paſs.

13. In the ſame Bone, for a Branch of the external Jugular.

14. One ſingle large Hole for the Medulla Spinalis.

The internal Holes are,

1. The blind Hole above the *Criſta Galli.*

2. The Holes in the *Os Ethmoides.*

3. In the *Os Sphenoides* for the Optic Nerves.

4. The *Foramen Lacerum*, thro' which the third, fourth, firſt Branch of the Fifth, and Sixth Pair of Nerves paſs.

5. For the ſecond Branch of the Fifth Pair of Nerves.

6. For the third Branch of the ſame Nerve.

7. The *Foramen Arteriæ duræ Matris.*

8. The Canal thro' which the Carotid enters, and the Intercoſtal Nerve paſſes out; but this is counted among the external Holes.

9. In the Proceſs of the *Os Temporum*, thro' which the Auditory Nerve paſſes.

10. Between the Temporal and Occipital Bones, it is divided in two by the *Dura Mater*; thro' the one Part paſſes the Eighth Pair of Nerves, and the *Nervus Acceſſorius*; thro' the other the lateral Sinuſes open into the internal Jugulars.

11. One in each Side of the large Hole of the *Occiput*, thro' which the Ninth Pair of Nerves goes out.

The lower Jaw has four Holes, two on its Inſide near its Proceſſes, and two on its Outſide near its Middle. By the internal Holes enter a Branch of the Fifth Pair of Nerves, an Artery from the Carotids, a Vein paſſes out to the Jugulars, their Branches are ſpread in the Roots of the Teeth. By the external Holes theſe ſame Veſſels paſs, and are diſtributed upon the Chin. It has alſo ſixteen Sinuſes, into which the Teeth are ſet. *Keill.*

I muſt appriſe Students in Phyſic, that it is not poſſible to form a perfect Idea of the Bones of the Head, and their various Connections, by any Deſcription whatever. The only Method of acquiring a Knowledge of them, is to procure a Skull ſeparated artfully into the ſeveral Bones, of which it is naturally compoſed; and another with the Bones connected together by their proper Articulations. Thus by carefully comparing them with the Deſcription here given, and with each other, a perfect Knowledge of theſe Parts may be readily acquir'd, which is indiſpenſably neceſſary in Surgery particularly. It is farther of Importance to the Surgeon, to know the Situation of the Cartilages and Ligaments belonging to the Head, of which *Winſlow* gives the following Account; but neither his, nor any other Deſcription of them is ſufficient for a complete Knowledge of them, without diſſecting the Parts to which they belong.

The Condyloide Apophyſes of the Os Occipitis, the Glenoide Cavities or articular Foſſulæ of the Temporal Bones, the Eminences next theſe Cavities, and the Condyloide Apophyſis of the lower Jaw, are all cruſted over with very white and ſmooth Cartilages; and there is likewiſe an inter-articular or moveable Cartilage in each Articulation of the lower Jaw with the temporal Bones.

This Cartilage is thick near the Circumference, very thin and tranſparent, and ſometimes perforated, in the Middle. The lower Side is uniformly concave, anſwering to the oblong Convexity of the maxillary Condyle; but the upper Side is partly concave, and partly convex, ſuited to the Foſſula and Eminence in the temporal Bone.

For the Cartilages and Ligaments of the Noſe, ſee NASUS.

For the Cartilages and Ligaments belonging to the Eye, ſee OCULUS.

For the Cartilages and Ligaments of the Ear, ſee AURIS.

For the Cartilages of the Os Hyoides, ſee LINGUA.

The Ligaments of the Bones of the Head are theſe. 1. Thoſe betwixt the Occipital Condyles, and the ſuperior Apophyſes of the firſt Vertebra of the Neck. 2. Thoſe between the Os Occipitis and Apophyſis Dentiformis of the ſecond Vertebra. 3. Thoſe of the Articulation of the lower Jaw with the Temporal Bones. 4. Thoſe by which the Os Hyoides is connected to the Styloide Apophyſes.

The Ligaments of the Occipital Condyles reſemble the articular Ligaments of the Vertebræ, conſiſting of a ſtrong Texture of ligamentary Filaments placed cloſe by each other round the whole Articulation, and fixed by one End in the Occipital Bone, by the other in the Edges of the ſuperior Apophyſes of the firſt Vertebræ, and ſurrounding the Capſular Ligament.

The Ligaments which go from the Os Occipitis to the Apophyſis Dentiformis, are very thick, and diſpoſed in ſeparate Faſciculi, which afterwards unite. The Faſciculi are fixed immediately before the great Occipital Foramen in the lower Side of the Apophyſis Baſilaris, and the united Ligament is inſerted in the Apophyſis Dentiformis.

The Ligaments of the Articulation of the lower Jaw are very ſtrong, and are diſpoſed and inſerted much in the ſame manner with thoſe by which the Clavicle is connected to the Sternum. They are fixed by one Extremity round the Glenoide Cavity, or articular Foſſula and Eminence of each Temporal Bone; by their Middle, round the inter-articular Cartilage; and by the other Extremity, round each Condyle of the lower Jaw. The Diſpoſition of the Capſular Ligament, with reſpect to the inter-articular Cartilage, is the ſame as in the Articulation of the Clavicle with the Sternum.

The Bones of the Head, as well as all other Bones of the human Body, are cover'd by a particular Membrane, of which that Part which belongs to the Skull, is term'd Pericranium, and that which covers the Bones of the Face, or of the two Jaws, is called ſimply Perioſteum.

The internal Structure of the Bones of the Head being for the moſt part cellulous, they contain alſo diſtinct Portions of Marrow included in membranous Cells lying in the Diploë.

The Sinus Frontales, Maxillares, and Sphenoidales, are lin'd with a glandulous Membrane, which ſecretes a Mucilage very different from that of the Joints.

The true mucilaginous Glands of the occipital and maxillary Articulations have nothing peculiar to them. They are proportion'd to the Joints to which they belong, and lie between the Capſular Ligament and Circumference of the Cartilages. *Winſlow.*

The Os Hyoides is a Bone properly belonging to the Head,

but, as it is deſcrib'd under LINGUA, I muſt refer to that Article for an Account of it.

As it is of infinite Importance to the Practice both of Phyſic and Surgery, to be perfectly acquainted with all the Parts of the Head ſubjected to Injuries either external or internal, I ſhall proceed to give an Account of the Muſcles of the Head moſt ſubject to Wounds, Contuſions, Abſceſſes, and other Diſorders. This I chuſe to do after the Deſcriptions of the Bones, becauſe the Origins and Inſertions of the Muſcles could not have been comprehended without a previous Knowledge of the bony Parts.

MUSCLES *of the* HAIRY SCALP *and* FOREHEAD.

To demonſtrate theſe Muſcles, the following Method may be obſerv'd: Make an Inciſion through the common Integuments of the Head, the firſt and direct Line of Diviſion being continued from the middle and inferior Part of the Os Occipitis, to the ſame Part of the Os Frontis; the other tranſverſe from two circular Ducts round each Ear, interſecting the former on the Sinciput, begin from the Concourſe of Angles, taking care, in freeing the Forehead, not to raiſe the Muſculi Frontales.

OCCIPITALIS.

This and its Partner are mentioned by *Columbus*, and accurately deſcrib'd by *Fallopius*; they are ſhort, but broad, thin, fleſhy Muſcles, ſituated on the Occiput, from whence they derive their Names; each of theſe ariſes fleſhy from that Part of the Os Occipitis, where the Maſtoideus and Muſculus Splenius are inſerted, and ſoon becoming tendinous, joins with the Pericranium, which firmly adheres to the hairy Scalp on the Sinciput. When theſe act, they pull the hairy Scalp backwards. *Cowper.*

Euſtachius figures two other Muſcles on the Occiput, which *Lanciſi* calls *Muſculi quadrati*; and which are repreſented *Tab.* 11. *Fig.* 1. 1.

Becauſe, ſays *Lanciſi*, none either of the Antients or Moderns, ſo far as I know, has given Repreſentations of theſe Muſcles, tho' *Thomas Bartholine* makes mention of them, but aſſerts, that they are not always, but only ſometimes, to be found, I therefore think it worth while to ſay ſomething by the Way concerning them.

Theſe Muſcles, as I myſelf have ſeen, in all the Subjects I have diſſected, riſe with a fleſhy Origin on both Sides the Os Occipitis, and with broad Tendons are carried directly upwards to the lambdoidal Suture. With reſpect to their Uſe then, till ſome more accurate Anatomiſt advances ſomething more probable, we may conjecture, that they perform the ſame Office in the poſterior Part of the Cranium, that the frontal Muſcle does in its anterior Part; for after this laſt-mention'd Muſcle has drawn the anterior Part of the Head, commonly called the Forehead, upwards, and when the Muſcles of the Ears have in ſome meaſure corrugated the lateral and poſterior hairy Parts, theſe poſterior Parts of the Skin are ſoon drawn downward by theſe occipital Muſcles, which act, as it were, like Antagoniſts, which any one may experience in himſelf, as I myſelf have often made Trial of the Thing. Perhaps theſe are the Muſcles which becoming often preternaturally contracted and tenſe, eſpecially in hyſteric Women, create the Pain in the Occiput, ſo often mention'd by *Hippocrates*.

FRONTALIS, *Tab.* 10. *Fig.* 1. 1.

This ariſes thin, broad; and fleſhy, from the upper Part of the Os Frontis, near the Sutura Coronalis; and, deſcending by the poſterior and fore Part of the Temporalis, meets with its Partner near their Inſertions to the Skin of the Eyebrows.

Theſe, acting, draw up and wrinkle the Skin of the Forehead, and cannot antagonize the *Occipitales*, as ſome imagine, ſince their Originations are from the Bone above, and their Terminations in the Skin of the lower Part of the Forehead.

Beſides theſe, *Volcherus Coiter* counts another Pair, which later Authors call *Corrugatores*, ariſing near each great Canthus of the Eye at the Puncta Lachrymalia, ſeeming to terminate about the middle Region of the Eyebrows. But we rather incline to the Opinion of others, who take them to be two oblique Elongations of the former Muſcles. *Douglaſs* makes theſe diſtinct Muſcles.

To raiſe the Skin, and diſcover the Muſcles, of the Face, which in the Order of Diſſection are next to be proſecuted, continue your former Diviſion from the Dorſum Naſi, where you before left it, to its Apex; form two ſemicircular Sections on each Side the Alæ Naſi, to the Septum Narium; make a direct one to join with a circular Inciſion about the Lips, and from the Middle of that of the lower Lip draw your Knife directly over the Chin, Neck, and Sternum, till you meet the longitudinal one made in the Diſſection of the Muſcles of the Abdomen. The Skin is beſt clear'd from the Eyelids, after raiſing it from the circumambient Parts. In the Practice of this Operation ſpecial Attention muſt be had, leſt you wound the Orbiculares Palpebrarum, *Tab.* 10. *Fig.* 2. 2. Care alſo muſt be taken, in raiſing the Skin of the Neck and Face, not to raiſe the *Quadratus Genæ*, or Subcutaneus, with it.

Of the MUSCLES *of the* EYELIDS.

Galen, and the antient Anatomiſts, together with *Veſalius*, were extremely deceived in their Ideas of theſe Muſcles, in dividing the *Orbicularis* into two, and ſuppoſing thereby all the Motions of the Eyelids were perform'd. But this Syſtem was firſt alter'd by *Fallopius*, partly from an Intimation of *Oribaſius*, in his Book *de Diſſect. Muſcul. ex Galeno*, *Cap.* 6. where he takes Notice, that, in the Cure of an *Ægilops*, not only the deſcribed Beginnings of theſe Muſcles are cut and burnt away, but the Bone underneath exfoliated; and yet the Motion of the Eyelids remains: And partly from the Diſſection of the Eye in a Sea-calf, where he obſerved four Muſcles latent in the Orbit, inſerted above, underneath, and on both Sides the Palpebræ, he was induced to make the like Inquiry in Man, in whom he happily diſcover'd the *Aperiens Palpebram Rectus*, which ſhall be deſcribed hereafter. We mention this Paſſage, becauſe ſome later Authors have favoured the Account of the former, retaining their Diſtinctions into *Semicircularis ſuperior*, and *Semicircularis inferior*.

ORBICULARES PALPEBRARUM.

Tab. 10. *Fig.* 2. 2.

This is a thin fleſhy Muſcle, whoſe Fibres circularly environ the Eyelids, and are inſerted to them, (like the Sphincter Labiorum, *Tab.* 10. *Fig.* 11. 11.) not adhering to any Bone from whence we may derive their Origin, except the ſuperior Part of the great Bone of the Noſe, by ſome reckon'd the fourth Bone of the upper Jaw.

This Muſcle, acting like the Sphincters of other Parts, conſtringes the Eyelids. To theſe *Riolan* adds another Muſcle, belonging to each Eyelid, which he calls Ciliaris, which we take to be a Portion of the former, adjacent to the Cilia.

To diſcover the *Aperiens Palpebram Rectus*, that Part of the Orbicularis Palpebrarum lying between the upper Eyelid and Eyebrow muſt be raiſed; after which the *Glandula Lachrymalis*, with Part of the Fat within the Orbit, being removed, by extending the upper Eyelid, either with a Hook, or your Fingers only, its tendinous Inſertion, and ſlender fleſhy Body, will appear.

APERIENS PALPEBRAM RECTUS.

So call'd from its ſtrait Progreſs and Uſe. It ariſes, ſharp and fleſhy, from the profoundeſt Part of the Orbit, near the Place where the Optic Nerve is tranſmitted; paſſing directly over the *Muſculus Attollens*, it becomes tendinous as it marches over the Bulb of the Eye, whence growing ſtill broader and thinner, till it is inſerted to the whole ſuperior Part of the upper Eyelid.

For the Muſcles of the Eyes, ſee OCULUS.

The MUSCLES *of the* NOSE.

The Noſe is altogether immoveable, except in its lower griſtly Parts, which are not improperly call'd Alæ or Pinnæ: Theſe, by their Approach or Receſs, conſtringe or dilate the Noſtrils. *Galen* aſſigns but one Pair of Muſcles to them, to which *Jacobus Beringarius Carpenſis*, in his Commentary on *Mundinus*, adds another, ariſing from the Extremities of the Bones of the Noſe, and inſerted to the Inſide of the Alæ; wherein he is follow'd by *Veſalius*. *Columbus* pretends thoſe deſcribed by *Galen* belong to the upper Lip, and that thoſe placed in the Inſide of the Noſe (above-mentioned) are entirely fictitious; deſcribing ſtill another Pair, ariſing from the upper Parts of the Bones of the Noſe, and inſerted to their Alæ. *Fallopius* is not poſitive, whether he has ſeen thoſe internal Muſcles, mention'd by *Carpus* and *Veſalius*; but Mr. *Bueſſier*, an accurate Anatomiſt, inform'd *Cowper*, he had frequently obſerved them; adding, that thoſe deſcrib'd by *Columbus*, abovemention'd, do not properly belong to the Alæ, but are rather Parts of the Orbiculares Palpebrarum. *Fallopius* ſtill deſcribes another Muſcle, not taken Notice of before him, which late Anatomiſts call *Conſtrictor Alæ Naſi*, the Invention of which *Placentinus* aſſumes. In deſcribing theſe Muſcles we ſhall imitate the Order of *Riolan*, and others, who divide them into proper and common.

The proper are thoſe which move the *Alæ* alone, as the *Dilatores Alarum Naſi*.

The common are thoſe which move the *Alæ*, together with the upper Lip, as the *Retractores* and *Conſtrictores Alarum Naſi*.

Firſt of the proper.

Dilatores

Dilatores Alarum Naſi.

Theſe are ſmall thin Muſcles, having a double Order of Fibres decuſſating each other, not unlike the Muſculi Intercoſtales. They ariſe from the inferior and internal Parts of the Oſſa Narium, and are ſoon inſerted to the ſuperior Parts of the Alæ. Theſe pull up the Alæ, and dilate the Noſtrils; but I am inclin'd to think they are not found in all Subjects.

Retractores Alarum Naſi, & Elevatores Labii ſuperioris.

Theſe were mentioned by *Galen*: They ariſe, broad and fleſhy, from the fourth Bone of the upper Jaw; whence deſcending obliquely, they are ſoon inſerted to the upper Lip and Alæ Naſi.

The *Conſtrictor Alæ Naſi*, mention'd by *Fallopius* and *Placentinus*, we ſuſpect to be altogether fictitious.

Conſtrictores Alarum Naſi, ac Depreſſores Labii ſuperioris.

Theſe ariſe fleſhy from the fore Parts of the fourth Bones of the upper Jaw, immediately above the Gums of the Dentes Inciſorii, and, aſcending, are ſoon inſerted in the Roots of the Alæ Naſi, and ſuperior Parts of the upper Lip.

When theſe act, they draw the upper Lip and Alæ downwards, by which means they bring the latter nearer each other. Hence, when we attempt the Reception of any odoriferous Effluvia, the upper Lip is pull'd downwards.

Of the MUSCLES *of the* CHEEKS *and* LIPS.

Since Authors generally diſagree concerning the Number, Deſcription, and Uſe of theſe Muſcles, we ſhall not inſert their particular Differences.

Theſe Muſcles of the Lips are either common to the Cheeks and Lips, or to both Lips, or proper to the upper and under Lip only.

Thoſe common to the Cheeks and Lips are two Pair, on each Side two Muſcles, *viz.* the Quadratus and Buccinator.

Quadratus Genæ, ſeu Tetragonus.

By *Galen* call'd *Platyſma Myoides*, or the muſcular Expanſion. This is a great ſquare Muſcle, lying under the Skin of the Neck, and is ſpread over the whole inferior Region of the Face. It ariſes thin and membranous, according to *Galen*, from the Spines of the Vertebræ of the Neck. It alſo ſprings from the Skin on the ſuperior Part of the Cucullaris and Pectoral Muſcle; from hence aſcending under the Skin of the Neck, it becomes fleſhy; and one Part, adhering to the Os Hyoides, is ſoon inſerted to the Middle of the lower Jaw; the other broader Portion proceeding farther to its Implantation in the Cheeks, below the Angle of the Lips.

When both theſe Muſcles act, they pull down each Angle of the Mouth, together with the Cheeks, which Poſture of the Face is the proper Expreſſion of Sorrow. But if the inferior Parts of theſe Muſcles (which lie on the Neck) act alone, they diſtend the ſuperincumbent Skin, by making it approach to a direct Line with the Claviculæ and lower Jaw-bone, which otherwiſe is indented according to the Formation of the Part, whereby a double Chin (as they call it) is repreſented. This Muſcle is alſo call'd *Subcutaneus*.

The BUCCINATOR is deſcribed under the Article of its Name, which ſee.

The Muſcles common to both Lips are ſuch as are inſerted into the Angles of the Mouth, as the *Zygomaticus*, *Elevator*, *Depreſſor*, and *Conſtrictor Labiorum*.

ZYGOMATICUS.

Tab. 10. *Fig.* 8.

So call'd by *Riolan*, becauſe it ariſes from the Os Jugale, or Zygoma. Its Origination is round and fleſhy, from the external Part of the ſame Bone; whence deſcending obliquely forwards, is inſerted near the Angle of the Lips.

When this Muſcle and its Partner act, they draw both Lips upwards, and make a pleaſant Countenance.

ELEVATOR LABIORUM.

Tab. 10. *Fig.* 9.

This lies between the Zygomaticus and Elevator Labii ſuperioris Proprius, *Tab.* 10. *Fig.* 10. It ariſeth from the fourth Bone of the upper Jaw, and deſcends directly to its Inſertion under the Termination of the former.

DEPRESSOR LABIORUM.

This ariſes fleſhy from the lower Edge of the inferior Jaw-bone laterally, and aſcends directly to its Inſertion at the Angle of the Lips.

This, with its Partner, and the Quadrati, acting, expreſs a ſorrowful Countenance, in drawing down the Corners of the Mouth and Cheeks.

CONSTRICTOR LABIORUM, or *Sphincter & Orbicularis Labiorum.*

Tab. 10. *Fig.* 11. 11.

This environs the Lips with Orbicular Fibres, and, when it acts, it corrugates them; wherefore ſome name it *Oſculatorius*.

The Muſcles proper to the upper and under Lip, in particular, are three Pair; *Elevatores Labii ſuperioris*, *Depreſſores*, and *Elevatores Labii inferioris*. Of theſe in their Order.

ELEVATOR LABII SUPERIORIS.

This ariſes fleſhy from the fore Part of the fourth Bone of the upper Jaw, immediately above the *Elevator Labiorum*, and deſcends obliquely under the Skin of the upper Lip, joining with its Partner, in a middle Line, from the *Septum Narium* to its Termination in the *Sphincter Labiorum*.

DEPRESSOR LABII INFERIORIS.

It is difficult to determine, whether this be one only or two Muſcles. It lying between the *Depreſſores Labiorum* (deſcrib'd above) poſſeſſes that Part of the lower Jaw call'd the Chin, and, aſcending with a direct and tranſverſe Order of Fibres, is inſerted into the under Lip, in depreſſing of which it turns it outwards.

ELEVATOR LABII INFERIORIS.

This Muſcle, with its Partner, lies within the lower Lip. Theſe we firſt obſerved ſome time ſince. They ariſe fleſhy from the inferior Part of the Gums of the lower Jaw, which belong to the Dentes Inciſorii, and deſcend directly to their Implantations in the inferior Part of the Skin of the Chin: Hence it is, when theſe act, they make divers Indentations in the Chin, as may be obſerved in living Perſons when the lower Lip is drawn upwards. *Cowper.*

For the Muſcles of the Ear, ſee AURIS.

For the Muſcles of the Tongue and Os Hyoide, ſee LINGUA.

As *Winſlow*, from whom I have taken the Deſcriptions of the upper Jaw, enumerates the Bones in a manner different from ſome other Anatomiſts, in order to the underſtanding the Origins and Inſertions of the Muſcles, as ſpecified by *Cowper*, it is neceſſary to remark, that

The firſt Bone of the upper Jaw is the *Os Mali*, or *Zygoma*.

The ſecond is the *Os Maxillare*.

The third is the *Os Unguis*.

The fourth is the *Os Naſi*.

The fifth is the *Os Palati*.

The MUSCLES *which move the lower Jaw.*

Theſe Muſcles are ten in Number, five on each Side, which are the

Maſſeter.

Temporalis.

Pterygoidæus major ſive internus.

Pterygoidæus minor ſive externus.

Digaſtricus.

To theſe ſome add the two Muſculi Cutanei, or Quadrati Genæ, but very improperly.

MASSETER: *Tab.* 10. *Fig.* 5.

This is a very thick fleſhy Muſcle, ſituated at the back Part of the Cheek. It ſeems to be made up of three Portions, like a *Triceps*, one large and external Portion, one middle, and one ſmall and internal.

The external Portion is fix'd by one tendinous Extremity to all the inferior Edge of the Os Malæ, and a little to the neighbouring Parts of the Os Maxillare, and Apophyſis Zygomatica of the Temporal Bone. From thence it runs down obliquely backward, being wholly fleſhy, and is inſerted by the other Extremity, in the rough Impreſſion on the Outſide of the Angle of the lower Jaw.

The middle Portion is fix'd by one End to the lower Edge of the whole *Apophyſis Zygomatica* of the Temporal Bone, and a very little to that of the *Os Malæ*. From thence it runs down a little obliquely forward, in an oppoſite Direction to the firſt Portion, under which it croſſes; and is inſerted, by its other Extremity, in the Middle of the Inſide of the Branch of the lower Jaw, near the Inſertion of the external Portion, with which it mixes.

The third Portion, which is leaſt and moſt internal, is fix'd by one Extremity to the inner Labium of the lower Edge, and alſo to the Inſide of almoſt all the Zygomatic Arch; and, by the other, to the Root or Baſis of the Coronoide Apophyſis, where it mixes, wholly fleſhy, with the Inſertion of the middle Portion. This third Portion, by its Nearneſs of Situation, ſeems

ſeems ſometimes to be an Appendix of the Temporal Muſcle.

The *Ductus Salivalis ſuperior* paſſes over this Muſcle, and this is obſerved, by *Cowper*, to be a provident Contrivance of Nature to accelerate the Motion of the *Saliva* during Maſtication.

Temporalis, or Crotaphites. *Tab.* 10. *Fig.* 4.

This is a broad flat Muſcle, reſembling a Quarter of a Circle in Figure. It occupies all the ſemicircular or ſemioval Plane of the lateral Region of the Cranium, the temporal Foſſa, and Part of the Zygomatic Foſſa. From this Situation it has its Name of Temporalis, and likewiſe that of Crotaphites, which is ſometimes given to it.

To conceive juſtly the Inſertions of this Muſcle, it muſt be obſerved, that, thro' all the Circumference of the ſemicircular Plane already mentioned, the Pericranium is divided into two Laminæ. The internal Lamina, ſometimes taken for a particular Perioſteum, covers immediately all the bony Parts of this Region. The external Lamina, ſeparated from the other, is ſpread out like an Aponeurotic or Ligamentary Expanſion, by means of its Adheſions to the external angular Apophyſis of the Os Frontis, to the poſterior Edge of the ſuperior Apophyſis of the Os Malæ, and to the upper Edge of all the Zygomatic Arch, all the Way to the Root of the Maſtoide Apophyſis.

This Muſcle is compoſed of two Planes of fleſhy Fibres, fixed to the two Sides of a tendinous Plane nearly of the ſame Breadth with them, by which they are ſeparated, it being ſpread quite through the Muſcle like a concealed middle Tendon; as may be plainly ſeen by dividing the Muſcle all the Way to the Bone, according to the Direction of its Fibres. The Body of the Muſcle thus formed is incloſed between the two Aponeurotic or Ligamentary Laminæ, in the following Manner.

The internal fleſhy Plane is fixed, by a broad radiated Inſertion, to all the ſemicircular Plane of the Cranium, by the Intervention of the internal Lamina of the Perioſteum.

Thus it is fixed to the lateral external Part of the Os Frontis, and to its external angular Apophyſis, to the lower Part of the Os Parietale, to the ſquamous Portion of the Os Temporis, to the great Ala, or Temporal Apophyſis of the Sphenoidal Bone, by which the Temporal Foſſa is formed; and a little to the Backſide of the internal Orbitary Apophyſis of the Os Malæ, which forms Part of the Zygomatic Foſſa.

Through all this Space the fleſhy Fibres contract gradually, by means of their Adheſions to the Tendinous Plane, which diminiſhes in Breadth, and increaſes in Thickneſs, in proportion as it deſcends.

The external fleſhy Plane is fixed in the ſame radiated Manner to the Inſide of the external Lamina of the Pericranium, from the great ſemicircular Circumference, all the Way to a ſmall Portion of this Lamina more or leſs ſemicircular, above its Inſertion in the Zygomatic Arch. Here the fleſhy Fibres leave the external Lamina, and the void Space thus formed between the ſmall ſemicircular Portion and the fleſhy Fibres is commonly filled with Fat.

Through the whole Extent of this Inſertion the fleſhy Fibres gradually contract, and adhere to the Outſide of the middle Tendinous Plane, in the ſame manner as the internal Plane adheres to the other Side, but in a contrary Direction.

The middle Tendinous Plane, continuing to contract by Degrees, ends at length in a very conſiderable Tendon, the Extremity whereof, which is in a manner double, incloſes the Coronoide Apophyſis of the lower Jaw, being ſtrongly inſerted in the Edges and Inſide thereof, and alſo a little in that Part of the Bone which lies between the two Apophyſes. The internal Portion of this Inſertion is thicker, and has more fleſhy Fibres, than the external, which is almoſt wholly Tendinous or Aponeurotic.

There is another ſmall Plane reckoned by ſome to be a Portion of this Muſcle; which, in reality, is no more than the third Portion of the Maſſeter, as may eaſily be perceived by ſawing off the Zygomatic Arch at the two Ends, and then turning it down; for this ſmall Muſcle parts from the Temporalis without Difficulty, and continues to adhere to the Maſſeter.

The Uſe of the Temporal Muſcles and Maſſeters is, to draw the lower Jaw upwards in Maſtication, or the Formation of Sounds, and Modulation of the Voice. *Cowper* ſays, he could never obſerve thoſe dreadful Symptoms which Authors relate to enſue from Wounds of the Temporal Muſcle, tho' he has ſometimes ſeen it divided, in order to apply the Trapan in Fractures of the Cranium.

Pterygoidæus major sive internus.

This Muſcle lies on the Inſide of the lower Jaw, almoſt in the ſame Manner as the Maſſeter does on the Outſide, being of the ſame Figure with that Muſcle, only ſmaller and narrower.

It is fix'd above in the Pterygoide Cavity, principally to the Inſide of the external Ala of the Apophyſis Pterygoides. This Inſertion is wholly fleſhy, and from thence the Muſcle has its Name.

It runs down obliquely toward the Angle of the lower Jaw, and is inſerted a little Tendinous in the Inequalities on the Inſide thereof, oppoſite to the Inſertion of the Maſſeter. It might be called Maſſeter Internus.

When the Pterygoidæus Major on either Side acts, it draws the Jaw to the contrary Side. If both act together, they aſſiſt the Temporal Muſcles and Maſſeters in drawing up the lower Jaw.

Pterygoidæus minor sive externus.

This is an oblong fleſhy Muſcle, much ſmaller than the other, and ſituated almoſt horizontally between the Outſide of the Apophyſis Pterygoides, and the Condyloide Apophyſis of the lower Jaw, the Subject being conſidered in an erect Poſture.

It is fixed by one Extremity to the Outſide and Edge of the outer Ala of the Pterygoide Apophyſis, filling the Foſſula which is at the Baſis of this Apophyſis, near the Baſis of the Temporal Apophyſis of the Sphenoidal Bone.

From thence it runs backward, and a little outward, into the void Space between the two Apophyſes of the lower Jaw, and is inſerted anteriorly in the Condyloide Apophyſis, at a ſmall Foſſula immediately under the inner Angle of the Condyle. It is alſo fixed to the Capſular Ligament of the Joint.

When this and its Partner act, they draw the lower Jaw forwards, and force the Teeth of the inferior Jaw beyond thoſe of the ſuperior, as *Fallopius*, their firſt Deſcriber, obſerves.

Digastricus.

This is a ſmall long Muſcle, ſituated laterally between the whole Baſis of the Jaw and the Throat. It is fleſhy at both Extremities, and tendinous in the Middle, as if it conſiſted of two ſmall Muſcles joined endwiſe by a Tendon; and from thence it is called *Digaſtricus* in *Greek*, and *Biventer* in *Latin*.

It is fixed by one fleſhy Extremity in the Sulcus of the Maſtoide Apophyſis. From thence it runs forward, inclining towards the Os Hyoides, where the firſt fleſhy Body ends in a round Tendon, which is connected to the lateral Part, and Root of the Cornua of that Bone, by a kind of Aponeurotic Ligament, and not by a Vagina or Pulley, as appears at firſt Sight, becauſe of its Paſſage by the Extremity of the Muſculus Stylogloſſus; of which under the Article of its Name.

Here the Tendon is incurvated, and preſently ends in the other fleſhy Body, which is fixed immediately above the internal Labium of the Baſis of the Chin near the Symphyſis, in a ſmall unequal Depreſſion. This Inſertion is broader than that of the other Extremity. Sometimes the anterior Inſertions of the two Digaſtrici touch each other, and ſometimes ſeveral of their Fibres croſs each other conſiderably. *Winſlow.*

The middle Tendon of this Muſcle, and its Partner, paſſing through the Aponeurotic Ligament, at the lateral Part and Root of the Cornua of the Os Hyoides, is a wonderful Contrivance of the Author of Nature to render them capable of pulling the lower Jaw-bone down, which, had their Progreſs been direct from their Originations, they could not have performed. Nor are there any Proceſſes, whether of the Vertebræ of the Neck, or the neighbouring Parts, that could give an Origination to theſe Muſcles below their Inſertions, as in ſome Quadrupeds: Wherefore the Divine Architect of human Bodies has placed this Aponeurotic Ligament to ſerve as a ſort of Pulley below their Terminations, whereby they perform their deſigned Office. Hence Deglutition is hindered, when theſe Muſcles are in Action, they then preventing the Aſcent of the Tongue and Larynx. Neither can we at that time draw the lower Jaw down, becauſe the Centre of Direction is pulled upwards. Wherefore we are obliged on that Occaſion to keep the Jaws cloſe together. But in Dogs, and other voracious Animals, who have theſe Muſcles ariſing from the tranſverſe Proceſſes of the firſt Vertebra of the Neck, theſe Actions are not dependent; whence it is they devour their Aliment ſo quick.

There are ſeveral Muſcles, beſides thoſe already mentioned, which are inſerted in the Head, and conſequently are ſubject to be affected in Wounds of that Part. The firſt of theſe is the Cucullaris, which is inſerted in the lower Part of the Occiput, as is expreſſed, *Tab.* 11. *Fig.* 2.

The Maſtoidei Anteriores, or Sternomaſtoidei, are inſerted into the Maſtoide Apophyſes. See Mastoideus.

The Splenii (*Tab.* 11. *Fig.* 3. expreſſed only on the Right Side) are inſerted in the upper Part of the Maſtoide Apophyſes, and along the adjacent curve Portion of the tranſverſe Ridge of the Occipital Bone. See Splenius.

The Complexus is inſerted by a broad fleſhy Plane in the poſterior Part of the ſuperior tranſverſe Line of the Occipital Bone, near the Criſta or Spine of that Bone. At its Inſertion it joins, by one Edge, the Complexus of the other Side, and by the other, the Splenius, which covers it a little. See Complexus.

The

The Complexus Minor, or Maſtoidæus Lateralis, is inſerted in the poſterior Part of the Apophyſis Maſtoidæus, where it is covered by the Splenius. See COMPLEXUS MINOR.

The Rectus major is inſerted in the poſterior Part of the inferior tranſverſe Line of the Occipital Bone, at a ſmall Diſtance from the Criſta, being a little covered by the Obliquus Superior. See RECTUS MAJOR.

The Rectus minor is inſerted immediately under the poſterior Part of the inferior tranſverſe Line of the Occipital Bone, in a ſuperficial Foſſula on one Side of the Criſta Occipitalis. See RECTUS MINOR.

The Obliquus ſuperior ſive minor is inſerted in the tranſverſe Line of the Occipital Bone, almoſt at an equal Diſtance from the Criſta and the Maſtoide Apophyſis, between the Rectus minor and Complexus minor, which covers it. See OBLIQUUS SUPERIOR.

The Rectus anticus longus is inſerted in the fore Part of the lower Side of the Apophyſis Baſilaris, or great Apophyſis of the Occipital Bone. See RECTUS ANTICUS LONGUS.

The Rectus anticus brevis is inſerted in a tranſverſe Impreſſion in the lower Side of the Apophyſis Baſilaris of the Occipital Bone, immediately before the Condyle on the ſame Side, being covered by the Rectus anticus longus. See RECTUS ANTICUS BREVIS.

The Tranſverſalis anticus primus is inſerted in a particular Impreſſion between the Condyle of the Occipital Bone, and the Maſtoide Apophyſis of the ſame Side, behind the Apophyſis Styloides, and under the Edge of the Jugular Foſſula. See TRANSVERSALIS ANTICUS PRIMUS.

In order to underſtand perfectly what is ſaid concerning Diſorders of the Head from an external Cauſe, it is indiſpenſably neceſſary to form a juſt Idea of the Membranes ſurrounding the Brain, which I am ſenſible no Deſcription can give without an Inſpection of the Parts themſelves. But the Perſon who has once ſeen them, will reap ſome Advantages from the following Account of them.

The Meninges, or Membranes of the Brain, are two in Number, one of which is very ſtrong, and lies contiguous to the Cranium; the other is very thin, and immediately touches the Brain. The firſt is named Dura Mater, the ſecond Pia Mater; which is again divided into two, the external Lamina being termed Arachnoides, the internal retaining the common Name of Pia Mater.

DURA MATER.

The Dura Mater incloſes the Brain, and all its Appendages. It lines the Inſide of the Cranium, and ſupplies the Place of an internal Periofteum, being ſpread in all the Holes and Depreſſions, and covering all the Eminences in ſuch a manner as to prevent their being hurtful to the Brain.

In deſcribing the Dura Mater, we muſt take Notice,

1. Of its Compoſition;
2. Its Adheſion to the Cranium;
3. Its Folds or Septa;
4. Its Productions, Veſſels, and Nerves.

The Dura Mater is made up of two Laminæ, adhering very cloſely together, the Fibres of both croſſing each other obliquely. By rubbing any Part of this Membrane between the Fingers, we eaſily perceive the two Laminæ ſliding a little upon each other. Their Texture is very cloſe and ſtrong, appearing to be partly ligamentary, and partly tendinous.

The Dura Mater ſticks cloſely to the Cranium by a great Number of Filaments of the external Lamina, which enter the Pores of the Bones principally at the Sutures, both above and below; and, by penetrating theſe Joints, they communicate with the external Periofteum. Theſe Filaments are, for the moſt part, ſmall Veſſels, which being broken in ſeparating the Dura Mater from the Skull, a great Number of red Points appear on the external Surface of that Membrane.

It adheres much more to the whole inner Surface of the Cranium in Children and young Perſons, than in thoſe of an advanced Age, the Filaments becoming then very ſmall, being compreſſed by the Contraction of the bony Pores; and conſequently they are more eaſily broke by any Force applied to them.

Theſe Adheſions are formed entirely by the external Lamina. The internal Lamina is very ſmooth, and poliſhed on the Inſide, which is alſo continually moiſtened by a fine Fluid, diſcharged thro' its Pores, much in the ſame manner as in the Peritonæum and Pleura.

The Folds of the Dura Mater are made by the internal Lamina; and three of them form particular Partitions, one of which is ſuperior, and repreſents a kind of Mediaſtinum between the two great Lobes of the Brain. The ſecond is in a middle Situation, like a Diaphragm between the Cerebrum and Cerebellum. The third is inferior between the Lobes of the Cerebellum. The ſuperior Partition is longitudinal, in Form of a Scythe, from whence it is termed the Falx of the Dura Mater; and it may likewiſe be called Septum Sagittale, Verticale, or Mediaſtinum Cerebri. The middle Partition is tranſverſe, and might be called the Floor of the Cerebrum, the Diaphragm of the Brain, or the Tent of the Cerebellum. The inferior Partition is very ſmall, and runs down between the Lobes of the Cerebellum; on which Account it may be term'd either ſimply Septum cerebelli, or Septum occipitale minus; the middle Partition being conſidered as the Septum occipitale majus.

The ſuperior or vertical Partition, called the Falx of the Dura Mater, is a long and broad Fold or Duplicature of the internal Lamina, reaching from the Edge of the Criſta Galli, along the Sagittal Suture, to the Middle of the tranſverſe Partition, which it joins in ſuch a manner, as that the lateral Laminæ of the Falx are continuous, on each Side, with the neighbouring Portions of the ſuperior Lamina of the middle Partition.

It is broader where it joins the middle Partition than at the Os Ethmoides, and it is thicker at that Edge which adheres to the Cranium than at the other, which lies looſe, and is very ſharp; and from this Reſemblance to a Scythe it had the Name of Falx.

The tranſverſe or middle Partition is fixed to the Os Occipitis, along the Grooves of the lateral Sinuſes, and thoſe of the great Angles of the Apophyſes Petroſæ, all the Way to the poſterior Clinoide Apophyſes of the Os Sphenoidale. By this Situation it forms a ſort of Floor, Tent, or ſhallow Vault, on the fore Part of which is a large Notch, almoſt of an oval Figure.

This Partition divides the Cranium into two Cavities; one large or ſuperior, and the other ſmall or inferior, which communicate together by the great oval Notch. It is formed by a particular Fold, and a very broad Membrane of the internal Lamina of the Dura Mater; and in the natural State it is very tenſe, becauſe of its Union, or rather Continuity, with the Falx.

This Union or Continuity of theſe two Partitions keeps them both very tenſe, ſo that the middle Partition is capable of ſuſtaining a conſiderable Weight without ſinking downward; and the Falx is able to reſiſt lateral Preſſures, without giving way to the Right Hand or to the Left.

We may be convinced of this reciprocal Tenſion by, firſt, touching theſe two Partitions in their natural State; and, again, after they have been cut one after the other, according to their Breadth, or rather after having cut in this manner the Falx in one Subject, and the tranſverſe Partition in another; for, as ſoon as the Falx is cut, the other will be perceived immediately to loſe its Tenſion and Firmneſs; and the ſame thing will be obſerved in the Falx, as ſoon as we cut the Septum Medium, or tranſverſe Partition.

The ſmall Occipital Partition is both very ſhort and narrow. It runs down from the Middle of the tranſverſe Partition to the Edge of the great Occipital Hole, being fixed to the internal Spine of the Occipital Bone. It is formed by a Fold and Duplicature of the internal Lamina of the Dura Mater, in the ſame manner as the other two, and diſtinguiſhes the lower Part of the Occipital Cavity of the Cranium into two lateral Parts. In ſome Subjects this Partition is double, anſwering to the double Spine of the Occipital Bone.

Beſides theſe large Folds, there are two ſmall lateral ones, on each Side of the Sella Sphenoidalis, or Turcica, each running from the poſterior to the anterior Clinoide Apophyſis on the ſame Side. Theſe two Folds, together with the anterior and poſterior Parts of the Sella Sphenoidalis, form a ſmall Foſſula, in which the Pituitary Gland is lodged. There are likewiſe two anterior Folds, at the Edges of the Sphenoidal, or ſuperior Orbitary Fiſſures, which augment the Depth of the middle Foſſulæ of the Baſis of the Cranium. Thus we have ſeven Folds of the internal Lamina of this Membrane, three large, and four ſmall, which may be termed internal Productions or Proceſſes of the Dura Mater.

The Elongations of the Dura Mater are Productions of both Laminæ, which go beyond the general Circumference, and paſs out of the Cranium, thro' the Openings therein; and in this they differ from the Folds which are formed entirely by one Lamina, and do not go out of the Skull. They may be nam'd the external Productions of the Dura Mater.

The moſt conſiderable of theſe Elongations paſſes thro' the great Occipital Foramen, and runs down the common Canal of the Vertebræ in form of a Tube, lining the Inſide of that Canal, and incloſing the ſpinal Marrow, by the Name of the Dura Mater of that Marrow. The other Elongations accompany the Nerves out of the Cranium in form of Vaginæ. Theſe are more numerous than the nervous Trunks which are reckoned by Pairs. Thus for the Olfactory Nerves there is the ſame Number of diſtinct Vaginæ, as there are Holes in the Lamina Ethmoidalis; and ſome Nerves are accompany'd by ſeveral Vaginæ thro' one Hole, as thoſe of the Ninth Pair.

There are two particular Elongations which form the Periofteum of the Orbits, together with the Vaginæ of the Optic Nerves. Theſe Orbitary Elongations go out by the Sphenoidal or ſuperior Orbitary Fiſſures, and, enlarging in their Paſſage,

line the whole Cavity of the Orbits, at the Edges of which they communicate with the Pericranium and Periosteum of the Face. They communicate likewise thro' the Spheno-maxillary or inferior Orbitary Fissures with the Pericranium of the Temporal and Zygomatic Fossæ; and by these Communications we may explain the Accidents which happen to these Parts in Wounds of the Head.

The Elongations of the Dura Mater, which accompany the Blood-vessels through the Foramina of the Cranium, unite with the Pericranium afterwards. Such, for Instance, are the Elongations which line the Fossulæ of the Foramina Lacera or Jugularia, and the bony or carotid Canals of the Apophysis Petrosa.

The Vessels of the Dura Mater are Arteries, Veins, and Sinuses. The Arteries in general are distinguished into anterior, middle, and posterior, and come from the Carotids and Vertebrals on each Side. The external Carotid sends a Branch through the spinal Hole of the Os Sphenoidale, which is the middle Artery of the Dura Mater, and is called, by way of Eminence, Arteria duræ matris. It is divided into a great Number of Branches, which are plentifully dispersed thro' the Substance of the external Lamina as high as the Falx, where these Ramifications communicate with their Fellows from the other Side. The Impressions of this Artery are seen on the Inside of the Parietal Bones, the anterior and lower Angle of which, instead of a simple Impression, contains a Canal for the Passage of a Trunk or Branch of this Artery; on which Account several Accidents happen in Fractures of the Skull.

The external Carotid sends another small Branch through the Corner or small End of the Sphenoidal or superior Orbitary Fissure, where there is sometimes a little Notch on purpose. This Branch is the anterior Artery of the Dura Mater, and it gives off Ramifications in the same manner as the former, with which it communicates, but its Ramifications are not so numerous. The internal Carotid, as it enters the Cranium, gives off a small Branch to the Substance of the Dura Mater.

The two Vertebral Arteries enter by the great Occipital Foramen, and unite in one Trunk on the anterior or Sphenoidal Apophysis of the Occipital Bone. Immediately afterwards they enter the Substance of the Dura Mater on both Sides, each of them by one or two Branches. These are the posterior Arteries of the Dura Mater; and they communicate by some Ramifications with the middle or spinal Artery above-mentioned.

The Dura Mater contains in its Duplicature several particular Canals, into which the venous Blood, not only of that Membrane, but of the whole Brain, is convey'd. These Canals are termed Sinuses; and some of them are disposed in Pairs, others in uneven Numbers; that is, some of them are placed alone in a middle Situation, others are disposed laterally on each Side of the Brain. The most antient Anatomists reckon'd only four, to which we can now add four times as many.

These Sinuses are in the Duplicature of the Dura Mater, and their Cavities are lined on the Inside by particular very fine Membranes. They may be enumerated in this manner:

The great Sinus of the Falx, or superior Longitudinal Sinus, which was reckoned the first by the Antients.

The two great Lateral Sinuses, the second and third of the Antients.

The Sinus called Torcular Herophili, the fourth of the Antients.

The small Sinus of the Falx, or inferior Longitudinal Sinus.

The posterior Occipital Sinus, which is sometimes double.

Two inferior Occipital Sinuses, which form a Portion of a Circle, and may likewise be called the inferior Lateral Sinuses.

Six Sinus Petrosi, three on each Side; one anterior, one middle or angular, and one inferior. The two inferior, togegether with the Occipital Sinuses, complete a circular Sinus round the great Foramen of the Occipital Bone.

The inferior transverse Sinus.

The superior transverse Sinus.

Two circular Sinuses of the Sella Sphenoidalis; one superior, and one inferior.

Two Sinus cavernosi, one on each Side.

Two Orbitary Sinuses, one on each Side.

All these Sinuses communicate with each other, and with the great Lateral Sinuses, by which they discharge themselves into the internal Jugular Veins, which are only Continuations of these lateral Sinuses. They likewise unload themselves partly into the Vertebral Veins, which communicate with the small Lateral or inferior Occipital Sinuses, and partly into the external Jugular Veins, by the Orbitary Sinuses which communicate with the Angular, Frontal, Nasal, and Maxillary Veins, as the Lateral Sinuses likewise communicate with the Occipital Veins.

Thus the Blood which is carried to the Dura Mater by the external and internal Carotids, and by the Vertebral Arteries, is returned to the Heart by the external and internal Jugular and Vertebral Veins; so that when the Passage of the Blood is obstructed in any particular Place, it finds another Way by virtue of these Communications, tho' not with the same Ease. This Observation is of Importance with respect not only to Obstructions, but to the different Situations of the Head.

The great Sinus of the Falx reaches from the Connection of the Ethmoidal Crest with the Os Frontis, along the upper Edge of the Falx, all the Way to the posterior Edge of the transverse Partition, where it ends by a Bifurcation in the great Lateral Sinuses. It is very narrow at its anterior Extremity, and from thence becomes gradually wider all the Way to its posterior Extremity.

The Cavity of this Sinus is not cylindrical, but triangular, having, in a manner, three Sides; one superior, parallel to the Cranium, and two lateral, inclined to the Plane of the Falx. The upper Side is formed by the external Lamina of the Dura Mater, and thro' the Middle of its Breadth a kind of fine Raphe or Suture runs from one End to the other.

The two lower or lateral Sides are Productions of the internal Lamina, which, having parted from the external, are inclined towards each other, and then unite, forming first the Sinus, and afterwards the Duplicature of the Falx. This Sinus is lined internally by a fine proper Membrane, which forms likewise a kind of Raphe or Suture along the Bottom of the Sinus, that is, along the Union of the two lateral Sides.

In this Sinus we observe several Openings, and several Ligamentary Fræna. The Openings are Orifices of Veins, the smallest of which belong to the Dura Mater, the largest to the Brain. The Veins of the Brain enter the Sinus, for the most part, obliquely from behind forward, after they have run about a Finger's Breadth in the Duplicature of the Dura Mater.

It has been thought, that the Arteries of the Dura Mater discharged themselves immediately into the Sinuses, because Injections made by the Arteries, or a Hog's Bristle thrust into them, have been found to pass into these Sinuses. But, on a more close Examination, it has been discovered, that the Injections passed from the Arteries into the Veins, and from thence into the Sinuses, thro' the small Orifices already mentioned; and that the Hog's Bristle pierced the Sides of the Artery, which, near the Sinuses, are very thin.

This Mistake gave Rise to another, that the Dura Mater had no Veins; and what confirmed it was, that the Arteries of the Dura Mater cover the Veins so entirely, that the Edges of the Veins are hardly perceivable on either Side of the Arteries. There are, however, some Places where the Veins being broader than the Arteries, their two Edges are seen on each Side of the Arteries like Capillary Vessels. These Veins are, for the most part, Branches of the Sinuses, and the small Trunks of some of them open into the Head of the internal Jugular Vein. We may easily be satisfy'd, that the Arteries on both Sides of the Dura Mater communicate with each other above the great Sinus of the Falx, either by injecting, or blowing into them.

The internal Fræna of this great Sinus appear to be tendinous, and to be designed to prevent the too great Dilatation of the Sinus by the Blood. They vary, however, in different Subjects, and do not always reach from one Side to the other. It has been pretended, that Glands have been found there; but we ought to take care not to take for such certain small Corpuscles which are the Products of Diseases.

The inferior Sinus of the Falx is situated in the lower Edge of its Duplicature, being very narrow, and, as it were, flatted on both Sides. It communicates immediately with the fourth Sinus of the Antients; and, in some Subjects, seems even to be a Continuation thereof. It likewise communicates with the great or superior Sinus, by small Veins which go from one to the other, and with the Veins of the Cranium by the same means.

The lateral Sinuses represent two large Branches of the superior Longitudinal Sinus, one going to the Right Hand, the other to the Left, along the great Circumference of the transverse Partition, all the Way to the Basis of the Apophysis Petrosa of the Temporal Bone; from whence they run down, having first taken a large Turn, and then a small one; and, being strongly fixed in the lateral Grooves of the Basis of the Cranium, they follow the Course thereof all the Way to the Foramina Lacera, and Fossulæ of the Jugular Veins.

They do not always arise by an equal and symmetrical Bifurcation of the superior Longitudinal Sinus; for, in some Subjects, one of the lateral Sinuses appears to be a Continuation of the longitudinal, and the other to be a Branch from it. This Variety may happen on either Side; and we sometimes find one of those Sinuses higher or lower, larger or smaller, than the other.

The Cavity of these lateral Sinuses is likewise triangular, and furnished with a proper Membrane, and with Fræna; and it has also the small venal Openings, which indeed are common to it, not only with the longitudinal Sinus, but with most part of the others. The posterior or outer Side of this Cavity is formed by the external Lamina of the Dura Mater, and the other two by the internal Lamina.

As these two Sinuses go out by the posterior Portions of the Openings of the Basis of the Cranium called Foramina Lacera, they

they are dilated into a kind of Bag, proportioned to the Foſſulæ of the Jugular Veins, where they terminate in theſe Veins.

Near the Concourſe of the ſuperior longitudinal and lateral Sinuſes, we obſerve an Opening, (ſometimes double) which is the Orifice of a Sinus ſituated along the Union of the Falx and tranſverſe Partition. It does not always end directly at the lower Part of the ſuperior Sinus, but ſometimes opens at the Beginning of one of the lateral Sinuſes, eſpecially when the Bifurcation is not equal; and in this Caſe it often terminates in that lateral Sinus, which appears like a Branch from the common Trunk of the ſuperior and other lateral Sinus.

This Sinus has been named Torcular Herophili, from its firſt Diſcoverer. Its Diameter is but ſmall, and it forms a kind of Bifurcation with the inferior longitudinal Sinus, and with a Vein of the Cerebrum, which is ſometimes double, called Vena magna Galeni.

The cavernous or lateral Sinuſes of the Os Sphenoides are Reſervatories of a very particular Kind, containing not only Blood, but conſiderable Veſſels and Nerves. Theſe Reſervoirs are within fill'd with a ſpongy or cavernous Subſtance full of Blood, much like that of the Spleen, or Corpus cavernoſum of the Urethra.

We obſerve ſome nervous Filaments, which go to the Dura Mater, from the Trunk of the Fifth Pair, at the Entry of the cavernous Sinus; and from the common Trunk of the Eighth Pair, and Nervus Acceſſorius, or Spinalis, as they paſs thro' the Foramen Lacerum. The ſmall Tubercles, ſometimes found on the lateral Sides of the longitudinal Sinus of the Falx, require farther Examination before we can determine any thing about them. The whole Inſide of the Dura Mater is moiſtened in the ſame manner as the Peritonæum and Pleura.

The prominent Fibres interſecting each other in different Manners, which appear on the Inſide of the Dura Mater, eſpecially near the Falx and tranſverſe Partition, and which have been taken for a kind of fleſhy Fibres, ſeem to be only ligamentary and elaſtic. The univerſal Adheſion of this Membrane to the Cranium proves, that it can have no particular Motion, and conſequently that ſuch fleſhy or muſcular Fibres would be altogether uſeleſs. This Adheſion was plainly demonſtrated by *Veſalius* and *Riolanus*, and afterwards by *Roonhuyſen*.

Pia Mater.

This Membrane ſurrounds the whole Maſs of the Brain more particularly than the Dura Mater. It adheres very cloſely to the Brain, and is connected to the Dura Mater only by the Veins which open into the Sinuſes, as has been already ſaid.

The Pia Mater is made up of two very fine Laminæ, the outermoſt of which covers pretty uniformly all the convex Surface of the Brain, and lines in the ſame manner all the concave or inner Surface of the Dura Mater. The internal Lamina forms, by a great Number of Folds and Duplicatures, a great Number of Partitions, which inſinuate themſelves into all the Folds and Circumvolutions, and between the different Strata of the Cerebrum and Cerebellum.

The two Laminæ of the Pia Mater are not ſo cloſely united as thoſe of the Dura Mater, being connected only by a cellulous Subſtance, which accompanies them through their whole Extent, except at ſome Places of the Baſis of the Cerebrum, where the internal Lamina continuing its Inſertions, the external remains uniformly ſtretched over the prominent Parts, the Interſtices of which are entirely ſeparated from the other Lamina, without any cellular Subſtance between them. Theſe ſeparate Portions of the external Lamina have made it been looked upon as a third Membrane of the Brain, diſtinct from the Pia Mater; and it has been named Membrana Arachnoides, from its Reſemblance to a Cobweb in Delicacy of Texture.

In each of theſe Laminæ of the Pia Mater we diſcover another kind of fine Duplicature, which contains a Number of Veſſels; but theſe ſmall Veſſels are hardly perceivable without the Help of an Injection, or of a great Inflammation. The cellular Subſtance does not only accompany the two Laminæ thro' their whole common Extent, in the manner already ſaid, but alſo the internal Lamina in particular, thro' all the Duplicatures and Partitions. This we diſcover by blowing through a ſmall Pipe, cautiouſly introduced between the two Laminæ, ſo as not to offend any of the Parts near it. *Winſlow.*

Before the Reader proceeds to the enſuing Detail of Diſorders incident to the Head from an external Cauſe, I ſhould adviſe him to read the Article Cerebrum, which he is to conſider as the Sequel of this Part of the Article Caput.

Wounds *of the* Head.

No Wounds can poſſibly be of a more formidable and terrible Nature than thoſe of the Head, ſince the leaſt Injury done to the Brain ſometimes proves the fatal Cauſe of immediate Death. Beſides, in thoſe Wounds of the Head which do not penetrate the Skull, but are received by a gentle Fall, or a Blow with blunt Inſtruments, ſome of the minute internal Veins and Arteries are ſometimes broken, and, by diſcharging their Contents on the Brain, excite the moſt melancholy Symptoms, and often put a ſpeedy End to Life. For this Reaſon Wounds of the Head, apparently the moſt light and ſuperficial, are never to be looked upon as inconſiderable, but always treated with the greateſt Care and Circumſpection.

In treating Wounds of the Head, 'tis the Surgeon's Duty to conſider,

1. What Parts of it are wounded; and,
2. In what manner the Wound has been inflicted.

For Wounds may be made in the Head either by the Puncture or Cutting of ſharp and pointed Inſtruments, or by ſuch as are blunt; by Blows, for Inſtance, Contuſions, the Throwing or the Falling of Bodies, and by Bullets. Wounds of this laſt Species are generally far more ſevere and dangerous than thoſe inflicted by ſharp and cutting Inſtruments.

As for the Parts of the Head wounded, they may either be the common Integuments, or, together with theſe, the fleſhy Parts of the Face, or the Pericranium itſelf, or the Temporal Muſcles, or the Cranium. Beſides theſe, the internal Parts of the Head may alſo be injured; ſuch as the Dura and Pia Mater, the Cortical or Medullary Subſtances of the Brain, as alſo its Ventricles. In ſome Wounds of the Head the Cranium is cut, and in others it is fractur'd, ſhatter'd, and contus'd; for which Reaſon we ſhall here reduce the Wounds of the Head to two Claſſes; thoſe inflicted on the Face, and thoſe which either injure, or entirely penetrate, the Cranium.

Wounds *of the* Face.

Since then the Parts of the Face are of the more noble and neceſſary Kind, two Things are carefully to be adverted to in treating its Wounds. The firſt is, that the Uſes of the reſpective Parts wounded may be preſerved; and, ſecondly, that as beautiful and comely Cicatrices as poſſible may be induced. But ſince there are various Parts of the Face, each of which calls for a different Method of Treatment, we ſhall at preſent conſider theſe Parts ſeparately, and by themſelves.

In almoſt all Wounds, then, of the Forehead, we are firſt to cleanſe the Wound from the Blood, then to anoint it with ſome vulnerary Balſam, ſuch as the Balſam of *Capivi*, or that of *Peru*, or ſome other of a like Nature; after which we are, with narrow Shreds of adheſive Plaiſter, to bring the Lips of the Wound into Contact, and apply ſome vulnerary Plaiſter over all. But, when the Wound is of the larger Kind, theſe Plaiſters alone are not ſufficient for producing an equable and beautiful Cicatrix; for which Reaſon, that the Wound may be the more commodiouſly conglutinated, Powder of *Sarcocolla*, or a Powder prepared of Comfrey-root, Gum Tragacanth, and Gum Arabic, are to be ſprinkled upon it, before the abovementioned Plaiſters are laid on; and upon theſe proper Compreſſes, and tight Bandages, are to be applied. Nor is it proper to uſe Suture in theſe or any other Wounds of the Face, except where it is abſolutely neceſſary, becauſe, by that means, the Number of Scars, and conſequently the Deformity, is increaſed. In longitudinal Wounds of the Forehead, that uniting or incarnating Bandage repreſented *Tab.* 23. at *f.* is of ſingular Service for inducing an agreeable Cicatrix. But in tranſverſe Wounds of the Forehead, where the Fibres of the frontal Muſcles are ſo divided, that the Eye-brows hang down in a diſagreeable manner, and the Skin of the Forehead cannot corrugate itſelf as uſual, the beſt Method is, immediately after cleanſing the Wound, to bring its Lips into Contact by one or two Stitches, and apply ſome vulnerary Powder or Balſam, uſing over all conglutinating Plaiſters, and proper Bandage, and injoining Reſt to the Patient at the ſame time: For it ſometimes happens, eſpecially in young Conſtitutions, that the cut Fibres of the Muſcles are again united and conſolidated by means of an accurate Dreſſing of this kind, without any Suppuration. If violent Effuſions of Blood ſhould happen, they are firſt to be ſuppreſſed with Linen Cloths, Compreſſes, and tight Bandage; but, at the next Dreſſing, the Wound is to be waſhed with warm Wine, and its Lips are to be brought into Contact with adheſive Plaiſters.

The Wounds of the Eye-brows are to be treated in the ſame manner with thoſe of the Forehead; only in theſe we muſt take care, leſt any violent Inflammations ſhould happen, which may prove prejudicial to the Eyes and Sight. For this Reaſon every thing of an acrid Nature, either in Meat or Drink, ought to be abſtained from by the Patient; Veneſection, in caſe of a Plethora, ought to be celebrated; and Compreſſes, dipt in warm Spirit of Wine, to be applied to the Wound, with a Plaiſter over them. But if the Eye-brows are quite divided by a large Wound, it ſeems neceſſary to uſe ſome kind of Suture, to dreſs the Wounds with vulnerary Balſams, to apply a Plaiſter of the ſame Quality, and ſo to fix the Eyes with ſome proper Bandage, that they may not eaſily move; for, when theſe Precautions are neglected, the Eyes are generally very much diſfigured.

Large Wounds, either of the ſuperior or inferior Eye-lids, are, for the moſt part, with great Difficulty conglutinated, and that not only by reaſon of the Tenderneſs of the Parts themſelves, but alſo on account of the large Quantity of Humours, which

which render the Eyes continually moiſt. In order, therefore, to treat the Wounds of theſe Parts with the more Succeſs, the Eye muſt be fomented gently with a Decoction of Chamomile, Hyſſop, or Eye-bright, till the Effuſion of Blood is ſtopp'd, and the Wound thoroughly cleanſed. If the Wound is tranſverſe, it ought to be forthwith ſtitch'd up in the Middle, with a ſlender Needle; and Powder of Sarcocolla, or a Powder prepared of Comfrey-root, Gum Tragacanth, and Gum Arabic, muſt be ſprinkled upon it; or it may be anointed with Balſam of *Capivi*, Balſam of *Mecha*, or any other of a like Nature, or with Oil of Eggs; applying, after all, a Plaiſter of *Diapalma*, and binding the Eyes in ſuch a manner, that they cannot move, that the Conglutination may ſucceed the more happily. But where the Wound of the Eyelids is longitudinal, its Lips muſt be brought into Contact by more Stitches, and the Wound itſelf, in other reſpects, treated as we have now directed.

If the Eye itſelf is wounded, but in ſuch a manner that none of the vitreous and cryſtalline Humours are diſcharged, the *Unguentum Alabaſtrinum*, or the White of an Egg, or the Mucilage of Quince-ſeeds, and Flea-bane, prepared with Roſe-water, may be applied to the Wound twice or thrice a Day, by means of a Feather or Pledget; and the Surgeon muſt always apply a ſmall Compreſs, ſufficiently moiſten'd in the following Collyrium, in order to contract the Lips of the Wound; and this Compreſs muſt be ſecured with proper Bandage. The Collyrium is prepared thus:

Take the Whites of two Eggs; Roſe-water, two Ounces and an half; Oil of Roſes, half a Dram; and of Camphire, three Grains: Shake all well together.

Nuck, in his Treatiſe *de Duct. oculor. aquoſ.* gives us an Inſtance of a Wound of the Eye, which he himſelf cured, without any Injury to the Sight, tho' ſome Part of the vitreous Humour was diſcharged. The Method he follow'd was this: He cut off the prolapſed Part of the vitreous Humour, and carefully fomented the Eye with a Collyrium, prepared of the White of an Egg, Roſe-water, *Armenian* Bole, and Camphire, ſufficiently agitated together. One Scruple of Gum *Arabic*, diſſolved in an Ounce of Roſe-water, is an excellent Medicine in this Species of Wounds of the Eyes. But if a violent Inflammation ſhould happen, as it ſometimes does, I have often found it proper to apply a larger Compreſs over the ſmall one, dipt in warm camphorated Spirit of Wine: But, in order to mitigate the Inflammation, we muſt, on this Occaſion, take care to keep the Patient's Body ſoluble, for ſome Days, with Potions prepared of Rhubarb, and the Pulps of Tamarinds, or any other refrigerating and laxative Subſtances. Then, if the Patient abounds in Blood, he is to be blooded in the Neck or Feet; all Aliments of a heating Nature are to be abſtain'd from; and the Patient is to be injoin'd as much Repoſe as his State will admit of; for, by following theſe Precautions, not only the Eyes, but the Sight of the Patient, are preſerved. But in Caſes where the cryſtalline Humour, or any Part of it, has penetrated into the Wound, it is forthwith to be taken out, leſt the Eye ſhould by its means become deform'd, and ſubject to other terrible Infirmities.

But when the vitreous and cryſtalline Humour are entirely fallen from the Eye, it is very difficult, if not altogether impoſſible, to preſerve either the Figure or the Sight of the Patient's Eye. In Caſes of this Nature, then, we are firſt to apply Compreſſes, dipt in warm Wine, or Spirit of Wine; and afterwards ſome vulnerary Balſam, in order to conglutinate the Wound; and, to prevent the Deformity of the Face, an artificial Glaſs, or Silver Eye, delineated in *Tab.* 28. *Fig.* 1. may be introduced into the Orbit, inſtead of the natural Eye.

It ſometimes happens, that when the *Tunica Albuginea* and *Sclerotica* are only gently wounded, the *Cornea* and the *Uvea* remaining entire, the Eye, tho' it has diſcharged its vitreous and cryſtalline Humours, is again ſupplied with a freſh Recruit of theſe Humours, and the Sight of courſe reſtored. The celebrated *Scegerus*, a Phyſician at *Stugart*, ſome time ago kindly communicated to me an Inſtance of a Woman, who had a Cure of this Nature happily perform'd upon her. By a careful Reflection upon this, I am induced to believe, that the Art of reſtoring the Eyes and Sight, even when the Humours are diſcharged, which *Burrhus* and *Kerkringius* ſo much boaſted of, is not altogether chimerical; and that Sight may ſometimes remain, even when the cryſtalline Humour is wanting, which ſome have of late denied.

Slight Wounds of the Noſtrils have their Lips generally brought into Contact by adheſive Plaiſters; but if they penetrate deep, or have ſo cut the tranſverſe Cartilage, that they cannot be retain'd by Plaiſters, the Skin on the Lips of the Wound muſt be ſtitch'd up. But tho' it is ſcarce probable, that any Part of the Noſtrils, when cut off, ſhould again adhere and unite with the reſt of the Noſe; yet *Blegny* maintains, that this End has ſometimes been obtain'd by means of Suture.

When the Bone of the Noſe is depreſs'd by a Blow, it is proper, after reſtoring it to its natural Situation, to ſupport it for ſome time by introducing ſmall Silver or Leaden Pipes, ſuch as thoſe repreſented *Tab.* 23. by the Letters P. Q. R. leſt fungous Fleſh, ſprouting up in the Noſe, ſhould block up its Paſſage, or induce other troubleſome Symptoms. Externally any Balſam, or the Eſſence of Maſtich, Amber, and Myrrh, or ſome conglutinating Powder, ſuch as the Powder of *Sarcocella*, or a Powder prepared of Comfrey-root, Gum Tragacanth, and Gum Arabic, may be very properly applied. The Lips of the Wound itſelf muſt be brought into Contact by conglutinating adheſive Plaiſters, and ſecured by a four-headed Bandage.

Wounds may be made in the Lips either with ſharp or obtuſe Inſtruments, or with Bullets. The Wounds made by ſharp Inſtruments, whether direct or tranſverſe, are moſt properly conglutinated by the Application of conglutinating Plaiſters; and, when they are of the larger Kind, they ought to have ſuch conglutinating Powders, as we have already recommended, ſprinkled upon them. In this Caſe the Patient muſt carefully abſtain both from ſpeaking and eating; for which Reaſon he is only to uſe ſuch Aliments as may be ſupt, ſoft Eggs, and other Food which requires no Maſtication. But if the Wound is ſo large as not to be cured by theſe Means, Conglutination muſt be aſſiſted by a proper Suture. In Wounds of the Lips made by obtuſe Bodies, Falls, or Bullets, the firſt Thing to be done is, by ſome digeſtive Ointment, to ſuppurate the contuſed Parts; after which the Lips of the Wound, when cleanſed, are to be brought into Contact by conglutinating Plaiſters, or by Suture, in the ſame manner with the Hare-lip.

Wounds of the Cheeks are to be treated in the ſame manner, and with the ſame Circumſpection as thoſe of the Lips: But if any of the Salival Ducts, which derive their Name from *Steno*, and which run acroſs the Cheek from the parotid Gland, ſhould happen to be cut, the Wound, in this Caſe, can with great Difficulty, if at all, be conglutinated, before an artificial Perforation is made for the Diſcharge of the Saliva into the Inſide of the Mouth; becauſe the Saliva, which continually flows from the wounded Duct as from a Canal, eſpecially in Maſtication, prevents the Wound from healing.

Wounds of the external Ear are either to be united and conglutinated by adheſive Plaiſters, or, if the Cartilage is quite cut, by Suture, applying, at the ſame time, Lint impregnated with ſome vulnerary Balſam, over which Compreſſes, and proper Bandage, muſt be applied. In Wounds of the Ear, near the *Meatus Auditorius*, we are, above all things, to take care, that no Blood, nor other Subſtance, ſlip in, and injure the *Membrana Tympani*: To prevent this, the internal Ear is to be carefully fill'd with Lint or Cotton.

It rarely happens, that the Tongue is pierced or cut, ſince it is defended from Accidents of this Nature by the Teeth and Jaws: But it is ſometimes cut by the Biting of a Perſon's own Teeth in Epilepſies, or by violent Falls, and eſpecially by Bullets. If, then, either by Bites, Blows, or Puncture, the Tongue is but gently wounded, ſo as to be left entire, either in the Middle or on both Sides, the moſt proper Method is, in this Caſe, frequently to anoint the Part affected with Oil of ſweet Almonds, mix'd with Sugar-candy; or with Honey of Roſes, mix'd with Oil of Myrrh *per Deliquium*.

Large and ſevere Wounds of the Tongue are, with Difficulty, conglutinated without the Help of Suture; ſo that, when the Tongue is wounded near the Gullet, it is not to be wonder'd at, if the Wound remains ever after, ſince the Situation of the Part renders Suture impracticable. That the Faculty of Speech may therefore ſuſtain as little Injury as poſſible, we are, in the firſt Place, to take care, that, in large Wounds of the anterior Part of the Tongue, the Lips be commodiouſly joined by Suture as ſoon as poſſible, and the above recommended Medicines applied to the Wound; for conglutinating Plaiſters cannot, in this Caſe, be applied. *Purmannus* informs us, that, for conſolidating Wounds of this Kind, he ſucceſsfully uſed a certain *Fibula* made of Silver Wire, or ſome other ſuch Subſtance. In Wounds of the Tongue made by Bullets, the moſt proper Medicines are Oil of ſweet Almonds, mix'd with Sugar-candy, or Honey of Roſes, mix'd with Oil of Myrrh *per Deliquium*; for, in this Caſe, Suture is of little or no Service. It alſo ſeems neceſſary, that, in Wounds of this Kind, the Patient ſhould, about the Beginning of the Conglutination, abſtain both from ſpeaking, and from ſuch Aliments as require Manducation.

Wounds of the Palate cannot more commodiouſly be conglutinated, than by anointing them either with Honey of Roſes alone, or with an Addition of a little *Peruvian* Balſam, and afterwards with Oil of Myrrh *per Deliquium*. Theſe Medicines are alſo found to be very effectual in conglutinating other Wounds of the internal Parts of the Mouth.

See VULNUS.

Wounds of the Head injure either the external common Integuments only, or the *Perioſteum*, or the *Cranium*, or the

the *Dura Mater*, or the *Pia Mater*, or the Veſſels, Subſtance either cortical or medullary, or the Ventricles of the Brain.

We may know, that the Integuments only are injured, firſt, by conſidering the Figure of the wounding Inſtrument.

Thus, if the Wound is made by an Inſtrument with a direct or ſtrait Edge, ſuch as a broad Sword or a Kniſe, the Wound may be pretty large, and yet not penetrate very deep. But if the Point of a ſharp Inſtrument is puſh'd againſt the Head, the external Wound may be very ſmall, and it may, notwithſtanding, ſink very deep; and if the Wound is made with a Weapon which has a convex Edge, as a Scymitar or Hanger, the Wound cannot be long, without being at the ſame time very deep.

Secondly, by reflecting on the Force with which the Wound was inflicted.

For, if this was ſmall, the Wound cannot be deep, and *vice verſa*. This can only be learn'd from the Patient, the Spectators, or the Perſon who did the Miſchief.

Thirdly, the Condition, and eſpecially the Figure, of the Part injured, will afford us ſome Light as to the Depth of the Wound.

Thus, when the Part affected happens to be flat, and but little convex, the external Wound may be long without being very deep; but when the Wound is upon a Part which is angular, prominent, and much convex, it is plain, that it muſt neceſſarily be deep, if it is extended in Length. *See what has been ſaid concerning the Figure of the Head above.* Becauſe all Heads are not exactly ſhaped alike, it is neceſſary the Surgeon ſhould be acquainted with the moſt uſual Deviations from the natural Conformation. *See, therefore, Tab. 9. and the Explications thereof.*

Fourthly, from the Mildneſs of the Symptoms, which conſiſt principally in the Depravations of the ſeveral Functions conſequent to the Wound.

The more numerous, and the more violent, theſe Symptoms are, the greater Suſpicion there is, that a proportionable Number of Parts, and thoſe too ſuch as are more remarkably neceſſary to the Perfection of Health, are injur'd. But ſince the Origin and Spring of the Animal Actions is lodged in the Head, it ought firſt to be inquir'd, whether, in conſequence of the Wound, any Change is induced on theſe. A Vertigo, a ringing Noiſe of the Ears, a Vomiting of Bile, Drowſineſs, a total Privation or Depravation of all, or at leaſt ſome of the Senſes, and an involuntary Diſcharge of the Urine and Excrements, are, in Caſes of this Nature, inauſpicious Prognoſtics. If none of theſe Symptoms appear at all, or if they are but ſlight, and ſoon go off, it is to be preſumed, that the Inſtrument, with which the Wound was made, has not penetrated very deep. *Hippocrates*, in the fifteenth Section of his Book *de Capitis Vulneribus*, beſides the Symptoms immediately ſubjected to our Senſes, carefully injoins the following Particulars to be inquired into, *ſince they are Signs or Marks of a Patient's being more or leſs dangerouſly wounded, Whether*, for Inſtance, *he is ſeized with a profound Sleep, a Loſs of Sight, a Vertigo; or whether he falls down apoplectic.* But it muſt be owned, that very ſevere Wounds of the Head, which have penetrated into the very Subſtance of the Brain, are not, upon their firſt Reception, univerſally attended with theſe formidable Symptoms; for, in the *Journal des Sçavans*, for *April* 1735. we have an Account of a young Man of twenty-ſix Years of Age, who had the Bone of the *Bregma*, on the Right Side, tranſfix'd in the Middle, by an Arrow pointed with Iron; but whilſt the Patient endeavour'd to extract the Arrow, its wooden Shaft broke near the Iron Point, which remain'd in the Wound. Notwithſtanding this, he remain'd in a tolerably eaſy State till the ſeventh Day, when, an Inciſion being made, the *Os Bregnatis* was found perforated with a circular Hole, and the retain'd Point of the Arrow appear'd. Tho', by applying the Trepan twice, a large Portion of the *Cranium* was removed, and tho' the *Dura Mater* was cut away all round the Perforation in it, yet the remaining Point of the Arrow could not be extracted. The Side, oppoſite to that on which the Wound was inflicted, became paralytic, a plentiful Suppuration came on, and a conſiderable Number of fungous Excreſcences appear'd on the Brain. Three Months after, the Iron Point was, by means of a Probe, felt in the Subſtance of the Brain: The Surgeon endeavour'd to extract it, but Convulſions, immediately ſeizing the Patient, put a Stop to his Deſign. But, about the End of the fourth Month, the Iron Point ſpontaneouſly preſented itſelf at the Aperture of the Wound; and, being laid hold on with a proper Tenaculum or Forceps, was eaſily, and without any Detriment, extracted; and, twenty Days after, this Wound, apparently ſo dangerous, was cover'd with a Cicatrix. Many other Obſervations occur in Authors, which ſhew us, that it is ſometimes adviſeable to leave foreign and adventitious Bodies in Wounds, ſince they are afterwards happily excluded purely by the Efforts of Nature. *Hippocrates*, and the moſt ſkilful Phyſicians who ſucceeded him, ſuſpected the Diſorder to be of the more terrible Kind, if violent Symptoms appear'd, not at firſt, but ſome Days after the Wound was inflicted: Thus *Hippocrates* informs us, "That he who is wounded in the Head is "in the moſt hopeful State, when he does not become fever-"iſh, when no Eruption of Blood appears, no Inflammation "enſues, and no Pain is felt; but that, if any of theſe Sym-"ptoms ſhould appear, they are the moſt lucky Prognoſtics, "when they do ſo in the Beginning, and remain only for a "ſhort time; whereas Fevers ſeizing Patients wounded in the "Head, on the fourth, ſeventh, or twelfth Day, generally "prove mortal." Hence *Jacotius*, in his learned Commentaries upon the *Coacæ Prænotiones*, lays it down as a general Axiom, that Fevers, and all other Symptoms of ſhort Continuance, which appear immediately after Wounds are inflicted, are leſs to be dreaded than ſuch as laſt for a conſiderable time, or happen ſome time after: When, therefore, violent Symptoms appear at the Beginning, he orders the Phyſician to ſuſpend his Judgment, till he ſees whether they prove permanent or not. 'Tis therefore obvious, that a certain Prognoſtic cannot be drawn from the Violence or Slightneſs of the Symptoms, but that other Circumſtances muſt be taken into the Account: But it may ſafely be affirm'd, that the worſt is to be dreaded, if formidable Symptoms immediately appear. We are not, however, to deſpair in the moſt terrible Caſes, nor to indulge a fooliſh Confidence, tho' in the Beginning no unfavourable Symptoms ſhould occur.

Fifthly, Wounds of the Integuments only, are diſtinguiſh'd from others by the Sight. In Wounds, therefore, of the Head the Hair is immediately to be ſhaved off, and the Part is to be waſh'd with equal Parts of Wine and Water, a little warm. The Wound is then, before the firſt Dreſſing, to be carefully inſpected, that the Parts injured may be known, a juſt Prognoſtic form'd, and a right Method of Cure purſued.

But, among the Signs ſubjected to our Sight, and which inform us, whether the Bone is injur'd, or only the common Integuments, *Hippocrates*, in his Treatiſe on *Wounds of the Head*, adviſes us to obſerve, whether the Hairs are cut off by the Weapon, and fix'd in the Wound; and if this ſhould happen, we may then aſſert, that the Bone is injur'd; for whilſt the wounding Inſtrument, tho' ſufficiently ſharp, only penetrates the ſoft Integuments of the *Cranium*, the Hairs follow the Impreſſion made by the Weapon, without being cut: But when the Hairs are ſtruck againſt the hard Bone, they can no longer yield to the Edge of the Inſtrument, but muſt of courſe be cut.

Sixthly, the Probe will diſcover the Nature of theſe Wounds.

Thus, gently drawing aſide the Lips of the Wound, an obtuſe pointed Probe, of the ſofteſt Lead, or pureſt Silver, which is always moſt ſoft and flexible, is, with a wary and cautious Hand, to be introduced, and the Bottom of the Wound thoroughly explor'd; and if the Bone is any-where laid bare, a Sound will be produced, by which it may be diſcover'd; but if in no Part any Roughneſs or Aſperity is felt, if all the Parts appear ſoft, and if no Noiſe is made by the Probe, we may infallibly conclude, that the Cranium is neither laid bare, nor injur'd, in the Part in which the Wound is inflicted.

Tho' theſe Wounds may at firſt ſeem ſlight, yet they frequently become dangerous, on account of the Vicinity of the Muſcles, Tendons, tendinous Expanſions, Sutures, Periоſteum, Cranium, Nerves, Blood-veſſels, and the Brain; as alſo becauſe the great contractile Force of the wounded Part cauſes the Sides of the Wound to recede from each other, and conſequently enlarges it.

When, therefore, we are aſcertain'd, that the *Cranium* is not injur'd, we are nevertheleſs frequently to expect very dangerous and violent Symptoms; though the Force, with which the Wound was inflicted, was not ſufficient to cauſe a Concuſſion of the Brain, or otherwiſe to injure any of the Parts within the Cranium: For a great many ſtrong Muſcles are inſerted in the Cranium, as the *Cucullaris*, *Splenius*, and ſome others, taken Notice of above in the Deſcription of theſe Parts; and there is a tendinous Expanſion, or *Aponeuroſis*, which covers the whole Head, and which is deſcrib'd in the ſame Place: The temporal Muſcles alſo cover a large Portion of the lateral Part of the *Cranium*. Now Wounds of the tendinous Parts are productive of very bad Symptoms, as is ſpecified under the Article VULNUS; and Wounds of the temporal Muſcles frequently, tho' not always, are follow'd by Convulſions; inſomuch that *Hippocrates*, in his *Coacæ Prænotiones*, pronounces, that thoſe who are wounded in the Temples are affected with Convulſions on the oppoſite Side.

As to the Sutures, it has been obſerved, that the *Dura Mater* adheres firmly to them, and communicates with the *Pericranium*; which alſo is ſtrongly connected to the Sutures, by particular Veſſels paſſing thro' the *Cranium* at theſe Places: Hence Injuries done to the external Parts, near the Sutures, may readily affect the internal Parts by theſe Communications.

As the *Perioſteum* imparts Blood-veſſels to the Bones of the *Cranium*, receives mutually Veſſels from theſe Bones, and is connected to the Bones by the means of both theſe ſorts of Veſſels, the Influx and Efflux of the vital Fluid to and from the Bones of the *Cranium*, eſpecially the external Table, depends upon the entire State of the *Perioſteum*. When, therefore, the Perioſteum is affected, the Diſorder is readily communicated to the Bones of the Cranium, and hence to the *Dura Mater*, particularly about the Sutures; where, by particular Veſſels, a manifeſt Communication is form'd between theſe two Membranes.

As to the Nerves, thoſe ariſing from the fifth Pair, and the hard Portion of the ſeventh, are diſtributed thro' the external Parts of the Head, in very numerous and conſiderable Ramifications. When, therefore, theſe Nerves are prick'd, or partially divided, all thoſe Symptoms are to be dreaded, which, under the Article VULNUS, are ſaid to attend Wounds of this kind in all Parts of the Body. This muſt happen here ſo much the ſooner, becauſe the Nerves are very tenſe as they run along the Integuments of the Cranium, and are alſo very near their Origin.

As to the Veſſels, very conſiderable Arteries run along theſe external Integuments, Wounds of which are ſometimes ſucceeded by profuſe Hæmorrhages.

As to the Brain, in ſome Parts the Bone of the Cranium is ſo thin, as to be tranſparent in a prepared Skull. For this Reaſon, when the Integuments are cut, 'tis always to be dreaded, leſt the Brain, which lies ſo near, ſhould be affected. This Effect may be brought about either in conſequence of an Injury done to the Nerves, or by reaſon of the Continuity of the external Perioſteum, and Dura Mater, or by any Affection ſubſequent to the Wound, and which may not only hurt the Cranium itſelf, but alſo reach the Brain contained in it.

As to the contractile Force of the injured Part, it is a common Phenomenon in all Wounds, (ſee VULNUS) that the ſolid Parts, when divided, recede from each other; but this Receſſion is greater or leſs, in proportion to the contractile Force of the Parts. The Skin of the Head is thick and ſtrong, equally tenſe on all the Parts of the Cranium, and very moveable, in conſequence of which it muſt eaſily yield. A cellular Membrane alſo lies under it. For theſe Reaſons, when the Skin of the Cranium is divided, the Lips of the Wound are ſpeedily far retracted from each other; for which Reaſon Wounds of the Forehead generally leave large Scars behind them. Now, if the Nerves are partially divided, and if the Lips of the Wound forcibly recede from each other, the Symptoms attending a Nerve thus wounded will be far more violent. Beſides, the more the Lips of the Wounds are retracted, the larger Portion of the ſubjacent Parts is expoſed to the Cold of the ambient Air, whence various Inconveniences may alſo ariſe.

If a Contuſion ſhould accompany a ſlight Wound, this Circumſtance renders it more liable to be attended with bad Symptoms.

For Contuſions tear and deſtroy a great Number of the ſmall Veſſels; whence the Humours which they contained are extravaſated, and conſequently ſtagnate and corrupt in the Places which receive them. But as the Cranium, a hard Body, lies under the Integuments, unleſs the wounding Inſtrument be exceedingly ſharp, ſome Degree of Contuſion muſt neceſſarily happen. Now, in this Caſe, becauſe the Skin upon the Head is extremely thick, the ſubjacent *Panniculus Adipoſus* is thin, and liable to be eaſily dilated; and becauſe the hard Bones of the *Cranium* lying under it reſiſt, in ſome meaſure, its Dilatation, hence the extravaſated and corrupted Humours readily make way thro' the yielding *Panniculus Adipoſus*, and, deſcending by their own Weight, may fall upon, and irritate, the large Muſcles above-mentioned, inſerted in the Bone of the *Occiput*, and there produce very bad Symptoms: Or theſe Humours may, in the ſame manner, deſcend to the Temporal Muſcles, or the Muſcles of the Forehead, near the Eyes, or the Root of the Noſe, and there produce the ſame Diſorders. That this is ſometimes the Caſe, we certainly know from undeniable Obſervations; for every one concerned in Practice muſt have frequently obſerved, that the very Day after a Contuſion has been made on the Top of the Head, the Forehead, and even the Eye-lids, have become tumid and livid, on account of the extravaſated Blood falling down upon theſe Parts. Hence *Hippocrates*, in his Treatiſe concerning Wounds of the Head, juſtly condemns thoſe as of a bad Kind which are made with obtuſe Darts.

Another Misfortune to be dreaded from this is, that the *Periſteum* and Bone may be contus'd or affected by the extravaſated Fluids: Hence a Corruption of the Bone, and the other Symptoms attending ſuch an Accident, are to be apprehended; for the Bones of the *Cranium* may be contus'd, tho' they appear to be in their natural State; and the Wound made by the Contuſion may have penetrated more or leſs into the Subſtance of the Bone, tho' the preciſe Degree of the Injury cannot be determin'd by the Eye, as *Hippocrates*, in the above-mention'd Work, juſtly obſerves. Hence 'tis obvious how juſtly Wounds of the Head, accompany'd with Contuſions, are ſuſpected by ſkilful Surgeons; ſince, long after, when all is thought to be in a happy State, the very worſt Symptoms ſometimes appear. Among the many Obſervations which prove this, *Bohinus (De Renunciat. Vulner. Sect. 2. Cap. 1.)* gives us, from *Paaw*, the following remarkable one. A certain Man was by his Neighbour, whilſt drinking, ſtruck on the Bone of the Bregma, on the Right Side, with a Pewter Pot; upon Inſpection there was no Fiſſure found in the Bone, the Party wounded remain'd vigorous, and walk'd about till ten Months after; when, being ſeized with a Vertigo, he dropt down, and ſoon after dy'd. Upon opening the *Cranium*, in the Place where the Blow was received, the Bones and Membranes of the Brain were found putrid and fetid.

If the Aperture is but ſmall, the Contuſion large, and a great Quantity of corrupted Humours are contain'd within, bad Symptoms will very probably enſue.

It frequently happens, in Caſes of a Fall, or an Injury received from any blunt Inſtrument, that a ſlight Wound is only inflicted in the Skin of the Head, at the ſame time that a conſiderable Portion is injur'd by the Contuſion. In Caſes of this Nature not only the Perſons wounded, but alſo leſs ſkilful Surgeons, are ſubject to overlook the Misfortune, till at laſt they are ſurpriſed to find ſo terrible Symptoms ariſing from a Wound apparently ſo ſmall: Nor is this to be wondered at, ſince the collected Matter, not being able to find a Paſſage thro' ſo ſmall a Wound, is increaſed, and finds out new Ways for itſelf thro' the cellular Membrane; or the corrupted Humours, by their Stay, affect the ſubjacent *Peritranium*, and adjacent Muſcles.

Some Years ago, ſays *Van Swieten*, I was call'd to a Joiner, who had labour'd under a Fever; and as his Diſorder had nothing in common with the epidemic Fever then raging, and as, by the ſtricteſt Scrutiny, I was not able to aſſign any Cauſe, tho' various Symptoms diſcovered ſome latent Diſorder, I was entirely at a Loſs what Judgment to form. His Head-ach was very intenſe; his Forehead, and the Eye-lids of both his Eyes, were become red and tumid; he complain'd of a Tenſion in the Nape of his Neck, and his Sleeps were broken and diſturb'd. I aſked him, Whether his Head had been hurt by any external Cauſe. The Patient denied, that it had, tho' I told him over and over again, that I ſuſpected ſuch a Thing. A Servant who was preſent, luckily call'd to mind, that, about eight Days before, a Tile had fallen from a ſmall Height upon the Patient's Head. He own'd it was ſo, but at the ſame time affirmed, that he felt little or no Pain from it, and was not ſenſible of any bad Conſequences ariſing from it. The Patient, upon this, permitting me to inſpect the Place, I found a ſmall Wound, ſcarce larger than a Pin's Head, but under it a Contuſion of an Inch Diameter. I forthwith ordered the Integuments of the Part affected to be removed, and the next Day the Fever, and all the other Symptoms, were conſiderably mitigated. At laſt, a kindly Suppuration coming on, the Wound was deterged, and the Patient happily cured, without the Appearance of any other Symptom.

In Caſes of this kind, the fordid Humours, collected and retain'd within, cauſe conſiderable Tumors, an Eryſipelas, or Oedema, Pains, Convulſions, Putrefactions of the Bones and Perioſteum, Fevers, and Death.

The Air alſo getting into the Cavities of the cellular Membrane, and being there confin'd by the incautious Application of Plaiſters, raiſes conſiderable Emphyſematous Tumors.

Tumors are rais'd particularly, when, by a powerful Contuſion, the Skin remaining entire, or being only very little broken, a large Number of Veſſels are hurt, and their diſcharg'd Contents collecting themſelves, and being pent up within the entire Skin, raiſe in it a large Tumor. This Effect is very ſuddenly produc'd, ſince the ſubjacent Cranium cannot poſſibly yield, for which Reaſon the whole Maſs of the diſcharg'd Juices diſtend and elevate the Skin conſiderably. And this is the Reaſon, why, in other Parts of the Body, Contuſions neither produce ſo large, nor ſo ſudden Tumors. I remember, ſays *Van Swieten*, in a Houſe where I once lodg'd, to have ſeen the Maid fall down-ſtairs, and daſh her Forehead upon a Stone Floor. I made all poſſible Haſte to her Aſſiſtance the Moment I obſerv'd her; but, before ſhe could be taken up, a Tumor as large as a Hen's Egg appear'd on her Forehead. It is a common thing for Children, amidſt their Diverſions, to have ſuch Tumors appear on their Heads, when they daſh them againſt any hard Bodies.

As for the Difference between an Eryſipelas and a Phlegmon, ſee the Article INFLAMMATIO.

It

It is ſufficient to obſerve here, that by Eryſipelas is underſtood a ſuperficial Inflammation, generally ſeated in the Skin only, of a reddiſh-yellow Colour, and which, for the moſt part, reſides in ſmaller Veſſels than thoſe deſtin'd for the Conveyance of the red Globules of Blood. According to *Galen*, *Meth. Medend. Lib.* 2. *Cap.* 1. a perfect Eryſipelas is a Diſorder of the Skin only. This Species of Swelling occurs more frequently in no Part of the Body than in the Head and Face, and in Wounds of the Head it almoſt always denotes ſomething malignant. Hence *Hippocrates*, in the nineteenth Aphoriſm of the ſeventh Section, ſays, Ἐπὶ ὀστέων φλύσεις ἐρυσίπελας· and *Galen*, in his Commentaries upon this Place, thinks, that, in the End of this Aphoriſm, the Word κακὸν ought to be underſtood; becauſe an Eryſipelas does not always ſucceed a Denudation of the Bones; but, when it does, it is always a bad Symptom. Beſides, 'tis certain that in many Paſſages, *Hippocrates*, by the Word ὀστέον, or Bone, means the Cranium, as is obvious from the twenty-fourth Aphoriſm of the ſeventh Section. Hence 'tis eaſily underſtood how ſuch a Diſorder may ariſe from a Compreſſion of the Veſſels of the Skin, by the diſcharged Humours diſtending it, or from the Irritation excited by their Acrimony.

Tho' an Oedema, in the general Acceptation of the Word, ſignifies any Tumor, eſpecially one which is ſoft and cold, yet ſuch a Tumor is not here underſtood, but one of a far different Nature. This cold Tumor, for the ſake of Diſtinction, is now called Oedema Oedematodes. But when ſuch a Tumor is white, pellucid, and accompany'd with Heat, it is call'd Oedema Eryſipelatodes. This Diſorder is ſaid to be preſent, when thoſe Veſſels which are ſo ſmall as neither to admit the red nor yellow, but only the pellucid Humours, are inflam'd. See the Article INFLAMMATIO. This Diſorder is alſo call'd *Eryſipelas Bullatum*, becauſe it diſtends and renders tumid the Parts it ſeizes, eſpecially the Eye-lids and whole Face, if it reſides about the Head. In Wounds of the Head it ariſes from the ſame Cauſes with a common Eryſipelas, but is generally eſteemed a worſe Symptom.

As for Pains, they are produced by the collected Matter diſtending the Skin and Nerves; or this Matter, by ſtagnating becoming acrid, affects the Pericranium, which is highly ſenſible, or even the adjacent Tendons and Muſcles.

As for Convulſions, they may ariſe from the ſame Cauſes, and particularly when the Diſorder penetrates at laſt to the internal Parts of the Cranium.

As for the Putrefaction of the Bone and Periоſteum, under the cellular Membrane lies that tendinous Expanſion taken Notice of above in deſcribing the Parts of the Head, and under it the Pericranium, which lies immediately on the Cranium, and communicates with it both by receiving Veſſels from it, and ſending forth others to it. Whilſt then the extravaſated Humours remain pent up under the tough Skin of the Head, the Diſorder produc'd by ſuch a Circumſtance is eaſily communicated to the Pericranium, which, when injured, intercepts the Influx of the vital Juices to the Cranium itſelf. Hence that Part of the Cranium which lies under the affected Pericranium putrefies, which muſt afterwards be ſeparated, before the Diſorder can be cur'd; or, becoming putrid, it will affect the ſubjacent Meninges and Brain itſelf. Hence ariſe the moſt formidable Diſorders, ſuch as Fevers, and even ſometimes unexpected Death: An Inſtance of which we have in a Caſe already mention'd, of a young Man, who, in conſequence of this Circumſtance, was ſeiz'd with a Vertigo, and dy'd ſuddenly.

As for the Air entering the Cavities of the cellular Membranes, this ſubtile Fluid is of ſuch a Nature as to preſs equally on all Sides. When, therefore, a Wound is inflicted on the Head in ſuch a manner as to penetrate the Skin as far as the Membrana Cellulоſa, and eſpecially when the Surgeon, by introducing a Probe under the Lips of the Wound, ſearches carefully whether the Periоſteum, or the Cranium itſelf, is hurt, the Air enters the cellular Membrane. If at this time the Wound is perfectly cover'd with any Plaiſter of an adheſive Nature, the Egreſs of the received Air is prevented, and, being rarefy'd by the Heat of the Body, it makes its Way thro' the cellular Membrane, and renders the adjacent Parts tumid. Upon obſerving this, Surgeons generally ſearch more narrowly with the Probe, in order to find out the latent Diſorder. By this means they give a freſh Admiſſion to the Air thro' the dilated Membrane; and, by applying the Plaiſter again, the Tumor is augmented, and ſpreads itſelf farther, eſpecially over the Forehead, Eye-lids, and Face. Hence it happens, that next Day the whole Face is ſometimes ſurpriſingly affected with a pellucid and elaſtic Tumor, inſomuch that the Eyes are, as it were, bury'd, and the Noſe not to be diſcover'd; for 'tis obſerv'd, that the cellular Membrane is the more eaſily diſtended, the more tender it is, and the leſs Fat it contains. Hence it is, that the Parts under the Eye-lids ſwell ſo eaſily, and that the cellular Membrane of the Penis and Scrotum are diſtended to ſuch an enormous Size in that Species of Dropſy call'd Anaſarca, becauſe, in theſe Caſes, the cellular Membrane contains no groſs Fat, but only a kind of mucilaginous Subſtance; but, in caſtrated Animals, a large Quantity of Fat is collected in theſe Parts. Tumors of this kind are properly enough call'd Emphyſemata, or Inflations, which *Gorræus*, in his *Definit. Medic.* defin'd Collections of a flatulent Air in the empty Spaces of the Body. *Galen*, in *Method. Medend. Lib.* 14. *Cap.* 7. uſes this ſame Word in the like Senſe. "Inflations," (ἐμφυσήματα) ſays he, "ariſe from a flatulent Air collected "ſometimes under the Skin, and ſometimes under the Mem"branes which cover the Bones, or which ſurround the "Muſcles, or any of the Viſcera: A large Quantity of this "Air is alſo ſometimes collected in the Stomach and Inteſtines, "as alſo in the intermediate Space between theſe and the Peri"tonæum." In order to diſtinguiſh thoſe Tumors from an Oedema, he afterwards ſays, that, when preſs'd with the Finger, they do not retain its Print, but yield a Sound reſembling that of a Drum. But this is only true, when this flatulent Subſtance is collected in a large Cavity of the Body, ſuch as the Abdomen, which, when ſtruck, ſounds like a Drum; for which very Reaſon this Diſorder is by Phyſicians call'd Tympanites. But when this flatulent Subſtance is lodg'd in the cellular Membrane, it may yield when preſs'd with the Finger; becauſe, in conſequence of its flatulent and elaſtic Nature, it is protruded into the adjacent Cells of this Membrane, and recovers its former Place when the Preſſure ceaſes, or is remov'd. Becauſe the Eye-lids ſwell ſo eaſily on account of the great Laxity, and conſequent Dilatability, of their cellular Membrane, *Paulus Ægineta*, in *Lib.* 3. *Cap.* 22. for this Reaſon defines an Emphyſema of the Eye-lid an œdematous Tumor of that Part. But in *Book* 4. *Cap.* 28. he ſays the ſame Things concerning an Emphyſema as thoſe already quoted from *Galen*.

But how eaſily the Air, when once admitted into the cellular Membrane, paſſes thro' all its Parts, we may learn from the Practice of Butchers, who, by making a ſmall Orifice in the Skin of the ſlain Animal, inject the Air, that they may the more eaſily ſeparate the Skin from the ſubjacent Fleſh without mangling it. 'Tis alſo confirm'd by Obſervation, that Air, entering the Panniculus Adipoſus, may pervade almoſt all the Parts of the Body, and excite ſurpriſing Tumors in various Parts, and ſometimes almoſt over all the Surface of the Body. In the *Mem. de l' Acadd. des Sciences*, *Ann.* 1704. we have an Account of a Girl of five Years of Age, gradually waſted with a chronical Diſorder, who, three Days before her Death, had a Tumor appearing on her Right Cheek, which gradually ſpread over the whole Trunk of her Body. When the Tumor was preſſed with the Fingers, the contain'd Air withdrew itſelf with a kind of Noiſe. After her Death, an Inciſion being made in the Skin of her Abdomen with a Knife, the entire Tumor forthwith ſubſided, and the flatulent Matter exhal'd with an intolerable Stench. *Thomas Bartholine*, in *Hiſtor. Anatom. rarior. Cent.* 5. *Hiſtor.* 12. gives us an Account of a robuſt young Man, who receiv'd two Wounds, one near the Right Clavicle, the other in the poſterior Part of his Body, near the Left Scapula. In conſequence of theſe Wounds, not only his Face, but all the other Parts of his Body were ſeized with a Tumor, which, in ſome meaſure, reſembled a Sponge full of Wind, and which reſtored itſelf to its former Situation after Preſſure. The ſame Author, in *Cent.* 6. *Hiſt.* 89. gives us another Inſtance of the ſame Nature. This Species of Tumor may alſo, probably, be produc'd whilſt the extravaſated Humours are becoming putrid; ſince at this Time, as is confirm'd by Experience, by the Putrefaction, the latent elaſtic Matter of Bodies is drawn out into Action, which, if it is not Air, is yet a Subſtance capable of being immenſely expanded by Heat. Thus the Carcaſes of Perſons drowned beginning to putrefy, and the Whole of the Body becoming diſtended, eſpecially the Abdomen, emerge and riſe above the Water, ſince, by having their Bulk enlarg'd, they are render'd ſpecifically lighter than that Fluid. Now, as a Collection of this extravaſated Matter, lodg'd under the Skin, is capable of degenerating ſo far, 'tis obvious it may ſometimes prove the Cauſe of this ſurpriſing Diſorder. Perhaps this was the Caſe with the Girl, who, being waſted with a chronical Diſorder, had the whole Trunk of her Body render'd tumid three Days before her Death.

Hildanus, in *Obſerv. Chirurg. Centur.* 2. *Obſ.* 25. gives us a Caſe, in which, after ſevere Wounds of the Head, the Carcaſe of the Deceas'd, two Days after the Wounds were inflicted, ſmell'd ſo ſtrong, that none could approach it; and next Morning the Head, Face, and Arms, were ſwell'd in an incredible Manner, and the Scrotum ſo diſtended as in Bulk to equal a Child's Head.

When ſuch an Emphyſema appears, the very Nature of the Thing indicates, that this elaſtic diſtending Subſtance ſhould be expel'd from the cellular Membrane, which it diſtends to ſuch a Degree. This Effect may be produc'd by moderate Preſſures, or Frictions, by driving the included Air to the Aperture of the Wound, which may alſo be dilated, if Neceſſity requires it; or a free Diſcharge of this Matter may alſo be procur'd by Scarifications, which penetrate into the cellular Membrane. *Part.* *Lib.* 10. *Cap.* 30. gives us a memorable Inſtance of the Succeſs of Scarification in a Caſe of this Nature: A Man received

ceiv'd a Wound in the Throat with a Sword, which cut a Part of the Aſpera Arteria, and one of the Jugular Veins; whence enſu'd a profuſe Hæmorrhage, and a whizzing Noiſe, made by the Air paſſing thro' the Wound of the Aſpera Arteria. The Lips of the Wound were united by Suture, and aſtringent Remedies were apply'd. A little after, the Air, inſinuating itſelf into the cellular Membrane, not only wonderfully diſtended the Places adjacent to the Wound, but alſo the whole Body. The Face was ſo inflated, that the ſmalleſt Traces of the Eyes and Noſe were not to be obſerv'd. Whilſt the Patient was by all abandon'd in this deplorable State, as one whoſe Recovery was not to be expected, a ſkilful Surgeon boldly ventur'd to make ſeveral deep Scarifications in his Skin, with an Intention to give a free Exit to the included Air. The Succeſs of the Operation was ſo ſurpriſingly happy, that the Patient was ſnatch'd from the Jaws of Death, and reſtor'd to perfect Health.

But thoſe emphyſematous Diſorders much more frequently accompany thoſe Wounds of the Breaſt which penetrate into the Cavity of the Thorax, becauſe the Air convey'd thro' the Wound into the Cavity of the Breaſt cannot often be diſcharg'd thro' the Wound, when it is either too ſmall, or obſtructed by any Cauſe whatever: Hence, being rarefy'd by the Heat of the vital Organs, it makes its Way into the cellular Membrane, But if the injur'd Lungs let the inſpir'd Air paſs into the Cavity of the Breaſt, 'tis obvious that terrible Emphyſemata may be produc'd, ſince by every repeated Inſpiration an Acceſſion of new Air is made.

If the Integuments only are injur'd, without any of the unpromiſing Circumſtances above related, the Cure is eaſily perform'd, tho' the Wound appears to be very large, by proper Bandage, and the Method directed for the Cure of Wounds in general, under the Article VULNUS. But the Cure ſucceeds beſt, when proper Meaſures are purſu'd whilſt the Wound is recent; when the Lips of the Wound are properly brought together; when it is dreſs'd but ſeldom, and then with the utmoſt Expedition; when all moiſt, relaxing, unctuous Applications are carefully avoided; and when it is well defended from the Air.

From what has been ſaid it is evident, that leſs is to be apprehended from a large Wound, than from a ſmall Wound with a great Contuſion; which laſt may be, and frequently is, attended with Danger. This, however, may, in ſome meaſure, be prevented, by enlarging the Aperture of the Wound.

All the Cautions relative to Wounds in general, given under the Article VULNUS, are applicable to Wounds of the Integuments of the Head without Contuſion. But there are ſome Particulars to be obſerv'd in Wounds of the Head, even when the external Parts are only injur'd. Thus the Ligatures deſign'd either for ſecuring the Dreſſings, or keeping the ſeparated Parts in Contact, ought to be ſo moderately apply'd, as only to ſecure the Parts gently; for if they ſhould be apply'd too tight, the external Integuments are preſs'd upon the hard Cranium, which every-where lies under them. Hence a Compreſſion of the Veſſels, an Inflammation, and the ſeveral Diſorders ariſing from it, are brought on. Expert and ſkilful Surgeons, on Occaſions of this Nature, always uſe ſoft and gentle Bandage. The Union alſo of the gaping Lips in Wounds of the Head is not ſo properly obtain'd by Compreſſions and Bandage, as by adheſive Plaiſters, or what we call the dry Suture, becauſe theſe Wounds generally divide only the Skin, and the ſlender ſubjacent cellular Membrane adhering to the Skin eaſily follows it.

The moſt ſkilful Surgeons, in Caſes of this Nature, to the Patient ſeem to do nothing at all, whilſt, at the ſame time, they ward off and prevent many Symptoms, which, in the like Caſes, are brought on by the officious Care of leſs ſkilful Hands, and which are afterwards remov'd with Difficulty; for all that is here requir'd is, that the ſeparated Integuments of the Head may again grow together, and be united. But for this Purpoſe Nature alone is ſufficient, and Art only removes the Impediments, and proves a kind of Aſſiſtant. When, therefore, all the Symptoms declare, that the Cure is proceeding happily, there is no manner of Occaſion for cleanſing the Wound often, and expoſing the ſprouting tender Veſſels to the unaccuſtom'd Influence of the Air; and that ſuperfluous and prepoſterous Method of wiping Wounds by the frequent Application of Pledgets will deſtroy the tender Parts, as faſt as they begin to ſprout afreſh. It is, therefore, ſufficient to dreſs Wounds but ſeldom; for if any thing peccant is conceal'd, or if too large a Quantity of Pus calls for Abſterſion, the Heat and gentle Itching about the Wound will inform us of it; we may alſo diſcover by the Smell, whether any thing of a putrid Nature is contain'd in the Wound; and the increas'd Malignity of the Symptoms will immediately indicate, whether any thing highly dangerous is to be dreaded. *Cæſar Magatus*, who has ſupported the rare Dreſſing of Wounds with the moſt ſolid Arguments, and evidently demonſtrated the happy Conſequences of that Practice, when ſpeaking of ſimple Wounds of the Head without a Denudation of the Bone, after having directed the Lips of the Wound to be united, and Turpentine, with Maſtich and Sarcocolla to be apply'd, forbids the Removal of the Dreſſings for four Days; becauſe, in that Time, he ſays, the Conglutination will be accompliſh'd. But where there is a Loſs of Subſtance, or where the Gaping of the Lips of the Wound requires a Generation of new Fleſh, he orders the Removal of the Dreſſings of the Wound to be defer'd till the ſeventh Day. The Surgeon may, indeed, once a Day, or oftener, inquire whether any Pain, Itching, or Heat, are perceiv'd; he may alſo ſmell whether any thing of a putrid Nature is contain'd in the Wound: But if he diſcovers no ſuch thing, 'tis more adviſeable to let the Dreſſings remain; and if a freſh Dreſſing is neceſſary, it ought to be apply'd with all poſſible Expedition; and every thing ought to be in Readineſs before the Wound be uncover'd. In Wounds of other Parts of the Body, where the Integuments are only divided, the uncovering and cleanſing them frequently does generally little more Harm than retarding the Cure; but this Practice is more dangerous in Wounds of the Head, ſince the Diſorders of the Integuments are ſo eaſily communicated to the ſubjacent Pericranium, and even to the Cranium itſelf: For this Reaſon the ſeldom Dreſſing of theſe Wounds cannot be too carefully inculcated. Where there is a Wound of the ſoft Parts, attended with a Fracture of the Bone, after the Bone is reſtor'd, the Dreſſing is left on for ſeveral Weeks; and yet the Cure of the Wound accompanying the Fracture ſucceeds very happily, tho' it has not been artificially deterg'd.

All moiſt, relaxing, and unctuous Applications ought carefully to be avoided; for under the external Integuments lies the tender and eaſily dilatable cellular Membrane, naturally pent up between the Skin and Cranium: When, therefore, upon a Diviſion of the Integuments, moiſt and relaxing Medicines are apply'd to the Wound, the cellular Membrane, moiſten'd by theſe, will become luxuriant, be fill'd with adventitious Fluids, and degenerate into a fungous Subſtance, to be again ſeparated by a ſubſequent Suppuration, which, when copious and laſting, ſeldom fails to affect the ſubjacent Pericranium. Hence all ſkilful Surgeons have unanimouſly condemn'd the Uſe of them in Wounds of the Head; and in this Particular they have follow'd the Practice of *Hippocrates*, who, in his Treatiſe of Wounds of the Head, Sect. 17. affirms, that "A Wound of "the Head is not to be moiſten'd with any thing, no not "with Wine, or at leaſt with very little; neither does ſuch a "Wound require Cataplaſms or *Liniments*." In the ſame Treatiſe he afterwards adds, that "It is a bad Symptom when in "Wounds of the Head the Fleſh is humid, moiſt, (μοδῶσαν) and "long before it is render'd clean." And after he has inform'd us, that Fleſh, ſhatter'd and mangled by a Dart, ought to be converted into Pus, he tells us, that the Wound is to be brought to a Suppuration as ſoon as poſſible; but when it is depurated, it ought to become drier, by which means it will heal the ſooner, and a dry and not over-moiſt Fleſh be generated. When, therefore, a Contuſion, accompanying a Wound, requires Fomentations, the Surgeons now always uſe Wine, leſt too great a Relaxation ſhould be produc'd by aqueous Applications alone. For the ſame Reaſons no pinguious Subſtances ought to be us'd in Wounds of the Head, by reaſon of the great Relaxation they induce. Oleous Subſtances alſo, by their Tenacity, obſtruct the Capillary Veſſels, and render them impervious. *Ludovicus Duretus*, in his *Comment. in Coac. Hippoc.* informs us, that in *Italy*, eſpecially among the *Florentines*, Wounds of the Head were obſerv'd to be very difficultly cur'd, which they aſcrib'd to ſome latent bad Quality of the Air. But ſeveral Authors, among whom *Bonetus*, in his *Anat. Practic. Tom.* 3. is one, have obſerv'd, that they apply Oil of Roſes and of unripe Olives to the Wound, and alſo anoint the adjacent Parts with the ſame. Hence theſe Authors inform us, that none or few eſcape, tho' they have been but ſlightly wounded. Hence alſo *Marcus Aurelius Severinus*, in his *Trimemb. Chirurg.* deplores the fatal Uſe of Oil, which, at *Naples*, was common in Wounds of the Head; and affirms, that the ſlighteſt Wounds became dangerous, inſomuch that of an hundred ſcarce one eſcapes; whereas the Phyſicians of *Malta* us'd a Mixture of Wine and Oil with ſuch Succeſs, that among an hundred ſcarce one periſh'd, as the tenacious Quality of the Oil was corrected by the Admixture of the Wine.

Wounds of the Head are alſo to be preſerv'd from the Air, not becauſe it is always hurtful in conſequence of ſome malignant Quality; tho' in Hoſpitals, where there are many Patients, the Air, contaminated with putrid Exhalations, may prove prejudicial to any Wound; but the principal Reaſon is, becauſe the tender ſprouting Veſſels are mortify'd by the Cold, to which they are not accuſtom'd; or becauſe, being too moiſt, it may produce bad Effects, by ſoftening and relaxing them. Hence the uncovering theſe Wounds very ſeldom is alſo to be recommended for this Reaſon. And when Wounds of the Head are dreſs'd, a dry and hot State of the Air is principally proper, which may be obtain'd by Fire, and kindled Aromatics, ſuch as Amber, Maſtich, and Frankincenſe.

When

When any of the Muſcles, Tendons, tendinous Expanſions, Periofteum, Cranium, Nerves, Blood-veſſels, or Brain, are injured, or when a Wound near the Sutures is productive of bad Effects, the Treatment muſt be varied, as the different Parts affected, and the Nature of the Injury, require, and as is directed under the Article of *Wounds* in general.

'Tis obvious, that nothing can be univerſally determin'd with reſpect to the Cure of the Diſorders ariſing from theſe Cauſes. But we muſt firſt know the Part adjacent to the Wound, and the Injury either already done to this Part by the Wound, or ſuſpected to follow from it, before we can determine any thing certain either with reſpect to the Cure or Prevention of theſe Diſorders: For another Method of Cure is requir'd, when conſiderable arterial Blood-veſſels are cut together with the common Integuments of the Head, than when a Wound of a Tendon brings on terrible and fatal Symptoms.

Thus, in Caſe of Contuſion, the Parts contus'd muſt be well digeſted by ſuch Applications as are capable of diſſipating the ſtagnating Humours, or of ſuppurating them; but, for theſe Purpoſes, ſuch Medicines muſt be made Choice of as are friendly to the Nerves and Membranes, or the contus'd Parts may be cut away.

A Contuſion ſuppoſes many Veſſels broke, and their contain'd Humours diſcharg'd, which being then collected in the cellular Membrane, frequently excite ſurpriſing Tumors; and unleſs the wounding Inſtrument is pretty ſharp, ſome Degree of Contuſion almoſt always accompanies Wounds of the Head. In Caſes of this Nature 'tis neceſſary to carry off the diſcharged Humours, or to diſpoſe them for being again abſorb'd, and to reſtore the Veſſels to their former Soundneſs: If the Contuſion is ſlight, and the diſcharged Liquids ſtill capable of being diſſipated, 'tis moſt proper and ſafe to procure this End by fomenting the Part with ſuch Medicines as dilute and reſolve concreted Fluids, reſiſt Putrefaction, and are not, at the ſame time, too emollient. The Urine of a ſound Man, with the Addition of a little Sea Salt, or Sal Ammoniac, and Wine, is an excellent Medicine in theſe Caſes, and often proves effectual for diſſipating the Tumors ariſing from Contuſions in the Heads of Children. Fomentations of Rue, Scordium, and Herbs of a like Nature, are alſo to be uſed, becauſe, by their ſingular antiſeptic Virtue, they guard againſt Putrefaction, and powerfully reſolve Concretions. Nor are ſlight Contuſions only cured by theſe Medicines, but alſo conſiderably large Tumors, which one would think could only be remov'd by Inciſion, may be happily diſſipated by them. A certain Woman, happening to fall from a Chariot, ſtruck her Forehead againſt the froſty Ground; by which means a large Tumor was forthwith excited on the Part. The Surgeon, underſtanding that the Patient had vomited a few times after the Accident, concluded that the Cranium was depreſs'd, and was juſt about to make a crucial Inciſion: But the celebrated *Ruyſch*, being called to the Conſultation, declared againſt the Inciſion, and apply'd a warm Fomentation of cephalic Herbs, boil'd in Wine, and put in a Linen Cloth, with ſuch ſurpriſing Succeſs, that in three Days the Tumor began to grow leſs, and was ſoon after diſſipated, without the Appearance of any bad Symptom whatever. He adds, that he has often, by the like means, ſav'd thoſe who were juſt about to have the Inciſion-knife plung'd into their Heads.

But when the Diſſipation of Contuſions is in vain attempted by ſuch Fomentations, or where the Greatneſs of the Diſorder leaves no Hopes of ſuch a mild and gentle Reſolution, then the only Method to be purſu'd is, to endeavour the Separation of the corrupted Parts by Suppuration. This is what Surgeons call *to digeſt*, when they convert a Matter, which cannot be reſolv'd, into a laudable Pus; and they call thoſe *digeſting Medicines*, which change the diſcharg'd irreſoluble Humours to the Condition of good Pus: But concerning theſe ſee the Article VULNUS. In Wounds of the Head, we are always to take care not to uſe ſuch Applications as may prove prejudicial, by relaxing too powerfully: Hence we are to abſtain from Cataplaſms, becauſe they moiſten too much; but we are to take the pureſt Turpentine, or any other native Balſam of a like Quality, and by the Addition of the Yolk of an Egg to correct its tenacious Quality, which in this Caſe would prove hurtful; then we are to add a little of the *Unguentum Baſilicon aureum*, or ſome ſuch Ointment; then Aloes, Myrrh, or Frankincenſe, reduced to a fine Powder, are to be ſprinkled upon it. Thus we have a digeſtive Medicine, in which are all the Ingredients which reſiſt every kind of Putrefaction, and are obſerv'd to be friendly to the Nerves, and the nervous and tendinous Membrane. This Medicine, ſpread upon a Pledget, is to be apply'd to the Part affected. Then an aromatic Plaiſter is apply'd, in order to cheriſh the Parts, and excite a ſomewhat briſker Motion in them, which is always uſeful in promoting a Suppuration. Over all theſe are to be apply'd Woollen Cloths, moiſten'd in ſome Fomentation which penetrates, diſſolves, and reſiſts Putrefaction. But care muſt be taken, that they be apply'd as warm as the Patient can poſſibly bear, and that the Part be not ſuffered to cool ſuddenly. All theſe Medicines are to be varied according to the Conſtitution of the Patient, and the Seaſon of the Year.

Boerhaave, in his *Materia Medica*, informs us, that in theſe Caſes ſuch Medicines as attenuate, dilute, and preſerve from Putrefaction, are to be us'd; and orders the following Ointment to be apply'd upon Pledgets:

Take of Turpentine, two Ounces, and the Yolk of an Egg: When theſe are ſufficiently mix'd, add two Ounces of Baſilicon, and of pure Aloes, four Drams.

Over this let the following Plaiſter be apply'd:

Take of Gum Galbanum, depurated, and made up with the Yolks of Eggs, four Ounces; of yellow Wax, two Ounces; of the Oil of St. John's-wort, three Drams: Mix all together.

Then add the following Fomentation, which is to be apply'd as warm as poſſible, with expreſs'd Woollen Cloths.

Take of the freſh Leaves of Rue and Scordium, each two Handfuls; of the Flowers of the Leſſer Centaury, Elder, and Roſes, each three Ounces: With thirty Ounces of theſe, boil'd in Water, and expreſs'd, mix five Ounces of Spirit of Wine, and two Drams of *Venice* Soap.

But when, by a profuſe Effuſion of Humours, the cellular Membrane is diſtended into a large Tumor, a Suffocation often hence ariſes; and the Membrane, almoſt become gangrenous, is ſeparated, together with the Humours pent up in it. In this Caſe it may ſafely be cut away. We ſee how ſurpriſingly the cellular Membrane ſwells in other Parts of the Body: In the Back of the Hand, for Inſtance, there is ſcarce any Fat, but the Tendons of the Muſcles are lodged in a very ſlender cellular Membrane; yet, when an Inflammation happens in this Place, a Tumor two Inches in Thickneſs is often produc'd, and the Whole of this is lodged in the ſlender cellular Membrane: Upon this a Suffocation happens; and, upon opening the Place, large gangrenous Portions of the Membrane appear, and may ſafely be extirpated. The ſame may alſo happen in Wounds of the Head; and this corrupted Membrane, together with the extravaſated Humours, may ſeparate. But we do not here mean, that Contuſions, which cannot be reſolv'd, are cruelly to be cut out, with the Skin which covers them; for it would be prejudicial to lay bare ſo large a Part of the Pericranium from its Integuments, which would not eaſily grow again; and, beſides, the Place would be render'd ſtill weaker, and be left more expoſed to external Injuries. Hence *Galen*, in *Comment.* 3. in *Hippoc. de Fracturis*, carefully adviſes the Skin to be preſerved as much as poſſible in all Wounds and Ulcers, becauſe, ſays he, bare Fleſh, when left without the Skin, is difficultly brought to a Cicatrix. I myſelf, ſays *Van Swieten*, ſaw a melancholy Proof of this. A healthy Man, of a middle Age, had a broad Wart near the inferior lateral Part of his Forehead, adjacent to his Temple. When its Removal had been in vain attempted by various Remedies, a Surgeon, in other reſpects ſufficiently ſkilful, cut out the whole Wart, together with the Skin. The Place, thus depriv'd of its Skin, could never by any Remedies be brought to a Cicatrix; but the Skin being gradually more and more retracted, the ſubjacent Parts were of courſe more expoſed, and a malignant Ulcer preying upon the adjacent Parts, the Patient died a miſerable Death ſoon after. Nor is this to be wonder'd at, ſince the Pericranium alone, lying on the Bone, does not ſeem ſufficient for the Regeneration of ſo much loſt Subſtance: But we are here only ſpeaking of the diſtended and corrupted cellular Membrane, which may be ſafely extirpated.

If the Humours ſtagnating in the contus'd Parts produce conſiderable Tumors, Pains, Convulſions, Putrefaction of the Bone and Periofteum, and their Conſequences, the moſt prudent Method is, to lay them open by Inciſion, and to depurate the Parts by digeſtive, abſtergent, corroſive, or drying Applications, as directed under the Article VULNUS.

For all the Malignity of ſuch a Wound conſiſts in this, that the diſcharged Humours, being pent up by the thick Skin of the Head, and not being able to paſs thro' the too narrow Orifice of the Wound, make a Way for themſelves thro' the cellular Coat; or being corrupted by their Stay, they affect the Pericranium, and the Cranium itſelf. By dilating the Wound, therefore, a Paſſage is made for the extravaſated Humours, and the Part affected may be more commodiouſly treated with proper Medicines. Such a Diſorder is diſtinguiſhed by the narrow Aperture of the Wound, by the Tumor and Mobility of the adjacent Integuments when touch'd with the Fingers, and from the Patient's being ſeiz'd with a Fever, for which no other Cauſe can be aſſign'd.

Not, in this Caſe, is there any Danger of wounding the tendinous Expanſions, ſince the Whole of this Tumor is lodged in the Cellular Membrane, which may be ſafely cut out, together with the Skin. And we are convinced, by numberleſs Inſtances, that not only the Skin, but alſo all the Integuments, may be ſafely cut to the very Bone, when it is neceſſary.

Whilſt *Hippocrates* (*de Capit. Vuln. Sect.* 18.) is recounting thoſe Wounds of the Head which require Inciſion, he mentions thoſe "which have not a Length and Breadth ſufficient to "diſcover if the Bone has been injured by the Weapon, *&c.* "and when Wounds have a kind of oblique Cavity, that Ca- "vity muſt be cut broad, *&c.* and when Wounds are orbicu- "lar, and very hollow, they muſt alſo be cut with a double "Inciſion longitudinally, that the Wound may be render'd "longitudinal."

But how greatly, in ſuch Caſes, the Symptoms are relieved by a timely Inciſion, we learn from the above related Caſe of a Joiner, who had his Symptoms conſiderably abated next Day after laying open the Integuments of the Parts affected. But, after the Wound is dilated, then the digeſtive Medicines, above recommended, may be applied. Concerning the Depuration of Wounds, ſee the Article VULNUS. But only that Dilatation of the Wound which is made with the Knife is commendable; for that which is made by Sponges, or other dry Subſtances, which ſwell by abſorbing the Humours, is generally prejudicial; becauſe, by their means, the Orifice of the Wound is ſo block'd up for ſome Hours, that nothing can be diſcharged: Hence an *Emphyſema*, and other Tumors, may be produced. Beſides, the Contuſion and Inflammation become greater in the Lips of the Wound, which will afterwards require a longer continued Suppuration, before they can be again conſolidated.

When the Pericranium is injur'd in ſuch a manner, as that the Bone lies for ſome time bare, or putrefies, the Bone is deprived of the Veſſels, which it otherwiſe receives from the Pericranium, and conſequently of its own proper Veſſels: Hence, the Humours ſtagnating in the Part, the Bone putrifies, and a Scale ſeparates from it: Whence the Bone appears yellow, brown, or black, and at laſt exfoliates.

After having treated of thoſe Wounds of the Head which only injure the common Integuments, it now remains, that we inquire into thoſe Diſorders which are produced by Wounds of the Pericranium. As all the other Bones of the Body are cover'd with a peculiar Membrane, which adheres pretty cloſely to them; ſo the Bones of the Cranium have alſo their Covering, which is call'd the *Pericranium*. *Ruyſch* demonſtrated, by Anatomical Injections, that a large Number of Veſſels were diſtributed thro' this Membrane, which, by Branches ſent off, were inſerted into the ſubjacent Bone, and ſerved to ſupply it with the Humours neceſſary for Life and Nouriſhment: By means of theſe Veſſels ſent off, the Coherence between the Cranium and Pericranium is very ſtrong: Hence, by tearing this Membrane from the ſubjacent Bone, in a living Animal, many ſmall red Spots appear in the Bone. The Pericranium cannot therefore be injured, but a large Number of thoſe Veſſels, running to the Bone, muſt be deſtroy'd. But the Extremities of the broken Veſſels may, on the external Surface of the bare Bone, form again a like Membrane in that Place where the Bone was ſtript of its Pericranium, by the ſame common Law by which all loſt or ſeparated Subſtances in Wounds grow again. *See* VULNUS. But where the Bone has been long bare, and eſpecially when the Air has had a free Acceſs, theſe tender Extremities of the Veſſels are deſtroy'd, and become quite unfit for forming a Membrane like that which is loſt. The external Surface, then, of the Bone, being deprived of the vital Influx of the Fluids, becomes mortified, nor can it ever grow again with the live Parts: Hence Nature, by means of the live Veſſels underneath, attempts the Separation of the corrupted and mortified Part from the ſubjacent ſound vital Part, and thruſts off the dead and mortified Part. After the Separation of this there grows a new Pericranium out of the Bone, and the adjacent ſound Membrane. When a Bone is thus affected, it may be known from its Change of Colour, which, in ſound Bones, is a little reddiſh, or, in many Places, of a whitiſh Blue: But, on this Occaſion, a yellowiſh Colour ariſes in the Part affected, which gradually becomes darker and darker, till it grows blackiſh, and at laſt the corrupted Part of the Bone is ſeparated. The more, then, the Colour of the Bone recedes from what it naturally ought to be, and the blacker it is, the greater Tendency it has to Corruption, as is obvious in the Teeth, which, when diſorder'd by any Cauſe whatever, begin gradually to loſe that bluiſh Pearl-colour they naturally ought to have, and become at firſt pale, then yellow, and at laſt, becoming blackiſh, fall away in Pieces. Now 'tis certain, from the moſt accurate Obſervations, that the Bones of the Cranium were originally in the Fœtus cartilaginous Membranes, in the Middle of which the firſt Rudiments of the Bone are form'd, and bony Ramifications are diffuſed every-where from this common Centre: Thus the internal bony Table of the Cranium, call'd the vitreous Table, is at firſt produced. Then theſe bony Ramifications, or the Filaments of this reticular Subſtance, gradually become broad externally, and form ſmall Plates, different as to their Bulks, Figures, and Situations, and of which the *Diploë* of the Cranium is form'd. Then the Points of theſe Plates, of which the Diploë is form'd, are blunted, as it were; and, becoming broad, are laid over each other like Scales, and form a kind of uneven Lamina, which conſtitutes the external Plate of the Cranium. Then both Tables become thicker, and more ſolid; for theſe bony Ramifications, and ſlender Plates, become tumid, and new Scales are added. From this Account of the Formation of the Bones of the Cranium, founded not on Speculation, but, by the celebrated *Albinus*, taken from the genuine Works of Nature, 'tis obvious, that the Structure of the Bones of the *Bregma*, *Occiput*, Forehead, and Temples, which are principally ſubject to be injur'd by Wounds, is lamellated: Hence the Diſorders of the injur'd Pericranium may be communicated to the ſuperior Laminæ of the ſubjacent Bone, and injure them more or leſs. And it is highly probable, that, in Infancy, when the Bones have not as yet acquired a great Degree of Solidity, Veſſels are diſtributed betwixt each of theſe Laminæ, which are afterwards, in Proceſs of Time, like many other Veſſels, gradually obliterated. This Conjecture is confirm'd by ſome Obſervations on the Parts conſtituting the Bone, which, being every way enlarged in their Dimenſions by a Diſeaſe, have appear'd to be of ſuch a pulpous, ſoft, and vaſcular Structure: Thus, in the *Hiſt. de l'Acad. des Sciences*, for the Year 1734. we are told, that the Bones of the Cranium of a Child of three or four Years of Age were every-where ſeven or eight Lines thick, and ſoft; and that, upon being preſs'd, they diſcharged a large Quantity of Blood and Lymph; and that the Blood-veſſels appear'd very conſpicuouſly in them. *Hippocrates*, in his Treatiſe of Wounds of the Head, *Sect.* 2. ſeems, in the following Words, to acknowledge this: "The whole Bones, "ſays he, of the Head, except a ſmall Portion of the loweſt "and uppermoſt, are like a Sponge, and contain a large Quan- "tity of a moiſt fleſhy Subſtance, which, when preſs'd with "the Fingers, diſcharges Blood: There are, beſides, in theſe "Bones, ſmall Veins full of Blood." The ſmall Laminæ, therefore, totally deprived of a vital Influx of the Humours, will be ſeparated by means of the Veſſels diſtributed between them; and if theſe ſhould be obliterated by the near Approach of the bony Laminæ to each other, the Veſſels which, ariſing from that ſoft ſpongious Subſtance call'd the *Diploë*, between the two Tables of the Cranium, are diſtributed to the Bone, may perform this Office: Hence, perhaps, the corrupted bony Laminæ are, with Difficulty, ſeparated in old Men: Hence alſo appear the happy Effects of making a great many ſmall Perforations in the Bone, in the manner hereafter to be deſcribed.

Tho', therefore, when the Bone is deprived of its Pericranium, if a remarkable Change of Colour happens, we are to expect a Separation of the corrupted Laminæ, by what Surgeons call Exfoliation; yet we are, by ſome very rare Caſes, taught, that a Cure may be completed without this; for *Ruyſch*, in *Obſervat. Anatom. Chirurg. Centur. Obſervat.* 5. gives us an Account of a Man, "who, being ſtruck by a Horſe "on the Head, fell to the Ground like one dead, with ſo large "a Denudation of the Os Sincipitis, that a Crown was "ſcarce ſufficient to cover it. The whole denudated Part of "the Bone became black, except a Circle about a Straw's- "breadth next to the Skin. This white Circle becoming daily "leſs, the Patient recover'd, without any viſible Separation of "the Bone, or the Uſe of the Raſpatory." Perhaps the affected Part of the Surface of the Bone was not ſeparated in the Form of a Scale, but was gradually carried off by the Pus in minute Particles.

One principal Cauſe of the Putrefaction, and conſequent Exfoliation, of the Bone, is an Interruption of the Continuity of the Veſſels which nouriſh it, and conſequently of the Circulation of the Humours thro' them. Another Cauſe is the Coldneſs of the Air, which contracts and dries up the Extremities of the ſmall Veſſels of the Bone, without, however, any of that imaginary Malignity which ſome attribute to the Air.

By means of a Wound, all thoſe Actions are injur'd which depend upon the Integrity of the Parts now ſeparated by the Wound, and the determinate Circulation of the Fluids thro' the Veſſels: But the Uſe of the *Pericranium* is to ſend off Veſſels to the Bone, and receive others from it, as appears obviouſly by the artificial Injection of the *Periоſteum* of a *Fœtus*; for, in ſuch a Subject, the Veſſels are, in this Membrane, found to be far more numerous than in a more advanced Age, when they coaleſce, and are obliterated. The *Pericranium* therefore being deſtroy'd, the Continuity of the Veſſels, on which the Life and Nouriſhment of the Parts depend, muſt of courſe be removed: That Part, then, of the Bone, which is thus deprived of the vital Influx of the Humours, will become mortified, and be ſeparated from the ſubjacent live Parts.

But

But as Surgeons always obſerved, that the Surface of the Bone, deprived of its *Periosteum*, cannot be long expoſed to the Air without a ſubſequent Corruption and Exfoliation of the Bone, and as, on the other hand, they often found, that the Bone, when deprived of the *Periosteum*, often did well, without any Separation, if immediately defended and cover'd up from the Air, they imagin'd, that the Air was poſſeſs'd of ſome malignant Quality, which corrupts the Bones: 'Tis, indeed, very true, that ſeveral Subſtances may be lodged in the Air, which may not only prove injurious to denudated Bones, but alſo to all Wounds in general. Thus, in Hoſpitals where there is a great Number of Patients, the Air, contaminated by the putrid Exhalations, is obſerved to render the Cure of Wounds difficult: But tho' theſe Subſtances are lodged in the Air, yet they are, properly ſpeaking, diſtinct from that Fluid. But the Air, freely admitted to denudated Bones, ſeems by its Coldneſs, and that Principle by which it attracts Moiſture and dry Bodies, ſo to ſhrivel the broken Extremities of the Veſſels on the Surface of the Bone, as to render them entirely impervious to the Humours: Hence all the other Symptoms are induced, as was obſerved above. For this very Reaſon, *Hippocrates* never accuſed the Malignity of the Air, but only aſſerted, that a cold Air was hurtful to the Bones, the Teeth, and the Nerves.

Whilſt the ſuperior Scale of the Bone, deprived of its Veſſels, is corrupted, the Diſorder is eaſily convey'd to the Part of the Bone lying immediately under it: Thus it may reach thro' the whole Thickneſs of the external Lamina of the Cranium to the *Diploë*, and corrupt it; which Diſorder may at laſt affect the inner Table of the Cranium, call'd the vitreous Table; or, creeping along in the *Diploë*, between the two Tables, may produce the worſt Symptoms.

In Caſes where the Bone is thus affected, the Cure is to be perform'd,

Firſt, By gently making in the Bone a great Number of ſmall Holes with the Perforator; by which means Exfoliation is prevented, and the Periosteum, or ſomething analogous to it, is regenerated.

Secondly, By keeping the Wound clean from Pus and Sanies, at the ſame time defending it from every thing unctuous and watery, and applying to it Pledgets dipt in Spirit of Wine, impregnated with Maſtich.

Thirdly, By renewing the Dreſſings very ſeldom, and then with the utmoſt Expedition.

When we are certain, that the Bone of the Cranium is diveſted of its *Pericranium*, and, by the free Acceſs of the Air, ſo changed in its Surface, that all vital Motion of the Humours is obſtructed, what is mortified muſt neceſſarily be ſeparated from the ſound Parts with which it coheres, before ſuch a Wound can be heal'd: But this Separation is entirely perform'd by ſound Veſſels lying under the mortified Part, which, by their continual Motion, and, as it were, Puſhing, ſeparate and expel the mortified Part of the Bone. *Hippocrates*, in his Treatiſe of *Wounds of the Head*, made the ſame Obſervation in the following Words: "In Wounds of the Head, the Bone to be "ſeparated, whether the Trace of the Weapon is left in it, or "whether it is much denudated, is, for the moſt part, ſepa- "rated when it is render'd exſanguous (ἀφίσται ὅταν πουλὺ ἐξαι- "μον)." And he afterwards adds, "For this Reaſon it is "principally ſeparated from the reſt of the Bone which has "Life and Blood, and is exfoliated, when become dry and ex- "ſanguous." But if this Work is left to Nature, it proceeds very ſlowly, and is not perfected ſooner than in forty Days, and ſometimes more; for, in ſo many Days, the contuſed Margins of the Perforation, made by the Trepan, are obſerved to be ſeparated. But, in this Interval of Time, various unlucky Changes may happen to ſuch a Wound, and the Diſorder of the Bone may be communicated to the ſubjacent Laminæ, and the Evil conſequently increaſed. Patients, eſpecially in public Hoſpitals, are, for the moſt part, much affected when obliged to remain long in them, as is atteſted by all Surgeons who have had an Opportunity of attending Hoſpitals: But this Circumſtance is obſerved to prove moſt fatal to thoſe who labour under Wounds of the Head: Hence it is a beautiful and uſeful Improvement of the Art, to diſcover by what Means the Separation of the corrupted from the ſound Bone may be accelerated. Surgeons have attempted this by raſping the Bone with a Rugine, and burning it with a Cautery; but thus the abraded or burnt Surface muſt be again ſeparated. The whole Separation of the mortified Part, as we have already obſerved, depends upon the Action of the ſubjacent live Parts: Every thing, then, which can make way for the ſubjacent live Veſſels, and promote their Riſing under the corrupted Part, will accelerate this Separation. The beſt Method, then, of anſwering this End, is gently to perforate the bare Bone with minute Holes, pretty near each other, to the *Diploë*, where we are ſure, that a great Number of live, and, at the ſame time, conſiderably large Veſſels are lodged. This is perform'd by the pyramidal Apex of the perforating Trepan, or by the Point of a common Needle, ſo fix'd in a Handle as to be commodiouſly turn'd about, or by the Inſtrument repreſented *Tab.* 28. *Fig.* 2. and *Fig.* 7. A.

And whilſt theſe Holes are made in various Parts, pretty near each other, the live ſubjacent Veſſels, not being encumber'd by the Part which covers them, riſe thro' theſe Holes, form a new Perioſteum, and often ſuch a Wound is happily cured without any Exfoliation. Beſides, the Veſſels lying between the Plates of the Bone may riſe, and be lengthen'd out thro' theſe Apertures, and thus ſeparate the ſuperincumbent corrupted Part of the Bone. Uncommon Succeſs has demonſtrated the Uſefulneſs of this Method; and *Belloſte*, a ſkilful Surgeon, to whom this Invention is owing, or at leaſt who firſt accurately deſcrib'd it, affirms, that, in many Caſes, he has by this Method perform'd happy Cures; and, in his *Treatiſe of Surgery*, gives two Caſes, which were cured before many Spectators in the public Hoſpital, in Confirmation of it.

A Soldier had the common Integuments of his Head carried off by a large Cannon-ball, but the Bone was unhurt, tho' the Pericranium was ſo contuſed as to become quite livid. *Belloſte* ſcratch'd off the Pericranium with his Nails, laid bare the ſubjacent Bone, and gently perforated it in ſeveral Places: Two Days after, the Dreſſing being removed, the Bone appear'd reddiſh; and, two Days after this, more than half of the denudated Bone appear'd cover'd with a freſh Pericranium. Seven Days after, the whole Surface of the Bone was entirely cover'd, and the Wound thoroughly conſolidated in the Space of eighteen Days.

The other Soldier, upon receiving a Wound on the Left Bone of the Bregma, with a cutting Inſtrument, had a pretty large Portion of the Cranium laid bare. At the ſecond Dreſſing the Bone had eight or ten ſmall Perforations made in it; but in ſuch a manner as not to reach entirely to the Diploë. The other Meaſures taken were the ſame as in the former Caſe. Two Days after, the Wound being uncover'd, the Bone began to appear red, and ſomething began already to riſe thro' the ſmall Perforations. Eight Days after, the Bone appear'd cover'd with a new Membrane, and the Cure was completed in ſeventeen Days, notwithſtanding the Largeneſs of the Wound.

From theſe two Caſes the Uſefulneſs of this Method is ſufficiently obvious; and it is plain, that 'tis, in theſe Caſes, only neceſſary artfully to procure a free Paſſage to the ſubjacent live Veſſels to emerge and ſprout out. By the laſt of theſe Examples it is alſo obvious, that it is not always neceſſary, that the Bone ſhould be perforated to the *Diploë*; but that, by a ſlight Aperture, the Veſſels lying between the Plates of the Bone are ſometimes ſufficient for the Regeneration or Reproduction of the loſt Pericranium; for *Belloſte* informs us, that he tried this Method with no other View, but in order to be certain, whether a gentle Perforation of the Bone was ſufficient for anſwering this Intention. But where the yellow or browniſh Colour of the denudated Bone indicate, that the Corruption of the Bone has penetrated pretty deep, it is neceſſary to perforate it to the *Diploë*, that, by means of the conſiderably large Veſſels lodged in it, a Separation of the corrupted Bone may be made, and a new Pericranium form'd.

Hippocrates ſeems to have had this Method in his View, when, in his Treatiſe of *Wounds of the Head*, *Sect.* 30. he uſes theſe Words: "But when the Bone is diveſted of its "Integuments, we ought carefully to conſider, if we cannot "diſtinguiſh, with our Eyes, whether the Bone is ſplit and "contuſed, or whether it is only contuſed, or whether "the Contuſion or Fiſſure, or both, bear any Reſemblance to "the Shape of the Inſtrument with which they were made; "and if the Bone ſhould be in any of theſe States, it is to be "perforated with a ſmall Perforator, and Blood extracted from "it; only it is to be remember'd, that the Bones of the Cra- "nium are thinner in young Perſons than in Adults." 'Tis certain, that when the Perforator has reach'd the *Diploë*, the Blood breaks out; and it ſeems to be ſufficiently obvious, that, in this Paſſage, *Hippocrates* does not mean a Removal of the Bone by the Trepan, but only a gentle Perforation of it till the Blood burſts out, that is, till the Inſtrument has reached the *Diploë*.

All Surgeons who have wrote on the Cure of Wounds of the Head, agree in this, that all pinguious, aqueous, and moiſtening Subſtances are prejudicial in theſe Wounds, as has been already obſerved.

Much more are we to abſtain from theſe Subſtances where the Bone is denudated, and the tender Veſſels beginning to ſprout thro' the Perforations; for aqueous Subſtances would make theſe pulpous Veſſels become tabid; and oleous Subſtances would obſtruct, and render them impervious. The Pus alſo, ariſing in too large a Quantity from the wounded Integuments, or attenuated and render'd acrid by its Retention, may injure the delicate and tender Compages of the ſprouting Veſſels: Hence Wounds of this Kind are to be gently and cautiouſly cleanſed with ſoft Lint, leſt theſe tender Veſſels ſhould be injured.

jured. 'Tis alſo obvious, from what has been ſaid, that ſuch Wounds ought to be preſerv'd from the Air, leſt, by its Coldneſs, and its drying Quality, it ſhould deſtroy theſe Veſſels. *Belloſte*, in theſe Caſes, applied a Pledget of Lint, dipt in Spirit of Wine, to the denudated Bone: Over this Pledget he applied a gentle Digeſtive, which did not touch the Bone, but proved beneficial to the Lips of the Wound made in the Integuments: Thus the Air was excluded, all Putrefaction prevented, and, by the corroborating Quality of the Spirit of Wine, the pulpous tender Veſſels are hinder'd from riſing in fungous Excreſcences. The fine Powder of Maſtich, Olibanum, Sarcocolla, and Myrrh, is very properly ſprinkled upon denudated Bones, ſince theſe Subſtances cover them over with a balſamic Cruſt, without proving injurious by their pinguious Quality. They alſo defend the ſubjacent Parts from the Air, and from all Fluids diſcharged in the Wound. With the ſame happy Succeſs the Powder of theſe is boil'd in weak Spirit of Wine, for Alcohol would quickly burn theſe Veſſels; and Pledgets, impregnated therewith, are applied to the denudated Bone. Thus,

Take of once rectified Spirit of Wine, an Ounce; of diſtil'd Roſe-water, half an Ounce; and of the Powder of Maſtich, three Drams; and, when boil'd in a tall Veſſel, preſerve it for Uſe in a long Phial.

Nothing is more carefully to be guarded againſt than a free Acceſs of the Air, which, by its Coldneſs and drying Quality, proves prejudicial to all Wounds, but eſpecially thoſe of the Head: Hence the Dreſſing of theſe Wounds very ſeldom cannot be too carefully inculcated. *Belloſte*, in the Caſes abovemention'd, ſuffer'd the firſt Dreſſings to remain for two Days; and afterwards only remov'd them every third Day. If, therefore, no Itching, or preternatural Heat, is felt about the Wound, if no fetid Smell is perceived, and no ſanious Subſtance is diſcharged, ſuch a Wound may ſafely be left without renewing the Dreſſings; but when a new Dreſſing is to be applied, it ought to be done with all Expedition. Let the Pus be imbibed by ſoft Pledgets, gently applied; then let others of the ſame Kind be applied, and the Wound cover'd up; for a curious and long Inſpection of ſuch a Wound, and a rude and incautious Cleanſing of it, will deſtroy the Mucus lodged in it, which is nothing but the Compages of the ſprouting Veſſels. It is of ſingular Service, if, before the Wound is uncover'd, a Veſſel is placed on each Side, with live Coals on which a little Amber, Maſtich, or Olibanum, has been ſprinkled; for thus the tepid Atmoſphere, richly impregnated with a grateful, corroborating, and aromatic Steam, will every-where be applied to the uncover'd Wound.

By the Treatment juſt mention'd a new fleſhy Subſtance ariſes out of the Punctures, and, ſpreading all around, covers the Part of the Bone depriv'd of its Perioſteum; and then the reſt of the Cure is to be perform'd by the Methods ſpecify'd above, when the Perioſteum and Bone have received no Injury.

To know in what Senſe the Subſtance which ariſes from the Punctures may be call'd Fleſh, ſee the Article VULNUS. *Belloſte*, who has given ſo plain a Deſcription of every Thing which belongs to this Method, ſays, in very proper Terms, that the Perforations of the Bone, after the ſecond Day, begin to germinate or ſprout; for there begins to ariſe inſenſibly, from theſe ſmall Perforations, a ſort of Mucus, which, view'd with a Microſcope, repreſents very tender little Veſſels, and you may even diſtinguiſh the Motion of the ſmall Arteries in this Mucus. A Contexture of Veſſels emerging from theſe little Perforations, and meeting with a like Subſtance ariſing from the neighbouring Perforations, weave, as it were, a new Membrane, and that in ſo ſhort a Time, that *Belloſte*, in thoſe Inſtances which are given above, obſerved a denudated Part of the Cranium, of the Compaſs of a Florin, cover'd over again in the Space of ſeven Days.

Fourteen Years ago there happen'd a pretty rare Caſe, which afforded an Opportunity of accurately examining this pulpous vaſcular Subſtance, which thus ariſes from theſe Perforations made in the Bone. A Man fifty Years of Age, in an acute continual Fever, had, by a ſudden Metaſtaſis, in the Space of one Night, all the extreme Part of his Right Foot, about as far as the Place where the Bones of the Tarſus and Metatarſus are contiguous, ſeiz'd with a Mortification. The Part affected was ſo perfectly ſphacelated, that the Patient felt no Pain from an Inciſion, made with the Knife, to the very Bone, and no Blood came from the Wound. Remedies being apply'd, in order to preſerve the dead Part from Putrefaction, and to ſtop the Progreſs of the Sphacelus, the Event was ſo happy, that the ſpreading of the Sphacelus was prevented; and, in the Space of five Days, a Line appear'd, ſeparating the dead Parts from the living, which gave good Hopes of a Cure beyond our Expectation. After an entire Separation of the corrupt from the ſound Part, the ſtrongeſt Tendons being cut with the Sciſſars by a very dexterous Surgeon, all the fore Part of the Foot was taken off, and the Patient, thus mutilated, eſcaped from a very dangerous Diſorder, and is ſtill living. In this Caſe it manifeſtly appear'd, that the Bones of the Tarſus, which were contiguous to the ſphacelated Bones of the Metatarſus, had contracted a conſiderable Injury; for a good Part of them, which appear'd prominent above the mutilated Member, being quite black, threaten'd to give us more Trouble. This obliged us to ſaw off as much of the corrupted Bones, as could be taken off without hurting the incumbent Parts. However, the dead Superficies of theſe Bones ſtill remain'd, and was to be ſeparated, before the Wound could be cloſed, with a good Cicatrix.

A very ſkilful Surgeon then perforated all this Superficies of corrupt Bones, with very ſmall Perforators, in a Multitude of Places pretty near each other; and in two Days we had the Pleaſure to ſee, that every one of theſe little Perforations had contracted a Moiſture; and, examining the ſame with a Microſcope, it appear'd very diſtinctly, that in all theſe Punctures there were ſmall Veſſels, which beat with a true Syſtole and Diaſtole, that perfectly correſponded with the Pulſe of the Patient, felt at the ſame time in the Carpus. This fully convinced us, ſays *Van Swieten*, that the Subſtance ariſing from theſe Perforations was really a Contexture of ſmall Veſſels.

When a Bone, deprived of its Membrane, is, by this Method, inveſted with a new one, the Cure is perfected by ſuch Means as are directed above, in caſe of ſimple Wounds of the Integuments.

If the Skull itſelf is injur'd, it will be either crack'd, broken, contuſed, depreſs'd, or deprived of a Portion of its Subſtance, according to the Difference of the Inſtrument, and the Force with which the Blow was given; and theſe may happen either in one only, or both its Tables.

Having conſider'd the Hurts and Injuries incident to the common Integuments, and the Pericranium, we come now to treat of Wounds of the Head which affect the Cranium; and here, firſt, are enumerated the different Ways by which the Bone of the Cranium may be injur'd, according to the various Figures of the Inſtruments by which the Wound is inflicted, or the Degree of Violence of the Stroke.

A Fiſſure is a Solution of Continuity in a Bone, generally of an oblong Figure, and very narrow, in which there ſtill remains ſome Coheſion of the Parts. There is a great Variety of Fiſſures, with reſpect to their Largeneſs, their ſtrait or winding Courſe, and the different Parts of the Cranium affected by them. Some paſs no farther than the outer Table, others penetrate into the inner Table of the Cranium, tho' the outer one appears to be ſound. Sometimes the Fiſſure is not in the Place to which the Inſtrument that gave the Wound was apply'd; but in a different and frequently oppoſite Part of the Cranium, and is then call'd a *Contrafiſſure:* Of this there are many Examples in Authors. Thus *Tulpius* relates, that a Man received a Stroke on the Head with a Gun, and, tho' he was immediately trepan'd, died the ſixth Day. After his Death the Cranium, tho' ſound outwardly, appear'd to have ſeveral Fiſſures on the Inſide. *Paré* confirms the ſame by two Examples. A certain Man, by a Blow from a Stone, had a violent Contuſion, with a Tumor, and ſmall Wound, made in the Right Bone of the Bregma. Upon dilating the Wound the ſubjacent Bone appear'd ſound; but the Patient died the twenty-firſt Day after his Misfortune. After his Death, the Cranium being cut out with a Saw, it appear'd, that the Bone of the Bregma, in the oppoſite Side of the Head, was ſplit. In another Gentleman of Diſtinction, who died by a violent Contuſion of his Head, notwithſtanding it was cover'd with a Helmet, the interior Table of the Cranium was ſo ſhatter'd, that the broken Splinters thereof ſtuck in the very Subſtance of the Brain, tho' the external Table of the Cranium was found entirely ſound. *Hippocrates* obſerved this, and after having recounted the ſeveral Methods in which the Cranium could be hurt, he adds this as the laſt: When, for Inſtance, the Bone is hurt on the Side oppoſite to that on which the Wound was received; and he affirms, that there is no Cure for this Diſorder, becauſe we cannot diſcover in what Part of the Head it is lodged. Hence *Celſus*, in the fourth Chapter of his Eighth Book, informs us, "That when any "one has receiv'd a ſevere Blow on the Head, if bad Sym"ptoms enſue, and if the Fiſſure is not found where the "Skin is cut, it is not improper to view whether, on the op"poſite Side, there is not ſome Part ſoft and tumid, which is "to be laid open, ſince the Bone will be found ſplit there; "nor is the Skin difficult to be heal'd, tho' the Operation "ſhould be perform'd in vain." But all theſe Things are uncertain, ſince the Fiſſure has been often found in the ſame Bone, tho' not in the Place where the Wound was inflicted: Thus *Joh. Bohnius, de Renunciat. Vulner.* gives us an Account of a Man, who being ſtruck with a Club in the Forehead, near the Right Eye-brow; and who, after his Death, had nothing

chang'd

chang'd in that Part of the Bone where the Wound was receiv'd, but in the Orbit of the Right Eye appear'd a Contrafiſſure of an Inch and half long, reaching to the *Sella Turcica*. It has alſo ſometimes been obſerv'd, that the Fiſſure has been propagated from the Part on which the Wound was inflicted, to other Bones of the Head. *Ruyſch*, in his *Obſervat. Anat. Chirurg. Cent. Obſerv.* 47. gives us ſuch a Caſe, where, by the Violence of the Contuſion, the Fiſſure of the Left Bone of the Bregma reach'd thro' all the Bone, then thro' the ſquamous Suture of the Os Temporum, the whole Os Petroſum, and as far as the large Foramen of the Os Occipitis, which tranſmits the Medulla Oblongata. From which Caſe 'tis obvious, that the Sutures do not hinder Fiſſures of any Bone of the Cranium from being propagated beyond the Limits of that Bone, as many imagine.

A Fracture of the Cranium differs from a Fiſſure, becauſe in a Fiſſure, properly ſo call'd, there is as yet ſome Coheſion of the Parts; whereas in a Fracture there is a total Solution of Continuity: Hence a Fiſſure is a ſmall Chink in the Bone, but a Fracture ſuppoſes a larger Separation of Parts formerly united. A Fracture may alſo be of ſuch a Nature, that the broken Piece of Bone may be entirely diſengaged from the reſt of the Bone, or it may be united with it in ſome of its Parts. If ſuch an entire Solution is made by the wounding Inſtrument, the diſengag'd Part of the Bone is almoſt always preſſed inwards, and injures the Brain. What *Hippocrates* call'd ἔδρη, or the Seat or Trace of the Weapon, may alſo be refer'd to Fracture. When, for Inſtance, a Wound made with a Hanger carries off all the Integuments of the Cranium, and injures the Bone itſelf. His Words are as follows: "It is call'd the Trace of the "Weapon, when the Bone remaining in its natural Situation, "the Inſtrument leaves a manifeſt Impreſſion in it." And he afterwards adds, "That the Removal of the Integuments, "ἀπαιρεσις, tho' thro' the whole Length and Breadth of the "Bone, may be refer'd to the Trace of the Weapon; provided the other Bones, contiguous to this Removal, remain "in their natural Situation, and are not preſs'd inwards by the "Wound." For he would no longer have it call'd the Trace of the Weapon, when the Bone, being every-where diſengag'd, changed its Situation, and was preſs'd inwards; in which Caſe he call'd it ἰσθλασις.

The Cranium is ſaid to be contus'd, when by a heavy and obtuſe Inſtrument it is ſo hurt, that neither Fiſſure nor Fracture appear; for as a Contuſion of the ſoft Parts may break a large Number of Veſſels whilſt the Skin remains whole, ſo likewiſe, in a contus'd Bone, it may happen, that the Veſſels lying between the bony *Laminæ* may be injur'd by the Contuſion, tho' the Bone appears entire. This Diſorder is often long before 'tis diſcovered, till malignant Symptoms appearing, prove the bad State and Condition of the Bone. This Diſorder was, by *Hippocrates*, call'd θλάσις, and he informs us, that we cannot by the Eye judge whether the Contuſion has injur'd the Subſtance of the Bone more or leſs, or whether ſuch a Wound has penetrated more or leſs deep; for if the Veſſels diſtributed thro' the Diploë, ſituated between the two Tables of the Cranium, are broken by ſuch a Contuſion, tho' the Bone ſhould remain whole, yet 'tis obvious, that the worſt Symptoms may be produc'd by the extravaſated Humours, the internal Table of the Cranium may be corroded, and the Diſorder may thus be communicated to the Meninges and Brain itſelf.

The Cranium may be depreſs'd in two manners; for either the broken Part of the Bone, being entirely diſengag'd from the adjacent Bones, falls inwards, or the Bone, without having the Coheſion of its Parts deſtroy'd, is preſs'd inwards, which principally happens in the Craniums of young Perſons, upon the Application of an obtuſe wounding Inſtrument; for in theſe the Bones, being as yet flexible, eaſily yield without being fractur'd. Such Depreſſions are alſo ſometimes obſerv'd in Adults; for the Bones of the Cranium in a living Man are moiſt, and far leſs friable, than in a Skeleton the ſame Bones appear to be when dry'd. But Depreſſions of this kind rarely happen to Adults, without being at the ſame time accompanied either with a Fiſſure or a Fracture.

The Cranium may be depriv'd of a Part of its Subſtance, which, in Cuts, is often the Caſe, when, together with the Integuments, a Portion of the Bone is cut off by the wounding Inſtrument. This is call'd the *Dedolatio*, or Paring of the Cranium; and *Scultetus*, in his *Armamentar. Chirurg. Obſerv.* 17. gives us a Caſe, where a Portion of the Cranium, as large as a Crown-piece, was taken away, and yet the Patient was happily cur'd. 'Tis alſo certain, that after ſtrong Contuſions of the Head, Splinters of Bone have ſtarted from the inner Table of the Cranium, and injur'd the ſubjacent Brain; an Inſtance of which we have already given from *Paré*.

All theſe Cauſes, already recounted, may either affect only the external Table of the Cranium, or the internal alone, or both; but they are always more dangerous in proportion as they have penetrated deeper, in which Caſe 'tis obvious the Cure muſt be far more difficult than otherwiſe.

Becauſe Wounds of the Skull may have very bad Effects, it is neceſſary to examine diligently when the Head is wounded, whether the Bone has receiv'd any Injury. But a ſuperficial Scrutiny is not ſufficient, of which *Hippocrates* warns us, when he confeſſes, with the Spirit of a Man of Senſe and Honour, that he himſelf miſtook one of the Sutures for a Fracture.

We are enabled to form Judgment whether the Bone is injur'd or not,

Firſt, By conſidering the Force with which the Wound is given.

This, however, cannot in all Caſes be preciſely known; and the Appearance of the Wound may poſſibly deceive us, when it is made with a blunt Inſtrument, or when it is very ſmall, and accompany'd with a conſiderable Contuſion.

Secondly, By comparing the Size of the Wound with the Part injur'd.

Thus, as has been already obſerv'd, if the Wound is upon a flat Part of the Head, it may be large, without penetrating deep. But if the Part is very convex, angular, and prominent, the Wound muſt penetrate deep in order to be large; unleſs, however, it ſhould happen to be made with an Inſtrument with a concave Edge, or a ſort of Turn ſhould have been given to the Inſtrument whilſt the Wound was inflicted.

Thirdly, By the Probe.

Skilful Surgeons, when call'd to Patients in this Condition, gently waſh the Wound with warm Water mix'd with a little Wine, and a few Grains of Salt; then, cautiouſly drawing aſide the Lips, inquire whether any Wound of the Bone is to be diſcover'd. Then they introduce a ſmooth blunt Probe, which ought to be ſmall and ſoft, and is moſt commodiouſly made of fine Silver, made red-hot, and then gradually cool'd, into the Wound. Thus, by trying about every-where, they ſearch, firſt, whether the Bone is laid bare, which will be eaſily diſcover'd by the Sound of the Probe upon it; then, running over all the Surface of the denudated Bone, they examine whether any thing rough occurs. That this might be perform'd without any Dread of Danger, *Celſus*, in the fourth Chapter of his eighth Book, adviſes, "That the Probe ſhould neither "be too ſlender, nor too ſharp; leſt, when it lights upon "ſome natural Sinuſes, it ſhould falſly create an Opinion of "the Bone's being broken; nor ought it to be too thick and "groſs, leſt the ſmall Chinks and Fiſſures ſhould eſcape its "Point. When the Probe has reach'd the Bone, if it appears "ſound and ſmooth, it is, in all Probability, entire: But if "any thing rough and uneven occurs where there are no Su-"tures, 'tis a Sign the Bone is broken." Hence 'tis obvious, that we are carefully to obſerve the Places where the Sutures occur, which, in different Perſons, and at different Ages, ſometimes vary. Thus the Sagittal Suture, in young Perſons, divides the Os Frontis in two to the very Root of the Noſe, but is gradually obliterated and effac'd in Perſons of a more advanc'd Ages; tho', in ſome Men conſiderably advanc'd in Years, it is ſtill to be obſerv'd; for which Reaſon, in Wounds inflicted on the Forehead, we are always to have a Regard to this Suture. In a very advanc'd Age, and ſometimes ſooner, all the Sutures are ſometimes effac'd and obliterated. According to *Herodotus*, in *Calliope*, after the Battle of *Platæa*, when the bare Bones were all carry'd into one Place, there was one Cranium found which had no Suture at all, but conſiſted of one entire Bone. It is alſo obſerv'd, that, in young Perſons, the Sutures are ſometimes obliterated: Thus, in the Cranium of a Boy about eight Years old, the ſmalleſt Traces of the Sagittal and Coronal Sutures could not be diſcover'd either in the external or internal Surface of the Cranium. The celebrated *Hunauld*, in *Hiſt. de l' Acad. des Sciences*, for the Year 1734. has obſerv'd, even in younger Subjects, the Obliteration of theſe Sutures beginning, for which Reaſon he thinks, that Caſes of this Nature are not ſo rare as is commonly thought. Beſides, in ſome Places, the Cranium is naturally rough, as in the *Os Occipitis*, for Inſtance; and ſometimes the Sutures themſelves differ from each other very conſiderably in different Men. Thus I myſelf, ſays *Van Swieten*, have in my Cuſtody a Cranium, the Sagittal Suture of which, near the Occiput and Forehead, is quite narrow, but, towards the Crown of the Head, is diſtributed in winding Meanders, ſo as to take up the Space of almoſt an Inch. Hence *Hippocrates*, in the Beginning of his Book on Wounds of the Head, juſtly obſerves, "That Mens Heads are not univerſally "alike in Shape, nor their Sutures ſituated in the ſame Places." See *Tab.* 9.

When, therefore, a Wound is inflicted near a Suture, even after a Search with the Probe, the Caſe remains dubious, and the Wound of the Bone is with Difficulty diſcover'd: Thus *Celſus*, in the fourth Chapter of his eighth Book, informs us, that *Hippocrates* himſelf was deceiv'd in a Caſe of this Nature. "This," ſays he, "he ingenuouſly confeſs'd, like all truly "great Men, who, conſcious of their ſuperior Worth, ſuſtain

" no Loſs of Reputation by acknowledging their Errors; " whereas ſuperficial Geniuſes are never fond of loſing a " Share of the little they have. 'Tis the diſtinguiſhing Cha- " racteriſtic of every truly great Genius, who, at any rate, " has a ſufficient Stock of Merit to recommend him, to con- " feſs his Blunders with Frankneſs and Ingenuity, eſpecially " when they are of ſuch a Nature as to be uſeful to Poſterity, " by preventing their being deceiv'd, and led into the ſame " Error he himſelf has committed."

Fourthly, Pouring ſome Ink upon the Part has alſo been recommended as one Method of diſcovering a Fiſſure of the Bone, when thoſe above ſpecify'd are not ſufficient.

When, from a Knowledge of the wounding Inſtrument, the Violence with which the Wound was inflicted, and the Malignity of the ſubſequent Symptoms, ſuch as a Vertigo, Inability to ſtand, and a profound Sleep, 'tis to be dreaded, that the Cranium has ſuſtain'd ſome Injury; and yet, upon laying bare the Part, neither a Fiſſure nor a Contuſion of the Bone can be diſcover'd either by the Eye or the Probe; *Hippocrates* preſcrib'd another Method for diſcovering the latent Diſorder, which, if neglected, might afterwards induce the moſt terrible and dangerous Symptoms. For this Purpoſe he orders the Bone to be cover'd over with ſome black liquid Medicine, and the Wound to be dreſs'd with a Linen Cloth ſoak'd in Oil, over which a Cataplaſm of Maize is to be apply'd. Next Day, when the Wound is uncover'd and cleans'd, he order'd the Bone to be ſcrap'd, by which means this black Subſtance was left in the Fiſſure or ſhatter'd Part of the Bone, whereas the ſound Parts appear'd white. 'Tis therefore obvious, that nothing elſe is here requir'd, than to apply the black Liquid to the bare Bone, which being again abraded or wip'd off, will appear in the Parts where the Cranium is ſplit or contus'd; becauſe, as it penetrates farther into theſe Parts, it cannot be ſo eaſily abraded or wip'd from them, as from the reſt of the Surface of the denudated Bone.

But 'tis by no means certain, from this Paſſage, whether for this Intention *Hippocrates* us'd Ink; tho' *Celſus*, in the fourth Chapter of his eighth Book, ſeems to have paraphras'd it in this Senſe: " For," ſays he, " if the Fiſſure is not mani- " feſt, Ink is to be laid upon the Bone, and afterwards abraded " with a Rugine, in which Caſe the Fiſſure, if there is any, " will retain Part of the black Subſtance."

In *Paulus Ægineta*, *Lib.* 6. *Cap.* 90. for diſcovering a latent narrow, and otherwiſe imperceptible Fiſſure, there is a black liquid Medicine propos'd, or ſuch Ink as is us'd in Writing [φαρμακόν τι μέλαν ὑγρὸν, ἢ ᾧ δυτὴ γεγραπται ἐγχείρεσι]. Beſides, the Antients us'd the Liquor of the Cuttle-fiſh, and perhaps other Subſtances, inſtead of Ink; at leaſt the Ink now us'd, and which is prepar'd of Vitriol, Galls, the Bark of Pomegranates, and other ſuch aſtringent Subſtances, ſeems very improper for this Purpoſe, unleſs when much diluted; ſince, if apply'd to the bare Bone, it would forthwith ſo conſtrict the tender Veſſels, as to deſtroy them; after which a mortify'd Scale would of courſe be ſeparated, and caſt off. And there is certainly no Neceſſity for uſing Ink for this Purpoſe, ſince the Intention may be equally well anſwer'd by any other colour'd Fluid; and if a black Colour ſhould ſeem more proper than any other, the Liquor for anſwering this Intention might be prepar'd of Bones calcin'd to Blackneſs, triturated to a fine Powder, and diluted with Water; as alſo of various other Subſtances, more proper than the Ingredients of which Ink is compos'd.

Beſides, it ſeems to be ſufficient to tinge the bare Bone with ſuch a Liquid, and afterwards to wipe it off with a Sponge; nor does it ſeem neceſſary to abrade the whole Surface of the Bone with a Rugine, ſince, by that means, a new Separation might be expected in the abraded Surface, as ſhall hereafter be ſhewn. As the Search by the Probe may prove fallacious about the Sutures, and in thoſe Parts where the Surface of the Bone is naturally rough, ſo this Method may alſo prove deceitful; for the colour'd Liquor will inſinuate itſelf into the Interſtices of the Sutures, and adhere to the Inequalities of the Cranium.

Fifthly, It may farther give us ſome Inſight into Wounds of this kind, to make the Patient ſqueeze ſome hard Subſtance betwixt his Teeth.

Hippocrates, in his *Prænotiones Coacæ*, when it is doubtful whether the Cranium is fractur'd or not, adviſes the Patient to take the Stalks of Aſphodel or Fennel between his Jaws, and chew them, and at the ſame time to obſerve, whether in any Part of the Cranium a Noiſe is perceiv'd, which will be the Part fractur'd. But it is obvious, that ſuch a Noiſe cannot be perceiv'd, unleſs the Fracture is conſiderably large; a Fiſſure, therefore, of the Cranium can never be certainly and infallibly diſcover'd by this Method. This Sign entirely depends on this, that the Temporal Muſcles, which, during the Action of Chewing, preſs the inferior Jaw with great Force to the ſuperior, ariſe broad on both Sides from the lateral Part of the Cranium, that is, from the ſuperior Proceſs of the Os Jugale, from the adjacent Side of the Os Frontis, from the largeſt Proceſs of the Sphenoide Bone, from the Os Bregmatis, and the ſquamous Part of the Os Temporis. Hence, whilſt theſe Muſcles act, if in the Neighbourhood of their Inſertion there is a large Fracture, the ſhatter'd Bones may poſſibly be mov'd, and make a Noiſe; and ſince theſe Muſcles are inſerted in ſo many Bones of the Cranium, and diffuſe themſelves ſo far, Fractures in various Parts of the Cranium, provided they are conſiderably large, may be diſcover'd by this means. Some Surgeons alſo order the Patient to bite an Iron Nail for the ſame Purpoſe; or they make him take a Cord in his Teeth, which, when extended, they ſtrike with their Finger, deſiring the Patient, in the mean time, to obſerve whether he perceives any Motion or Noiſe in his Cranium.

Sixthly, If the Cranium is broken or contus'd, or if white Spots appear upon it, the Sight will direct us to judge of the Injury it has receiv'd.

If the Wound is either ſpontaneouſly, or by the Aſſiſtance of Art, made ſo large, that the denudated Bone may be view'd by the Eye, then the Fiſſures or Fractures, if there are any, will be ſufficiently conſpicuous; but where the Bone is contus'd without a Separation of its Coheſion, the Injury will be diſcover'd with the greater Difficulty, as *Hippocrates* juſtly obſerved.

The principal Sign by which, in a Caſe of this Nature, the Surgeon can be determin'd, is, if the Bone changes its natural Colour, which, for the moſt part, is ſomewhat reddiſh, or a little inclin'd to blue. If pale Spots appear here-and-there, 'tis a Sign, that the ſubjacent Veſſels, which gave their Colour to the pellucid bony Lamina, are mortify'd, and no longer fit for tranſmitting the Fluids; whence the Separation of the Lamina, now deſtitute of the ſubjacent Veſſels, is to be expected.

Seventhly, The Touch will alſo contribute to the Diſcovery of the particular Injury done to the Cranium.

We muſt not here forget to obſerve, that the Touch of the Fingers is often ſo deceitful, as to make the Surgeon believe, that the Bone is depreſs'd, when in reality it is not. In violent Contuſions, the Integuments, by being forcibly daſh'd againſt the ſubjacent Cranium, are often ſo much injured, that many Veſſels being broken, a large and ſudden Collection of the diſcharg'd Humours is form'd under the Skin, which remains entire. If, in ſuch a Caſe, the Edges of this Tumor are preſs'd with the Fingers near the ſound Part, the Bone appears to be depreſs'd, the Reaſon of which Phenomenon is this: The Integuments of the Cranium are conſiderably thick, and eſpecially the Skin. Theſe Integuments are, by the ſubjacent Parts, elevated when the cellular Membrane becomes turgid with the diſcharg'd Humours, and about the Edges of ſuch a Tumor the Skin as yet is contiguous to the ſubjacent Parts. By carrying the Finger a little farther to the ſwelled Part, ſince the Skin is there elevated, the Margin, which is the Boundary between the ſound and contus'd Parts, feels as if the Bone was depreſs'd, becauſe the thick Skin is there elevated from the ſubjacent Bone and Pericranium. Skilful Surgeons have often been impos'd upon by this Circumſtance; and the celebrated *Ruyſch*, in *Obſerv. Anatom. Medic. Cautur. Obſerv.* 55. confeſſes, that when handling with his Fingers a large Tumor of the Forehead, produc'd by a violent Contuſion, he ſhould have been tempted to think, that the Cranium was depreſs'd, as a Surgeon then preſent affirm'd it to be, unleſs, by repeated Experience, he had been taught, that in ſuch Caſes the Touch might prove fallacious.

Eighthly, The Appearance of the Integuments will alſo furniſh us with Signs whereby to judge of the Injury done to the Cranium, as will likewiſe a Separation of the Integuments from the Bone about the ſeventh Day; great Pain; an ichorous and fetid Diſcharge from the Wound; and an apparent Malignity, not uſual when the Integuments only are affected.

From theſe Signs the Cranium is known to be injur'd, but the Diſcovery is frequently not made, till bad Symptoms ariſing, contrary to the Expectation both of the Phyſician and Surgeon, cut the Patient off. When Wounds are only inflicted on the Integuments, without wounding the Cranium, they are often ſoon cur'd, tho' pretty large, by obſerving the Directions already laid down concerning Wounds of the Integuments; but when the Cranium is injur'd, and the Injury cannot be diſcover'd by the now enumerated Signs, the Wound is generally treated like a ſimple Wound, and often the Cure ſeems to ſucceed well enough for ſome few Days in the Beginning. In the mean time the ſubjacent injur'd Bone begins to become corrupted; the Integuments are ſeparated from the affected Bone; the Pain is increas'd; concocted Pus no longer appears, but only a thin, and often a ſufficiently fetid Ichor is diſcharg'd; and the Wound, proving obſtinate to the beſt-choſen Remedies, affords a certain Sign of a latent, and ſtill undiſcover'd Diſorder. But all theſe Symptoms appear ſooner or later, according to the Violence of the Diſorder, the Conſtitution of the Patient, and eſpecially the greater or leſſer Warmth of the Atmoſphere. *Hippocrates*,

pocrates, in his *Prognostines Graecae*, accurately obſerv'd all theſe Circumſtances; for, after he has recounted the Signs by which Fractures of the Cranium may be known, he adds, "But, in "Proceſs of Time, Fractures are diſcover'd partly on the "ſeventh, and partly on the fourteenth Day, and partly by "other Circumſtances; for a Separation of the Fleſh from "the Bone happens, the Bone becomes livid, the Pain is in-"creaſed, and Ichor is diſcharg'd; and theſe Symptoms very "difficultly admit of a Cure." And, in his Treatiſe concerning Wounds of the Head, where he recounts the Signs which prognoſticate the Death of a Patient wounded in the Head, he uſes theſe Words: "If the Bone is fractur'd, ſplit, or "contus'd, &c. and if Scraping and Cutting have been ne-"glected, upon a Suppoſition, that it did not ſtand in need of "them, as being ſound, a Fever will generally ſeize the Pa-"tient before the fourteenth Day in the Winter, but, in the "Summer, after the ſeventh. A little Ichor will be diſcharg'd "from it, and the inflam'd Part will become mortify'd. When "this happens, the Ulcer becomes diſcolour'd, glutinous, like "ſalted Fleſh, (ὅσπερ τάριχος.) of a browniſh Colour, and "ſublivid; and, when the Bone begins to be corrupted, "(σφακελίζειν) becomes black, ſmooth, and, towards the "Margin, pale and whitiſh; but, when it becomes purulent, "Puſtules appear on the Tongue, and the Patient, growing "delirious, dies." Thus accurately did *Hippocrates* advert to all theſe Circumſtances; for ſo long as the Lips of the Wound are red, and but little inflam'd, ſkilful Surgeons are not much afraid of Danger; but when this live Colour is loſt, and the Lips of the Wound begin to aſſume a Colour reſembling that of wither'd Fleſh, or ſuch as has lain long in Salt, they well enough know, that the moſt terrible Symptoms are approaching. For this Reaſon the moſt ſkilful Surgeons, after *Hippocrates*, as we have already obſerv'd, are not ſo much afraid of terrible Symptoms which appear immediately after the Infliction of the Wound, as of thoſe which appear afterwards, eſpecially about the ſeventh Day.

For the ſame Reaſon *Hippocrates* affirm'd, that, in Wounds of the Head, Fevers which began on the fourth, ſeventh, or eleventh Day, were generally mortal.

Since, then, even gentle Wounds of the Cranium are often ſucceeded by many and terrible Symptoms, ſome of which we have already conſider'd, and others of which will be enumerated, 'tis obvious, that this ſort of Wound is to be carefully laid open, and cur'd as ſoon as poſſible. Such is the Nature of the already recounted Signs, that if many of them concur, they afford a pretty certain Diagnoſtic; and thoſe hereafter to be enumerated furniſh an infallible Proof, that the Bone is injur'd: But then the latent Diſorder is often diſcover'd too late for a Cure, whereas, had it been ſooner found out, effectual Relief might have been afforded.

From what has been ſaid, the Reaſon is obvious, why ſkilful Surgeons do not neglect, or ſuperficially treat, the ſlighteſt Wounds of the Head; ſince often a latent Wound of the Bone has eſcaped the moſt Skilful; and ſometimes, when the Integuments are only wounded, the ſubjacent Bone has been affected by the Pus, or the Atmoſphere.

The Effects of the Injuries above-mention'd, done to the Pericranium, are,

Firſt, A Mortification or Deſtruction of that Part of the Bone, which happens to be ſeparated from the reſt.

The Mortification of the Bone is produced by a Deſtruction of thoſe Arteries of the Periоſteum, which convey the vital Juices to the Bone, and an Abolition of thoſe Veins which carry back the ſame Juices: When, therefore, theſe Veſſels ceaſe to do their Offices, the Plate of Bone, with which they have a Connection, becomes mortified. Whether by a Wound of the Pericranium the Veſſels, communicating with the Bone, are deſtroy'd; or whether the Veſſels diſtributed from the Pericranium, between the Laminæ of the Bone, are obliterated by a Wound of the Bone itſelf; or whether thoſe Veſſels which paſs to the Diploë thro' the Foramina or Holes in the external Lamina of the Cranium, are deſtroy'd, the Effect will be the ſame; that is, the Part deprived of thoſe Veſſels which convey and tranſmit the vital Juices, will become mortified. Now every Part of the Body, totally deprived of an Influx of the vital Juices, can never be again united with the live Parts; but muſt always be ſeparated from the adjacent ſound Parts: Hence the mortified bony Laminæ are ſeparated and expel'd, in the manner already mention'd, when treating of Wounds of the Pericranium.

Secondly, By the Mortification of the ſeparated Portion of Bone, the adjacent Parts of the Cranium will be infected.

And, *Thirdly*, Hence a Putrefaction of all the Parts, thus infected, may be produced.

The Bones of the Cranium conſiſt of various Laminæ, laid over each other, and between which very tender Veſſels are diſtributed, at leaſt before an advanced Age, when theſe Veſſels are obliterated and effaced, by a cloſe and near Approach of the Laminæ to each other, as has already been obſerved. This is alſo confirm'd by the Experiment try'd by *Belloſte*, in which the Bone was gently perforated, tho' not entirely to the Diploë; and yet Veſſels aroſe thro' the Perforations, by means of which the corrupted Part was ſeparated, and a freſh Pericranium form'd, as we have above obſerved. There were, then, Veſſels in the bony Subſtance of the external Table of the Cranium, which, being freed from the ſuperincumbent bony Laminæ, and lengthen'd out, conſtituted this Compages of Veſſels, ariſing thro' the ſeveral Perforations. *Tulpius*, in his *Obſervat. Medic. Lib.* 1. *Cap.* 2. relates a very memorable Caſe, which confirms this: "A certain Man was ſtruck with a "Muſket on the hinder Part of the Head; and tho' no Fiſ-"ſures were to be diſcover'd in the Cranium, yet the Violence "of the ſubſequent Symptoms was ſo great, that the Trepan "was apply'd; and, whilſt the Surgeon was twiſting about "the Crown of the Trepan, a large Number of ſmall Drops "of Blood burſt thro' the ſound Bone, and, like Drops of "Dew, cover'd the whole Cranium. Theſe Drops, being "ſeveral times wiped off, forthwith burſt out afreſh." It is therefore obvious, that, in conſequence of the Continuity of the Veſſels, a Way is open to the Blood from the very Subſtance of the Bone, ſince it may burſt forth, like Dew, over all the external Surface of the Bone. If, then, the ſuperior Lamina, for Inſtance, of the Bone is mortified, this Diſorder is eaſily communicated to the ſubjacent Veſſels, by the Injury done to which the ſubſequent Lamina will be affected: Thus the Diſorder may be propagated thro' all the Laminæ of the external Table, which again will affect the Diploë; which, in its Turn, may, in like manner, corrupt the internal Table.

From what has been now ſaid, it is obvious, that, by the Deſtruction of the Veſſels, the Life of the Part is aboliſh'd; whence the Corruption of the mortified Part ſpontaneouſly follows. And we have before given an Inſtance of a Man dying ten Months after a violent Contuſion of the Head, where the Cranium was found entirely putrid and fetid. *Paré*, in the twenty-ſecond Chapter of his tenth Book, gives us a ſurpriſing Caſe, by which it appears, that the Cranium may not only become thus putrid, but alſo be ſeparated when it is ſo, the Patient remaining alive at the ſame time. "A certain Man "received a Wound on the Left Bregma with a Sword, which, "tho' it wounded the Bone, did not, however, penetrate to "the internal Table of the Cranium. When the Wound was "almoſt heal'd, the Patient happening, with his Companions, "too wantonly to indulge his Appetite in the Uſe of rich "Wine, and Aliments of a hot Nature, was ſeiz'd with an "acute Fever, a Loſs of his Senſes and Speech, and a violent "Swelling of his whole Head and Face. Some Days after, an "Apoſtem ariſing in the wounded Part, and being laid open "with a Lancet, yielded a large Quantity of Ichor; upon "which the whole Subſtance of the ſubjacent Bone of the "Cranium appear'd black, putrid, and fetid; and a large "Quantity of live Worms afterwards form'd their Neſt in the "Wound. A Portion of the corrupted Bone, as large as the "Palm of the Hand, was ſeparated; but the Patient was en-"tirely cured of ſo terrible a Diſorder; only the Cicatrix re-"main'd for a long time weak, and very ſenſible of Pain."

Fourthly, A Caries of the Diploë will be produced.

When the corrupted Bones moulder, as it were, into a fine Powder, this is ſaid to be a Caries of the Bones, which is entirely diſtinct from that Separation of the corrupted Laminæ which is made by Exfoliation. The Diploë, lying between the two Tables of the Cranium, conſiſts of a large Number of Veſſels, and the cellular Structure of the Bone: It alſo contains a medullary Oil, capable of being very ſoon corrupted. Hence, whether the Wound of the Bone, by propagating the Diſorder, at laſt affects the Diploë; or whether, in conſequence of a violent Contuſion, the Bone in the mean time remaining entire, the broken Veſſels of the Diploë diſcharge their contain'd Juices; from both theſe Cauſes may ariſe a Corruption of the ſtagnating and extravaſated Fluids: By theſe corrupted Fluids the tender Veſſels, which are as yet entire, may be corroded, and the Diſorder thus increaſed; ſince, by creeping thro' the bony Cellulæ of the Diploë, between the two Tables of the Cranium, it may diffuſe itſelf very far; and it is, at the ſame time, obvious, that the Diploë being thus affected, both Tables of the Cranium may be in like manner corrupted: An Accident which is ſucceeded by a numerous Train of Misfortunes.

Fifthly, A Corruption of the Integuments of the Cranium, and of thoſe of the Brain itſelf.

The Pericranium covers the convex Part of the Cranium; and the Dura Mater, which is the internal Periоſteum of the Cranium, firmly adheres to its concave Part. Both theſe Membranes diſtribute Veſſels to the contiguous Bone, and receive others from it. And it ſeems highly probable, that the Veſſels

Veſſels of the Pericranium, which penetrate the external Table, do, in the Diploë, communicate and unite with the like Veſſels ſent from the Dura Mater, thro' the internal Table, to the Diploë. When, then, the Bone of the Cranium is corrupted, and eſpecially when the Diploë itſelf is thus affected, both the internal and external Integuments of the Cranium may, in conſequence of this Communication of Veſſels, be equally affected. This is confirm'd by the Inſtances above related. But when the internal Integuments of the Cranium are thus diſorder'd, the ſoft contiguous Brain is eaſily affected and corrupted, as we are taught by a Variety of Inſtances.

Laſtly, All thoſe Diſorders which proceed from Affections of the Brain, as Convulſions, profound Sleep, Palſey, Apoplexy, and Death.

All Senſations and Motions of the ſpontaneous and arbitrary Kind depend upon the Brain, as is obvious from Phyſiological Obſervations: When, therefore, the Brain is corrupted or injured, either all or only ſome of its Actions may be diſturb'd or aboliſh'd, according as the Diſorder affects either the whole Maſs of the Brain, or only ſome Parts of it; but when the Diſorder, being ſlowly communicated from the wounded Bone, gradually affects the Brain itſelf, the Symptoms often follow in the Order here enumerated. In Caſes of this Nature various Obſervations alſo prove, that Patients have ſometimes been cut off by a ſudden and unexpected Death. It is ſufficient to obſerve here, that all the Diſorders of the Brain, from the ſlighteſt Vertigo to the moſt fatal and terrible Apoplexy, have been found to derive their Origin from this Cauſe.

From what has been ſaid above, relative to Wounds of the Head, their different Natures, and the Prognoſtics thence deducible, are eaſily underſtood.

From what has been already ſaid concerning Wounds of the Head, it may, ſo far as Art can aſſiſt us, be determin'd, whether the Cranium is injured or not; tho', when the Wound is very ſevere, there is always ſome Dread of a latent Diſorder, tho' it cannot be diſcover'd by the Senſes. When, for Inſtance, the Cranium is often ſplit in another Part than where the Wound was inflicted, as we have already obſerved.

But when, by the Signs already ſpecified, 'tis obvious, that the Cranium is wounded, in forming our Prognoſtics we are always to dread the Symptoms enumerated above; not that they always enſue, but becauſe they may ſometimes follow. Prudence therefore requires, that the Danger ſhould be repreſented to the Patient's Friends, leſt the ſubſequent Train of terrible Symptoms ſhould be aſcrib'd rather to the Unſkilfulneſs of the Surgeon, than the Malignity of the Wound: Beſides, when both the Patient, and his Friends who attend him, are ſufficiently warn'd, that ſo terrible Symptoms may be conſequent to Wounds of the Head apparently very ſlight and ſuperficial, they will be far more careful in obſerving the neceſſary Precautions, requir'd both with reſpect to Regimen, and the Cure of the Wound; from a Neglect of which a ſudden and unexpected Death has often cut the Patient off, when he was thought to be entirely out of Danger.

The curative Indications, hence ariſing, are,

Firſt, To lay bare the injur'd Bone.

We have much Reaſon to doubt, whether 'tis always abſolutely neceſſary to lay bare the wounded Part, tho' there ſhould be a ſtrong Suſpicion, that the Cranium is injur'd; ſince 'tis poſſible, that, when wounded or ſplit, it may again unite, as happens in other Bones of the Body. For this Reaſon 'tis adviſeable, as much as poſſible, to avoid both Extremes; for ſome Surgeons, in all Wounds of the Head, indiſcriminately have recourſe to Inciſion; whilſt others, too much under the Influence of Fear, dare not venture upon it in the moſt terrible Caſes. *Ruyſch*, in *Obſervat. Anatom. Chirurg. Centur. Obſerv.* 60. who, during a long Courſe of Practice in a populous City, had ſeen ſuch a great Variety of Caſes, tells us, That, in true Fractures of the Cranium, when the Symptoms are not augmented, we are not immediately to proceed to Inciſion and Perforation; but that, after Veneſection, we are to attempt the Cure by the often repeated Application of warm cephalic Fomentations: And he adds, That he himſelf had, by this very Method, cured many, after an Inciſion was juſt about to be made. *Celſus*, in the fourth Chapter of his eighth Book, informs us, "That, when Bones were ſplit or fractur'd, the "antient Phyſicians had immediate recourſe to Inſtruments for "their Extirpation: But, ſays he, 'tis far more adviſeable, "firſt to make Trial of ſuch Plaiſters as are intended for Diſ"orders of the Cranium." This Method he order'd to be uſed till the fifth Day. "But, continues he, if the Fleſh "begins to grow, if the Fever is either removed, or become "more gentle, if the Patient ſleeps ſufficiently, and his Appe"tite returns, we are to continue in the Uſe of the ſame Me"dicine. By this Method the Fiſſures are often fill'd with a "kind of Callus, which is, as it were, a Cicatrix of the Bone. "And Bones ſo fractur'd, as not to cohere together, are again "conglutinated by a Callus of the ſame Nature. This Callus "is a more proper Covering for the Brain than the Fleſh, "which grows after the Exciſion of the Bone: But if, in the "Beginning of the Cure, the Fever is increaſed, if the Pa"tient's Sleeps are ſhort, and diſturb'd by Dreams, if the Ulcer "is moiſt, and is not nouriſh'd, if ſmall glandular Tumors "appear in the Neck, if the Patient is afflicted with violent "Pains, and if his Loathing of Food is increaſed, we are "then to have recourſe to manual Operation, and the Uſe of "the Rugine."

Hence 'tis obvious, that from the Violence and Malignity of the Symptoms we are principally to determine, whether, when the Bone is injur'd, the Place affected ought to be laid bare; or whether there is any Hope left of the Wound of the Bone being cured, without making an Inciſion.

Secondly, To cleanſe the Wound,

By removing whatever cannot poſſibly be reunited to the ſound Parts, as grumous Blood, Fragments of Bone entirely divided from the reſt, and corrupted Membranes; or by bringing away, by means of Suppuration, all thoſe partially divided Parts, that will not unite with thoſe which are ſound. By theſe Means whatever impedes the healing of the Wound, whilſt remaining in it, is removed; and thus the Cure is facilitated.

Thirdly, To make ſmall Perforations in the Bone,

In the Manner already directed; that,

Fourthly, A new Perioſteum, or a Membrane equivalent to it, capable of communicating Veſſels to, and receiving them mutually from, the Bone, may be regenerated:

Becauſe the Integuments will not adhere to the Bone whilſt it is bare, and deſtitute of ſuch a Membrane.

Fifthly, To heal the Wound,

By proper Bandage, and the Methods directed above, for ſimple Wounds of the Integuments, without Contuſion.

When the Condition of the Wound, and the Symptoms conſequent to it, ſhew that there is a Neceſſity of laying bare the Part affected, the Integuments muſt be cut thro' quite to the Bone, by an Inciſion, which muſt be either direct, angular, perpendicular, or decuſſated, as the Nature of the Place affected, and of the particular Injury received, ſhall require; taking care to preſs cautiouſly on the Bones which are fractur'd, and yield to the Knife.

After the Hairs are ſhaved off, we muſt inquire into the Largeneſs of the wounded Part, and its Situation, with reſpect to the Sutures, Muſcles, and Tendons: By this means we are principally enabled to determine what Kind of Inciſion is neceſſary; whether, for Inſtance, one Inciſion thro' the Middle of the wounded Part is ſufficient; or whether two Inciſions are requir'd, which again may be made to denudate a larger or ſmaller Portion of the Bone, according to their various Inclinations to each other; for, if two Inciſions are ſo made as to form an Angle, the whole Portion of the Bone, included within the two Sides of that Angle, may by that means be laid bare; but if one Inciſion is made by way of a Line, touching the Margin of the wounded Part, and if another Inciſion is made perpendicular to the former, thro' the Middle of the injur'd Part, 'tis obvious, that by this means double the Portion of the Bone may be denudated. And if this perpendicular Inciſion ſhould be lengthen'd out, and cut croſs the Inciſion on the Margin of the Part affected, in the middle Point, 'tis obvious, that by this means four right Angles muſt be form'd, and conſequently a Portion of the Cranium, four times as large, muſt be laid bare, as by that Method in which the two Inciſions form'd only one Angle. This is call'd a decuſſated or crucial Inciſion of the Integuments, which, becauſe it denudates the largeſt Portion of the Bone, *Celſus*, in the fourth Chapter of his eighth Book, affirms to be the moſt commodious. "This Inciſion, ſays he, "is moſt properly made by two tranſverſe Lines, in the Form "of the Letter X, that the Integuments may be raiſed from "each of the four Angles." But, at preſent, ſuch an Inciſion is only made as is ſufficient for laying bare the Part affected; and it is obvious, that a ſingle Inciſion is only required, when the injur'd Part is ſo ſmall, as to be expoſed to the Eye by the receding or gaping of the Lips of the Wound. But an angular Inciſion is proper when the Part injur'd is not exceſſively large, but yet too large to be laid bare by a ſingle Inciſion. But when a large Portion of the Bone is to be laid bare, that Method is to be uſed in which a ſtrait Inciſion is made, by way of Tangent to the Circumference of the Part affected, and another made to fall perpendicularly upon it, thro' the Middle of the injur'd Part: And, where a ſtill larger Portion of the Bone is to be denudated, a ſtrait Inciſion is to be made thro' the Middle of the Part affected, and another made ſo as to cut it in the Middle at right Angles: Thus the four Angles of the cut

Integuments

Integuments being raiſed, the whole Portion of the Bone, contain'd within the Extremities of theſe two Inciſions, may be laid bare.

This Inciſion ought to be made with a Knife which is ſharp, and ſufficiently ſtrong, leſt its Edge ſhould happen to be blunted; for the Skin of the Cranium, in conſequence of its hard and callous Nature, requires a conſiderable Force to cut it.

The Edge of the Knife ought to be carried immediately to the Bone, that, by ſtriking upon it, the Pericranium may alſo be divided by one and the ſame Inciſion: "Leſt, ſays *Celſus*, "(in the fourth Chapter of his eighth Book) any Part of the "Membrane which ſurrounds the Cranium, below the Skin, "ſhould be left undivided; for a Laceration of this Membrane, "with Rugines and Perforators, excites violent Fevers and In-"flammations." For, whilſt the Inciſion is making in the Integuments, if the Edge of the Knife does not run cloſe upon the Bone, there is a Neceſſity for dividing the Pericranium afterwards. 'Tis, indeed, true, that, by the Knife, a kind of Furrow is made in the Bone; but, tho' this cannot be avoided, yet the Injury done the Bone may be eaſily cured, after the Part affected is laid bare.

Since, then, for this Purpoſe, 'tis neceſſary, that the Knife be pretty ſtrongly apply'd to the Bone, it is obvious, that we ought carefully firſt to examine, whether the Cranium is ſo fractur'd, as that the ſhatter'd Parts may be depreſs'd by the Application of the Knife to the Bone; from which the moſt terrible Symptoms, and ſometimes Death itſelf, may enſue, as is plain from various melancholy Inſtances. When, therefore, by feeling every-where with our Fingers, we diſcover ſomething looſe, the Inciſion is to be ſo made as to avoid this Place; but where a violent Contuſion has raiſed a large Tumor on the Part affected, it is often very difficult to diſcover, whether the fractur'd Bone is looſe and yielding, or not.

We muſt alſo be as careful as poſſible not to cut the large Arteries diſperſed thro' the Integuments. The remarkable Ramifications of Nerves diſperſed, for Inſtance, in the Forehead, above the Orbit of the Eye, muſt carefully be avoided: As alſo the Muſcles, Tendons, and Sutures, the Situations of all which are to be learned from the Anatomy of the Parts above given.

Sharp ſays, That if the Fracture be not complicated with a Wound of the Scalp, or the Wound is too ſmall to admit of the Operation, which ſeldom fails to be the Caſe, then the Fracture muſt be laid bare, by taking away a large Piece of the Scalp. It is a Faſhion with ſome Surgeons to make a crucial Inciſion for this Purpoſe, which they prefer to all other Methods, upon the Suppoſition, that the Wound will more eaſily heal again after the Operation, by turning down the Flaps; and in caſe we find no Fracture, which ſometimes happens, after Scalping, that, by making this Species of Wound, an Exfoliation of the Bone, and a Tedioufneſs of Cure, will be avoided. But whoever has ſeen the Practice of the crucial Inciſion, muſt be ſenſible of the falſe Reaſoning uſed in its Favour; for it ſeldom or never happens, that we inquire for a Fracture of the Skull by ſcalping, but that the Scalp itſelf is contuſed, which Circumſtance bringing on a plentiful Suppuration, and the Matter lodging between the Cranium and Skin not only prevents their immediate healing, but generally occaſions a Caries of the Bone, which is the Accident meant to be ſhunned by it; and frequently at laſt the Lips of the Wound, growing callous, require cutting off to procure a Cicatrix. If then the Objection be good to the crucial Inciſion, when no Operation is perform'd, it becomes of ſo much more Force when we are aſſur'd of uſing the Trepan, that he thinks it is indiſputably right at all times to take off the Scalp, when we lay bare the Cranium with a View to the Operation, which ſeldom fails to granulate with Fleſh in a few Days, if dreſs'd only with dry Lint, and rarely grows carious, if not affected by a great Diſcharge of Matter from the Brain; or if, after it is thus expos'd, new Fleſh ſhould not generate upon its Surfaee, the Growth of it may be quicken'd by boring little Orifices into the Subſtance of the Bone, or raſping it with the Rugine. The Form of the Piece taken away may be nearly circular; and, to be better aſſur'd of the Courſe of the Fracture, it will be proper it ſhould be of the whole Length of it. He believes there are few who will care to expoſe ſo much naked Skull; but whoever knows the great Advantage, and the little Danger of it, will not heſitate. When the Scalp is remov'd, the Periofteum muſt be rais'd, and the Arteries immediately ty'd, which will make Way for the Operation to be directly perform'd; tho' the Effuſion of Blood has been eſteem'd ſo troubleſome in this Part, as to have made it almoſt an univerſal Practice to poſtpone the Uſe of the Trepan to the Day after: But the Apprehenſion is without Foundation; for if two or three of the larger Veſſels are ty'd, the others may eaſily be ſtopt with a little dry Lint, and the Operation take place without any Inconvenience; which he has always done himſelf, and would recommend to others, conſidering how urgent the Nature of the Diſtemper is, and that leſs than twenty Hours is often the Difference between Life and Death, when the Brain is much preſs'd by a fractur'd Bone. *Sharp.*

The next Step to be taken is, to ſeparate exactly the Parts cut from the Cranium, by the Rugine, an Inſtrument of which there are various Forms, repreſented *Tab.* 28. *Fig.* 3, 4, 5.

The Pericranium, as has been already obſerv'd, adheres pretty firmly to the Cranium, by means of the Veſſels it ſends to it, and receives from it. Hence, tho' all the Integuments, together with the Pericranium, are cut, they will, nevertheleſs, by a broad Surface, adhere to the Cranium. For this Reaſon, before the bare Bone comes in View, the Pericranium muſt be ſeparated from the Cranium. Sometimes, upon elevating the Angles made by Inciſion, the Pericranium follows, and is ſeparated from the Bone, eſpecially when it adheres but looſely to it, as is obſerv'd in old Patients; but when it adheres ſtrongly, as it often does, it is as ſoon as poſſible to be abraded from the Cranium with a well-poliſh'd Ivory Rugine, which cannot be done without a very intenſe Pain, unleſs the Patient is quite ſtupid and lethargic, as it often happens in violent Wounds of the Head. It were, therefore, to be wiſh'd, that young Surgeons would exerciſe themſelves on the Heads of Calves or Sheep, in order to learn, by a dexterous Uſe of the Rugine, to make a ſpeedy Separation of the Pericranium from the Cranium, ſince to acquire a Dexterity of this kind upon Men is both cruel and dangerous.

The next thing to be done is, to ſtuff the Wound, thus made, with dry Lint.

When the Integuments are thus ſeparated, the Blood diſcharg'd generally hinders the Wound of the denudated Bone from being accurately diſcover'd. For this Reaſon, except the utmoſt Danger preſſes, a farther Examination of the Wound is generally defer'd till next Day, or at leaſt for ſome Hours. But leſt the Parts lately divided ſhould grow together again, which they are very ſoon obſerv'd to do, flat ſoft Pledgets of Lint are applied to the denudated Bone under the elevated Integuments, by which means this Accident is prevented. Thus, when the Hemorrhage is ſtop'd, the Pledgets remov'd, and the Integuments rais'd, the whole Surface of the denudated Bone appears. By this means *Hippocrates*, in his Treatiſe concerning Wounds of the Head, informs us, that next Day the Wound will be ſufficiently large: He alſo orders a Cataplaſm to be applied, of fine Flour boil'd in Vinegar till it becomes highly glutinous, to prevent too great an Inflammation; for the dry Pledgets, by abſorbing the Blood, and other Juices, become tumid, and dilate the Wound, which always produces a kind of Irritation and Inflammation. See the Quotation above from SHARP.

The Blood, Pus, Sanies, and Sordes, muſt be abſorb'd by Sponges; the Fragments, Splinters, and Scales of Bone, if ſmall, not adherent to any Membrane, and in Sight, muſt be taken away by the Forceps, or they may be cut away by the Sciſſars. This is an artificial Mundification.

When the Pledgets are remov'd, and the Blood and all manner of Sordes, which may hinder a full View of the expos'd Superficies of the Bone, are abſterg'd, we are next to ſearch with all poſſible Care, whether there be any thing that requires to be taken off, or ſet to rights. If there appears no Fracture nor Contuſion of the Cranium, nor the leaſt Sign of a Fiſſure can be diſcover'd, and there ſeems no Reaſon to ſuſpect an Extravaſation of Humours within the Cranium, which would require Perforation in that Place, in order for their Extraction, the Wound is to be incarn'd and conſolidated again. The moſt experienc'd Phyſicians and Surgeons have been ſubject to Miſtakes in this Affair, when they have concluded, before Scalping, as they thought, from evident Signs, that ſome Defect or Diſorder lay in the Place to be open'd. Obſervations and Examples to this Purpoſe are very numerous: *Hippocrates* obſerv'd, that ſometimes the Bone is fractur'd in a Part remote from the Place where the Wound was receiv'd; and it appears, from Obſervations made by very good Authors, that the Caſe may be always dubious; and therefore it is the beſt way to tell the Patient and his Friends before-hand, that all the Signs indicate the laying open of the affected Part, in order to diſcover the latent Diſorder, which yet may be ſeated in another, and perhaps remote, Part of the Head. A prudent Surgeon, therefore, conſults with a Phyſician, or ſome other Surgeons, what is to be done in ſuch Caſes; by which means he will, at leaſt, reap the Advantage of having ſome to atteſt for him, that all things have been perform'd according to the Rules of Art, tho' the Event did not anſwer his Wiſhes.

When it appears, that the denudated Bone has been injur'd, the general Indication directs the Removal of all thoſe things which may poſſibly obſtruct the Cure of the Wound. Any Effuſion of the Humours which adhere to the Part, and incommode it, are eaſily abſorbed with Sponges, or dry Lint; but Fragments of Bones, ſmall Splinters, and Scales which ſeparate themſelves, or are ſeparated by the Inſtrument, are to be regarded as heterogeneous Bodies, which may do Miſchief by

their Preſence, and much retard the Cure of the Wound. But firſt, as has been obſerv'd, we are to conſider whether they may be remov'd without injuring the Part, or whether it would be ſafeſt to leave them till they ſeparate, and fall off of themſelves. If the Fragments of the Bones are but ſmall, and no longer cohere to the living Parts, there is no Hope of their Reunion, and they may be ſafely remov'd with proper Inſtruments. But ſince the Bones, being depriv'd of their Perioſteum, may be very much injur'd by the free Acceſs of the Air, as is ſaid above, it is requir'd alſo, that theſe Fragments ſhould appear to View in ſuch a manner, as to be readily ſeparable, and not to give Occaſion for long exploring a Wound of ſuch a Nature with Inſtruments. It is no leſs dangerous to pull away by Violence any bony Fragments which continue to adhere to the Membranes, ſince the Vehemence of the Pain, and the Connection of the Pericranium with the Dura Mater, eſpecially about the Sutures, may produce very bad Effects; but if there is a Neceſſity of their being remov'd, it is better to cut them off with the Sciſſars.

That Depuration of a Wound, which is thus perform'd with the Hand, or with an Inſtrument, is call'd *artificial* Mundification, to diſtinguiſh it from what ariſes ſpontaneouſly by Suppuration, and is for that Reaſon call'd *natural*.

If the Fragments, Splinters, or Scales, are very large, with any conſiderable Adherence, or if they are ſo conceal'd as not readily to be come at, they are to be left; and they will either ſeparate ſpontaneouſly, or unite with the other Parts. This is a natural Mundification.

If the Fragments of the Cranium are very large, we are to examine whether they are corrupted to ſuch a Degree as to leave no Hope of their reuniting with the other Parts of the Bone. This is principally known by the Change of Colour; for if a Fragment of a Bone be turn'd yellow, brown, or black, it will never grow again, but will ſpontaneouſly ſeparate in ſome Time, or is to be remov'd immediately, if it may conveniently be done. But when ſuch Fragments retain their natural Colour, and eſpecially if they ſtill cohere to the Pericranium, there is great Hope, that they will grow again. It ſometimes happens, that in Fractures of large Bones, the Tibia, for Inſtance, or Os Femoris, the middle Fragment is entirely diſunited from the other Parts on both Sides; and yet it has been frequently obſerv'd, that ſuch Fragments have united and grown together again with the reſt of the Bone; therefore we are not to deſpair of the ſame Event in the like Fractures of the Cranium, agreeably to the Obſervations of Surgeons. A Man receiv'd ſo ſevere a Kick from a Mule ſhod with Iron, that the Os Frontis was fractur'd and depreſs'd. A round Piece was cut out of the Cranium with the Trepan, that the fractur'd and depreſs'd Bone might be the more conveniently elevated, and taken out; but as the Fracture reached from the Middle of the Forehead to the leſſer Canthus, M. *Paré* would not venture to take out ſo large a Portion of Bone, but elevated the broken Bone ſo as that it might no longer preſs upon the Dura Mater, and the Patient was happily cured. And a Fragment of a Bone, which was entirely ſeparated from the reſt of the Cranium, but cohering to the Pericranium, has been known to grow together again. A Captain had a large Portion of his Os Frontis, being about three Fingers Breadth in Length, and as many wide, cut off with a Sword, ſo that the Dura Mater was quite naked, and expoſed to View. This large Fragment of Bone ſtill cohering to the Pericranium, together with the Integuments hanging over the Face, was a diſmal Spectacle, and *Paré* was thinking of cutting off the Whole; but fearing leſt the Dura Mater, being left bare, and expoſed by ſo great a Wound, might be very much injur'd, he wip'd off the Blood which cover'd the Dura Mater, he adapted to it the cut Bone with the Integuments, and ſecur'd the Whole with a ſlight Suture in three Places, that it might not be eaſily mov'd out of its Place. The good Succeſs of this Method ſhew'd what might be expected in the like Caſes, when ſo large a Portion of Bone, entirely cut off, had yet the Power to grow again, and that upon a Man who had receiv'd ſeveral other Wounds.

As long, therefore, as ſuch Fragments adhere to the quick Parts, they ſeem proper to be left, becauſe there is Hope, that they may be reunited with the reſt of the Bone; but if this ſhould not ſucceed, and there are Signs, that theſe ſeparated Fragments begin to corrupt, they may be always taken out, or they will ſeparate ſpontaneouſly. Hence it appears, that it is prejudicial to be too curious in ſearching Wounds of the Head, in order to the Extraction of ſuch Fragments of Bones as do not immediately preſent themſelves in View; for if they cohere in any Part to the living Corpuſcles, they may poſſibly unite; or if they are incapable of ever growing again, they will ſeparate themſelves by ſpontaneous Suppuration. Nature often knows how to provide for its own Security in the moſt dangerous Caſes, as we are taught by the following Hiſtory: A Girl, nine or ten Years of Age, receiv'd eighteen Cuts on the Head with a Sword, beſides ſome others on the Arms and Body. All theſe Wounds on the Head affected the Cranium, and took off ſome Portions of Bone home to the Diploë; and in other Places the whole Cranium, quite to the Dura Mater, was cut away. This miſerable mangled Head was dreſs'd with a proper Bandage, and was open'd only once in two Days. Every Dreſſing Splinters of Bones adher'd to the Pledgets, and ſeparated themſelves without giving any further Trouble; and thoſe Fragments, which ſtill cober'd to the Pericranium, grew together again, and readily fill'd up the Places where the whole Cranium had been taken off; ſo that in the Space of five Weeks this Girl, who had receiv'd ſo many Wounds, was cur'd of them all. But it is to be obſerv'd in this Caſe, that there was no artificial Mundification; for whatever was incapable of growing again, was ſeparated by a ſpontaneous Suppuration.

It is therefore very prudently obſerv'd by *Hippocrates*, in his Treatiſe on Wounds of the Head, "That thoſe Bones which "are violently alter'd from their natural State, and depreſs'd "inwards by a Fracture, or entirely cut off, are leſs dangerous "if the Membrane remain entire; and Bones affected on the "Inſide with more and wider Fiſſures are leſs dangerous, and "more eaſily extracted; for none of theſe needs Section, "nor muſt we try to remove them by violent and dangerous "Means, before they make their own Way out ſpontane-"ouſly."

If the Bone appears to be contus'd, white, brown, livid, or crack'd, a great Number of ſmall Perforations muſt be made in it, in the Manner directed above, that, thro' theſe, live Veſſels may ſprout out, and the ſtagnating and putrefy'd Humours may be diſcharg'd: For by theſe means a new Perioſteum is generated.

It ſometimes happens, that after the Integuments are taken off, no Fracture appears in the Bone, tho' it may be much injur'd; and this is principally obſerv'd when the Wound was made by a blunt Inſtrument, or the Patient fell with his Head upon a plain and hard Superficies. For, in ſuch a Caſe, either the Bone of the Cranium is crack'd, the Integuments of the Head frequently remaining entire; or the Pericranium ſuffers ſuch a Preſſure and Attrition between the reſiſting Body imping'd againſt, and the hard Bone of the Cranium, as to cauſe a Rupture of the Veſſels which keep up a Communication between the Cranium and Pericranium, whence follows an Abolition of all vital Influx into the Lamella of the Cranium, which is contiguous to the Pericranium; and it is evident, that the Veſſels lying between the Lamellæ of the Cranium may be injur'd by the ſame Cauſes, whence the Diſorder will be increas'd. This Contuſion and Deſtruction of the Veſſels in the Bone of the Cranium are known by the Colour of the Bone being chang'd: For ſound and living Bones are naturally reddiſh, or of a bluiſh white, becauſe the vital Veſſels, which are full of a colour'd Liquid, appear thro' the Lamella of the Bone, which is white, and, by reaſon of its Thinneſs, pellucid, of ſuch a Colour. Where-ever, therefore, the Veſſels ſituated under the oſſeous Lamellæ are deſtroy'd by a Contuſion, there will be a Whiteneſs; for which Reaſon, among the Signs of an injured Cranium, pale Spots upon it are enumerated above; and *Belloſte, Chirurg. d' Hoſpital*, after perforating the Cranium, depriv'd of its Membrane, with minute Punctures, mentions it as the firſt Sign of a happy Event, for the Bone to begin to turn reddiſh, as being a manifeſt Indication of the Return of Life into it, whereas it was before depriv'd of the Influx of the vital Humours. When the Bone, after the Deſtruction of its Veſſels, begins to corrupt, the white Colour changes to yellow, brown, livid, and even quite black, the Degrees of its Corruption increaſing in proportion as it alters more and more from its natural Colour, as has been already obſerv'd.

In ſuch a Caſe, therefore, as it is to be fear'd, that this Corruption of the Bone ſhould infect the ſubjacent and contiguous Lamellæ, and that the Contagion ſhould ſpread to the Diploë, with the ſubjacent vitreous Table, and afterwards to the Brain itſelf, and the more, becauſe the extravaſated and corrupted Humours have no Paſſage thro' the entire Superficies of the contuſed Bone, hence, again, appears the excellent Uſefulneſs of the Method before deſcrib'd, which directs the making of ſmall Perforations here-and-there in the Cranium, that the extravaſated Humours may find a Way to diſcharge themſelves, and the living Veſſels underneath, being freed from this hard Covert of a dead Bone, may be enabled to emerge and caſt off all that is dead and corrupted. For the Separation of the corrupt Part of the Bone is only to be expected from the ſubjacent living Veſſels, as *Hippocrates* long ago obſerv'd, *Lib. de Cap. Vuln.* where, after he had adviſ'd to make no raſh and dangerous Attempts to extract the Fragments of Bones, but let them alone to be work'd off ſpontaneouſly, "which is done by "the growing of Fleſh under them, which Fleſh grows out of "the Diploë, and the ſound Part of the Bone, if only its upper "Part be corrupted." Thus did *Hippocrates* learn from Obſervation alone, what the Induſtry and Experience of the Moderns have confirm'd the Truth of: For the antient Phyſicians gave the Name of *Fleſh*, which is the Word uſed alſo by Moderns, to that Contexture of Veſſels, which, ſprouting up in Wounds, reſtores,

reſtores, by its Growth, the Loſs of Subſtance in them. *Hippocrates* adds, what deſerves our Notice, that this *Fleſh* pullulates from the Diploë, thro' which ſuch manifeſt Veſſels are diſpers'd; he obſerves alſo, that when only the ſuperior Lamellæ are corrupted, this Fleſh grows out of the ſubjacent ſound Part of the Bone, and not from the Diploë.

In the Caſe of a Fiſſure the ſame Method will have a like Effect; for all the bad Symptoms, conſequent upon a Fiſſure, depend principally upon the Rupture of a great Number of Veſſels, and a Detention of the extravaſated Liquids, whence the Bone is corrupted, which is attended with many other Evils. But if the Bone have little Perforations made in it about the Place of the Fiſſure, there are Outlets open'd for the extravaſated Humours, and an eaſy Way made for the living Veſſels to ſtretch, and to work themſelves thro', and to weave themſelves into a new Pericranium.

How expeditiouſly a Cure may be perform'd by this Method, and even when the Cranium has receiv'd conſiderable Damage, appears from what has been ſaid above.

When a new Periоſteum is generated by the Method above directed, the reſt of the Cure is to be conducted as in ſimple Wounds of the Integuments.

From what has been ſaid above the Reaſon is evident, why a ſmall Fiſſure is frequently more dangerous than a large Contuſion of the Cranium.

All ſkilful Phyſicians and Surgeons agree, that a Fiſſure of the Cranium is frequently of far more dangerous Conſequence than a violent Contuſion, or a Fracture itſelf.

For a Fiſſure is more difficult to be known, and frequently is not diſcover'd till late, eſpecially if it lies about the Sutures, or affects only the inner Table of the Cranium, the outer remaining entire; and ſo alſo when the Fiſſure is to be found in a Part of the Cranium remote from the Place where the Wound was given. To theſe Reaſons may be added, that a Fiſſure, tho' it appears in View, frequently runs too far for the Surgeon, with any Safety, to lay it all open by cutting away the Integuments. That all theſe Caſes may one time or other happen, has been prov'd by very credible Obſervations, which are given above.

But when the Bone receives a large Wound, it lays itſelf open to View; and the Phyſicians and Surgeons, being mov'd with the formidable Appearance, try all their Skill, in order to prevent the threatening Danger; whereas a Fiſſure, which is ſo often conceal'd, and ſometimes diſcoverable by no Sign at all, may deceive the moſt ſkilful Practitioners, as *Hippocrates* ingenuouſly confeſſes of himſelf.

Another Reaſon why a ſmall or ſtrait Fiſſure is accounted ſo dangerous is, becauſe it cannot be certainly known how far it has penetrated, whether it be only to the Diploë, or deeper. If the Fiſſure reach to the Diploë, ſome conſiderable Veſſels muſt be broken, and the extravaſated Humours, finding no Way thro' the ſtrait Fiſſure of the Bone, will be corrupted, and deſtroy the tender cellulous Part of the Bone which conſtitutes the Diploë, and extending themſelves between the two Tables of the Cranium, will corrupt all before them. The inner Table of the Cranium being corroded, and eaten thro', the Brain itſelf may come to be affected, and ſo the Patient may die ſuddenly when he was thought to be in perfect Health, tho' afterwards it appear otherwiſe, when the whole Bone is found corrupted. Many Examples of this kind are to be met with in Authors. But when there is a large Wound made in the Cranium, there is a Paſſage laid open for the extravaſated Humours, or a Way may be made by Art for their Diſcharge, and the living Veſſels underneath will have Strength ſufficient to ſeparate the corrupted Parts. For theſe Reaſons very formidable Wounds of the Head, wherein the Cranium has been very much injur'd, have often been happily cur'd, when a ſlight Fiſſure, not diſcover'd till too late, has frequently carry'd off the Patient on a ſudden, when he miſtruſted no Harm. *Hippocrates*, therefore, *de Locis in Homine*, takes the Liberty to aſſert, "That if the "Bone *(of the Cranium)* be fractur'd and contus'd, it is void "of Danger; but if it be crack'd, and the Fiſſure proceeds "inwardly, the Caſe is very dangerous." He adds, that the Saw is to be us'd, in order to prevent the Sanies from flowing thro' the Fiſſure of the Bone upon the Dura Mater, and ſo putrefying the ſame. And, *de Cap. Vuln.* he ſays, that a Fracture of the Cranium, or a large Piece of it cut away, or the Bone divided by many and large Cracks, are none of the moſt dangerous Caſes. Beſides, it is to be conſider'd, that the Cranium can receive no Fiſſure, without being at the ſame time more or leſs contus'd; by which means a more conſiderable Number of Veſſels in the Subſtance of the Bone, or diſpers'd in the Diploë, happens to be broken, whence every bad Symptom is exaſperated.

It is farther evident, that this Method of boring ſmall Perforations, is preferable to Burning, Scraping, or the Application of that ſort of Trepan us'd by the Antients on theſe Occaſions.

From what has been ſaid above, it appear'd, that the Piercing of the Cranium with ſmall Perforations was both a ſafe and ſpeedy Remedy for the Diſorders there mention'd, and, conſequently, to be prefer'd before all other Methods. And tho' we meet with ſomething of this kind in *Hippocrates*, as we ſaid before, yet in his Time they commonly us'd a Rugine, in order to ſeparate the corrupted Part of the Bone by Abraſion. But if we thoroughly conſider all the Effects which neceſſarily follow from this Practice, we ſhall find it to be leſs ſafe, and to conduce very much to the Prolongation of the Cure. Some Surgeons have recommended Burning with a hot Iron, but I do not remember, that this has been mention'd by *Hippocrates*, nor by *Celſus*; and indeed it would be very difficult to burn the corrupted Part of the Bone, without hurting the ſound Part which lies under it, which, in that Caſe, requires a new Separation before a Cure can be expected.

Where a ſmall Fiſſure, or the Mark of the Weapon, appeared in the Bone, the Antients us'd Rugines of various Figures and Sizes anſwerable to the preſent Occaſion, with which they abraded the Bone, till there was no Sign of a Fiſſure, or Mark of a Weapon, left: And that they might be ſure, that the Fiſſure was quite aboliſh'd, they firſt mark'd the Bone with Ink, or ſome other black Liquors, (ſee above) which, penetrating into the Fiſſure, might ſhew how deep it reach'd; for they continu'd raſping or ſcraping till the Black quite diſappear'd. If the Fiſſure penetrated deep, and could not be obliterated by ſcraping, they had recourſe to the Trepan, with which they cut out a good Piece of the Bone. Where a large Part of the Cranium had been damag'd by a Contuſion, and it appear'd by the Signs, that the Bone was corrupted, they us'd what they call'd the *exfoliatory Trepan*, which conſiſted of two Wedges plac'd in a contrary Direction: This they turn'd about, and ſo wore away the Superficies of the Cranium by an orbicular Abraſion. And becauſe the Superficies of this Bone is convex, and in ſome Places unequal, it is evident, that the Abraſion of the corrupted Part cannot be equal in all Places. Beſides, after the Fiſſure had been obliterated, or the corrupted Part of the Bone taken away by means of the Rugine, or the exfoliatory Trepan, the abraded Superficies of the Bone remain'd dead, becauſe of the Deſtruction of all its Veſſels; and therefore it requir'd to be ſeparated, before the Part could be inveſted with a new Pericranium. It appears, therefore, that not much Good is to be expected from theſe Proceedings; but, by the Method above recommended, the Separation of the corrupted Part is neatly perform'd, and at the ſame time the loſt Subſtance is quickly regenerated.

When the Cranium is preſs'd inwards, in young Subjects, without Fracture, or, in older Subjects, with Fracture, the Brain muſt be compreſs'd. Hence, according to the Difference of the Part compreſs'd, and according to the various Degrees of Magnitude, Profundity, Sharpneſs, and Puncture of the Part compreſſing, Dulneſs of the Senſes, Lethargy, Vertigos, Ringing in the Ears, Deliriums, bilious Vomiting, Pains of the Head, Convulſions, Palſies, involuntary Diſcharges of the Urine and Fœces, Apoplexies, Fevers, and Death, are produc'd.

Having ſpoken of Diſorders conſequent upon Hurts of the Bone of the Cranium, we are now to examine what Effects will be produc'd from a Compreſſion or Hurt of the Brain by the Cranium, when preſs'd inwards, or beaten in upon it by a Fracture. It appears from Geometry, that among Figures of equal Perimeters, the Circle comprehends the greateſt Space; but the Figure of the Cranium is nearly ſpherical, and therefore, if it be preſs'd inwards, its Capacity muſt be diminiſh'd. It is known alſo from Phyſiology, that the Cavity of the Cranium is always quite full in Health; whence, if the Cranium be cut away, the Brain ſwells, and elevates itſelf, to ſuch a Degree, that the Part of the Cranium, which is cut off, can never be fitted again to its Place, unleſs it be by Violence. It is plain therefore, that as ſoon as the Figure of the Cranium is chang'd by Intropreſſion, the Contents of its Cavity muſt of Neceſſity be compreſs'd.

Whether, therefore, the convex Figure of the Cranium be chang'd by Intropreſſion without a Fracture, or the fractur'd Bone be forc'd from its Place, and depreſs'd, the Effect will be the ſame, which is a Compreſſion of the Brain. In young Subjects the Softneſs of the Cranium is enough to perſuade us of the Poſſibility of an Intropreſſion without a Fracture; but the Firmneſs of that Bone in Adults ſeems to ſhew the Neceſſity of a Fracture in order to ſuch an Effect. *Hippocrates*, *Lib. de Cap. Vuln.* enumerating the various Species of Fractures of the Cranium, reckons this Introceſſion in the third Place, which he calls ἐσφλασις, *(Eſphlaſis)* and ſays it was always attended with Fiſſures. "For what is preſs'd inwards is fractur'd, and broken "off from another Bone, which continues in its natural State; "and ſuch an Intropreſſion muſt neceſſarily be accompany'd "with a Fiſſure." But the Subſtance of the human Bones is much ſofter in a living Body, than it appears to be in dry'd Skeletons; for which Reaſon it is not, perhaps, altogether impoſſible for

for a Depreſſion of the Cranium to happen without a Fracture in adult, tho' not in very old Perſons.

But ſince the Whole of the human Life and Nature depends on the Things contain'd within the Capacity of the Cranium, and the whole Subſtance of the Brain is ſoft, and eaſily compreſſible, it appears, that all the Functions which depend upon the Soundneſs of the Brain, may be diſturb'd, and even totally aboliſh'd, by an Intropreſſion of the Cranium. And becauſe the Cerebellum is a firmer Subſtance, and more ſafely lodg'd, than the Brain; hence it is, that the ill Effects produc'd by an Intropreſſion of the Cranium primarily affect the Actions of the Brain, but at length extend their miſchievous Influence ſo far as to deſtroy the Action of the Cerebellum, on which Life depends. It appears alſo, that the Effects of this Diſorder are various, according to the different Places of the Brain which ſuffer the Compreſſion; or as the compreſſing Cauſe acts with more or leſs Violence; or, laſtly, as the ſharp Fragments of the Bone penetrate more or leſs into the Subſtance of the Brain. That a ſlight Compreſſion of the Brain may diſturb its Action, appears from an extraordinary Caſe: A Woman who had half her Cranium taken away, went about the Streets with it, begging from Door to Door, where, if any one touch'd the Dura Mater, which lay bare, with the Tip of his Finger, tho' but ſlightly, ſhe cry'd out aloud, ſaying that ſhe ſaw a thouſand Candles. *Mem. de l' Acad. des Sciences.*

As to Dulneſs of the Senſes, it is a Symptom conſequent to a very ſlight Compreſſion of the Brain. In all thoſe who are apoplectic from a cold and viſcid Cauſe, there is firſt obſerv'd ſuch an unuſual Hebetude of all the Senſes, with a Slowneſs and Indiſpoſition to muſcular Motion, which are Signs of a gradual Collection of ſuch Humours in the Cranium, as, by a ſlight Compreſſion, blunt and obſcure the Vivacity of all the Senſes, and are at length accumulated to ſuch a Degree, as wholly to extinguiſh them. If the Cranium, by Intropreſſion, affects the Brain, by compreſſing it in a ſlight manner, a like Dulneſs of the Senſes is produc'd, which remains during Life, if the compreſſing Cauſe be not remov'd. We have an Example in *Hildanus*, *Obſerv. Chirurg. Cent.* 3. *Obſerv.* 21. to this Purpoſe: A Boy, ten Years old, of promiſing Parts, had his Cranium, near the Lambdoidal Suture, depreſs'd by a Fall. Becauſe no threatening Symptom follow'd the Misfortune, the Parents neglected the Caſe, and the Impreſſion in the Bone continu'd. By Degrees the Boy's Memory and Underſtanding began to fail him, ſo as to render him utterly incapable of learning any thing; and in this ſtupid Condition he liv'd to the fortieth Year of his Age, and then dy'd of the Peſtilence. A like Hebetude is obſerv'd when the Blood, in too great a Quantity, diſtends the larger Veſſels in plethoric Habits; or when, in acute Diſtempers, it has its Velocity increas'd, and becomes rarefy'd to ſuch a Degree as to dilate the Veſſels, which by that means preſs upon the pulpous Subſtance of the Brain.

A Lethargy indicates an increas'd Compreſſion of the Brain; for, as ſoon as the Cauſes which produced a Dulneſs of the Senſes are increas'd, there ariſes a Drowſineſs, and at laſt a moſt profound and mortal Sleep, which is the ſame as an Apoplexy. Hence, among dangerous Symptoms from Wounds in the Head, *Hippocrates*, *de Vuln. Cap.* reckons profound Sleep, and Vertigo, accompany'd with Dimneſs of Sight.

A Vertigo is one of the ſlighteſt Diſorders which belong to the Brain; for almoſt all of them begin and end in a Vertigo. In every Vertigo there is uſually an apparent Rotation of external Objects, which are really at Reſt; ſometimes all things ſeem to fall downwards, or the contrary. When the Diſorder increaſes, the Objects appear of various Colours, and ſoon after follows a Tottering of the whole muſcular Frame. The Patient begins to be afraid of falling, and catches hold of every thing near him to ſuſtain himſelf; his Nerves fail him all at once, ſo that he falls to the Ground; and at the ſame time Darkneſs overwhelms him, and takes away all Senſe of Seeing. And this is the utmoſt which the Patient is ſenſible of; for, if the Diſorder proceed farther, it terminates in an Apoplexy, Epilepſy, or Lipothymy.

The ſlighteſt Vertigo, then, is when there appears a Rotation of all Objects; as the Diſorder increaſes, there comes on a Dimneſs, and then the Diſeaſe is call'd σκοτοδινος, *(Scotodinos)* a dim or dark Vertigo; at length the Patient falls to the Ground. *Hippocrates*, in the Book before quoted, among other Symptoms of dangerous Wounds in the Head, reckons up theſe three: Dimneſs of Sight, Vertigo, and Falling to the Ground. When *Antilochus* wounded his Enemy in the Forehead, ſo that the Point of his Lance penetrated the Bone, the Eyes were cover'd with Darkneſs, ſays wiſe *Homer*: τὸν δὲ σκότος ὄσσε ἐκάλυψεν, *Iliad.* 4.

A ſimple Vertigo, then, indicates but a ſlight Compreſſion of the Brain; a Vertigo, accompany'd with Dimneſs of Sight, denotes an Increaſe of the Diſorder, which, the compreſſing Cauſe being remov'd, ceaſes. Hence, in acute Diſeaſes, when the larger Veſſels, being diſtended by the great Quantity and impetuous Motion of the Blood, preſs upon the Brain, there ariſes ſuch a dark Vertigo, which is remov'd by an Hæmorrhage at the Noſtrils, as *Hippocrates* informs us in his *Coacæ Prænotiones*, "a dim or dark Vertigo in the Beginning is reſolv'd by "a Flux of Blood from the Noſtrils," that he might diſtinguiſh it from a like Vertigo, which does not moleſt the Patient ſo much in the Beginning, but comes on more ſlowly from Bile corrupted by the Diſtemper, or from a Collection of other Sordes about the Præcordia.

As to a Ringing in the Ears, a Vertigo, attended with a Dimneſs of Sight, is almoſt always accompany'd with an uneaſy ringing Noiſe in the Ears, as if the Patient heard a thouſand ſmall Bells. But when, without the Concurrence of an external Cauſe, ſuch a Noiſe is heard, it is call'd a Ringing of the Ears. This ſometimes ariſes from a very ſlight Diſorder in the Organ of Hearing, in which Caſe 'tis generally pretty ſoon remov'd by thruſting the little Finger into the auditory Paſſage, and twiſting it about, or by compreſſing the Tragus; nor does this Species of the Diſorder protend any future Ill. But when a Ringing of the Ears proceeds from a Diſorder of the Brain, it is not ſo eaſily remov'd, but often proves troubleſome for Years together, and is the ungrateful Harbinger of an approaching Apoplexy, or Epilepſy, as *Hippocrates* has obſerv'd in his *Coacæ Prænotiones*. This Symptom proceeds from the ſame Cauſe which produces a Vertigo, and almoſt always ſucceeds violent Wounds of the Head.

As to Deliriums, 'tis known from Phyſiological Obſervations, that the Brain is that important Organ, on the Soundneſs of which the Perception of Ideas, their various Combinations, the ſeveral ſubſequent Judgments form'd, and the Affections of the Mind, depend. But when the Perception of Ideas does not correſpond to their external productive Cauſes, but depends on the Change induc'd on the State of the Brain itſelf, a Delirium is ſaid to be preſent. When the Brain is compreſs'd, in conſequence of the Figure of the Cranium being chang'd, all the Functions of the Body, which depend upon a free and uninterrupted Action of the Brain, may be diſturb'd; for 'tis obſerv'd, that moſt of thoſe who have the Misfortune to be born Idiots, have ſomething amiſs and uncommon in the Shape and Figure of their Heads; and *Hippocrates*, when recounting the fatal Symptoms which follow any Wound of the Cranium, if due Care is not taken to treat it properly, at laſt adds, that the Patients, who become delirious, die: And he elſewhere pronounces a Delirium following Wounds in the Head to be a bad Sign; for, ſays he, in *Aphor.* 14. of *Sect.* 7. a Stupor or Delirium, ſucceeding Wounds of the Head, are bad and inauſpicious Symptoms; and in *Aphor.* 24. of the ſame *Section*, he tells us, that a Wound of the Bone, penetrating into its Cavity, produces a Delirium.

As to a Vomiting of Bile, this ſurpriſing Symptom in Wounds of the Head always denotes, that the Brain is wounded, or diſorder'd either by Compreſſion or Concuſſion; for 'tis obvious, from daily and unqueſtionable Obſervations, that remarkable Changes in the Brain of the ſoundeſt and moſt healthy Men not only excite ſuch bilious Vomitings, but alſo often ſurpriſingly change the Bile itſelf almoſt in a Moment of Time.

A Man not accuſtom'd to the Toſſings of a Ship, after a Vertigo, and intolerable Uneaſineſs, vomits an eruginous Bile. The ſame happens to the moſt healthy Man, when quickly turn'd round for ſome Time. In this Caſe alſo a Vertigo precedes, which ſhews that the Brain is affected. On the contrary, a corrupted Bile, lodged about the Præcordia, ſurpriſingly diſturbs all the Actions of the Brain, by producing Vertigos, Deliriums, and Convulſions; and when this ſordid Bile is diſlodg'd, and thrown off, the above-mention'd Symptoms forthwith ceaſe. Hence 'tis obvious, that there is a ſurpriſing Communication between the Head and the Præcordia, ſince they act ſo effectually upon each other. Nor can this Phenomenon be eaſily accounted for from the known Structure of the Parts, tho' the Truth of the Fact is evinc'd by the moſt unexceptionable Experiments. Thus *Scultetus*, in his *Armamentar. Chirurg.* obſerves, that almoſt all thoſe who receive Wounds on their Heads, complain of a bitter Taſte in their Mouths.

This has, therefore, been always accounted a bad Sign in Wounds of the Head; accordingly *Hippocrates*, in his *Coacæ Prænotiones*, tells us, "That he whoſe Brain is wounded is, "for the moſt part, ſeiz'd with a Fever, a Vomiting of Bile, "and an Apoplexy; and that his Condition is, in conſequence "of theſe Symptoms, very deſperate." In the fifteenth *Aphoriſm* of his ſixth *Section*, he informs us, "That Wounds "of the Brain muſt neceſſarily be ſucceeded by a Fever, and a "Vomiting of Bile:" And, in his *Coacæ Prænotiones*, he tells us, "That Vomitings of Bile are bad Symptoms, when "ſucceeding any Wound, eſpecially thoſe of the Head." When the Brain begins to be compreſs'd, or otherwiſe affected by internal Cauſes, the Vomiting of Bile, eſpecially of the eruginous kind, is enumerated among the bad Signs; for *Hippocrates*, in *Prorrhet. Lib.* 1. tells us, "That, in Pains of the Head, "eruginous Vomitings, accompany'd with Deafneſs and "Watching, ſoon render the Patients highly delirious." The Truth of this Aſſertion is, in his Epidemics, confirm'd by the Example of *Philiſta*, who was ſeiz'd with all theſe Symptoms in

the Order in which they are enumerated, and died on the fifth Day of the Diſorder.

'Tis therefore obvious, that when the Brain is diſorder'd, either by an external or an internal Cauſe, a Vomiting of Bile frequently enſues, and is an unfavourable Prognoſtic. But 'tis to be obſerved, that ſince ſlight Diſorders of the Brain are ſometimes follow'd by a Vomiting of Bile, we are not, therefore, to prognoſticate the worſt from this Symptom, unleſs other bad Symptoms appear in Conjunction with it; for it often happens, that Perſons falling from an Eminence, and daſhing their Heads againſt a hard Body, vomit from the ſole Concuſſion of the Brain, tho' afterwards no bad Symptom whatever appears; for, in that Caſe already mention'd from *Ruyſch*'s *Obſervat. Anatom. Chirurg.* when the Surgeon underſtood, that the Woman, who had fallen from the Chariot upon the Ground, harden'd by the Froſt, had vomited ſeveral times, he ſuſpected the worſt Conſequences; and would have made a crucial Inciſion in the contuſed Part of her Forehead, had not *Ruyſch* prevented him, and ſpeedily carried off the Diſorder by applying Fomentations to the Part affected.

As to Head-achs, it is not as yet confirm'd by Experiments, whether, when the Head aches, the Subſtance of the Brain or Cerebellum is pain'd. We know, for certain, that the cortical Subſtance of the Brain, when ſprouting forth in Funguſes, may ſafely be wounded, and even cut off. 'Tis, in like manner, certain, that when the medullary Subſtance of the Brain is wounded, Convulſions are forthwith produced. But, upon this Emergence, all the Functions of the Brain are ſo diſturb'd, that it cannot, at that Time, be determin'd whether the Brain is affected with Pain or not. 'Tis, however, certain, that the external Integuments of the Cranium, eſpecially the Pericranium, and the tendinous Expanſion lying upon it, as alſo the internal Perioſteum, or Dura Mater, are affected with Pain when they are wounded. For this Reaſon the moſt celebrated Phyſicians have affirm'd, that a Head-ach was a Diſorder proper to the Cranium and its Integuments; whereas a Delirium was an Affection of the Brain: Since, then, a Depreſſion of the Cranium, or an Intropulſion of it, in conſequence of a Fracture, cannot happen without a Wound, or at leaſt a Diſtraction of the Integuments and Dura Mater, it is obvious, that Head-achs muſt be produced by ſuch a Diſorder; unleſs, at the ſame time, the Brain is ſo compreſs'd by the Depreſſion of the Bone, that all the Senſes are entirely aboliſh'd. For this very Reaſon, in Caſes of this Kind, Head-achs denote ſomething of a promiſing Nature, which is, that the Functions of the Brain are not entirely deſtroy'd.

As for Convulſions, they always teach us, that the Brain is ſo compreſs'd or wounded, that the equable Influx of the Spirits into thoſe Nerves, which are ſubſervient to muſcular Motion, is diſturb'd.

As to Palſeys, they are produced when the Brain is ſo wounded, that the Influx of the Spirits into thoſe Nerves, which move the Muſcles, is entirely hinder'd. This Diſorder receives various Names, according as it affects all the Muſcles, or thoſe of one Side, or only ſome particular Muſcles; for, according to the various Parts of the Brain wounded or compreſs'd, the Effect will be proportionably different. A Palſey, following a Wound of the Head, is always an unfavourable Prognoſtic, becauſe it denotes, that the medullary Subſtance of the Brain is compreſs'd or wounded.

As to an involuntary Diſcharge of the Urine and Fœces, proceeding from a Relaxation of the Sphincter Muſcles of the Anus and Bladder, it is, in all Diſeaſes, and eſpecially in Wounds of the Head, enumerated among the worſt Symptoms; for the Nerves, ſubſervient to theſe Sphincter Muſcles, draw their Origins from the laſt Nerves of the ſpinal Marrow, which paſs thro' the Foramina of the Os Sacrum; from which it is obvious, that the Origin of the ſpinal Marrow muſt be by this time injur'd in the Brain. But we muſt diſtinguiſh between this Relaxation of the Anus and Bladder, by which the Urine and Fœces are gradually and continually diſcharged, and when, in Apoplectic Caſes, as alſo in acute inflammatory Diſorders of the Head, the Urine, previouſly collected in the Bladder in a large Quantity, is diſcharged perhaps every ſix Hours, without the Knowledge of the Patient; but, at the ſame time, without a Relaxation of the Sphincter of the Bladder, becauſe the Urine remains ſo long ſhut up in it before it is diſcharged.

For it is a far more terrible Diſorder, when, in conſequence of a Relaxation of the Sphincter of the Bladder, the Urine is inſenſibly diſcharged, than when, being collected in a large Quantity, it is evacuated without the Patient's perceiving it. This laſt Misfortune happens frequently to Children in a tolerable State of Health, and ſometimes to grown Perſons, without any bad Conſequences following from it. Hence it is obvious, that a far greater Diſorder is indicated when the Urine is inſenſibly diſcharged, in conſequence of a Relaxation of the Sphincter of the Bladder, than when a conſiderable Quantity of it is collected in the Bladder, and diſcharged without the Patient's being conſcious of it: But *Hippocrates*, in his *Coacæ Prænotionis*, after having recounted the bad Properties of Urine, as to Colour, Thickneſs, and other Qualities, abſolutely condemns every Kind of Urine which is involuntarily diſcharged; λαθρίως ἐκκρινόμενον.

As to Apoplexies, Fevers, and Death, the Phenomena already enumerated denote, that a Depreſſion of the Cranium may, by a gentle Compreſſion, diſturb ſome Actions of the Brain; but when the Compreſſion is ſo far augmented, that all the internal and external Senſes, together with the ſpontaneous Motions, are deſtroy'd, then there is an Appearance of a profound Sleep, which is call'd an Apoplexy, and which is almoſt always accompanied with a ſtrong and quick Pulſe; whilſt the Action of the Cerebellum not only remains, but is increaſed, becauſe, lying ſafely defended under the Dura Mater, it is leſs eaſily compreſs'd. At laſt, when the Cerebellum is alſo compreſs'd, or its Structure deſtroy'd by an Augmentation of Motion, Death enſues; ſince, when the Brain is compreſs'd, the whole Force of the Blood, which ought to circulate thro' it, acts almoſt entirely on the Cerebellum.

If the Brain itſelf is any way injur'd, the ſame Symptoms and Effects will be produced, as by its Compreſſure by the Bone, in conſequence of its being affected by an Inflammation, Suppuration, Gangrene, Fungus, or Hæmorrhage.

The principal Malignity of Wounds of the Head depends upon this, that the adjacent Brain is eaſily affected: When, therefore, the Wound is ſo great as to reach the Brain itſelf, 'tis obvious, that the worſt and moſt terrible Symptoms are thence to be dreaded; for the Whole of the human Functions depend upon the Soundneſs of this ſoft and pulpous Organ. Now 'tis obvious, from anatomical and phyſiological Obſervations, that the whole Brain conſiſts of Veſſels, in which, when compreſs'd or hurt, Obſtructions, Inflammations, and all their terrible Conſequences, may happen; as alſo all thoſe Diſorders which are excited by the Preſſure of the extravaſated Juices, or their corroding Quality, when become corrupted. But chirurgical Obſervations teach us, that all theſe Conſequences may follow Wounds of the Brain.

A certain Man was wounded in the poſterior Part of his Head with a Hanger, which alſo injur'd the Cranium; and as, from the Beginning, he was under the Care of an unſkilful Surgeon, who, rudely examining the Wound with the Probe, thruſt a third Part of it thro' the Fiſſure of the Cranium into the Subſtance of the Brain; when more ſkilful Surgeons were call'd, they would not make uſe of the Trepan, for fear of rendering this Operation, which proves ſalutary to many, infamous. After the Appearance of various Symptoms, the miſerable Patient died on the twenty-third Day; and, upon opening the Cranium, a large Abſceſs was found in the Left Side of the Brain, included in its proper Membrane: When this was laid open, a large Quantity of fetid Pus was diſcharg'd. *Scultet. Armamentar. Chirurg.* *Paré*, in the twenty-third Chapter of his tenth Book, tells us, that he had often obſerved a large Quantity of Pus, and even a Corruption of the Subſtance of the Brain, whilſt examining the Bodies of thoſe who had died of Wounds of the Head, in order to give in a Report to the Judges. He alſo adds another Caſe, which informs us, that the Patient remain'd alive, after a Suppuration happen'd within the Cavity of the Cranium. A Boy daſh'd his Head againſt a Stone Floor, with ſuch Violence, that he was forthwith deprived of all his Senſes; upon which a Fever, Delirium, and other terrible Symptoms, ſucceeded. On the ſeventh Day a profuſe Sweat broke out, the Patient was ſeiz'd with a Sneezing, and a large Quantity of Pus was diſcharged from his Mouth and Noſtrils: Thus all the Symptoms were relieved, and the Patient cured. In the *Hiſt. de l' Acad. des Sciences*, for the Year 1700. we have a memorable Caſe, where, after a Fall from an Eminence, by which the Cranium was wounded, a large Quantity of Pus was diſcharg'd thro' a ſmall Hole in the Sagittal Suture; which Evacuation being ſometimes ſuppreſs'd for ſome Days, the Patient was ſeiz'd with Convulſions frequently each Day. But when the Pus began again to be diſcharg'd, the Convulſions ceaſed: On the fiftieth Day, however, the Patient died. In the Cranium there was found a large Fiſſure, above ſix Inches long, which had already grown together. In the Dura Mater no Diſorder appear'd, but the whole Left Lobe of the Brain was ſuppurated; whilſt its Right Lobe, and the Cerebellum, remain'd entirely ſound.

Many Obſervations of this Nature occur in practical Authors; but theſe are ſufficient to demonſtrate, that a genuine Suppuration may happen in the Subſtance of the Brain. And, at the ſame time, it appears, that tho' a Suppuration in this Part is always very dangerous, yet Death is not always the Conſequence of it.

But when, inſtead of a benign and kindly Suppuration, which ſeparates every Thing in which the Circulation can no longer be perform'd, a Gangrene ſeizes the Brain itſelf; 'tis obvious, that all Hopes of the Patient's Recovery are cut off. But that ſuch a Diſorder ſometimes ſucceeds Wounds of the

Brain, is ſufficiently vouch'd by the Obſervations of good Authors. Thus *Sculletus*, in his *Armamentar. Chirurg.* gives us an Account of a Soldier, who, after a violent Contuſion of the Head, without any Wound, was taken into the Hoſpital: But, nine Weeks after, when he felt no more Pain, nor any Diſorder, and was thinking of returning to his native Country, he died ſuddenly in the Night-time in his Bed. No Wound was diſcover'd in his Cranium; but about a Finger's Breadth of the Subſtance of the Brain, lying under the Part where the Blow was received, appear'd corrupted, like a rotten Apple; together with a violent Putrefaction, which reach'd almoſt to the anterior Ventricles. The Pia Mater was alſo ſlightly corrupted, but all the other Parts appear'd ſound. *Hildanus*, in *Obſerv. Chirurg. Centur.* 2. *Obſervat.* 25. gives us an Account of a Man, who, in the Month of *October*, died two Days after having received ſome terrible Wounds of the Head, which penetrated into the Subſtance of the Brain. Upon removing the Dreſſings, after his Death, his Wounds diffuſed ſo offenſive a Smell, that none almoſt durſt venture to come near his Corps; ſo violent was the Putrefaction produced in a healthy Man, in a ſufficiently cold Seaſon.

Hippocrates obſerved, that the Brain might be corrupted; and uſed the Words σφακελίζειν to denote this Corruption: Thus, in his *Coacæ Prænotiones*, he tells us, that "when the "Brain is corrupted, ſome die in three, and others in ſeven "Days; and that, if they paſs theſe Days, they recover; but "that thoſe die, in whom, after an Inciſion made, the Bone "appears disjoin'd." And, in the fiftieth Aphoriſm of his ſeventh Section, he tells us, "That they whoſe Brain is cor"rupted (σφακελισθῇ) die in three Days; but that they reco"ver, if they ſurvive that Time." But, in theſe Paſſages, he inſinuates, that the Cure is ſtill poſſible, tho' the Brain is corrupted. It will hereafter appear, that the Subſtance of the Brain, riſing in fungous Protuberances, may be cut off or corroded, whilſt not only Life, but all the Functions of the Brain, are preſerved entire afterwards.

Under the Article VULNUS it is ſhewn, that when the Skin is cut, the ſubjacent Part, being now no longer reſtrain'd by the equable Preſſure of the Skin, riſes up, and degenerates into what we call fungous Fleſh in Wounds. The like Misfortune happens in Wounds of the Head, when the Cranium and Dura Mater are cut thro'; for, naturally, the Cavity of the Cranium is very full, as has already been obſerved: When, therefore, in conſequence of the Wound of the Cranium and Dura Mater, their Contents are no longer reſtrain'd, they begin to protuberate; and becauſe the Arteries, before they enter the Subſtance of the Brain, loſe their thick elaſtic Coats, they are therefore leſs able to reſiſt the Fluids propel'd to them from the Heart, to which they are pretty near: Hence they are greatly dilated, and form ſurpriſing Tumors; and becauſe theſe Tumors riſe much ſooner than Expectation, and expand themſelves very wide, after they have got without the external Lips of the Wound, whereas they are more compreſs'd in the Wound itſelf; they are therefore call'd Funguſes of the Brain, becauſe they reſemble that Subſtance both in their Shape, and ſudden Production. But the largeſt of theſe Fungi are produced when a violent Fever increaſes the Force and Velocity of the Liquids, convey'd to the Veſſels of the Brain, which are ſo eaſily dilated. But, ſo long as the Dura Mater is ſtill entire, Funguſes of this Kind are rarely produced; for this Membrane, being conſiderably ſtrong, reſtrains the ſubjacent Subſtance of the Brain: But when the Pia Mater is at the ſame time wounded, theſe Funguſes ariſe ſtill more; for, in Carcaſes, we obſerve, that, when a gentle Wound is made in the Pia Mater, the cortical Subſtance of the Brain forthwith riſes thro' the Wound.

Many chirurgical Obſervations prove, that, when the Cranium and Dura Mater are cut, the Subſtance of the Brain riſes thro' the Wound in ſurpriſing Tumors: But one or two Inſtances of this Kind will be ſufficient for our Purpoſe.

Paré, in the twenty-third Chapter of his tenth Book, gives us an Account of a Youth of Diſtinction, who, by a Blow of a Stone, had his Right Os Bregmatis broken. Immediately the Bulk of half a Nut of the Subſtance of the Brain was thruſt forth; and when a certain young Phyſician preſent denied, that it was a Part of the Brain, affirming it only to be Fat, *Paré* proved, by Experiment, that the Subſtance of the Brain had come out at the Wound. This Caſe proves, that when the Cranium, and Membranes ſurrounding and encompaſſing the Brain, are cut, the ſoft Subſtance of the Brain may very ſoon protuberate, and appear thro' the Wound.

Hildanus, in *Obſervat. Chirurg. Centur.* 4. *Obſerv.* 3. gives us an Account of a Youth of fourteen Years of Age, who, amidſt his Play, had the Left Part of his Os Frontis ſtruck with a wooden Ball. He immediately fell down, vomited Bile, and afterwards continued to vomit up almoſt every thing he eat or drank. Two Months after, whilſt the Patient ſtill remain'd in a bad State, his Cranium being perforated, the Pus burſt thro' the Perforation with conſiderable Force. Afterwards the Subſtance of the Brain began to riſe, nor could it be reſtrain'd; for which Reaſon it was cut off, by means of a Thread tied about it. Immediately a like Subſtance, reſembling a Fungus, broke out to a Height equal to three Fingers Breadth, which was alſo removed by the ſame Method. This Method was ſo frequently repeated, that all the Funguſes cut off were as large as one's Fiſt; and yet the Patient was afterwards cured.

In the *Miſcell. Curioſ. Decur.* 2. *Anno* 9. *Obſerv.* 174. we have an Account of a Boy of ſeven Years of Age, who, by a Fall from a Horſe, had his Right Os Bregmatis violently wounded. On the fifth Day a Fungus, as thick as one's Finger, and an Inch long, grew forth from the wounded Part of the Cranium. The Boy's Parents would not admit of the Wound's being accurately examin'd, and the depreſs'd Part of the Cranium elevated; but conſtantly affirm'd, that they would rather have their Son die by mild and gentle Meaſures, than be ſubjected to the Agonies of an Operation, the Event of which was dubious and uncertain. For this Reaſon, both Phyſician and Surgeon endeavour'd to remove the Fungus, almoſt by the Uſe of drying Medicines alone: However, it remain'd without any conſiderable Change for three whole Months; but the formidable Symptoms, which appear'd at the Beginning, were much mitigated, and almoſt entirely removed. All the vital, animal, and natural Actions were reſtor'd to ſuch a Degree, that the Habit of the Patient's Body became fuller, and he could divert himſelf by his uſual Recreations. About the Beginning of the fourth Month the Fungus increaſed very much, but was removed by ſprinkling it with the Powder of Euphorbium, and burnt Alum. However, in the Space of twenty-four Hours another Fungus, as large as a Hen's Egg, appear'd, with an Increaſe and Exacerbation of all the Symptoms. In this laſt Fungus there was a ſtrong Pulſation of the Arteries, and, when handled roughly, it diſcharged a large Quantity of Blood. Attempts to deſtroy the luxuriant Fungus by Corroſives were vain and fruitleſs; for which Reaſon the Surgeon tied a Thread about the narrow Part of its Neck, upon which there aroſe ſo violent a Pulſation of the Arteries in the Fungus, that the Whole of it ſeem'd to have a ſubſultory Motion: However, by drawing the Thread tighter, the greater Part of the Fungus fell off with an intolerable Stench, together with the Thread. The remaining Part of the Fungus appear'd blackiſh, ſordid, and corrupted to ſuch a Degree, that the very Sight of it was loathſome. Convulſions, Tremors, and an Hemiplegia, ſucceeded. Some Days after, all the corrupted Parts of the remaining Fungus dropt off: But a freſh Fungus, of a cineritious Colour, as large as a Walnut, without Pain, and with a manifeſt Pulſation of the Arteries diſperſed thro' it, aroſe from the Wound; but in a few Days ſpontaneouſly dropt off, and left a large Hiatus, which penetrated into the very Subſtance of the Brain. Two Days after, the Whole of this Cavity was, in the Space of one Night, fill'd with a freſh Fungus; and a few Days after he died, in the End of the fourth Month after he received the Wound, having been violently rack'd with Convulſions in the poſterior Part of his Body for two Days before his Death; but all his Senſes, his Speech, and the Uſe of his Reaſon, remain'd till the very End of his Life.

This ſurpriſing Caſe teaches us, that ſuch Funguſes conſiſt in a Dilatation of the vaſcular Subſtance of the Brain itſelf; and that they ſoon ſprout out afreſh, when they are removed or taken away. Upon opening the Patient's Cranium the cortical Subſtance of the Brain was found quite conſum'd in the wounded Part, and the Whole of the Brain overflow'd with a large Quantity of Pus.

As to the Effects of a Hæmorrhage of the Brain, three Kinds of Blood-veſſels are generally conſider'd in the Brain: Firſt, thoſe Arteries which, being diſperſed thro' the Dura Mater, are pretty ſtrong and vigorous; and, being defended by the Duplicature of this Membrane, are pretty ſafely ſituated. But that very conſiderable Arteries are lodged here, we are ſufficiently convinced, by the Furrows they impreſs upon the Cranium. Secondly, the Blood-veſſels diſperſed thro' the Pia Mater, the Whole of which is, by Anatomical Injections, demonſtrated to be of a vaſcular Structure. Now theſe Arteries, loſing their thick Coats before they enter the Pia Mater, muſt be very tender, and of courſe eaſily ſuſceptible of Injuries. But as ſoon as theſe Blood-veſſels have reach'd from the Pia Mater to the contiguous cortical Subſtance of the Brain, they no longer contain red Blood, but a far finer Fluid; for, naturally, no red Blood ever appears in the cortical Subſtance of the Brain. Thirdly, thro' the medullary Subſtance of the Brain there are Blood-veſſels diſpos'd, which are ſufficiently conſpicuous to the Eye, which, by their benign Warmth, nouriſh the tender medullary Stamina; ſufficiently large Blood-veſſels of the ſame kind alſo ſurround the Medulla Oblongata. In the hollow Ventricles of the Brain are lodg'd thoſe ſurpriſing Proceſſes of the Pia Mater call'd the Plexus Choroidei, which adhere to no Part of the Ventricles of the Brain, but fluctuate there freely, and are entirely vaſcular, as is obvious not only from anatomical Injections, but alſo, without theſe, from Obſervations made with

with the naked Eye. In all theſe Parts, therefore, Wounds inflicted may injure theſe Veſſels; and Blood, conſequently, may be diſcharg'd; and tho' the wounding Inſtrument does not penetrate very deep, yet, by a ſtrong and powerful Concuſſion, the tender Veſſels, diſpers'd thro' the Pia Mater and Ventricles of the Brain, may be broken, and the diſcharg'd Blood may, by compreſſing the Brain, either diſturb, or entirely deſtroy, all its Actions, as is plain from numberleſs Inſtances.

Whatever is the Cauſe, then, which injures the Brain, or compreſſes it, or deſtroys its Structure and Compages, by Inflammation, Suppuration, or Putrefaction, all thoſe Symptoms, already recounted, may be produc'd by it, from the ſlighteſt Vertigo, to the moſt fatal Apoplexy.

A Depreſſion of the Cranium is diſtinguiſh'd by Feeling, or by the Sight, eſpecially when the Integuments are taken away.

In applying the firſt Dreſſings to Wounds of the Head, Circumſtances are, with all poſſible Care, to be inquir'd into, ſince the Symptoms, ſucceeding Wounds of the Head, are frequently the ſame, tho' different Parts of it are wounded; for, whilſt the Cranium, being depreſs'd, or forcibly driven inwards by a a Fracture, compreſſes the Brain, all the Diſorders of the Brain may, by that means, be produc'd: And, on the contrary, when the Cranium is unhurt, but the Veſſels of the Pia Mater broken, the Blood diſcharg'd compreſſes the Brain, from which all the ſame Symptoms may enſue: But when, by the Senſes, it can be diſcover'd, whether the Cranium is wounded, or not, this is the firſt thing to be ſet about; and the Method of doing it is this: The Hairs are firſt to be ſhav'd off; then the Part affected is gently to be felt every-where with the Fingers, that it may be diſcover'd, whether the convex Figure of the Cranium is chang'd, or not. But we have before obſerv'd, that, in this Examination, great Caution is requir'd, and that the Touch often proves fallacious; but if the Depreſſion of the Cranium is ſo conſpicuous as to be diſcover'd by the Eye, no Doubt can remain: And when, on account of the Violence of the Symptoms, the Integuments are rais'd, and the Bone laid bare, 'tis eaſily diſcover'd, whether there really is ſuch a Diſorder, or not.

A Removal of whatever pricks the Brain; a Reſtitution of whatever preſſes it, to its natural State; and a Retention of it in this State, are ſufficient, in the laſt-mention'd Caſes, for the Cure.

The general Indication of Cure is comprehended in theſe three Particulars; for it ſometimes happens, that a ſharp and pointed Splinter of the Cranium, when fractur'd, and driven inwards, wounds the ſubjacent Brain; and ſometimes it happens, eſpecially when the Head is daſh'd againſt any round Object, that an orbicular Portion of the Cranium is thruſt inwards, which compreſſes, but neither pierces nor tears, the Subſtance of the Brain. It has ſometimes alſo happen'd, that, whilſt the external Table of the Cranium remain'd entire, the internal one has been broken into Splinters, which, by penetrating and lacerating the ſubjacent Brain, have frequently brought on Death. *Paré*, in the eighth Chapter of his tenth Book, gives us a Caſe of this kind: A Gentleman, ſays he, of Diſtinction, whoſe Head was cover'd with a Helmet, happen'd, by a Muſket-bullet, to have his Iron Defence depreſs'd: No Wound, however, appear'd in the external Integuments, nor could any Depreſſion of the Cranium be diſcover'd. On the ſixth Day the Patient dy'd apoplectic. Upon laying open the Cranium, it was found, that, tho' its external Table was entire, yet its internal one had been broke into Splinters, which had penetrated into the Subſtance of the Brain. He alſo affirms, that he exhibited another Caſe of the like Nature, in the Preſence of ſome very celebrated Phyſicians. The Difficulty of diſcovering a Diſorder ſo latent, and remote from the Senſes, may be eaſily conceived. But, when this is known to be the Caſe, the pointed Splinter is, with the greateſt Caution, to be extracted, and the higheſt Care taken, leſt, by twiſting it about, or handling it roughly, the Brain ſhould be more ſeverely wounded. When that Part of the Cranium which is depreſs'd, or driven inwards, is reſtor'd to its natural Situation, 'tis highly neceſſary to take proper Meaſures to retain it in this Situation, and prevent its falling inwards again. When the compreſſing Cauſe is remov'd, the equable Circulation of the Fluids, thro' the now pervious and free Parts, will reſtore their natural Uſe; Art can only, in this Caſe, reſtore thoſe Parts to their natural Situation, which were put out of it.

The Cranium in Children, when depreſs'd, may ſometimes be reſtor'd by means of an adheſive Plaiſter, as being ſoft and yielding; but, in Adults, where it is more firm, an Elevator is neceſſary to raiſe it. In Caſes, however, where the depreſs'd Bone is looſe, and yields to the Terebra, a Perforation muſt be made in the Skull, near the Fracture, thro' which a Lever muſt be introduc'd, in order to elevate the depreſs'd Bone. Sneezing, and holding the Breath, have been recommended for the ſame Purpoſe.

The Cranium, ſays *Heiſter*, eſpecially of young People and Children, is ſometimes, like a Veſſel of Tin or Copper, by an external Force, ſuch as a Blow or Fall, depreſs'd, without any manifeſt Fracture; or, at leaſt, ſo fractur'd, that, by reaſon of its Flexility, it coheres firmly with moſt of the contiguous Parts of the Cranium: But, in Adults, the Cranium, in conſequence of its Rigidity, can ſcarcely, if at all, be depreſs'd, without having its Parts diſjoin'd and ſeparated. This kind of Wound in the Cranium is, by Phyſicians, call'd Fractures, by which the Parts of the Brain are, at the ſame time, compreſs'd, and its Actions and Offices diſturb'd.

Sharp ſays he has met with one Inſtance of a Depreſſure without a Fracture himſelf, in a Girl of ſeven Years of Age. When ſhe firſt receiv'd the Injury, ſhe had the Complaints of an oppreſs'd Brain, but they ſoon went off. The Blow form'd a large Tumor on the Parietal Bone, for which ſhe was put under his Care ſome Days after the Accident. He open'd immediately into it, by cutting away a large circular Piece of the Scalp, and took out a great Quantity of grumous Blood, lying underneath the Periofteum; he then dreſs'd the Depreſſion with dry Lint, and, finding no Complaint come on, continu'd the ſame Method, till in about ſix Weeks ſhe was perfectly cur'd.

Hence, in my Opinion, ſays *Heiſter*, 'tis obvious, that no leſs fatal Symptoms are produc'd by Depreſſions of the Cranium, than by thoſe other Wounds of it we have already mention'd. This Species of Wounds are, however, more or leſs dangerous, according as the Depreſſion is greater or leſs. They are ſometimes incurable, becauſe almoſt always ſome internal Blood-veſſels are broken, and pour forth their Contents on the Brain, from which the moſt terrible Conſequences muſt neceſſarily enſue.

That the Cranium is thus fractur'd or depreſs'd, may be known either, firſt, by Inſpection, or, ſecondly, by the Touch, or, thirdly, by the Inſtrument with which the Wound is made, and, fourthly, from the ſucceeding Symptoms. Fractures and Depreſſions of the Cranium are, for the moſt part, much more eaſily diſcover'd than ſmall Fiſſures: But that any Wound of the Cranium is not only dangerous, but may alſo prove mortal, may be eaſily infer'd from what has been ſaid.

In the Cure of this Diſorder we are, above all things, to remove the Subſtance which compreſſes the Brain, or to elevate, and reſtore to its former Situation, the depreſs'd Bone, when it coheres with the reſt of the Bones of the Cranium; and if any Splinters are detach'd from the Bone, and prick the Brain like ſo many Needles, theſe are to be remov'd with all poſſible Expedition.

But if ſlight Depreſſions are made in the Cranium of Children, without troubleſome Symptoms enſuing, it ſeems better to abſtain from the more violent Methods of elevating the depreſs'd Part, and to treat the Part affected with a View to attenuate the contus'd Matter, either with the reſolvent Fomentations, or with warm Spirit of Wine, or with camphorated Spirit of Wine; or, in ſtill gentler Depreſſions, with ſome digeſtive Plaiſter, ſuch as the *Emplaſtrum de Melilato*, or the *Emplaſtrum de Betonica*; for, by theſe Remedies, gentle Depreſſions in the Cranium of Children are often happily and thoroughly cur'd.

But when, in Children, the Symptoms are of a very formidable Nature, the depreſſed Part may be elevated in the following Manner: A Piece of Leather, cover'd with ſome highly adheſive Plaiſter, and ſtrong Cords affix'd to it, is to be apply'd warm to the Part affected, after the Hairs are ſhav'd off; and, after it is ſuffer'd to ſtay on for ſome Time, that it may adhere the more firmly, the Cords are to be ſtrongly pull'd upwards, ſee *Tab.* 28. *Fig.* 6. and thus the Plaiſter and depreſſed Part of the Cranium are both elevated at the ſame time. If the Operation does not ſucceed at the firſt Time, it is to be repeated till the Intention of the Surgeon is anſwer'd; for, by this means, depreſs'd Parts of the Cranium are often happily reſtor'd. According to *Hildanus*, *Cent.* 2. *Obſ.* 5. a Plaiſter for this Intention may very properly be prepar'd of Pitch, Reſin, Colophony, and Gum Elemi: Sometimes alſo a large Cupping-glaſs, apply'd to the Head, is of ſingular Service for elevating the depreſs'd Part of the Cranium, eſpecially when the Mouth and Noſtrils are kept ſhut, that the retain'd Breath may buoy up the Brain, and, by that means, elevate the depreſs'd Part of the Cranium. But, if the Intention can neither be anſwer'd by the Plaiſter nor the Cupping-glaſs, 'tis neceſſary, after having remov'd the Integuments and Membrane of the Cranium, gently to enter a Terebra, like that repreſented in *Tab.* 28. *Fig.* 7. *Let.* B. into the Cranium, and, drawing it back, by that means to elevate the depreſs'd Part.

But when, in Adults, or even in Children, the Cranium is ſo depreſs'd, that the Bones are quite broken aſunder, the depreſs'd Parts are forthwith to be reſtor'd to their former Situation. Some maintain, that Sternutatories are very properly exhibited with an Intention to diſtend the Brain, and, by that means, to

elevate

elevate the depreſs'd Parts of the Cranium: But I do not think it adviſeable to recommend this kind of Medicine, ſince it may very poſſibly produce fatal and unhappy Effects. We muſt, therefore, have recourſe to the Elevators repreſented *Tab.* 28. *Fig.* 7. *Let.* C. and *Fig.* 8. provided there is a Fiſſure, or Chink, at which the Inſtrument may be introduc'd. But where no Chink or Fiſſure can be perceiv'd, the Terebra, repreſented by *Let.* B. *Fig.* 7. or ſome ſuch other, is forthwith to be us'd, and, by its Aſſiſtance, the Part depreſs'd to be elevated. But there ought always to be a previous Inciſion made with a Knife to the Bone, in the Part where the Wound appears moſt ſoft and tumid, that the Integuments may be laid aſide; and, by the Aſſiſtance of a ſharp Inſtrument, like that repreſented by *Fig.* 2. or that by *Let.* A. in *Fig.* 7. in *Tab.* 28. a ſmall Perforation is to be made, that the Terebra may enter the Bone with the greater Eaſe and Facility.

But, ſince ſuch is the Frame and Make of the Elevators repreſented by *Fig.* 7. and 8. *Tab.* 28. that they cannot be ſafely us'd, without the Depreſſion of the contiguous Parts of the Cranium, when they are either fractur'd or weak; the antient Phyſicians, with good Reaſon, contriv'd a certain Species of Elevator, which they call'd a *Tripes*, repreſented *Tab.* 28. *Fig.* 12. which ought to be almoſt as large again as 'tis there exhibited. Its Feet, A. A. A. may be brought nearer, or drawn farther from each other, as the Nature of the Operation requiress; and the Method of applying it is this: The Machine is ſo apply'd, as that its Feet may reſt upon the ſound Parts of the Cranium. Then, after making a Perforation with the Inſtrument repreſented by *Fig.* 2. the Terebra, B. C. by continually turning about its Handle, D. D. is gradually enter'd into the depreſs'd Part. After this the Terebra is, by means of the Screw, E. E. to be elevated along with the depreſs'd Part of the Cranium, till it is in its natural Situation; as may be ſeen more fully in *Tab.* 28. *Fig.* 13. But, if any Fiſſure or Aperture is obvious between the Parts of the ſhatter'd Bone, it will be more proper to remove the Point of the Terebra, and fix the Elevator, G. by means of the Screw, H. at the *Let.* F. *Fig.* 12. and, by its means, raiſe the depreſs'd Part of the Cranium in the manner now directed.

We find another very convenient Elevator of this kind, but more ſimple in its Structure, deſcrib'd by *Hildanus*, in *Cent.* 2. *Obſ.* 4. We have given a Repreſentation of it in *Tab.* 28. *Fig.* 14. In this Machine there muſt alſo be a Terebra, A. and a Hook, repreſented by *Fig.* 15. either of which ought firſt to be introduc'd into the depreſs'd Part, and held by the Lever, B. C. paſs'd thro' them. Then the Plate, D. is to be apply'd to the ſound Part of the Cranium, with Compreſſes under it, for fear of exciting Pain; and, elevating the Extremity of the Lever, B. the depreſs'd Part of the Cranium is, by that means, to be gently rais'd. Near the other Extremity of the Lever there is a Joint, C. for inclining the Plate, D. as the Caſe requires, or the Convexity of the Head calls for it; and this Plate may be either rais'd or depreſs'd at Pleaſure, by means of the Screw, E. But it will be proper to uſe a Lever ſomewhat longer than that we have repreſented; ſince, by that means, the depreſs'd Part may be both more forcibly, and more commodiouſly, elevated.

But, if the depreſs'd Part of the Cranium is entirely ſeparated from the reſt of the Bones, and ſunk ſo far, that it can neither be elevated by theſe means, nor extracted, it ſeems neceſſary to perforate the adjacent ſound Part of the Cranium with the Trepan, and cut the Piece of Bone, interpos'd betwixt the perforated Part and the Fracture, with a ſlender Saw, repreſented by *Fig.* 9. *Tab.* 28. as far as it ſafely may; and then to cut it quite out with a proper Chiſel, repreſented *Fig.* 10. and a Leaden Mallet, repreſented *Fig.* 11. for, by making a Perforation of this kind, Elevators may be more eaſily apply'd, and, conſequently, the depreſs'd Parts more commodiouſly elevated; but it rarely happens, that this laborious and tedious Operation is neceſſary.

When the depreſs'd Parts are reſtor'd, we muſt take all poſſible Care, that they be not again depreſs'd; for this Reaſon the Patient's Head is to be laid on the ſound Part, with the Wound uppermoſt. Then the Part affected is to be fortify'd with a Plate of Braſs, Copper, or Iron; and the Wound is, in the mean time, to be treated according to the Directions above laid down. Or a Ring may be made of Paper, or twiſted Linen, ſomewhat larger than the Part affected, that the Whole of it may be contain'd within its Circumference; and this, being fixed by proper Bandage, will prevent the Pillow, or the Bandage deſtin'd to keep on the Dreſſings, from preſſing too forcibly on the Part.

As to Sneezing, and Retention of the Breath, above recommended, it is to be obſerv'd, that, in Sneezing, a mild and gentle Titillation is perceiv'd about the Noſtrils, and ſometimes about the Præcordia. When any one or both of theſe Senſations are perceiv'd, all the other Actions of the Body are ſuſpended, and the Patient is oblig'd to wait for what is to happen. The next Moment all the Muſcles, ſubſervient to the Purpoſes of Expiration, are convuls'd in an irreſiſtible manner, and the Lungs, ſuddenly contracting, expel the Air contain'd in them with a kind of whizzing Noiſe. At the very Inſtant, therefore, in which this ſtrong Expiration is made, the Blood cannot poſſibly paſs thro' the Lungs. Hence the venous Blood, returning from the Head, is hindered from diſcharging itſelf freely into the Right Ventricle of the Heart; by which means all the Veſſels of the Brain are not only diſtended, but alſo the Impetus of the arterial Blood is, at the ſame time, augmented, by the Violence of the Concuſſion: Thus, by the Concurrence of theſe two Cauſes, the whole Maſs of the Brain is ſufficiently diſtended. That this is a genuine Repreſentation of the Affair, is obvious, becauſe, by a repeated Sneezing, all the Senſes, and muſcular Motion in general, begin to fail, the Face ſwells, Tears burſt from the Eyes, and the Noſtrils drop; and, if Sneezing is very often repeated, all the Actions of the Brain are often ſurpriſingly diſturb'd.

But, whilſt the Breath is retain'd, the Circulation of the Blood is, in like manner, obſtructed thro' the Lungs, which are compreſs'd by the retain'd Air dilated by the Heat. Hence the jugular Veins cannot diſcharge their Contents, by which means all the ſame Effects will be produc'd as by Sneezing; only with this Difference, that, during the Interval between two Sneezings, the Blood has a free Paſſage thro' the Lungs; but, ſo long as the Breath is retain'd, the Compreſſion of the Lungs is every Moment augmented, ſince the Air contain'd in them is, by its Continuance, gradually more heated, and, conſequently, more dilated. When, therefore, in young Patients, the Bones are as yet flexible, or when, in Adults, they are ſo broken as to be mov'd by a gentle and ſmall Force, the Brain, render'd turgid by the retain'd Blood, may elevate the depreſs'd Part of the Cranium, or, at leaſt, contribute to its Elevation, in Conjunction with other Meaſures.

How conſiderable the Force is with which the diſtended Brain preſſes outwards the depreſs'd Cranium, we may learn from a very memorable Caſe, related by Mr. *Jamieſon*, Surgeon in *Kelſo*, in the ſecond Volume of the Medical Eſſays. "Some "Slates," ſays he, "falling from the Roof of a Houſe four "Stories high, upon the Head of a Girl about thirteen Years "of Age, broke and ſhatter'd her Cranium, at the Place "where the ſagittal and coronal Sutures meet, making a De"preſſion of the Bone, of about four Inches Diameter. The "Symptoms attending this Accident were ſuch as commonly "attend Caſes of a like Nature, that is, an univerſal Stupor, "Bleeding at the Noſe, Difficulty of Breathing, and a full "irregular Pulſe. I immediately took twelve Ounces of Blood "from her Arm, and ſent for all the Phyſicians and Surgeons "of the Place, who agreed to trepan her ſpeedily, which I "perform'd. When I endeavour'd to raiſe the depreſs'd Pieces "of Bone, they were all found ſeparated from the neighbour"ing ſound Bone, and therefore were all brought away, and ſo "left a terrible Chaſm in the Cranium. The Dura Mater was "cover'd with a Syndon, dipt in Honey of Roſes, with a little "Tincture of Myrrh; Pledgets, wet in the Tincture, were "apply'd to the Cranium, and the other common Dreſſings "were put on. Being laid in Bed, an emollient Clyſter was "injected, and procur'd two plentiful Stools; and before "Night ſhe recover'd the Uſe of her Tongue, and all the "other Parts of her Body, except the Left Arm, which con"tinu'd in a paralytic State for eight Days.

"She was kept to a low Diet; and the Cure went ſucceſsfully "on, and was completed ſo far in three Months, that the In"teguments were cicatriz'd.

"On the fifth Day after her Wound, I had caus'd a Plate "of Lead to be made for covering all the Dreſſings, and kept "it on all the time ſhe was under my Care, with two Pieces "of broad Tape put thro' four Holes, one on each Side of the "Plate before, and the other two behind, tying the Ends under "the lower Jaw, and behind the Occiput.

"Notwithſtanding the Wound's being ſkinn'd over, I re"commended the conſtant Uſe of the Plate of Lead laid over "a Compreſs, upon the Cicatrix, to ſupply the want of Bone; "and ſhe kept it on two Months after I left off ſeeing her; "but then, thinking herſelf ſecure, ſhe laid it aſide, and con"tinu'd well ſeven Months more, when the Chin-cough, "*(Tuſſis Convulſiva)* then epidemic in the Place, ſeiz'd her, "and was ſo violent one Night, when ſhe was in Bed, that "the Cicatrix in her Head was lacerated, and the Brain was "puſh'd out at the Teguments. Being inſtantly call'd for, I "found above two Ounces of the Brain lying on the Scalp. "After cleanſing this away, I apply'd Dreſſings, with the "Plate of Lead over them, thereby preventing a greater Diſ"charge.

"The Symptoms that follow'd this direful Accident, were, "an entire Paralyſis of the Limbs, ſhe retaining ſtill the Uſe "of her Reaſon and Tongue; but much inclin'd to Sleep, "with a low depreſs'd Pulſe, and Anxiety; and her Urine "was diſcharg'd involuntarily. In this Condition ſhe con"tinued five Days, and then died."

'Tis ſufficiently known, that, in this troubleſome Species of Cough, the Circulation of the Blood is ſo obſtructed, that the whole Face of thoſe who are afflicted with it becomes monſtrouſly

ſtrouſly livid, and ſometimes black; ſince no venous Blood, carried either from the internal or external Parts of the Head, can enter the Right Ventricle of the Heart, already full by the Convulſion of the Lungs, whilſt the Left Ventricle of the Heart continues, in the mean time, to puſh the Blood thro' the Arteries: Hence the much diſtended Maſs of the Brain broke thro' the Cicatrix of the Wound, which had now been cured for nine Months. Hence 'tis obvious, how violently the diſtended Veſſels of the Brain preſs upon the Cranium.

In Caſes of a Fiſſure, Fracture, or Contuſion of the Cranium, the Arteries, Veins, or Lymphatic Veſſels, within the Cranium, are ſometimes broke, and diſcharge their reſpective Humours: Now theſe, by preſſing on the Brain, produce the ſame Conſequences as a Compreſſion of the ſame Part by a Depreſſure of the Skull: Theſe alſo, when converted into Pus or Ichor by Putrefaction, infect the extremely tender adjacent Parts of the Brain, and hence are productive of the ſame Diſorders. Theſe Veſſels (the Veins and Arteries) are propagated from the Cranium to the Dura Mater, thence to the Pia Mater, thence to the Brain, its Sinuſes and Ventricles, where, when ruptur'd, they produce various Inconveniences, both with reſpect to the Degrees of Danger, and Difficulty of Cure.

If the wounding Inſtrument is applied to the Head with ſuch Force as to ſplit, break, or, by a ſtrong Contuſion, to injure the Bone of the Cranium, 'tis obvious, that it is highly to be dreaded, leſt the Blood-veſſels, and others fill'd with finer Fluids, and diſperſed thro' the Membranes and Subſtance of the Brain, ſhould be broken, and by that means the diſcharg'd Humours, collected under the Cranium, compreſs the Brain; for, as we have already obſerved, ſince the whole Cavity of the Cranium is always perfectly full, the diſcharg'd Humours, collected here, muſt neceſſarily compreſs the Brain. All thoſe Symptoms, therefore, which ariſe from ſuch a Compreſſion, and which have already been enumerated, are, on this Occaſion, to be dreaded; for 'tis no matter what the compreſſing Cauſe is, ſince, whether, by a Change of the Figure of the Cranium, its Cavity is leſſen'd, or whether the diſcharg'd Humours, whilſt its Cavity remains the ſame, poſſeſs the Space formerly taken up by the Brain, the ſame Effects will be produced; which are a Perturbation, or total Abolition, of the Actions of the Brain, in conſequence of its Subſtance being compreſs'd.

The Blood-veſſels diſperſed thro' the Dura Mater are ſufficiently ſtrong, ſince, as in moſt other Parts of the Body, they are furniſh'd with callous Coats, in conſequence of which they are with Difficulty broken: But when we conſider, that the Dura Mater every-where adheres firmly to the Cranium, 'tis obvious, that the Force of the wounding Inſtrument, acting upon the Cranium, may be eaſily communicated to the Dura Mater, in conſequence of their Contiguity to each other. When therefore the Cranium is ſplit or fractur'd, there is great Danger, leſt the Dura Mater, which adheres to it, ſhould at the ſame time be lacerated or wounded by ſharp Splinters of Bone. But the conſiderably large Blood-veſſels diſtributed thro' the Pia Mater, and Medullary Subſtance of the Brain, are very tender, ſince, when they arrive here, they loſe their callous Coats, as is plain from phyſiological Obſervations; for this Reaſon they are more eaſily broken, tho' they are more ſafely ſituated.

Beſides, the Humours, diſcharged from the broken Veſſels, ſtagnating, will ſpontaneouſly degenerate, and become corrupted; and, when they have acquir'd an acrid Quality, will, by inflaming, ſuppurating, and corroding, deſtroy the tender pulpous Subſtance of the Brain. Hence again will ariſe all thoſe Symptoms which were obſerved to be produced by Compreſſion; but they will be ſtill more terrible in the former, than in the latter Caſe; becauſe, when the compreſſing Cauſe is removed, there are ſome Hopes, that the Functions may be entirely reſtored; whereas when the Structure of the Brain itſelf is deſtroy'd, and its tender Veſſels corroded, the Diſorder is incurable. Now that, by an Effuſion and Corruption of the Humours, ſuch Symptoms may be produced, is obvious, from what has already been ſaid, and what is ſpecified relating to Wounds in general, under the Article VULNUS.

Hence 'tis obvious, that the moſt violent Wounds of the Head, when, by a Fracture of the Cranium, a free Paſſage is given to the diſcharg'd Humours, are often leſs dangerous, than when, in conſequence of a ſmaller Wound, the effuſed Humours are retained under the Cranium, as has been before obſerved.

But that the Arteries and Blood-veſſels, when broken, diſcharge their Contents within the Cranium, is not to be doubted; and that, by this Blood compreſſing the Brain, all the Symptoms already recounted have been produced, is obvious, from uncontroverted Inſtances. But 'tis more to be doubted, whether the Lymphatic Veſſels, diſtributed thro' the Compages of the Brain, do, when broken by a like Accident, diſcharge ſo large a Quantity of Lymph as will, when collected, compreſs the Brain, ſince theſe Veſſels are ſo very ſmall; and ſince it rarely happens, that when the Blood-veſſels, diſtributed thro' the Brain, remain entire, the Lymphatic Veſſels alone are broken.

But that there are ſuch Veſſels, which convey the fine Lymph, is ſufficiently certain; for the whole Surface of the Dura Mater, which lies above the Pia Mater, always appears moiſt; as alſo the whole external Surface of the Brain. The whole Circumference of the Ventricles of the Brain is alſo wet with this fine Fluid, without which the contiguous Surfaces of the Parts would ſoon coaleſce, and grow together. Unleſs this highly ſubtile Fluid, which is continually diſcharged from the tender Veſſels in the Form of Exhalations, is again reſorb'd by the Veins, it is accumulated, and may produce all the various Diſorders of the Brain. And many Inſtances, given by Authors, teach us, that this Lymph has been collected betwixt the Dura Mater and the Brain, betwixt the Pia Mater and the Tunica Arachnoides lying above it, and in the Ventricles of the Brain themſelves; for *Winſlow* has obſerv'd, that the whole Surface of the Ventricles of the Brain is cover'd with a very tender Membrane, which, by Anatomical Injections, and the Inflammations ſometimes ariſing in it, is found to be of a vaſcular Structure; but the ſmall Veſſels, of which it conſiſts, naturally contain only the fine Lymph, but not red Blood. Beſides, what Anatomiſts commonly call Lymphatic Veſſels, and which are always of a venous Nature, were here alſo diſcover'd, and are delineated by *Ridley*, in his *Anatomy of the Brain*. Since, therefore, when other Parts of the Body are wounded, an incredible Diſcharge of thin Lymph ſometimes enſues, 'tis not only probable, that this may alſo happen in the Brain, but alſo confirm'd by the Obſervations of Phyſicians. Thus *Bohnius*, in his Work *de Remediat. Vulnerum*, gives us an Account of a Boy of ſeven Years of Age, who, being ſtruck with a Stick on the Head, died on the twenty-ſixth Day, after having been afflicted with Head-achs, Watchings, Drowſineſs, and a Vertigo. Upon laying open the Cranium, the anterior Ventricles of the Brain were found diſtended with a limpid and tranſparent Serum. In the *Miſcellanea Curioſa*, *Decur.* 1. *An.* 6. *Obſerv.* 12. we have an Account of a Man of ſingular Diſtinction, who, falling down Stairs, daſh'd the Left Side of his Head ſo violently againſt the Steps, that he lay like one half dead, without Senſe, Motion, or Speech, almoſt for a whole Day. After Veneſection he recover'd a little; but was ſeiz'd with a violent Pain of his Head, which rack'd him Night and Day, and entirely deprived him of Sleep. By the common Conſent of the moſt ſkilful Phyſicians it was agreed, that the Trepan ſhould be apply'd; and, when it was juſt about to be done, a ſerous Humour began to drop from his Left Ear, which continued dropping till about eight Pounds were diſcharged. There are many Obſervations of this Kind to be met with; but, in all theſe Caſes, the Lymph was either found in the Brain, or diſcharg'd from the Ears, a conſiderable time after the Wound was inflicted; ſo that 'tis ſtill ſomewhat dubious, whether this Accumulation of Lymph was produced by a Rupture of the Lymphatic Veſſels, or by ſome other Cauſe.

As to the Veins and Arteries propagated from the Cranium to the Dura Mater, the Pia Mater, and the Brain, together with its Sinuſes and Ventricles; ſince the Fluids diſcharged from theſe Veſſels, when ruptur'd, are depoſited in various Places of the Brain, they may, by Compreſſion or Corroſion, injure its ſeveral Functions: Thus, for Inſtance, when the Humours diſcharg'd in the Ventricles of the Brain arrive at the fourth Ventricle, which is the Beginning of the Aperture, which runs down thro' all the Length of the Spinal Marrow, they may fall down thro' this Aperture, and produce various Kinds of Palſeys and Hemiplegias. But when other Circumſtances are alike, the Diſorder will always be the more terrible, and the more difficult of Cure, in proportion as the extravaſated Humours are lodged deep, or the reverſe; for the Blood, collected between the Cranium and Dura Mater, will immediately be diſcharg'd upon perforating the Cranium. If it is lodged between the Dura and Pia Mater, it cannot be extracted without making an Inciſion in the Dura Mater. If the diſcharg'd Humours are lodged in the Ventricles of the Brain, or about its Baſe, 'tis obvious, that the Danger is great, and the Cure not only difficult, but ſometimes alſo utterly impracticable; ſince the Attempts of Art, to procure a Diſcharge of the extravaſated Humours which compreſs the Brain, may be vain.

A violent Concuſſion of the Head, without fracturing the Cranium, will frequently, on account of a Rupture of the internal Veſſels, and conſequent Compreſſure of the Brain, cauſe the ſame Diſorders, as the Preſſure of the depreſs'd or fractur'd Bones of the Cranium upon the Brain have been ſaid above to produce.

Sometimes it happens, in conſequence of a Fall from an Eminence, or a violent Contuſion of the Head made with an obtuſe Inſtrument, that, whilſt the Cranium is entire, the Brain is ſo wounded, that all the Symptoms already enumerated enſue. When, for Inſtance, one, falling from an Eminence, daſhes

his Head againſt a hard Body, the Brain contain'd in the Cranium is carried downwards with the ſame Degree of Velocity; but the reſiſting Body firſt ſtops the Motion of the Cranium: Hence the Maſs of the Brain, moving at that Inſtant in its former Direction, may be forcibly daſh'd againſt the Cranium, and thus remarkably injur'd; juſt as when one, carried in a Ship, proceeds to move forwards, and falls when the Veſſel is ſuddenly ſtopt by any Obſtacle. 'Tis, indeed, true, that, when the Cranium is entirely fill'd with the Brain, the Violence of this Shock is conſiderably leſſen'd; but that, even in this Caſe, the Veſſels of the Brain may be ruptur'd, the Humours diſcharg'd, and the Symptoms ariſing from theſe Circumſtances produced, is ſufficiently plain from Inſtances given by Authors of unqueſtionable Veracity. Thus *Hippocrates*, in the ſecond Book of his *Epidemics*, gives us the following Account: "A "beautiful Damſel, of twenty Years of Age, and the Daughter of *Nereus*, was, in Sport, ſtruck on the Sinciput with "the flat Hand of a young Woman, her Companion. Upon "which ſhe was ſeiz'd with a Vertigo, accompanied with "Dimneſs of Sight, and her Reſpiration ceaſed. When ſhe "was brought home, ſhe was ſeiz'd with a Fever, her Head "aked, and her Face became red. On the ſeventh Day, "above an Ounce of a fetid reddiſh Pus was diſcharg'd from "her Right Ear; upon which ſhe ſeem'd to be better, and "had her Symptoms relieved; but died on the ninth Day." 'Tis obvious, that by ſuch a gentle Stroke, given with the flat Hand, the Cranium could neither be fiſſur'd, fractur'd, nor depreſs'd; but that the Brain itſelf had been ſo wounded, that the Humours, diſcharg'd from the ruptur'd Veſſels, degenerated into a fetid reddiſh Ichor, which Accidents were follow'd by the Death of the Patient. In later Authors many Obſervations occur, by which it is prov'd, that, even when the Cranium remains entire, the Brain may, by ſtrong Percuſſion, be ſo wounded, that its larger Veſſels being broken, and the Blood diſcharg'd within the Cranium, immediate Death enſues. But one Inſtance of this Kind is ſufficient for our Purpoſe: *Bohnius*, then, in his Treatiſe *de Renunciat. Vulnerum*, gives us an Account of a Girl, who died on the fourth Day after receiving a violent Fall. He himſelf, as he tells us, examin'd the Body, in order to give in a Report to the Judges; and tho' during the Time ſhe lived, after the Reception of the Wound, and alſo after her Death, a large Quantity of Blood was diſcharg'd from her Mouth and Noſtrils, yet no Effects of Violence could be diſcover'd in her Head. Upon laying open her Cranium, and elevating the Brain, the Left anterior Branch of the Carotids was found ruptur'd. By this Caſe we are taught, that this large Artery, ſituated ſafely, as it ſhould ſeem, under the Baſis of the Brain, may be broken by ſuch a Concuſſion alone, whilſt the Cranium, in the mean time, remains unhurt. Hence 'tis obvious, that the like Misfortune may happen to the other Veſſels of the Brain. But ſince 'tis plain, from phyſiological Obſervations, that as ſoon as the Arteries, diſpers'd thro' the Pia Mater, enter the cortical Subſtance of the Brain, they become extremely minute, and, as it were, villous, and that the ſmall Medullary Fibres are continuous to theſe tender Veſſels of the cortical Subſtance, 'tis very obvious, that, by ſuch a powerful Concuſſion, theſe tender Stamina of the Brain, on which Life and the Animal Functions depend, may be broken; and by that means all the various Depravations, or even a total Abolition, of all the Functions of the Brain, produced, tho' no Wound nor Effuſion of Humours can be diſcover'd within the Cavity of the Cranium; for theſe highly minute Veſſels entirely elude and eſcape the Obſervation of the Senſes. In the *Hiſtoire de l' Academie des Sciences*, for the Year 1705. we have an Account of a robuſt young Man, who, in order to avoid being broke upon the Wheel, put his Hands behind his Back, and, ſtooping forwards with his Head, run ſo forcibly againſt the Priſon-wall, that he forthwith dropt down dead, without uttering a ſingle Word, or making the leaſt Noiſe: When his Body was examin'd, no Contuſion, no Tumor, no Fracture, were found in the Crown of his Head, the Part he daſh'd againſt the Wall, as was atteſted by his Fellow-priſoners. When the Integuments were removed, no Wound appear'd on their internal Surface, which lies next to the Cranium, nor in the Cranium itſelf, except that the ſquamous Part of the Os Temporum was a little removed from the Os Bregmatis, on which it lies; but, from this, ſo ſudden a Death could by no means have follow'd. Upon cutting open the Cranium with a Saw, no Injury at all appear'd; but the Brain did not exactly fill the Cavity of the Cranium, as it generally does; and the Whole of its Subſtance appear'd more firm and ſolid, than in other Subjects it is found to do. From this Caſe it is obvious, that the ſudden Death, produced by this violent Blow on the Head, could only be aſcrib'd to this ſubſiding of the whole Brain, by which thoſe tender Stamina, of which it conſiſts, were either broken, or ſo contorted and ſhrivel'd together, that they were no longer pervious to the Fluids of the whole Body.

From what has been ſaid we may alſo infer, that various Functions of the Brain may be injur'd, according as different Parts of that Organ have been hurt by ſuch a Concuſſion. *Hippocrates*, in the fifty-eighth Aphoriſm of his ſeventh Section, informs us, that "they who, by any Cauſe, have their Brain "concuſs'd, muſt neceſſarily be ſoon deprived of Speech." And, in the ſecond Section of his firſt Book *de Morbis*, he tells us, that "a Perſon who meets with this Misfortune, "muſt neceſſarily neither hear nor ſee." And *Heurnius*, in his Commentaries on this Aphoriſm, informs us, that he knew ſeveral Perſons, who, in conſequence of Falls upon the Occiput, loſt the Senſes of Smell and Taſte all their Lives after. In the *Miſcel. Curioſ. Dec.* 1. *An.* 2. *Obſ.* 120. we have an Account of a Boy of four Years of Age, who could ſpeak without any Difficulty, and who fell off a Deſk on his Head; but no Injury was obſerv'd to be done by the Fall. On the third Day, however, when he aroſe, he began to ſtammer in his Speech, tho' he was well enough in other reſpects; and on the ſubſequent Days his Diſorder increaſed; but, by the Application of cephalic Fomentations to his Head, and the Exhibition of ſome Medicines internally, the perfect Uſe of his Speech was reſtor'd. In the *Hiſtoire de l' Academie des Sciences*, for the Year 1732. we have an Account of a Man, who, in conſequence of a Blow on his Head, labour'd under a Difficulty of Speech for many Years, when he lay down in Bed. Such a Concuſſion may not only happen by a Blow on the Head, but alſo by daſhing any Part of the Body againſt a hard Object, in conſequence of a Fall from an Eminence. Thus *Galen*, in the ſixth Chapter of his firſt Book *de Locis Affectis*, gives us an Inſtance of a Man, who, falling from an Eminence, daſh'd the Beginning of his Back upon the Ground: On the third Day his Voice became very low, and on the fourth he was entirely dumb: His Legs, in the mean time, were paralytic, but his Arms remain'd well; and, on the ſeventh Day, his Speech, and the Uſe of his Legs, return'd. *Galen*, indeed, in this Caſe, attributed the Diſorder to an Affection of the Spinal Marrow; but ſince the Palſey ſeiz'd only the inferior Joints, it is obvious, that the Beginning of the Spinal Marrow was not injur'd; otherwiſe the Hands would have become paralytic. Hence the Privation of Voice ſeems, in this Caſe, juſtly to be aſcrib'd to the Concuſſion of the Brain.

The Diſorders ariſing from a Rupture of the internal Veſſels, either with or without an Injury done to the Cranium, are diſtinguiſh'd, by conſidering the Cauſe, its Violence, and the Part which receiv'd it.

When all theſe Circumſtances are thoroughly known, they contribute conſiderably to the Diſcovery of latent Diſorders; for a blunt Inſtrument, forcibly apply'd to the Head, always lays a Foundation for ſuſpecting either a Fracture or Fiſſure of the Cranium; and the Danger is more or leſs, according as different Parts of the Head are wounded; for in ſome Parts the Cranium is very thin, and in others conſiderably thicker. Beſides, very conſiderable Arteries of the Dura Mater are, in ſome Parts, lodged in deep Sinuſes of the Cranium; for which Reaſon the wounding Inſtrument, apply'd to theſe Parts, may eaſily break theſe Veſſels, and the diſcharg'd Blood may compreſs the Brain.

Bilious Vomitings,

Subſequent to Wounds of the Head, almoſt always denote, that the Brain is affected, whether it is compreſs'd by the diſcharg'd Humours, or its Action is diſturb'd by the Violence of the Concuſſion: But of Vomitings of this Kind we have already ſpoke.

When the Senſes of Seeing, Hearing, Smelling, Taſting, and Touching, are either diminiſh'd, deprav'd, or aboliſh'd,

'Tis a Sign, that the Brain is more or leſs affected; for it is certain, from phyſiological Obſervations, that the Soundneſs of the Brain, and its free Communication with the Nerves ſubſervient to theſe Senſes, are requiſite to the Perception of thoſe Ideas which are repreſented to the Mind by the Interpoſition of the external Senſes: Hence 'tis obvious, that if, in conſequence of Wounds of the Head, the Whole or only ſome of theſe Senſes are either depraved, or entirely deſtroy'd, the Brain is ſo affected, that the Origin of the Nerves ſubſervient to theſe Senſes, being either compreſs'd, or by any other means injur'd, is no longer capable of tranſmitting the highly ſubtile Spirits, ſecreted in the Compages of the Brain, and requiſite to the Perfection and due State of the Senſes.

A Vertigo, a Dimneſs of Sight, and Inability to ſtand, are alſo Signs of the Brain's being affected.

We have already obſerv'd, that the ſlighteſt Diſorder of the Brain is a Vertigo, or an apparent Circumrotation of the viſible Objects; that, when the Diſorder is increaſed, a Dimneſs of Sight is produced, in which Caſe the Diſeaſe is call'd *Vertigo tenebricoſa*. Upon this the Strength of the Body is ſo far loſt, that all its Members begin to fail, and the Patient drops down. Now this denotes, that not only that Part of the Common Senſory

Senſory is affected, which affords an Origin to thoſe Nerves which are the Inſtruments of Senſation, but alſo that the Diſorder has reached to thoſe Parts in which the Origins of the Nerves, ſubſervient to muſcular Motion, are lodg'd. Hence *Hippocrates*, in the fifteenth Section of his Treatiſe on Wounds of the Head, when enumerating the Signs, by which it is known, that any one is ſeverely wounded in the Head, joins theſe three Symptoms, Dimneſs of Sight, a Vertigo, and Falling down: And, in the tenth Section of the ſecond Book of his *Prorrhetics*, he tells us, that, in all conſiderable Wounds of the Head, it is of Importance to know whether the Patient has dropt down, or fallen into a profound Sleep; for, if either of theſe has happened, the greater Care is required, for this Reaſon, that tho' theſe Symptoms do not always denote, that the Brain itſelf is wounded, yet they prove, that it is, at this Time, ſenſible of the Wound, τῦ ἐγκεφάλυ ἰσαχόσαντ☉ τῦ τρώματ☉.

In Wounds of the Head, a profound Sleep is always enumerated among the bad Signs; but, if a Stertor is join'd to it, it is ſtill more formidable.

When, for Inſtance, the Patient, during Sleep, breathes deep, with a Noiſe, as happens to thoſe who are apoplectic, then it imports, that all the Actions of the Brain are deſtroy'd by the Wound, and that only the Functions of the Cerebellum remain entire: And, in this Caſe, they are, for the moſt part, increas'd, ſince, in conſequence of the free Circulation of the Blood thro' the Brain being hinder'd, the Circulation of the Fluids thro' the Compages of the Cerebellum is render'd quicker and ſtronger.

Palſeys and Convulſions are alſo Signs, that the Brain is affected.

For ſince the Exerciſe of muſcular Motion, ſo far as it is ſubjected to the Will, depends upon the Soundneſs of the Brain, hence all or ſome of the Muſcles of the Body may become paralytic, in conſequence of a Wound of the Brain; and, becauſe the Muſcles, thus affected, are flaccid and pendulous, they are ſaid to be paralytic, or preternaturally relax'd. But, when a violent, alternately repeated, and involuntary Contraction of a Muſcle, which ought to move by the Direction of the Will, happens, then a Convulſion is ſaid to be preſent, which, in this Caſe, is generally produc'd, when the Tranſmiſſion of the Spirits thro' ſome Parts of the Brain remains entire, and is obſtructed in others. This Diſorder may alſo be produced by Splinters of Bone pricking the medullary Subſtance of the Brain, or by the diſcharged Humours, when they acquire an acrid and corroſive Quality. Both Palſeys and Convulſions, produc'd by Wounds of the Head, denote that the Brain is affected.

A Delirium is alſo a Sign, that the Brain is affected.

When the Ideas, excited in the Mind, do not correſpond to the external Objects, but are produced by the Change induced on the Common Senſory, then the Patient is ſaid to be delirious. Hence 'tis obvious, that, in Wounds of the Head, a Delirium is always a bad Sign, becauſe it ſhews, that the Brain is affected, as has been obſerv'd above from *Hippocrates*.

A Lethargy alſo is a Sign, that the Brain is affected.

This Diſorder is a State of Indolence and Oblivion, which deſtroys Motion and Senſation, and produces an irreſiſtible Neceſſity of Sleeping, but in ſuch a manner, that the Patients may be wak'd by ſuch Things as powerfully affect the Senſes, but they immediately fall aſleep again. Hence this Diſorder imports, that all the Actions of the Brain are much hindered, and, conſequently, denounces great Danger.

An Apoplexy is another Sign, that the Brain is affected.

All the Symptoms already enumerated teach us, that the Brain is affected in ſuch a manner, as to have ſome of its Functions deprav'd or aboliſh'd; but, when all the Actions of the Brain, all the internal and external Senſes, and voluntary Motion, ceaſe, the Action of the Cerebellum, which is ſubſervient to the vital Motions, in the mean time, remaining, then an Apoplexy is ſaid to be preſent, which is the higheſt Diſorder of the Head, and generally is a Sign, that, in Wounds of the Head, the Brain is compreſſed by the diſcharged Humours.

Horripulation is alſo a Sign, that the Brain is affected.

This Symptom, following Wounds of the Head, almoſt always denotes, that the Blood is diſcharged from the Veſſels, eſpecially when it recurs irregularly, and does not accompany a beginning Fever. We alſo frequently obſerve, that, in ſeveral Diſeaſes, ſuch a Horripulation precedes conſiderable Changes. Hence 'tis always a bad Symptom in Wounds of the Head, as it is a Sign of a thorough Perturbation of the Common Senſory, by which ſuch Concuſſions in the whole Body are cauſed.

A redoubled Fever is alſo a Sign, that the Brain is injur'd.

Every conſiderable Wound, whilſt the Pus is forming, is accompanied with a ſlight Fever, which prognoſticates nothing fatal; but, when this ſlight Fever is ſuddenly increaſed, or when, after it has ceaſed, a new and violent Fever appears, it always ſignifies, that ſome violent Diſorder lies conceal'd. For this Reaſon *Hippocrates*, in his *Coacæ Prænotiones*, tells us, "That thoſe who are wounded in the Head are generally ſeiz'd "with a Fever, a Vomiting of Bile, and a Palſey; and that "ſuch Patients are in a bad State." And, in the Paſſage already quoted from his *Prorrhetics*, he ſays, "That it is the beſt Sign, "when thoſe, wounded in the Head, do not become feveriſh; "but that, when any of thoſe Symptoms happen, 'tis beſt "they ſhould appear in the Beginning. But when, in Wounds "of the Head, a Fever begins on the fourth, the ſeventh, or "the eleventh Day, it is a very fatal Sign;" for ſuch a Fever denotes a new Inflammation, or a ſtrong Suppuration, which, in this Caſe, are ſo dangerous. Hence, in the Caſe before ſpecify'd from the ſecond Book of *Hippocrates*'s Epidemics, ſuch a Fever was followed by the worſt of Symptoms, and, at laſt, by Death; for the Girl, who was gently ſtruck on the Sinciput with the flat Hand of her Companion, became immediately feveriſh; but when, on the ſeventh Day, a reddiſh fetid Pus was diſcharged with a Relief of the Symptoms, the Fever again increaſed, the Patient became lethargic, and loſt her Speech, the Right Side of her Face was contracted, her Reſpiration became difficult, ſhe was ſeized with a Tremor and Convulſions, and at laſt died on the ninth Day. In peruſing thoſe Authors who have wrote on Wounds of the Head, many ſuch Caſes occur, which teach us, that the Fever ſuddenly increaſing after ſome Days, or appearing afreſh, is an unlucky Prognoſtic, and almoſt always denotes, that the Brain is wounded or depreſs'd.

Blood diſcharged from the Mouth, Noſe, and Ears, is alſo a Sign, that the Brain is affected.

It is not probable, that the Blood diſcharged within the Cranium can be evacuated thro' theſe Paſſages, ſince the Dura Mater ſo cloſely covers the internal Surface of the Cranium, that there can be no Evacuation made this Way. It is, indeed, obvious from ſeveral Caſes, that chronical Diſorders of the Head have often been relieved by a Diſcharge of Humours from theſe Paſſages, as *Hippocrates*, in the tenth *Aphor.* of his ſixth *Sect.* obſerves, in theſe Words. "When any one labours "under any Diſorder, or univerſal Pain, of the Head, Pus, "Water, or Blood, diſcharged from the Mouth, Ears, or "Noſe, put a happy Period to the Diſeaſe." But Anatomiſts have not as yet diſcovered the Paſſages, by which the Humours, contained in the Cavity of the Cranium, are thus diſcharged: Perhaps they are produc'd by the Diſeaſe, tho' they naturally had no previous Exiſtence. Thus, in other Diſeaſes, ſuch Diſcharges of Humours are obſerv'd, tho' the Paſſages by which they are convey'd are not as yet diſcovered. A Pleuriſy, for Inſtance, is carry'd off by Spit, convey'd thro' the Lungs, and expectorated. 'Tis certain, that if the Evacuation of the Blood, diſcharged within the Cranium, were ſo eaſy, there would be no Neceſſity for the Operation of the Trepan, which, however, is proved not only to be uſeful, but alſo indiſpenſably neceſſary, by numberleſs Inſtances. But the Blood diſcharged from the Mouth, Ears, and Noſe, is a Sign, that the wounding Inſtrument has ſtruck the Head with great Force, ſince it was capable of breaking the Arteries: 'Tis, therefore, to be highly dreaded, that the Blood-veſſels running thro' the Brain, and which no longer retain their callous Coats, are broken.

Redneſs of the Face and Eyes is alſo another Sign, that the Brain is affected.

The Blood, thruſt from the Heart thro' the carotid Arteries, goes partly to the internal Parts of the Head, thro' what we call the internal Carotids, and is partly diſtributed thro' the external Carotids, which lie near the Face, and external Parts of the Head. When, therefore, by an Effuſion of Blood compreſſing the Brain, the free Circulation of the Humours thro' that Organ is obſtructed, the Blood is carried in a proportionably larger Quantity thro' the external Carotids, by which means the Face will become more red, tenſe, and florid; and ſince the internal Carotid, after it emerges from the bony Canal thro' which it paſſes, ſends off Ramifications, which reach to the Orbit of the Eye, and the Eye itſelf, and there communicate with the Branches of the external Carotid, the Circulation of the Blood thro' the Veſſels of the Brain being by this means obſtructed, the Eyes become red, becauſe immediately a larger Quantity of Blood is carried thro' theſe Branches of the internal Carotid which reach to the Eyes. For this Reaſon a Redneſs of the Face and Eyes is juſtly look'd upon as a bad Symptom in all Wounds of the Head. Patients afflicted with the moſt violent Apoplexy have their Faces red, turgid, and inflated. This florid Colour of the Countenance is, by *Hippocrates*, ſaid to be an

an unlucky Omen in phrenetic Patients; and the Girl who died by a gentle Stroke of her Companion's flat Hand on the Sinciput, and whoſe Caſe we have already given from *Hippocrates*, had a Redneſs of her Face. In ſeveral Paſſages of *Hippocrates*, this Redneſs of the Eyes and Countenance is condemn'd. Thus, in his *Coacæ Prænotiones*, he tells us, "That they who have "a Head-ach, Stupor, and Delirium, attended with Coſtive-"neſs, a Fierceneſs and Redneſs of the Eyes, are ſeiz'd "with Convulſions in the poſterior Parts of their Bodies;" in which Paſſage he means, that the Eyes are fierce, turgid, and blood-ſhot, as happens in violent Fits of Anger: And, in the next Sentence, he adds, "In Concuſſions of the Head, red "Eyes and a Delirium are very unlucky Symptoms."

When, from the preceding Signs, 'tis certain, that the Brain is wounded, whether the wounding Inſtrument has reach'd to the internal Parts of the Head, or whether the Brain is compreſs'd by a Depreſſure of the Cranium, or an Effuſion of Humours, it ought to be determin'd in what Part of the Brain the Injury is done. 'Tis highly obvious, that a Knowledge of this muſt be a Circumſtance of the laſt Importance, ſince the Operation of the Trepan can neither be judiciouſly nor ſucceſſfully perform'd, till we know in what particular Place the Diſorder is lodged. But 'tis frequently pretty difficult to determine the Part affected; for ſometimes the Wound is found in a Place remov'd at a conſiderable Diſtance from that to which the wounding Inſtrument was apply'd, as we have already obſerved. It alſo often happens, that neither the Patient nor the Byſtanders can determine what Part of the Head has receiv'd the Blow. Nor can this certainly be determined by obſerving the injured Functions, in conſequence of a Wound receiv'd in the Head. Hence it may, indeed, be concluded, that the Brain is wounded; but no one can, from that Circumſtance, conclude what particular Part of it is injur'd. Who would take upon him to determine the particular Parts of the Brain, whence the various Nerves, ſubſervient to the external Senſes, derive their Origins? Who can aſcertain the preciſe Seat of the Memory, and Faculty of Reaſoning, in this ſurpriſing Organ? Some Men, juſtly celebrated for their Learning, have advanced ſurpriſing Hypotheſes with reſpect to this Subject; but the Event has prov'd, that the greateſt Geniuſes are capable of falling into the moſt egregious Blunders, when they wantonly indulge themſelves in Speculation. The great *Steno*, who was ſo ſkilful an Anatomiſt, frankly acknowledged, before a Set of Men eminent for their Learning, that he was an entire Stranger to the Structure of the Brain; and in a beautiful Diſſertation, to be found under the Article CEREBRUM, deſtroys all the chimerical Hypotheſes relating to this Subject, and pointed out the true Way by which human Induſtry can gradually attain to a Knowledge of this Organ. By the Signs, however, hereafter enumerated, we are, with all our Art, to inquire into the Part of the Brain affected; and if, notwithſtanding an accurate Examination of theſe, the Surgeon ſhould err, the Miſcarriage is not to be attributed to his want of Skill, but to the Defect of the Art, which, perhaps, the Diſcoveries of ſucceeding Ages may amend.

The injured Part, therefore, within the Cranium, is diſtinguiſhed, firſt, by the external Appearances already deſcrib'd; ſecondly, by an Inveſtigation of the particular Injuries received by the Cranium, in the manner already taught.

For when it is diſcover'd, that the Cranium is hurt, and, at the ſame time, any Symptoms appear, which give Reaſon to believe, that the Brain is affected, 'tis highly probable, that the internal Injury lies immediately under that which is external.

Thirdly, by a Tumor and Redneſs of the Skin after ſhaving the Head, and the Application of a Plaiſter to it.

When, by the Signs already recounted, it is obvious, that the Brain is wounded; and when, at the ſame time, there is no particular and diſtinguiſhing Circumſtance, by which the Part affected can be determin'd, then Surgeons endeavour to diſcover it in the following Manner: They ſhave off the Hair, and then apply to the whole Head any aromatic Plaiſter, which they ſuffer to remain for ſome Hours. Then, taking off the Plaiſter, they carefully examine whether any Tumor or Inflammation appear in any Part; and, if theſe are found, we may juſtly ſuſpect, that the wounded Part lies under them. For, ſince this Plaiſter adheres to the Skin of the Head, and, by its mild aromatic Stimulus, excites a ſomewhat briſker Motion of the Humours, if there is any Contuſion, it will the more eaſily appear, when a Tumor ariſes. When it cannot be diſcover'd in what Part of the Head the Wound is lodged, *Hippocrates* pronounc'd the Diſorder incurable by any Medicines.

Fourthly, by a ſpontaneous Motion of the Patient's Hand to a particular Part of the Head.

Tho' we cannot aſcertain the particular Reaſon why this is done, yet we are certain, from inconteſtable Facts, that it is ſo. Very lately, ſays *Van Swieten*, I ſaw a Man, who had fallen from an Eminence, lying without any Senſe; and, as he had daſh'd the Right Part of his Head and Face againſt a hard Object, and had a ſtrong Contuſion, and ſlight Wounds of theſe Parts, he forthwith lifted up his Right Hand, and not only touch'd, but pretty ſtrongly rub'd, the Parts affected. Two Hours after, when, in conſequence of a liberal Veneſection, he recover'd a little, he ſaid, that he was conſcious of nothing after his Fall. Whilſt Surgeons, therefore, obſerved, that the Hands of Patients thus wounded were, by a kind of mechanical and neceſſary Motion, convey'd to the wounded Part, they thought they had Reaſon to conclude, that, when no external Wound appear'd, the Part affected was indicated, if the Patient's Hand was, by ſuch a mechanical Motion, always carry'd to a particular Part of his Head. In apoplectic Patients the ſame Phenomenon alſo frequently appears. This Sign ſeems to be of conſiderable Importance, when ſeveral ſuch repeated mechanical Motions appear, which are not perform'd by the Direction of the Will, nor predetermined by any Act of the mental Powers, but to which our Bodies themſelves are wiſely and neceſſarily determined by the bountiful Author of our Natures, to attempt the Removal of what is hurtful and injurious to them.

Fifthly, from a Palſey on one Side, and Convulſions on the other.

That corporeal Organ of the Body, upon which Senſation and voluntary Motion depend, ſeems to be double with reſpect to its Origin, Collection, Diſtribution, and Operation; for there is a Right and a Left Carotid Artery, and a Right and a Left Vertebral one: From theſe ariſe the Right and Left Hemiſpheres of the Brain, which are intirely diſtinct from each other. The whole Collection of the Medulla is alſo divided into two Partitions, one on the Right, and another on the Left Side; which evidently appears in the Corpus Calloſum, the Fornix, the Crura medullæ oblongatæ, the optic and olfactory Nerves, as alſo in the ſpinal Marrow, and the Nerves diſtributed from it. But, tho' all theſe Parts are thus found double, yet the Man who perceives and feels by their means, is but a ſingle and individual Man; for the two olfactory Nerves, ſo diſtinct in their Origin and Progreſs, at laſt excite the ſame Senſation of Smelling. Tho' with our two Eyes we doubly ſee each Object preſented to them, as is obvious from the intermediate Space between the two Eyes, or from gently preſſing the Bulb of either Eye with the Finger, yet Viſion is only ſingle. This ſame Obſervation holds with reſpect to the Senſe of Hearing.

Since, then, the Brain, the immediate Inſtrument of Senſation and Motion is double, 'tis hence obvious, that one Part of it may remain ſound, whilſt another may become entirely unfit for performing all its ſeveral Functions, as is plain in an Hemiplegia, in which Diſorder half of the Body is rendered ſo paralytic, that none of the Motions depending on the Direction of the Mind remain in it: Yet the conſcious Faculty, which deſigns and directs the Motion, remains; and though the Perſon ſo affected endeavours, as much as poſſible, to move the affected Side, yet no ſubſequent Motion is produced in the Muſcles; and ſometimes, in the worſt Species of this Diſorder, all Senſation is alſo entirely deſtroy'd on the affected Side.

Hippocrates, in the third Section of his Book *de Morbo Sacro*, made this ſame Obſervation in the following Words: "The "Brain, ſays he, of Man, as well as of all other Animals, is "double, and divided in the Middle by a ſlender Membrane; "for which Reaſon the Head does not always ake in one Part, "but ſometimes in one, and ſometimes in another; and ſome-"times the Whole of it feels the Pain." A ſubtile Queſtion here ariſes, which is, Whether this Origin of Senſation, and Principle of Motion, are ſituated on the Side oppoſite to that on which their Effects are produced; that is, Whether the Origin of the Senſation and Motion, exerciſed on the Left Part of the Body, is lodged in the Right Side of the Brain, or in the Left: But this muſt be determin'd by the minute Obſervations of accurate and ſkilful Anatomiſts; and, when this Circumſtance is fully known, it will be of ſingular Service in Wounds of the Head, to determine, from the Diſorder of the Senſations and Motions on either Side of the Body, what particular Part of the Brain is wounded.

The ſoft and pulpous Subſtance of the Brain has always laid a Foundation for great Difficulties in Anatomical Demonſtrations: But its Conſiſtence is leaſt of all firm in young Perſons, whereas in an advanced Age, and eſpecially in thoſe Men who have been accuſtom'd to hard Exerciſe, it is more firm, and capable of being handled with greater Freedom. In ſuch Subjects, after, by a long-continued Maceration, the cortical and cineritious Subſtance of the Brain has in a great meaſure been diſſolved, it has evidently appear'd, that the medullary Fibres, ariſing in the Right Side of the Brain, were ſtretch'd out to the Left Side, and *vice verſa*. But this Direction of the Fibres is principally obſervable in three Parts, that is, in the anterior and poſterior Border of the annular Protuberance; and ſtill more conſpicuouſly in the Extremity of the Medulla Oblongata, where it terminates in the Spinal Marrow. But this Phenomenon is moſt diſtinctly obſerv'd about two Lines below the *Corpora Pyramidalia* and *Olivaria*; for if the *Corpora Pyra-*

midalia

midalia are gently drawn from each other, not ſlender Fibres, but large Congeries of them are obſerv'd to run acroſs each other to the oppoſite Parts, as *Santorini*, in his *Obſervat. Anatom. Cap.* 3. has obſerv'd. This is almoſt all that Anatomy has diſcover'd, with reſpect to the Direction of the medullary Fibres of the Brain.

Several medicinal Obſervations confirm this decuſſated Action of the Brain. *Hippocrates*, in the fifth Book of his *Epidemics*, gives us an Account of a Girl of twelve Years of Age, whoſe Cranium was contuſed and fractur'd; but the Trepan being injudiciouſly apply'd, ſhe died on the fourteenth Day. Her Left Hand was ſeiz'd with Convulſions, tho' the Wound was inflicted on the Right Side of the Head. In his *Coacæ Prænotiones* he tells us, that thoſe who are wounded in the Temples, are ſeiz'd with Convulſions on the Side oppoſite to that on which the Wound is inflicted. And, in the nineteenth Section of his Treatiſe on *Wounds of the Head*, he confirms the ſame Doctrine, by adviſing Surgeons not raſhly to make Inciſions in the Region of the Temples, becauſe ſuch Inciſions produce ſubſequent Convulſions; and he affirms, that if an Inciſion is made in the Left Temple, the Right Part of the Body will be ſeiz'd with Convulſions; but that, if the Inciſion is made in the Right Temple, the Left Side will of courſe be convulſed. And, in the thirty-firſt Section of the ſame Book, when he enumerates the Signs by which it is known, that a Patient wounded in the Head will die, he affirms, "That moſt Patients ſo wounded are ſeiz'd with Convulſions on the Side oppoſite to that in which the Wound was receiv'd; for, if there is a Wound on the Left Side of the Head, the Right Side of the Body will be ſeiz'd with Convulſions; but, if the Wound is on the Right Part of the Head, the Left Side will be convulſed." Thus, in theſe early Ages of Medicine, ſuch were the Obſervations which favour this Opinion.

Among later Authors, *Fabricius Hildanus*, who generally only ſimply relates what he ſaw, without any Admixture of Reaſoning, has various Obſervations, which confirm the Truth of this Doctrine. Thus, in his *Obſervat. Chirurg. Centur.* 2. *Obſerv.* 3. he gives us an Account of a Man of forty Years of Age, who, being ſtruck on the Left Bregma with a Ball of Iron, which weigh'd more than a Pound and an half, had his Cranium conſiderably depreſs'd and fractur'd; upon which he dropt to the Ground like one dead; and not only loſt his Speech, Sight, and Hearing, but was alſo ſeiz'd with a Palſey on the Side oppoſite to that on which the Wound was inflicted. By elevating, however, the depreſs'd Parts of the Cranium, and uſing other proper Means, he was reſtor'd to perfect Health. In the ſame *Century* of that Work, *Example* 3. he gives us an Account of a Man of ſixty Years of Age, who, by the Blow of a Stone, had the Left Part of his Os Frontis, where the Hairs begin to grow, conſiderably depreſs'd: He no ſooner receiv'd the Blow than he dropt to the Ground, loſt his Speech, his Reaſon, his Sight, and his Hearing; and had the whole Side, oppoſite to that on which the Wound was receiv'd, ſeiz'd with a Palſey. His Friends would not ſuffer an Inciſion to be made in the Integuments, and the depreſs'd Parts of the Cranium elevated, ſo that he died a few Days after.

In the thirteenth Obſervation of *Centur.* 1. he gives us an Account of a Woman, who received a Wound with Contuſion in the Right Os Bregmatis, accompanied with a Fracture and Depreſſion of the Cranium. Upon this ſhe immediately vomited up a bilious Humour, together with crude and indigeſted Aliments; and her Left Side became paralytic, whilſt the Right was ſeiz'd with Convulſions. She recover'd, however, tho' a large Quantity of the Subſtance of the Brain was extracted thro' the Wound. In the nineteenth Obſervation of the ſame *Century*, he gives us an Account of a robuſt young Man, who, with a Club, receiv'd a Wound on the Left Bregma, accompany'd with a Fracture of the Bone. After dilating the Wound, and extracting the Splinters of the Cranium, the Wound was almoſt cover'd with a Cicatrix in the Space of five Weeks; when, a few Hours after Venereal Intercourſe with a Courtiſan, he was again ſeiz'd with a Fever; and the Pain of his Head became more violent than before. The oppoſite Side, in the mean time, became paralytic; the Arm, on the Side on which he had receiv'd the Wound, was ſeiz'd with Convulſions; and, on the fourth Day after, he died. In the *Hiſtoire de l' Academie des Sciences*, for the Year 1700. we have an Account of a Boy, who, falling from an Eminence, receiv'd a Wound in his Head, which at firſt was thought to be but ſlight. Some time after, however, the Bone began to be denudated in the Middle of the Wound; and in the Sagittal Suture a ſmall Hole appear'd, thro' which a large Quantity of Pus was diſcharged. This Evacuation was ſometimes ſtopt for a few Days; and, at this time, his Right Arm was four or five times a Day violently convulſed, for the Space of a Quarter of an Hour; as alſo the Jaw on the ſame Side. As ſoon as the Evacuation of Pus return'd, theſe Convulſions ceas'd. At laſt, upon the Patient's Death, the whole Left Lobe of his Brain was found ſuppurated, whilſt the Right Lobe and Cerebellum remain'd entirely ſound.

Valſalva, in his Treatiſe *de Aure humana*, affirms, that, in the Diſſection of many Subjects, either of whoſe Sides had been paralytic, he always found the Cauſe of the Diſorder lodg'd in the oppoſite Side of the Brain; and mentions Men of Skill and Learning, who were preſent at theſe Diſſections. And if, on any Occaſion, he found the Wound extending to the other Side of the Brain, yet he obſerv'd, that it was more conſiderable in the oppoſite Part. Among the Men of Skill and Learning, who were preſent at theſe Experiments, he mentions *Petrus Molinellus*, Doctor of Philoſophy and Medicine, who, in his *Comment. de Bononienſi Scientiarum & Artium Inſtituto*, made the following remarkable Experiment: He open'd the Left Part of the Cranium of a live Dog; then, making frequent Punctures in the Dura Mater, he obſerv'd, that the Dog was thrown into various Convulſions, eſpecially when that Part of the Dura Mater, which adher'd moſt firmly to the Cranium, was prick'd; but the Animal never became apoplectic. At laſt he extracted the Left Lobe of the Brain entirely; upon which the Animal immediately fell, not on the Left Side, as might have been expected, but on the Right; and, being raiſed up, fell down again on the ſame Side. The Right Part of his Body ſeem'd, in the mean time, to be deprived of all Senſation and Motion; whilſt the Left, on the contrary, retain'd both. He adds, that he knew others who had tried the ſame Experiment with the like Succeſs; and, from theſe Circumſtances, concludes, that *Morgagni* and *Lanciſi* had juſt Reaſon to affirm, that we might eaſily conjecture what Part of the Brain was injur'd, provided we only remark what Side of hemiplectic Patients was affected.

Many other Caſes might be brought, which both in other Diſorders, and in Wounds of the Head, confirm the Truth of this Doctrine; but theſe already given are ſufficient: And this Doctrine is, in a particular manner, confirm'd by the laſt-mention'd Experiment made upon the live Dog. 'Tis not, however, to be denied, that, in practical Authors, ſome Inſtances occur, which ſeem repugnant to this Sentiment.

Thus *Foreſtus*, in *Obſervat. Lib.* 10. *Obſ.* 11. gives us the Caſe of a Boy of eleven Years of Age, who, falling into a violent Lethargy, had, whilſt faſt aſleep, the whole Right Side of his Body ſo affected with a Palſey, that the Powers both of Senſation and Motion were deſtroy'd in it. *Foreſtus*, being call'd, and having no other Medicines at hand, apply'd Thyme, beat up with Vinegar, to his Right Noſtril, by which the Boy ſeem'd to be ſomewhat relieved; and, at the ſame time, a thick, highly corrupted, bloody, and viſcid Matter, reſembling putrid Sanies, was diſcharged from the Noſtril. From this Circumſtance *Foreſtus* prognoſticated, that there was an Abſceſs and Sphacelus lodged in the Right Part of the Brain. Soon after, the Boy died: But *Foreſtus*, before his Death, concluding his Caſe to be deſperate, intended to leave him; but was detain'd by a Lady of Diſtinction, who had the Care of the Boy in his Parents Abſence, with a View to have the Body diſſected, the Cauſe of his Death diſcover'd, and a juſt Account of the Accident given to the Parents. The Cranium being divided, the poſterior Parts of the Brain and Cerebellum, on the Right Side, were found entirely ſanious, putrid, corrupted, and bloody; but, on the Left Side, the Brain was white, ſound, and uncorrupted. Thus the Truth of the Prognoſtic, diſcover'd in the Subject, procured a large Share of Reputation to *Foreſtus*. This Caſe, ſo accurately deſcribed, is directly repugnant to thoſe before given, and ſeems to be of conſiderable Moment.

Bonetus, in his *Sepulch. Anatom. Pract. Lib.* 1. *Sect.* 15. *Obſerv.* 27. gives us an Account of a Youth, who was wounded in the Region of the Left Bregma. Next Day convulſive Motions were obſerved in his Right Side, and his Left became paralytic. The whole Region of the Left Bregma was found contuſed to ſuch a Degree, that eight Splinters of Bone were ſpontaneouſly ſeparated, one of the ſharpeſt of which had pierc'd both Meninges, and was found lodged in the Subſtance of the Brain itſelf. In this Caſe, the Side on which the Wound was inflicted became paralytic, and the oppoſite Side was convulſed, which is quite the Reverſe of what happen'd in the above-mention'd Inſtances.

Valſalva, in the fifth Chapter of his Book *de Aure humana*, frankly and ingenuouſly confeſſes, that, in one or two Inſtances, the Diſorder to him appear'd equal in both Hemiſpheres of the Brain; but that he had moſt frequently found that Side of the Brain affected, which was oppoſite to the paralytic Side.

But we muſt obſerve, that frequently no Diſorder has, after Death, been found in the Brain, tho', before Death, its Functions have been highly impair'd and injur'd; for a ſlight Change or Compreſſion of the tender Stamina, of which it is compoſed, is ſufficient to produce the moſt terrible Symptoms, as *Valſalva*, in the Place above quoted, proves by a beautiful Experiment.

The Nerves of a Dog, which are diſtributed to the Heart, being ſtrongly compreſs'd by a Ligature, which was immediately after removed, they were ſo weaken'd in their Structure, that

the Dog died ſome Days after, juſt as if they had been cut off; but, upon being inſpected, the ſmalleſt Marks of any ſenſible Injury they had ſuſtain'd were not to be diſcover'd: Hence it may happen, in ſuch Caſes, that, by the Concuſſion only, the oppoſite Hemiſphere of the Brain may be injur'd, tho', at the ſame time, no Diſorder ſhould be diſcover'd after the Death of the Patient; which will appear ſtill more probable, when we conſider, that the Cranium is often fiſſur'd in the oppoſite Part, whilſt that on which the Blow was received remains entire, as we have already obſerved.

Since, then, numberleſs Obſervations made by celebrated Authors, and Experiments tried on live Animals, confirm this decuſſated Action of the Brain, which is the immediate Inſtrument of Senſation and Motion; ſince there are only few Inſtances repugnant to this Doctrine, and ſince even theſe may be explain'd in ſuch a manner as to appear leſs inconſiſtent with it, it is obvious, that it is, if not certain, yet at leaſt highly probable, that, if the one Side is paralytic, and the other convulſed, then the Origin of the Diſorder is lodged within the Cranium, in the Part oppoſite to the paralytic Side: But if the Convulſion ſeizes the Right Side, and if no Diſorder is obſervable in the Left, then, for the ſame Reaſon, it ſeems highly probable, that the Left Part of the Brain is ſo affected, that the equable Influx of the Spirits into the Muſcles of the Right Side is indeed diſturb'd, tho' not entirely obſtructed. Such Caſes occur among the Inſtances already given.

But it is to be particularly obſerved, that, in the Nerves, this Oppoſition of Direction does not obtain, which, by theſe Experiments, is diſcover'd in the Brain; for the Nerves, ariſing in the Right Part, are diſtributed thro' the ſame Side. Some celebrated Anatomiſts have been of a different Opinion, and believed, in particular, that the Optic Nerves mutually decuſſated each other; and that each of them reach'd to the Eye of the oppoſite Side: And ſome Philoſophers have been of Opinion, that this Circumſtance might enable us to account for many Phenomena in Optics. A fortuitous Inſtance has, however, prov'd the contrary: The celebrated *Santorini*, as we are inform'd in the third Chapter of his *Obſervat. Anatom.* was diſſecting the Body of a Man, whoſe Right Eye had, for a long time before his Death, been blind of a true *Amauroſis*; tho', at the ſame time, no apparent Diſorder was obſervable in the Eye itſelf. The Optic Nerve of this Eye was found ſlenderer, and of a more dark and cineritious Colour, than it ought to have been: And, when this accurate Anatomiſt was diligently tracing it as far as he could, he perceived, by the Diverſity of its Colour, that it always kept the Right Side. He evidently obſerved, at the ſame time, that the Optic Nerves were ſo far from decuſſating each other, that they were not ſo much as mix'd; but that they only lay juſt by each other, and were again diſjoined.

When it appears, that the Functions of the Brain are injur'd, whatever be the Cauſe, by the Application of which to the Head ſuch an Effect is produced, our firſt Care is to inquire into the Nature of the Hurt or Injury; as, whether it be a Compreſſion of the Brain from the forcing inwards of the Cranium, a Puncture or Laceration of the ſame Part by ſome ſharp Fragments of that Bone, an Effuſion of Humours under the Cranium, or, laſtly, a violent Concuſſion. The diagnoſtic Signs belonging to each of theſe Caſes have been ſhewn already; and the Cure of a depreſs'd Cranium has been treated of above.

By a violent Concuſſion, the very tender and pulpous Subſtance of the Brain may be affected in ſuch a manner, as to have its minuteſt Veſſels compreſs'd by the Shock, ſo as to prevent the Paſſage of the Humours thro' them: But if theſe Veſſels are not broken, or wholly deſtroy'd, an equable Circulation of the Humours will open anew theſe compreſs'd minute Canals; and, after ſome Hours, the Brain will, by degrees, reſume its Functions. If there be any thing ſettled under the Cranium, which may compreſs or hurt the Brain, the general Indication directs us to remove it; in which Caſe it will appear reaſonable to obſerve the following Rules:

Firſt, Then, the extravaſated Blood is immediately to be taken away;

Becauſe, ſo long as it remains, it will preſs upon the Brain; and, if this Preſſure continues long, the Sides of the ſmall Canals, thus compreſs'd, will grow together, and remain for ever impervious; and hence an incurable Impediment to the Functions may ariſe.

Secondly, The Parts infected muſt be depurated,

And cleanſed from the extravaſated Humours, corrupted by their Stagnation, and converted into Pus, Ichor, or Sanies: And the ſolid Parts, if affected, muſt be deterg'd, and reduced to a ſound State.

Thirdly, If any Splinters of Bone ſtick in the Brain, they muſt be taken away.

The extravaſated Blood is taken away,

Firſt, By Reſorption.

In Contuſions where, the Veſſels being broken, an Effuſion of Blood ſettles under an entire Skin, and marks the Place affected with a black or blue Spot, we very frequently obſerve all the extravaſated Liquid to diſappear by degrees, being inſenſibly reſorb'd into the bibulous Veſſels of the Veins, and attenuated by the Afflux of thinner Humours. What ſhould hinder, then, but that the ſame Effect might be accompliſh'd in ſuch a Place as this, of which we are ſpeaking? Now extravaſated Blood, in a cloſed Place, where the Air has no Acceſs, may ſettle a very long time, without being corrupted.

Secondly, By Diſſipation;

Which is effected, when the extravaſated Blood is ſo attenuated by Diluents and Reſolvents, as to be reſorb'd into the venous Veſſels, which are open, and extended over all the internal, as well as external, Superficies of the Body; and is by that means diſſipated, and inſenſibly diſappears.

Thirdly, By perforating the Cranium.

When the Quantity of extravaſated Blood is ſo great, as, by its ſtrong Compreſſion, to injure the Functions of the Brain to a very conſiderable Degree, the Caſe will not allow us Time for the Removal of ſo great an Inconvenience by the ſlow Ways of Reſorption or Diſſipation; for the Patient would often ſooner periſh. There remains, then, no other Help, but the neceſſary, tho' cruel, Remedy of the Trepan; by which, the Cranium being perforated, a Paſſage is open'd for the Diſcharge of the extravaſated Blood.

We come now to give Directions how each of the three fore-mention'd Intentions may be anſwer'd.

The Blood is ſaid to be reſorb'd, when it is repel'd, by the vital Powers, into the Veins evacuated by plentiful Bleeding, and ſuccedaneous Purging.

If we open the Cranium of a living Animal, which is young, and which, for that Reaſon, will the more eaſily admit of having the Cranium removed, there manifeſtly appears a Vapour to exhale from the internal Parts, the Surfaces of both Membranes are cover'd with Humidity, and the whole Circumference of the Ventricles is moiſten'd with a thin Sort of Dew. The fineſt and minuteſt Veſſels, being thus in a State of continual Exhalation, muſt, by that means, diſcharge a very thin Liquid, ſuch as moiſtens and cheriſhes theſe internal Parts. If, therefore, there were no reſorbent Veins in thoſe Places, the Quantity of Liquor would by degrees be ſo accumulated, as, by Compreſſion, to deſtroy the Functions of the Brain; and hence I conclude, that the extravaſated Blood muſt be reſorb'd by the gaping Orifices of theſe minute Veins. It may ſeem ſtrange, perhaps, that the Blood, which immediately concretes when out of the Veſſels, ſhould be capable of entering theſe very fine Tubes; but if we conſider, that the extravaſated and concreted Blood is by degrees again diſſolved, and reduced to a thinner Liquid; and the ſooner, as ſuch an Effect is promoted by the Influence of a kindly Heat, and the very fine dewy Exhalations which are continually diluting the coagulated Blood; and further, that the Cranium, being always full, is ſtrongly preſs'd; and that the arterious Fabric belonging to the Brain, and eſpecially the Veſſels of the Dura Mater, are alternately diſtended and contracted by the Blood impel'd by the Heart; it will appear from theſe Conſiderations, that the extravaſated Blood is not a Moment free from Preſſure, Attrition, and Dilution, with the fineſt of Liquids; whence it may, at length, be ſo attenuated, as to be capable of entering the leaſt Orifices of the abſorbent Veins. But ſince theſe minute abſorbent Veſſels convey the Humours, after Reſorption, to Veins of a larger Capacity, the Reſorption will be facilitated by the Depletion of the larger Veins; for which Reaſon, taking away a large Quantity of Blood is here recommended. Again, ſuch Cathartics as ſtrongly evacuate, and, without Acceleration of Motion, or adding a Stimulus, powerfully reſolve, are proper to diſcharge the Body of Humours; which being effected, thoſe Humours which remain are attenuated, and, their Paſſage into all Parts being facilitated, the Veſſels are leſs diſtended. By theſe means an eaſy Ingreſs is open'd for the reſorb'd Humours into the exhauſted Veins; and the Body, being render'd drier by theſe Evacuations, greedily abſorbs the Liquids, where-ever contiguous to its internal or external Superficies: Hence ſtrong Purges are obſerved to excite a vehement Thirſt; and Liquids, drank in great Quantities, are very quickly abſorb'd by the gaping Orifices of the Veſſels, in the Cavities of the Stomach and Inteſtines. The great Efficacy of this Method, for Reſorption of extravaſated Blood, is apparent to Sight in great Contuſions. I knew a Tumor, ſays *Van Swieten*, in the Nates, as big as a Child's Head, which was occaſion'd by a Fall out of a Coach, totally diſſipated by this Method, tho' all the Part was black, from a Stagnation of the extravaſated Blood under the entire Skin. Now ſcarce any one will venture to ſay, that this Blood perſpir'd thro' the unbroken Skin; for, if the coagulated Blood might be attenuated to ſuch a Degree as to find a Paſſage, by Exhalation, thro'

the

the Veſſels of the Skin, it cannot be doubted, but it may very well enter the Mouths of the abſorbing Veins: Great Benefit, therefore, may be expected from this Method.

The Forms of Purges, recommended on theſe Occaſions, in *Boerhaave*'s *Mat. Medica*, are the following:

Take of the fineſt *Syrian* Scammony, fourteen Grains; and of *Hungary* Water, two Drams: When they are ſufficiently triturated in a Glaſs Mortar, add ſix Drams of ſolutive Syrup of Roſes with Sena, for a Draught. Or,

Take of the Powder of Jalap-root, one Dram; and of the fineſt Sugar, two Drams: When they are ſufficiently triturated in a Glaſs Mortar, add gradually, and at different times, three Ounces of Rain-water. Make into an Emulſion; to which add half an Ounce of the Syrup of Rhubarb, for a Draught.

Bleed, therefore, and purge, immediately upon theſe Occaſions, to the greateſt Degree the Patient can bear; and let theſe Evacuations be repeated, and that more than once, if after the preceding the Symptoms are alleviated.

Such large Evacuations, provided the Strength hold out, can never be prejudicial to the Patient, eſpecially plentiful Bleeding, which, on the contrary, tho' repeated, has been found of excellent Service; for it has been frequently obſerved, that, where there have been all the Indications of a Compreſſion of the Brain by an Effuſion of Blood under the Cranium, the Symptoms have immediately remitted under a very bold Phlebotomy, tho' the Trepan was ready to be apply'd. And tho' the Diſeaſe ſhould not give way to theſe Remedies, but it ſhould be found neceſſary afterwards to have recourſe to the Trepan, it can be of no Diſadvantage to the Patient to have his Body, by this Method, rendered leſs ſubject to an Inflammation, ſince hereby ſome very bad Symptoms, which are ſometimes conſequent upon a Perforation of the Cranium, and eſpecially the Generation of Funguſes of the Brain, are, in a great meaſure, prevented. Theſe Remedies, therefore, ſeem proper firſt to be tried before Trepanning. If, then, thoſe bad Symptoms, which attend the Compreſſion of the Brain by an Effuſion of Humours, begin to be alleviated, we may conceive good Hopes, that, by their repeated Uſe, reſpect being always had to the Strength of the Patient, they may be wholly removed. I remember, ſays *Boerhaave*, with Pleaſure, the extraordinary good Effects of this Method, which I have often ſeen; and *Paré* has a remarkable Example of Bleeding boldly, ſucceſsfully repeated. A young Man, he ſays, twenty-eight Years of Age, by a Fall, had ſtruck the Left Os Bregmatis with great Violence againſt a Stone. There was a Contuſion, but no Fracture of the Cranium. On the ſeventh Day the Patient was ſeiz'd with a ſtrong Fever, Delirium, and a great Inflammation, with a vaſt Tumor of the whole Head, Face, and Neck, beſides an Impediment of Speech, Sight, and Deglutition. The next Day the Surgeon took away twelve Ounces of Blood; and, the Day after, *Paré* being ſent for, and finding that theſe very bad Symptoms did not remit, but that the Strength was firm, he had forty-two Ounces of Blood more taken away. The following Day the Diſorder rather increaſing, he took away twelve Ounces more, and after that fifteen Ounces at two ſeveral times; ſo that, within the Space of four Days, the Patient loſt eighty Ounces of Blood, and was afterwards perfectly cur'd of ſo dangerous a Diſorder. The great *Hippocrates* has indeed obſerved, *Aphor.* 3. *Sect.* 1. "That Evacuations, carry'd to Extremity, "are dangerous;" but, in his ſixth *Aphor.* of the ſame *Sect.* he ſays, "That Diſeaſes in their Extremity require extreme "Remedies." Since, therefore, this young Man was in danger of his Life without ſpeedy Relief, we ſee the Reaſon for ſuch large Evacuations, which, in ſlight Diſorders, no prudent Man would venture to uſe.

The Diſſipation of the ſtagnating Humours is brought about,

Firſt, By a Reſorption of the finer Parts, in the manner juſt mentioned;

Secondly, By attenuating the reſt, by diluting, aqueous, and reſolvent Potions, drank very warm.

If Blood, taken from the Vein of a healthy Perſon, and coagulated, be ſhaken in warm Water, the coagulated Maſs will decreaſe by degrees, Water pour'd upon it grows red, and at laſt ſo little of it will remain as is ſcarce credible; ſome of it will, however, ſtill remain, perhaps becauſe the Blood has been ſo long expos'd to the open Air; for we every Day ſee the extravaſated Blood, in Contuſions, diſſolv'd in ſuch a manner as to be entirely diſſipated. Wherefore, after Phlebotomy and Purging, let as great a Quantity of aqueous Decoctions be drank, as the Strength is ſufficient to move and circulate with the Blood. By this means all the Blood is diluted, and the exhaling Fluid is ſupplied with Plenty of Matter, whence the coagulated Maſs is inſenſibly diſſolved, and afterwards reſorb'd into the minute Veins. But becauſe aqueous Liquors, drank by themſelves, eſpecially after great Evacuations, enervate the Body to ſuch a Degree as to diſpoſe it to a Dropſy, by beginning to collect themſelves together in its Cavities, therefore mild Aromatics, which are gently reſolvent, and alſo ſtimulating to Motion, which can do no Harm after the preceding Evacuations, are mix'd with theſe Decoctions.

For our whole Intention is directed to the rendering of the Blood ſo very much diluted, that a ſufficient and perpetual Exhalation of a thin Liquid through the ſmall Veſſels may be continually apply'd to the extravaſated Blood, till this be render'd alſo ſo diluted and attenuated, as to be capable of Reſorption into the Veins.

Boerhaave's Preſcription, in his *Mat. Medic.* is as follows:

Take of white Sanders, half an Ounce; of yellow Sanders, one Ounce; of Saſſafras, half an Ounce; of the Leaves of Rue, half a Handful; of Agrimony, one Handful; of the Flowers of *Arabian* Stœchas, and Lavender, each two Drams; of the Roots of Fennel, Parſley, and Butchers-broom, each an Ounce: Boil theſe for a Quarter of an Hour in a cloſe Veſſel, with a ſufficient Quantity of Water for four Pints of the ſtrain'd Liquor, of which let the Patient take two Ounces every half Hour.

Thirdly, By applying to the Part affected, when ſhaved, Plaiſters, Cataplaſms, and Fomentations, made of diſcutient, nervous, and cephalic Ingredients.

Theſe Remedies, indeed, cannot act directly and immediately on the extravaſated Humours, which are ſettled under the Cranium, ſince the external Parts of the Head receive almoſt all their Humours from the external Carotids. They will, however, be of Efficacy, by warming and relaxing the external Parts of the Head, ſo as to leſſen and retard the impetuous Motion of the Humours towards the inward Parts; and alſo becauſe Part of theſe Remedies enters the Blood by the reſorbent Veins of the external Skin, and afterwards, in the common Courſe of Circulation, may be convey'd to the Part affected. Nor is it always worth while to diſpute about the Manner, in which Remedies thus applied act, provided we are convinc'd, by Experience, of their Efficacy. Thus, when an acute inflammatory Diſtemper ſeizes the internal Parts of the Head, we find, that Fomentations of Water, Vinegar, and Nitre, are very ſucceſsfully applied to the Head, being firſt ſhaved. Wherefore, in ſo dangerous a Diſorder as is our preſent Subject, all Methods are to be put in Practice, and nothing left untried, from whence any Benefit, tho' never ſo little, may be expected. But, in the Uſe of thoſe Remedies, regard is always to be had to what has been ſaid above, with reſpect to the Application of Topics in Injuries done to the Integuments only; and we muſt always take care to have the Cataplaſms and Fomentations kept in a due Heat, which is done by a frequent Application of hot Woollen Cloths. The Plaiſter and Fomentation directed above, in caſe of Contuſion of the Integuments, are here proper.

Fourthly, By the Application of the ſame diſcutient, nervous, and cephalic Ingredients to the Ears and Noſe.

The Dura Mater, it is true, moſt exactly covers the internal Superficies of the Cranium, ſo that the whole Maſs of the Brain ſeems to be ſecluded from all others within its proper Region: However, we are convinced by Obſervations, that theſe two Places are a kind of Vent-holes to the Brain, by which the Humours are often diſcharg'd in a ſurpriſing Manner. We took Notice above, that chronical Diſorders of the Head are often very quickly relieved by an Efflux of Water, Pus, or other Matter, thro' the Ears or Noſtrils, and confirm'd the ſame by the Teſtimony of *Hippocrates*: And it is well known, that in all Diſeaſes of the Head, which proceed from a Repletion of the Veſſels of the Brain, or an inflammatory Denſity of the Humours, an Efflux of Blood by the Noſtrils has proved beneficial. We have alſo related Examples above, by which it appeared, that in very terrible Hurts of the Head, which, by the unanimous Advice of the moſt experienc'd Phyſicians and Surgeons, required the Uſe of the Trepan, the Patients have been cured by an Efflux of Lymph thro' the Ears; ſo that the neareſt Way to the internal Parts of the Head ſeems to be thro' theſe Paſſages. Of this we are certain, that on the Top of the Noſtrils is placed the Os Ethmoides, like a thin Plate full of Perforations, which, indeed, in a living Perſon, are moſt exactly fill'd up with Vaginal Proceſſes, and nervous Fibrils, from the Dura Mater; but how thin is the Partition, which, in this Place, ſeparates the Cavity of the Cranium from the Noſtrils! So that Vapours attracted thro' the Noſtrils are almoſt immediately applied to the Brain.

If, after the Evacuations and Applications above directed, the Symptoms are not entirely removed, or, at leaſt, much diminiſh'd, but, on the contrary, perſevere or increaſe, the Cranium muſt immediately be perforated by the Trepan, for the Convenience of diſcharging the extravaſated Humours, depurating

depurating the affected Parts, and removing the Splinters of Bone, if any should stick in the Brain, or its Membranes.

It seems a Piece of Rashness and Cruelty to be immediately for perforating the Cranium, upon Indications that the Functions of the Brain are very much injured by a Wound of the Head: For, unless we are certain, that the Cranium is depress'd, or that some Fragments of it hurt the Brain, and that these Disorders can no way be remov'd but by the Trepan, it is best to wait a few Hours at least, and try whether the Symptoms may not be mitigated by strong Evacuations: For many such Cases occur every Day; as where a Person, by a Fall from an Eminence, lies depriv'd of all Sense and Motion, and, after a few Hours, revives by degrees, the Brain being disturbed by so strong a Concussion, tho' there was no Effusion of Humours. And tho' it might be proper to apply the Trepan, yet the taking away a large Quantity of Blood can never be prejudicial, but on the contrary, be highly beneficial: Therefore the Method before proposed seems fittest always to be tried in the first Place; and if, in the Space of twelve Hours after the Use of those Remedies, the Patient receives not the least Relief, but the Disorder rather increases, the last and only Remedy left is, by making a Perforation in the Cranium, to open a Way for the Discharge of the extravasated Humours. The Friends of the Patient are to be then seriously told, that nothing but Death can be expected, and that in a short time; that the only Way, by which it can possibly be prevented, is by the hazardous and troublesome Operation of the Trepan, from which there is good Reason to expect much Benefit, but not a certain Cure cannot be promised: For it is possible, that the extravasated Humours may be lodg'd in such Places, as, tho' the Cranium be opened, may render their Discharge impracticable; and a strong Concussion may break the very tender Stamina of the medullary Substance of the Brain, on which the human Life and Functions depend. When the Operation is determin'd to be necessary, the sooner it is perform'd, the better; for the Efflux of the Liquids out of the broken Vessels will continue, and the Compression of the Brain, by the extravasated Liquid, which increases in Quantity every Moment, will be augmented; whence it often happens, that the very tender medullary Fibres, which are only pervious to the thinnest Liquid in all the Body, having their Sides compress'd, and render'd contiguous, cease to be open Canals; and tho' the compressing Liquids may be afterwards discharged, yet the Sides of these minute Vessels, being once rendered contiguous by the equable Pressure of the surrounding Liquid, will always continue in that State of Contact; whence they will grow together, to the irreparable Damage of all those Functions which depend on the Motions of the most subtile Liquid thro' these minute Vessels: Besides, the extravasated Humours, being left to settle for a considerable Time, may be corrupted, and, by their acquir'd Acrimony, corrode every thing near them. From the Whole it appears, that Delay in this Case is dangerous; and yet, by very credible Observations, we are inform'd, that Perforation of the Cranium has been very successfully perform'd a long time after the Hurt was receiv'd: For Instance, a Man receiv'd a Wound in his Head, which, being attended with no bad Symptoms, was healed in fourteen Days. A long time afterwards the Patient was seized with a great Pain of the Head, a Vertigo, and Dimness of Sight, with a Palsey of the Right Arm; all evident Symptoms of some latent Disorder of the Parts of the Head. Upon this Consideration *Scultetus*, (*Arm. Chir. Obs.* 13.) the nine-and-twentieth Week after the Wound was inflicted, laid bare the Cranium, and, observing a narrow Fissure, he made two Perforations in the Cranium, and cut out the Bone between them with a Saw. Thro' this wide Aperture the Collection of Humours under the Cranium was discharged, and, in a Month's time, the Patient was restor'd to his perfect Health. From this History it plainly appears, that the Quantity of extravasated Liquid under the Cranium was at first but inconsiderable; but the Cranium being divided with a small Fissure, there arose, by degrees, a Collection of Pus or Sanies in the Place. But when, after a Rupture of the Vessels, there immediately gathers a considerable Quantity of the effused Liquid under the Cranium, it is plain, that the Operation cannot long be deferred without Danger. Wherefore *Hippocrates*, *de Cap. Vuln.* speaking of those Cases which require Perforation, says, "That in three Days we must "proceed to Section, and never exceed that Time, especially "if we undertake the Cure, at first, in a hot Season of the "Year:" And yet he is treating here only of such Wounds of the Cranium as could not be erased with the Rugine; but the Danger is more imminent and pressing from an Effusion of Humours under the Cranium.

Trepanning the Cranium is usually undertaken, as is said above, for the sake of raising a loose and depress'd Bone with the Elevator, but, in this Case, a threefold Benefit may be expected from it: First, The opening a free Passage for the Discharge of the extravasated Liquids; secondly, That, if any thing should require to be separated by Suppuration from the living Parts, the Pus, after it is generated, may find a Vent; and, lastly, That the Fragments of the Bone, which incommode the Brain by Puncture, Laceration, or otherwise, may conveniently be extracted.

Mr. *Sharp* seems not to agree entirely with *Boerhaave*, but is for trepanning at all Adventures: Altho' People with Concussions in a violent Degree, says he, sometimes recover, it is so very seldom, that there can be no Pretence, when they happen, for neglecting the Trepan, but not being able to learn in what Part the Concussion is. The Opportunities I have had, says *Sharp*, of opening some People who have died under this Circumstance, have sufficiently convinc'd me, how little is to be trusted to any other Method than an Opening for the Discharge of the Abscess, which, by Confinement of the Matter, becomes very sharp, spreading over a great Quantity of the Brain before it kills.

When we are assur'd of a Fracture or Depression, tho' the Symptoms, in a great measure, go off, it is yet adviseable to trepan as soon as possible, to prevent the spreading of the Abscess, which seldom fails to follow upon the Rupture of the Vessels of the Brain and Membranes, and, for the most part, in a few Days, tho' there are a great many Instances of Fractures not bringing on a fatal Abscess for a great Length of Time after the Accident.

Sharp says, he once trepan'd a young Woman about a hundred Days after she receiv'd the Blow. The lower Part of the Parietal, and upper Part of the Temporal Bones, were fractur'd and depress'd. She had bled at the Nose and Ears when she first receiv'd the Injury, and had at times been drowsy, and in some little Pain, till towards the ninetieth, when the Symptoms of a compress'd Brain came on stronger; and, a small time after, she put herself under his Care; which, with the many Instances of the same kind to be met with in Authors, shew how little safe it is to trust to any Extravasation, or Depression on the Brain, doing well, without the Assistance of the Trepan. *Sharp*.

The Trepan is to be applied upon the Part of the Cranium which is injur'd, as being the most proper Place, unless any Circumstances render its Application there improper.

After it is agreed upon to apply the Trepan, in order to procure a free Discharge to the extravasated Humours, it ought next to be diligently inquir'd, on what particular Part of the Cranium this Operation is to be perform'd. 'Tis sufficiently obvious, that, when by the Signs already enumerated the wounded Part is discover'd, the Trepan ought to be apply'd there, since 'tis most probable, that the extravasated Blood will reside in that Part; but, from what follows, it will appear, that there are various Parts of the Cranium, where it is either absolutely impossible, or highly dangerous, to apply the Trepan. The Part, then, to which this Instrument is to be apply'd, ought not to be determin'd without mature Deliberation and Reflection, lest afterwards the Repetition of this Operation, apparently so cruel in the Eyes of the By-standers, tho' the Patients themselves are, on these Occasions, generally so stupid and dull as to be insensible of Pain, should again become necessary.

The Circumstances which render Trepanning immediately upon the injur'd Part of the Cranium improper are,

First, A Suture lying immediately under it.

Whilst, in a human Subject, Anatomists endeavour to elevate the Cranium after it is every-where divided with a Saw, they evidently perceive, that the Dura Mater, almost in every Part, adheres to the Cranium; but that, where the Sutures occur, this Adhesion is so strong, that, by the Interposition of an Iron Lever, it can with Difficulty be separated. 'Tis, therefore, obvious, that if, in these Parts, the Trepan is apply'd, the orbicular Portion of Bone cut cannot be extracted without a considerable Dilaceration of the Dura Mater; whence an immense Pain, Convulsions, and other terrible Symptoms, may be produc'd. For this Reason, by the common Consent of all Authors, these Parts are avoided, and the Trepan is rather to be applied on either Side of the Suture, than directly on it. *Hildanus*, in *Observ. Chir. Cent.* 2. *Observ.* 8. gives us an Account of a Man who receiv'd a severe Wound with an Ax, in that Part where the Sagittal is united with the Coronal Suture. After very terrible Symptoms, and the Extraction of several Splinters of Bone, the Patient, indeed, recover'd; but *Hildanus* could not, with all his Art, prevent a fistulous Ulcer remaining in the Part. For this Reason he ranks the Difficulty of Cure among the Arguments used against applying the Trepan immediately upon the Sutures: But the celebrated Physician *Johannes Fredericus Werdenburgius*, in an Epistle to *Hildanus* on this Subject, to be met with in the last quoted Part of that Author, affirms that he saw this Operation perform'd immediately on the Sutures, when he resided in *Italy*, for the sake of Improvement in his Studies. But 'tis obvious, from what has been now said, that it is always dangerous to apply the Trepan on the Sutures themselves.

Secondly,

Secondly, Some remarkable Muſcles lying upon the Part.

'Tis ſufficiently known, that about the Occiput very ſtrong Muſcles are inſerted in the Cranium, and that its lateral Parts are, on both Sides, poſſeſſed by the Temporal Muſcles; for which Reaſon theſe Parts ought, if poſſible, to be avoided. *Hippocrates*, in the nineteenth Section of his Treatiſe on Wounds of the Head, informs us, "That the Head may be ſafely cut in "any Part, except in the Temples, and that Space which lies "above them, near the Vein which paſſes thro' the Temples; "and that theſe Parts ought not to be cut, becauſe, by that "means, the Patient is ſeized with Convulſions." And, in a "Paſſage of his *Coacæ Prænotiones*, already quoted, he tells us, "That they who are cut in either of the Temples, be-"come convuls'd on the Side oppoſite to that on which the "Inciſion was made." From which we may conclude, that it is always dangerous to wound theſe Muſcles, tho' Death does not always enſue; for many Caſes prove, that theſe Muſcles have been cut, and the Trepan apply'd to that Part of the Cranium which lies under them, and that, notwithſtanding this, the Patients have recover'd. We ſhall give a few Inſtances of this kind from among the great Number that might be brought *Scultetus*, in his *Armamentar. Chirurg. Obſerv.* 3, gives us an Account of a Man who receiv'd a Wound in his Left Temple with a Hanger, which made a Fiſſure in his Cranium large enough to admit the fore Finger; yet this Wound, apparently ſo dangerous, was ſoon cur'd, and the Patient ſav'd. *Riverius*, among the Obſervations communicated to him by *Samuel Formius*, a Surgeon of *Montpelier*, who had practis'd for fifty Years, gives us the following Caſe, in the nineteenth Obſervation: A certain Woman receiv'd a Blow with a Stone on her Left Temple. When the Trepan was thought neceſſary, that ſkilful Surgeon, being call'd to the Conſultation, did not heſitate to make a crucial Inciſion in the Temporal Muſcle, and apply the Trepan to the denudated Cranium; and he affirms, that no violent Symptom enſu'd. He elſewhere gives us another Caſe of a like Nature, which was communicated to him by another Surgeon. A Boy of twelve Years of Age, by a Fall from a high Tree, had his Temporal Bone ſo fractur'd, that the Surgeon was forc'd to remove a large Portion of the Temporal Muſcle, in order to diſcover the latent Diſorder, and apply the Trepan. The Cure, however, ſucceded happily in every reſpect, except that the lower Jaw remain'd a little diſtorted towards the oppoſite Side. Where Neceſſity, therefore, demands it, it is more adviſeable to apply the Trepan to theſe Parts, than cruelly to abandon the Patient to inevitable Death.

Thirdly, The Cavities of the Os Frontis lying under it.

It is ſufficiently known, from anatomical Obſervations, that the Tables of the *Os Frontis*, divided from each other, conſtitute what we call the Frontal Sinuſes, which are, for the moſt part, pretty large; but of different Sizes in different Men, lengthen'd out above the Orbits of the Eyes, almoſt to the Middle of the Eye-brows, and ſometimes divided into leſſer Cavities by bony Lamellæ. Theſe Sinuſes open in two pretty large Apertures, at each Side of the Septum Narium, and thus increaſe the internal Cavity of the Noſtrils. Theſe Sinuſes are every-where cover'd with the ſame Membrane which lines the internal Surface of the Noſtrils. If, therefore, the Trepan was apply'd here, upon perforating the external Table, this Membrane, which covers its internal Surface, would forthwith occur; and there would be a Neceſſity for removing it, as well as that Part of the ſame Membrane, which, in like manner, covers the internal Table, before the internal Table could be perforated. 'Tis therefore obvious, that this muſt be highly difficult, if not altogether impoſſible; ſince the Membrane, lining the Cavity of the Noſtrils, is ſo exquiſitely ſenſible, that, by the ſlighteſt Agitation of a Feather in the Noſtrils, Sneezing is excited, and the whole Body convulſed. We muſt, at the ſame time, obſerve, that thoſe Wounds, which penetrate to the Frontal Sinuſes, can ſcarcely ever be brought to a Cicatrix. *Celſus*, in the fourth Chapter of his eighth Book, made this Obſervation; and expreſly tells us, "That, after the Application of the "Trepan, a Cicatrix may be induced on all Parts of the "Head, except that Part of the Forehead which lies a little "above the intermediate Space between the Eye-brows; for "here it is ſcarce poſſible, but, during the Whole of the Pa-"tient's Life, an Exulceration muſt remain, which muſt be "cover'd with a Cloth, on which ſome proper Medicine is to "be laid." The Obſervations of later Authors have ſince given a Sanction to this Remark. Theſe Parts, then, the Situation of which is to be learn'd from Anatomy, are carefully to be avoided in the Application of the Trepan.

Fourthly, The Neighbourhood of ſome conſiderable Artery.

Upon accurately viewing a prepar'd human Cranium, in its internal Surface, various Impreſſions appear, and ſometimes conſiderably deep Traces, which correſpond to the Ramifications of the larger Arteries diſtributed thro' the Dura Mater. But if ſuch a large Branch of an Artery ſhould occur, and, during the Operation, happen to be lacerated by the Teeth of the Crown, a violent Hæmorrhage may happen, which not only embroils and diſturbs the Operation, but is often ſtopt with Difficulty. But it is a difficult Taſk exactly to determine theſe Parts; becauſe, in different Men, the Situation of theſe large Ramifications varies: There are, however, ſome Parts in which theſe larger Sulci, or Furrows, are generally found in moſt Craniums; theſe Parts are, therefore, to be avoided in applying the Trepan. Thus, for Inſtance, in both the Oſſa Bregmatis, near the Coronal Suture in the inferior lateral Part, ſuch a large Furrow appears, and is gradually diminiſh'd as it aſcends; but theſe Parts are principally known by a mutual Compariſon of different Craniums with each other.

Fifthly, The low Situation of the Part injur'd.

For if the diſcharg'd Humours are lodg'd near the Baſis of the Cranium, there is ſcarce any Hope, that they can be evacuated by the Trepan, ſince it muſt of courſe be apply'd much higher. 'Tis, indeed, true, that, ſince the Cranium is always exactly full, the extravaſated Humours may, by the Preſſure of the Brain which fills the Cavity of the Cranium, be forced up to the Perforation made, and thus evacuated. But, at the ſame time, 'tis obvious, that this Effect muſt be with conſiderable Difficulty brought about. *Tulpius*, in the third Chapter of the firſt Book of his *Obſerv. Medic.* gives us an Account of a Man of ſeventy Years of Age, who, being drunk, and falling from an Eminence, receiv'd ſo large a Wound in his Cranium, that, thro' the Aperture, every thing that ſtuck in the external Membrane of the Brain might be extracted. He was, however, forthwith ſeiz'd with a Vertigo, a Vomiting, and a Stupor. Next Day, indeed, he appear'd free from a Fever, and all other Symptoms; but, on the fourth Day, he unexpectedly died apoplectic, after having expectorated a purulent Matter. Upon laying open his Cranium, a large Quantity of Humour was found in the Ventricles of his Brain; and, near the Sella Turcica, a large Splinter of the Os Cuneiforme appear'd ſeparated from the reſt of the Bone; and there was, in this Place, a large Collection of coagulated Blood. Since, then, thro' ſo large a Wound, the diſcharg'd Blood, collected near the Baſis of the Brain, could not be evacuated, 'tis obvious, that, in ſuch a Caſe, very little Good was to be expected from the Application of the Trepan. Hence *Celſus*, in the twenty-ſixth Chapter of his fifth Book, juſtly affirms, that "the Patient, the "Baſis of whoſe Brain is wounded, cannot be preſerv'd."

Sixthly, The Inſtability of the Bone, whether on account of a Fracture, Contuſion, or Caries.

Upon applying the Trepan to the Cranium, the orbicular Portion of Bone cannot be extracted, without preſſing the Trepan to the Bone: If, therefore, that Part of the Bone, to which the Trepan is apply'd, is either entirely diſengaged from the reſt, or only retains a ſlight Coheſion, it will, in the Operation, be depreſs'd, and the ſubjacent Brain by that means compreſs'd. The ſame Misfortune is to be dreaded, when a Lues Venerea, for Inſtance, has corroded the Bone, or when the Cranium has, by any other Cauſe, contracted a Caries; for, in theſe Caſes, the Trepan, applied with a very gentle Force, would forthwith penetrate thro' the whole Thickneſs of the Bone. We have already given Inſtances of the Bone of the Cranium becoming thus corrupted, after Wounds of the Head.

Seventhly, A conſiderable external Convexity, and, in conſequence of that, an internal Concavity of the Part.

Upon accurately examining the internal Surface of the Cranium, it evidently appears, that it is not ſmooth and even, but that in ſome Parts it protuberates and riſes; whereas in others it is more excavated, that it may be the better accommodated to the Veſſels and Sinuſes of the contain'd Brain: Hence the Bone of the Cranium is of a different Thickneſs in different Parts. It would, therefore, be moſt proper, whilſt we are deliberating on the Part to which the Trepan is to be apply'd, to take a View of ſeveral Craniums, and obſerve in what Parts theſe Inequalities are principally found, that we may, if poſſible, avoid them.

Tho', from the Rules of Art, and an anatomical Knowledge of the Parts, it is ſufficiently obvious, that, in the Application of the Trepan, the ſeven Circumſtances above enumerated render the Application of it, upon the Places above-mention'd, improper, if it can be avoided; yet the beſt Surgeons have, in Caſes of Neceſſity, adviſed to perform the Operation, tho' it ſhould be attended with ſome of theſe Diſadvantages; ſince, when the Death of the Patient is otherwiſe certain, it is often better to try a doubtful Remedy than none at all; for it is ſcarce credible, that all theſe Cautions could be obſerved, with reſpect to a Girl of twelve Years of Age, who, falling from an Eminence, had the Trepan apply'd to twelve different Parts of her

Cranium, in the Space of a few Days. The Girl, however, was perfectly cured, tho' the whole Os Bregmatis, and Part of the Temporal Bone, were entirely fractur'd by the Violence of the Fall. This memorable and surprising Case is related by *Dionis*, in his *Operat. de Chirurgie*, whose Son perform'd the Operation, the fourth time, on the Patient.

If any of the above related Circumstances render the Application of the Trepan, to the injur'd Part, improper, it must be apply'd as near as is possible to that Part.

When, for the Reasons above enumerated, the Trepan cannot be apply'd on the wounded Part, the Place, of all others the most proper for its Application, is that which is free from these Obstacles, and lies most contiguous to the Part immediately afflicted. Some Cautions, however, of considerable Importance, are to be observed, with respect to this Particular: The Dura Mater, as has been before observ'd, adheres everywhere to the Cranium, but most strongly where the Sutures occur: Hence the discharg'd Blood, lodging between the Cranium and Dura Mater, may separate the latter from the former; but this cannot happen in those Parts where the Sutures occur: Hence the Blood, extravasated between the Cranium and Dura Mater, will remain confin'd within certain Limits; since it cannot easily go beyond the Parts where the Sutures occur. Thus, for Instance, if the wounded Part was in the anterior Portion of the Os Bregmatis, which, on account of its Vicinity to the Coronal Suture, by which it is join'd to the Os Frontis, and the large Artery which is generally situated here, cannot have the Trepan safely apply'd to it; then, indeed, the Place most contiguous to it is to be chosen, but, at the same time, this Place must be contain'd within the Os Bregmatis; for, if the Trepan was apply'd to the Os Frontis, on the other Side of the Coronal Suture, the Blood lying below the Os Bregmatis, on the Dura Mater, could not be evacuated; because the Dura Mater, adhering strongly to the Coronal Suture, will prevent its being discharg'd that Way. With this Limitation we are, therefore, to understand the general Rule, which orders us to chuse the most contiguous Part, when the Trepan cannot be apply'd to the Part affected itself; for the Blood, extravasated between the Cranium and Dura Mater may thus be lodg'd, as it were, in distinct Cells, which have no manner of Communication with each other. The largest Space of this Kind is under the Ossa Bregmatis, and is, by the Sagittal Sutures, divided into two such equal and distinct Cells. This also holds with respect to the Forehead, which, in like manner, has a Space thus separated; for, since the Os Frontis is generally in young Persons, and often in Adults, divided as far as the Root of the Nose, by a middle Suture, it is obvious, that this Space must, in like manner, be divided into two.

But, when the extravasated Blood is lodg'd between the Dura and Pia Mater, we must remember, that the whole internal Cavity of the Cranium is divided into two Parts; for what is commonly call'd the Falciform Process of the Dura Mater, reaches from the Crest of the Os Ethmoides, all along the Sagittal Suture, as far as the transverse Process of the Dura Mater, which covers the Cerebellum, and defends it from the Pressure of the incumbent Brain, and, being sunk deep between the two Hemispheres of the Brain, divides the internal Cavity of the Cranium into two, and hinders the Blood, extravasated on the Right Side, from reaching to the Left. For this Reason we are, in Cases of this Nature, to have a due Regard to the now mention'd Circumstance.

If the threatening Symptoms of a compress'd Brain, above related, are very urgent, tho' the precise Place, where the Compression resides, cannot be exactly determin'd, yet the Trepan must be apply'd to one or more Parts of the Cranium, if necessary, in order to remove the Pressure, and depurate the Part affected.

It sometimes happens, that all the Symptoms inform us, that the Blood, extravasated under the Cranium, compresses the Brain; and yet, at the same time, there are not certain Indications, by which it can be determin'd in what Part of the Cranium it is lodg'd. In this Case the Patient must either be abandon'd to certain Death, or the Trepan must be apply'd to the Cranium, whilst the Event is entirely uncertain; for the extravasated Blood may be lodg'd about the Basis of the Cranium, or in the Ventricles of the Brain; in a Word, it may be accumulated in a quite different Part from that to which the Trepan shall be apply'd. In this Case, after having duly appris'd the Patient's Friends of the ambiguous Event of the Operation, it seems more adviseable to try a doubtful Remedy than none at all; especially since, from numberless Instances, 'tis plain, that the Operation of the Trepan, when skilfully perform'd, is not so dangerous as it is commonly thought; and since the Patients, who stand in need of it, are generally entirely depriv'd of Sensation. Thus *Dionis*, in his *Operat. de Chirurgie*, informs us, that he himself, after having apply'd the Trepan in a young Gentleman of Distinction, evacuated the Blood discharg'd under the Cranium; and that the Patient never knew of his having undergone such an Operation, till he was told of it, after the Cure was completed: Hence, tho' a Repetition of this Operation in another Part of the Cranium, when it has prov'd unsuccessful in a former Attempt, may appear cruel to the By-standers, yet it is not generally very painful to the Patients themselves. But when we know nothing at all of the Part affected, then the Trepan is generally apply'd to the Os Bregmatis; because it constitutes the largest Part of the Cranium, and because considerably large Vessels lie under it. If by this means no Disorder is discover'd, the Operation is to be attempted afresh in the Os Bregmatis of the opposite Side. We do not find, that *Hippocrates* repeated the Operation of the Trepan in one and the same Patient: But, so far as we can learn from his Book on *Wounds of the Head*, he did not apply the Trepan in order to procure a Discharge to the Humours extravasated under the Cranium, but only with a View to remove the affected Part of the Cranium itself. In the fourth Section, indeed, of the above-mention'd Book, he observes, that the disorder'd Bone of the Cranium may collect Pus, which may fall down on the Brain; but he makes no Mention of an Extravasation of Humours, in consequence of a Rupture of the Vessels, under the found Cranium: Hence he did not, in all Probability, apply the Trepan, except when it was evident, that the Cranium was disorder'd, and when the Part affected was known. Accordingly, when the Bone was broken in another Part of the Head than that in which the Wound was inflicted, he, in the tenth Section of the same Work, asserts, that the Disorder was incurable by any Remedies. *Celsus*, however, seems to have been acquainted with such an Extravasation of Humours; for, in the fourth Chapter of his eighth Book, he has these Words: "Sometimes, tho' "rarely, it happens, that the Bone remains sound and entire, "whilst, in consequence of a Blow, some Vein, ruptur'd in "the Membrane of the Brain, discharges some Blood inter-"nally, which, stagnating there, excites violent Pains, and, "in some, produces Blindness. But, generally, there is also a "Pain in the opposite Part, where, an Incision being made, "the Bone appears pale, and is therefore also to have the Tre-"pan apply'd to it." In the same Chapter he also orders the Trepan to be apply'd in various Parts, if the Fissure is long.

In later chirurgical Authors various Instances occur, by which 'tis prov'd, that the Trepan may, with Success, be apply'd to several Parts of the Cranium. Thus *Dionis*, in his *Operat. de Chirurg.* gives us an Account of a Man, who, by a Fall from a Horse, receiv'd a Wound in the Os Bregmatis. Upon applying the Trepan, a large Quantity of Blood was evacuated, but without any Alleviation of the Symptoms. Three Days after, a Tumor appear'd on his Occiput: When this Tumor was laid open, the Trepan was a second time apply'd to the Os Occipitis: A large Quantity of Blood was discharg'd from the Perforation; and, whilst this Blood was flowing out, the Patient began to return to himself, and was at last perfectly cur'd. This Case excellently confirms what we advanc'd in the preceding Paragraph, which was, that the Blood, extravasated between the Dura Mater and the Cranium, was lodg'd in separate Cells, which have no Communication with each other. The same Author, in the above quoted Work, gives us an Instance of a Girl, who had the Trepan successfully apply'd to both Bones of the Bregma. *Scultetus*, in *Armamentar. Chirurg. Observ.* 7. informs us, that he was forced to apply the Trepan seven times in one Day, about the Circumference of a Depression of the Cranium, receiv'd by a certain Captain; who, in the Space of two Months, was, nevertheless, so effectually cur'd, that he was able to perform the several Functions of his Office with Approbation and Applause. And, in the memorable Case already related, a Girl of twelve Years of Age had the Trepan apply'd to twelve different Parts of her Cranium, and yet was at last happily cur'd. *Solingen*, the most celebrated Surgeon of the Age in which he lived, in his *Manuale Operatien der Chirurgie*, gives us a still more memorable Case. *Philip* of *Nassau*, descended from the illustrious House of *Orange*, by a Fall from a Horse, had his Head so violently dash'd against the Stump of a Tree, that his Cranium was fractur'd in various Parts: For this Reason the Trepan was twenty-seven times apply'd to different Parts of his Cranium, by a Surgeon of *Nimmegen*, and yet the Patient recover'd. This Account *Solingen* saw confirm'd under the Hand of the illustrious Patient, after his Recovery. And the same Author adds, that *Philip* was, after this Accident, so robust, that, at a Drinking-match, he kill'd three of his Companions.

Hence 'tis obvious, that the Operation of the Trepan, tho' frequently repeated, is sufficiently safe, provided it is perform'd with Judgment; the Method of doing which we now come to consider.

When the Place for the Operation is fixed upon, and the Hair shav'd off, the Integuments must be cut thro', and separated from the Cranium, the Lips of the Wound must be lifted up, the Bone dry'd, and cover'd with Lint, the Blood stopt, the Pain mitigated, Inflammation prevented; and then, if the Symptoms are not very pressing, the Part must be

properly

properly bound up, and the Operation be defer'd till the next Day.

After the Place for the Application of the Trepan is fix'd upon, the Cranium muſt be laid entirely bare of its Integuments, leſt the Teeth of the Trepan ſhould lacerate the ſoft Parts left. We muſt be particularly careful, that none of the Pericranium be left, ſince a Laceration of it with the Rugine or Trepan excites violent Fevers and Inflammations, as has already been obſerved from *Celſus*. Hence, when the Hairs are ſhav'd off, a crucial Inciſion is to be made in the Integuments to the very Bone, as we have already directed on another Occaſion. The four Angles of the Inciſion thus made are to be rais'd, and the Pericranium ſeparated from the Cranium with the Fingers, or a Rugine. With ſoft Pledgets, a little warm'd, the Blood is to be wiped from the Surface of the denudated Bone. Then a Pledget of the like kind, with a little finely powdered Maſtich, ſprinkled upon it, is to be applied to the denudated Cranium. Lint is alſo to be put under the elevated Integuments, that they may recede the farther from the denudated Bone. The Hæmorrhage is, in this Caſe, generally ſlight, and ſoon ſtops; but if any conſiderably large arterial Ramification ſhould happen to be cut, the Hæmorrhage may be ſtopt by the Application of warm Alcohol, or the Effuſion of Blood may be ſtay'd by the Application of a proper compreſſive Bandage for ſome Hours; or, where the Symptoms are very urgent, the cut Artery may commodiouſly enough be ty'd, by paſſing a Thread thro' that Part of the Integuments where it lies; for 'tis ſufficiently obvious, that the Trepan cannot be apply'd ſo long as the Hæmorrhage continues, ſince the Effuſion of Blood would immediately hinder the Operator from examining how far the Perforation of the Cranium was carried on. The Pain attending the Operation may be alleviated, by gently anointing the Parts with Unguentum Populeum, which is highly ſoft, and at the ſame time of an anodyne Nature; but generally Patients, in this State, are dull, and inſenſible of Pain. If an Inflammation is dreaded, and eſpecially if the Trepan is not to be immediately apply'd, but the Operation defer'd till the following Day, 'tis proper to foment the Parts with Water and Vinegar. Thus *Hippocrates*, in a Paſſage before quoted, when the Cranium was to be laid bare, after making the Inciſion in the Integuments, order'd the Wound to be fill'd with Lint, in order to enlarge it with as little Trouble as poſſible; but, at the ſame time, during the Uſe of this Lint, he adviſ'd the Application of a Cataplaſm of fine Flour, boil'd in Vinegar to a proper Conſiſtence, in order to prevent too great an Inflammation.

We now come to inquire whether, when the Cranium is laid bare, the Operation ought to be deferred for a few Hours, or till next Day; or whether it ought to be performed immediately. It ſeems proper, then, always to perform this Operation as ſoon as poſſible, ſince it is rarely us'd except in urgent Caſes. Three Cauſes are generally aſſigned by ſome Surgeons, why they would have the Operation deferred: The firſt is, becauſe the Shaving off the Hairs, the Inciſion of the Integuments, and their Separation from the Cranium, require a conſiderable Time. Hence, they think, the Patient's Friends take it ill, that he ſhould be ſubjected to longer Torments. The ſecond is, the Dread of an Hæmorrhage after an Inciſion of the Integuments: And, laſtly, they would have the Operation deferred, becauſe the cut Integuments, being ſpontaneouſly retracted, will render the Wound larger, and, by that means, afford an eaſier Acceſs to the Trepan. But if we conſider, that ſuch Patients are generally depriv'd of all Senſation, or, at leaſt, are pretty inſenſible of Pain; that the Hæmorrhage may, by proper Remedies, be ſufficiently ſeen, or, at leaſt, in a few Hours, ſtopt; and that the Lips of the Wound, provided it has been made large enough, may be ſo drawn from each other, as to afford an Acceſs to the Trepan; it will appear of all other Methods the moſt proper, to proceed to the Operation immediately after the Denudation of the Cranium.

Nor does the Authority of *Hippocrates* run counter to this Doctrine: He, indeed, after the Inciſion of the Integuments, with a View to inveſtigate the Wound of the Bone, ordered a farther Examination to be defer'd till next Day; but, as we obſerv'd juſt before, *Hippocrates* ſeems not to have performed the Operation of the Trepan, in order to procure a Diſcharge to the extravaſated Humours, but only with a View to remove the diſordered Part of the Cranium; in which Caſe the Operation may certainly be delay'd longer without ſo much Danger; but when the ruptur'd Veſſels continue to pour out their Contents, unleſs a free Diſcharge is given to them, it is to be dreaded leſt the Brain ſhould be ſo compreſs'd, that the injur'd Functions cannot again be reſtor'd, tho', by an Application of the Trepan, the extravaſated Humours ſhould be evacuated. *Hippocrates*, however, in his Book on Wounds of the Head, after enumerating the Signs, which indicate that a Patient wounded in the Head will die, uſes theſe Words: "If you are "ſure, that the Patient labours under a Fever, or any other "urgent Symptom, the Operation is by no means to be de- "lay'd, but the Bone is either to be cut with a Saw, or raſp'd "with a Rugine to the very Membrane."

The OPERATION *of the* TREPAN; *From* HEISTER.

The Antients us'd Trepanning not only for external Percuſſions of the Cranium, but alſo for ſome internal and obſtinate Diſeaſes of the Head, which were incurable by inward Medicines, or the Uſe of Iſſues upon the Coronal Sutures, by which means they thought to give a more immediate Vent to the peccant Humours; but the modern Surgeons ſeldom or never perform this Operation for internal Diſorders of the Head, but ſeldom neglect it in external Percuſſions, from a Fall, ſome miſſile Weapon, Blow, or Bullet; or in ſome dangerous Contuſion, or Colliſion, where, in any of theſe Caſes, there is a manifeſt Fracture of the Cranium, or a Suſpicion of a Fracture, Fiſſure, or Collection of extravaſated Humours, which can no other Way be diſcharg'd, and threaten the Death of the Patient.

When you are determin'd to uſe the Trepan, you are to ſet about it with all Expedition; but be very cautious and circumſpect, and not too haſty, in the Management of that Inſtrument: For it is extremely difficult, if not impoſſible, to cut out the leaſt Portion of the Cranium, and to ſeparate it from the Dura Mater, which ſo cloſely adheres to it, without injuring that Membrane, tho' you uſe the greateſt Circumſpection. Wherefore I think they are highly to blame, to ſay no worſe, who, on almoſt every Occaſion, where the Head receives any violent Percuſſion, are, without any farther Conſideration, for having recourſe immediately to the Trepan. For I am wholly of the Opinion of *Celſus*, and moſt Moderns, who adviſe firſt to try all manner of Medicines, both internal and external, as Phlebotomy, Purging, Cluſters, internal Reſolvents, and digeſtive Aromatic Topics, before you proceed, by a too precipitate Perforation of the Cranium, to hazard, without Neceſſity, the Life of the Patient.

In the mean time we are to be no leſs ſolicitous, on the other hand, leſt our Delay ſhould prove the Ruin of the Patient; for as ſoon as it appears, that the Injury which the Head has receiv'd is of ſo conſiderable a Nature, that no Medicines, which Phyſicians, with their utmoſt Care and Skill, can preſcribe, are of the leaſt Efficacy, but that the Diſorder is rather increaſed, we muſt with all Speed betake ourſelves to the Trepan, in order to elevate or extract the depreſs'd Parts of the Cranium, and to open a Way for the ſpeedy Diſcharge of the extravaſated Humours; for here, if in any Caſe, Delays are dangerous.

When the Wound of the Head is bound up, the Apparatus of Inſtruments, and other Things neceſſary for the Operation, is to be provided, among which the firſt and principal is the Trepan or Terebra, with its Crown (*Tab.* 36. *Fig.* 3.). Some of the Antients us'd a Trepan made in the Shape of a common Carpenter's Gimlet, according to the Figures of *Fabricius ab Aquapendente*, *Andreas a Cruce*, and *Scultetus*, which Inſtrument they manag'd with one Hand, whence it is uſually denominated the *Hand Trepan*. But becauſe it labours under ſeveral Defects, which render the Application of it leſs commodious, we generally uſe at preſent the Trepan, or one much like it, repreſented (*Tab.* 36. *Fig.* 3.) with a Handle turning round, much like the Inſtrument us'd by Coopers or Cabinet-makers, which is much more commodious than that of the Antients, eſpecially if the Crown of it be not cylindrical, or of uniform Dimenſions, as formerly, but decreaſing downwards in the Shape of an inverted Cone, as repreſented (*Tab.* 36. *Fig.* 3. A.); by which it is the more eaſily prevented, after penetrating the Cranium, from deſcending into the Brain. Some call this kind of Inſtrument the *Trepan of Hildanus*; but *Celſus*, to ſay nothing of others more antient than *Hildanus*, was long ago acquainted with the Uſe of it, and has deſcrib'd it. The Crown of this Inſtrument, mark'd A. is join'd to the lower Part of the Handle at B. by a Screw, that it may be taken off at Pleaſure, and another Crown, as the Surgeon is ſuppoſed to be provided with Crowns of different Sizes, fitted on in its Place. Some of our modern Surgeons have contriv'd the Juncture of the Crown and Handle after a different manner, which they fancy to be more commodious; but what has been deſcrib'd is found, by common Experience, convenient enough for all Purpoſes. When the Crown is furniſh'd with a ſharp or pyramidal Spike, which ſticks out in the Middle, the Inſtrument is call'd a *Male Trepan* (*Fig.* 3. E.); but if this Spike (*Fig.* 4.) be taken out by the Key (*Fig.* 5.) fitted for this Purpoſe, it is term'd a *Female Trepan*. *Heiſter*.

Mr. *Sharp* recommends the Hand Trepan, or Trephine, which *Heiſter* condemns as incommodious, and prefers the cylindrical to the conical Crown. As I am not capable of determining which is in the right, I muſt do Mr. *Sharp* the Juſtice to let him anſwer for himſelf.

The Crown or Saw of the Trepan, as repreſented by *Sharp*, is cylindrical, differing from thoſe in Uſe, which are all conical, and ſome in a very great degree. Surgeons have hitherto conceiv'd

ceiv'd great Advantages to arise from this Form: First, as a Circumstance of the utmost Importance, they have imagin'd there would be Danger of injuring the Brain, by sawing too suddenly thro' the Cranium, if the Enlargement of the Saw did not increase the Obstruction in proportion as they advanc'd towards it, and make the Working of the Instrument exceeding slow. It has also been believ'd, that, unless the Saw was smaller near the Teeth than towards its Basis, it would be impossible to incline it on any Part where it had not made so deep an Impression as in another, in consequence of which one Side of the Circle would be saw'd thro', and the Membranes or Brain injur'd; while, on the other, perhaps the Saw would not have penetrated thro' the first Table of the Cranium. The last remarkable Argument in favour of the conic Saw is, that it more readily admits, and afterwards retains, the saw'd Piece of Bone in its Cavity. But I think all the Advantages attributed to this Figure are imaginary, and the great Labour of working so slowly and difficultly is not only very inconvenient to an Operator, but by no means serviceable to the Operation; for, notwithstanding the Saw be cylindrical, and works without any other Impediment than what lies before the Teeth, yet, even with this Advantage, the Operation goes on so gradually, that, from the Experience I have had, says he, I do not find the least Danger of suddenly passing thro' the Brain, as is apprehended, if we proceed with the Caution of not leaning too hard on the Instrument when the Bone is almost saw'd thro': Indeed with respect to the Impracticableness of inclining it on any particular Part of the Circle when saw'd uneven, which is commonly alleg'd, whoever will try the Experiment will in a Moment discover the Falseness of the Assertion. Besides, the very Instance stated overthrows this Reasoning; for, if the Circle has been already made deeper in one Part than another, it must imply, that we have lean'd with more Force on one Part than another, and, consequently, may at Pleasure do the same thing again. As to the last suppos'd Advantage, of its receiving and retaining the saw'd Piece of Bone in its Cavity, the Benefit would be so frivolous, if it had truly the Preference of the cylindrical one in that respect, that it would not be worth mentioning: But, in fact, the cylindrical Saw receives the Piece of Bone very readily, and will be more likely to hold it in its Cavity than the other, because there will be more Contact between the Edges of the Bone and the Inside of the Saw. *Sharp.*

In the next Place, the Surgeon ought to be provided with an Incision-knife, armed with a blunt or flat Head, (*Tab.* 36. *Fig.* 6.) which some call the *Lenticular*; and also with an Instrument proper for depressing the Dura Mater, and arm'd like the other (*Fig.* 7.). He must also have in Readiness a perforating Instrument, (*Fig.* 8.) to begin the Operation, which is usually fasten'd to a Handle near the Letter B. (*Fig.* 3.); also a Hair-brush, (*Fig.* 9.) or something like it; a smaller Terebra, (*Tab.* 28. *Fig.* 7. *Let.* B.) or another like it; a Lancet; Elevator (*Tab.* 28. *Fig.* 7. *Let.* C. *Fig.* 8. and 14.); a Tooth-pick made of a Quill; a Probe with a very sharp Point; some Dossils of Lint, and a Vessel with highly rectify'd Spirit of Wine; all which must be plac'd in a large Dish or Plate, in their proper Order, that they may be ready to the Surgeon's Hand, when performing his Operation. The Apparatus of Dressings and Bandage, to be apply'd after the Operation, consists, first, of a Dossil of Lint, of an orbicular Figure, and of the Breadth of a Piece of Money of an ordinary Size; to which, in the Middle, is fasten'd a Thread, a Span long, represented (*Tab.* 36. *Fig.* 11.). Next must be provided a Ball of Lint, adapted to the Size of the Dossil before-mentioned, and ty'd in like manner with a Thread (*Tab.* 36. *Fig.* 12.). There must be also in Readiness some orbicular Pledgets of Lint, of various Sizes, for filling up the Wound made in the Cranium (*Tab.* 36. *Fig.* 13.); besides, some Honey of Roses, Essence of Amber or Mastich, or Spirit of Mastich, scrap'd Lint, a square Compress, and, in the last Place, a good large Napkin, or Piece of Linen, to make the Bandage for the Head; all which Particulars are to be orderly dispos'd in a peculiar Dish, that they may be ready at hand when wanted.

All things being thus rightly dispos'd, we proceed next to the Operation; to perform which with the greater Readiness and Exactness, the Patient must, first of all, be dispos'd in a convenient Room, with the Air well temper'd, in a proper Posture, upon a Chair, or, if he be weak, upon a Couch, in such a manner that the Surgeon and his Assistants may have free Access to him. This done, the Dressings remov'd, and the Cranium cleansed from the Blood, the Patient is to have his Head dispos'd as conveniently as may be, supported by Pillows, and firmly held by an Assistant. The Surgeon then takes the perforating Trepan, (*Tab.* 36. *Fig.* 8.) and adapting it to the Handle, (B. *Fig.* 3.) instead of the Crown, (A.) he turns round the Handle at (D.); and having thus made a small Entrance into the Cranium, he then applies the Trepan, with its Male Crown (*Fig.* 3. A.). Upon the Top of the Trepan (C. C. *Fig.* 3.) the Surgeon fixes his Left Hand, upon which he places his Chin or Forehead. It has been generally the Custom hitherto to place the Forehead upon the Left Hand; but it seems to be a better Practice to apply the Chin, as Messr. *Petit* and *Garengeot* direct, because, in such a Situation, the Surgeon has a better View of the Place he is to perforate, while, with his Right Hand, he slowly and cautiously turns round the Handle (D. *Fig.* 3.) till he perceives, that the serrated Crown, with the Spike in its Centre, have made a sufficient circular Impression upon the Cranium; after which he takes out the Spike, by the Help of the Key, (*Fig.* 5.) and, putting on the Crown again, continues to work with his Right Hand, turning it with all the Circumspection imaginable, and taking care, all the while, by Help of his Brush and Toothpick, to clear the Cranium and Crown of the Trepan from the Saw-dust, till he perceives it to become bloody, which is a Sign, that the Instrument has penetrated to the Diploë, or the middle and medullary Part of the Cranium. But it is to be observ'd, that he will not always meet with this Signification, because, in some Parts of the Cranium, this medullary Substance is not to be found. However, as soon as the Saw-dust comes off bloody, the Instrument is taken off; and, the Blood being first deterg'd with a Sponge dipt in Spirit of Wine, the Surgeon enters the small Terebra (*Tab.* 28. *Fig.* 7. B.) into the little Hole or Aperture first made in the Middle, and, after a few Turns, takes it out again; and then putting on the Crown once more, turns it two or three times about, but very gently. The Saw-dust is again cleans'd, and the Surgeon, with a slender Probe or Toothpick, carefully searches whether the Cranium be sufficiently perforated, which cannot be better known than by heedfully attending to the Colour of the circular Groove or Trench; for when the Bottom of it, which before was white, appears of a bluish or grey Colour, it is a Sign, that the Dura Mater appears thro' the Cranium, which, of consequence, is nearly penetrated. In this nice Juncture, therefore, the Trepan must be manag'd with the greatest Circumspection, lest the serrated Instrument should happen to lacerate the Dura Mater, so closely annexed, or growing to the Bone, the Consequence of which might be a violent Inflammation, or some other fatal Symptom. But if the circular Groove appears black only in some Parts, it is a Sign, that the Cranium has not been equally saw'd, and therefore the Crown must be a little inclin'd, and press'd upon the whitish Parts, where it has not cut deep enough, and be very gently turn'd about, till the round Piece of Bone, which is to be cut out, becomes loose or moveable. In that Case it will not be convenient to cut quite thro' the Cranium with the Teeth of the Crown, for fear of wounding the Dura Mater, but rather to screw in the Terebra (*Tab.* 28. *Fig.* 7. B.) again into the Aperture wherein the Pin had been inserted, and with the same cautiously move the Bone this way and that way; or with the Help of the Elevator it may be taken out.

Having thus extracted the round Piece of Cranium, the Blood effus'd underneath usually follows it; which being deterg'd, the Surgeon's next Business is carefully to examine whether there be any loose Fragments of Bones to be extracted, or depress'd Parts to be rais'd: If so, he must set about it immediately; if not, he must apply himself to the Smoothing the Roughness of the inner Margin of the Aperture with the Lenticular, (*Tab.* 36. *Fig.* 6.) to secure the Dura Mater from being prick'd or injur'd by any of the sharp Points. This done, the Blood, if there be any within, will the more readily discharge itself; but, to promote its Exit, it will be very convenient gently to move the Patient's Head from Side to Side, and with the before-mention'd Lenticular, or the Depressor, (*Fig.* 7.) in a very tender and cautious Manner, to depress the Dura Mater. While the Surgeon is thus employ'd in freeing the Brain from the Weight of the incumbent Blood, or the Pressure of the Bone, the Patient often recovers his Senses, either suddenly or by degrees, like one roused from a deep Sleep. When the Patient is thus come to himself, and yet the Blood is, in some measure, retain'd, some advise the Application of a Sternutatory now-and-then to the Nostrils; for, say they, not only holding the Breath, but especially Sneezing, expels the extravasated Blood, when not free to discharge itself, with a kind of Violence; but this is a very dubious Remedy.

If, after the Operation, the Dura Mater appears black, or elevated as tho' it were ready to break thro' the Aperture of the Cranium, it is a Sign, that Blood or Pus are retain'd underneath it. In this Case, the only Remedy, tho' it be a doubtful one, is to perforate the Dura Mater, and the Pia Mater too, if the peccant Matter lies so deep, with a Lancet or Incision-knife; carefully avoiding the larger Veins, since the Blood or Matter can no way else be discharg'd, and their Retention must be very fatal to the Patient. Some condemn all Perforation of the Dura and Pia Mater as absolutely destructive; but, besides my own Experience, we are assured, by the Authorities of *Paré*, *Glandorp*, *Coiter*, *Fallopius*, *Marchetti*, *Rouhault*, *Blancard*, and other Writers of good Credit, that these Membranes have been frequently perforated without Danger of Death, especially if you avoid cutting any of the larger Veins or Arteries. If any Fragments of Bones, which press upon the Brain, happen to appear, they must be very carefully extracted either with the Fingers,

Fingers or the Forceps; or, if they are only depreſs'd, they muſt be rais'd with the Fingers or the Elevator, and reſtor'd to their former natural Situation. If a Splinter be lodged between the Dura Mater and the Cranium, ſo that you cannot conveniently extract it by the firſt Aperture, a ſecond or third Perforation muſt be made with the Trepan, till you have removed every thing that may be injurious to the Brain. Sometimes it will be neceſſary to cut off the Parts of the Bones between the Perforations, if they are hard and ſtrong, with a ſmall Saw, (*Tab.* 28. *Fig.* 9.) or a very ſharp Forceps, or with a Mallet and Chiſel, repreſented in the ſame Plate (*Fig.* 10. and 11.); or, if theſe intermediate Parts are but thin and weak, they may be cut off and removed by the Lenticular, (*Tab.* 36. *Fig.* 6.) in order to the extracting of the offenſive Splinters or Fragments. When there is a long Fiſſure in the Cranium it will be proper to trepan at each Extremity; but when the Fiſſure runs in ſeveral Directions, you muſt trepan upon each, becauſe every one of them has uſually ſome extravaſated Blood or Pus lodged under it.

Having deſcribed the Method of perforating the Cranium by the Trepan, and of diſcharging the Blood, Matter, and bony Fragments, we now proceed to the Dreſſings and Bandage, which are perform'd in the following manner: Firſt of all a round Pledget of dry Lint (*Tab.* 36. *Fig.* 11.) is to be laid next the Dura Mater, with a Thread faſten'd to it, and hanging out of the Aperture; it muſt be dry, that it may the more conveniently be placed under the Cranium. On this Pledget muſt be poured Honey of Roſes, diluted with a little Spirit of Wine. Many adviſe an Application of Spirits or Eſſences of Maſtich, Amber, and the like, which, in my Opinion, are too acrimonious, becauſe they often put the Patient to great Pain. Upon this Pledget then you apply a Ball of Lint, furniſh'd alſo with a String, (*Fig.* 12.) and upon that lay round Doſſils of Lint, (*Fig.* 13.) till the Cavity be filled. In the next Place, the Cranium, and external Wound, muſt be dreſſed with Lint ſpread with ſome mild digeſtive Ointment, or Honey of Roſes; upon which add a ſquare Compreſs, dipt in warm Spirit of Wine, or Lime-water, and camphorated Spirit of Wine; but uſe no Plaiſters, as being unneceſſary on this Occaſion; and the Whole muſt be ſecured with the Head-bandage.

In the ſubſequent Dreſſings, which muſt be repeated once or twice every Day, you muſt ſtrictly avoid fat and oily Applications, which will corrupt the Bones and Membranes. Inſtead of ſuch you muſt uſe balſamic Topics, particularly Honey of Roſes, with a little Spirit of Wine, or Eſſence of Maſtich, which are excellent Remedies. The Wound being thus duly dreſſed and attended, there will be a ſpontaneous Exfoliation of a thin Lamina from the Margin of the bony Aperture, uſually within forty or fifty Days, which ought not to be pulled away by Force. Your Exfoliation being obtained, new Fleſh will appear ſhooting up from the clean Bone and Dura Mater, which at length will fill up the whole Cavity. When you find the Cavity about half filled, the new Fleſh is to be moderately compreſſed by Lint, and a proper Bandage, to prevent it from becoming too lax and ſpongy; and when it is grown up even with the Surface of the Bone, you muſt endeavour to extend over it, and unite the Edges of the external Skin, in order to its Coalition with the new-formed Maſs, which, having filled up the Cavity, becomes gradually more and more indurated; but in ſuch a manner, as even at laſt to be rather a Cartilage than a Bone; for upon boiling the Cranium it ſeparates and falls off. And this ſeems to be the Reaſon why thoſe who have undergone trepanning are not only ſenſible of a remarkable Weakneſs or Pain of the Head, but are much affected with the various Changes of the Weather; which Inconveniencies may, in ſome meaſure, be remedy'd by keeping the Place cover'd with a Leaden or Silver Plate.

It ſometimes happens, that, after the Operation, a Vein opens, and bleeds profuſely; in which Caſe you muſt ſprinkle Powder of *Armenian* Bole, Sanguis Draconis, Frankincenſe, and Colophony, upon the Place, and compreſs it for ſome time with Lint. If the Brain or Dura Mater ſhould be ſeized with an Inflammation, you muſt endeavour to remedy it by internal reſolving and cooling Medicines, together with Abſtinence and Phlebotomy; or, as *Roubault* adviſes, by Scarification of the Dura Mater, and the Application of common Malt Spirit impregnated with Saffron, and lower'd with Elder-flower Water. If there ſhould happen a Suppuration or Exulceration, the Surgeon's Buſineſs is firſt to wipe off the Sordes with Lint, and then to apply to the Part affected Honey of Roſes, mixed with Spirit of Wine, or Eſſence of Maſtich or Amber, or Elixir Proprietatis, or a Powder prepared of Myrrh, Maſtich, and Frankincenſe. When the Patient, after being once trepanned, feels great Uneaſineſs, with a Weight in the Head, it ſignifies that ſomething preternatural ſtill infeſts the Place; and that the Trepan muſt again be applied. If any ſpongy or fungous Excreſcence ſhoot forth from the Wound of the Cranium, it muſt be repreſſed by ſome of the following Methods: Firſt by applying a Doſſil of Lint dipt in Spirit of Wine or Maſtich at every Dreſſing, and ſtrongly depreſſing the ſame upon the growing Fleſh; or, in the next Place, by Application of the round perforated Piece of Lead, contrived by *Belloſte*, (*Tab.* 36. *Fig.* 14.) and furniſhed with *Anſæ*, (ſee *Fig.* 15.) which is to be depreſſed into the Aperture of the Cranium, and well cover'd with round Pledgets of Lint; but you will ſeldom have Occaſion for this Inſtrument, if the firſt Method be rightly obſerved: Or, laſtly, if the fungous Excreſcence be already prominent above the Aperture, it may be cut off either by tying it round with a Thread, or by the Sciſſars, as it is practiſed in Tubercles. What is left of it may be repreſſed by rubbing it with blue Vitriol, or ſprinkling on it the Powder of Savin or burnt Alum, and afterwards compreſſing it with a tighter Bandage, and ſtrongly compacted Doſſils of Lint; by which means not only the ſpongy Fleſh will be check'd and reduced, but the Wound alſo will be the more ſpeedily healed. *Heiſter.*

As this Operation is one of the moſt important in Surgery, I ſhall add the Method of performing it, recommended by *Sharp.*

The Manner of Trepanning is this: Having fix'd your Patient's Head ſteady, either on the Bolſter of a Bed, or by placeing him in a low Chair, with the Pin of your Saw mark the Centre of the Piece of Bone to be taken out; then with the perforating Trepan make an Orifice deep enough to receive the Pin, which, being fixed in it, will prevent the Saw from ſlipping; and thus you are to continue ſawing till the Impreſſion made will preſerve the Steadineſs without the Pin, when it is to be taken away for fear of its wounding the Brain before the Saw has entered through the Cranium, which it would do at laſt, becauſe of its Projection. In working through the Bone, the Teeth of the Saw will begin to clog by the time you arrive at the Diploë: Wherefore a Bruſh muſt be ready to clean it every now-and-then; and with a pointed Probe you muſt clear away the Duſt in the Circle of the trepan'd Bone, obſerving if it be deeper on one Side than the other, to lean afterwards on that Side where the Impreſſion is leaſt, that the whole Thickneſs may be ſaw'd thro' at the ſame time. To do all this with leſs Interruption it will be proper to have two Saws of exactly the ſame Diameter, that an Aſſiſtant may be bruſhing one while you operate with the other. We are adviſ'd to ſaw boldly till we come to the Diploë, which, it is ſaid, will always diſtinguiſh itſelf by the Bloodineſs; but, however, this is not a certain Mark to go by; for though where there is a Diploë, it will manifeſt itſelf by its Bloodineſs, yet ſometimes the Skull is ſo very thin as not to admit of any; in which Caſe, if an Operator ſhould puſh on his Inſtrument in Expectation of meeting with this Subſtance, he would unwarily wound the Brain. This is not very often the Caſe, but however often enough to put a Man on his Guard, and make him enquire whether the Bone be looſe after a little ſawing; which is the only Rule we go by, when we have paſs'd through the Diploë; and may as well be attended to before coming at it, without any conſiderable Loſs of Time. When it is quite ſaw'd through, and lies looſe, it may be taken away with the Forceps contriv'd for that Uſe (*Tab.* 60. *Fig.* 1.); and if the lower Edges of the Orifice next to the Dura Mater are ſplinter'd, they may be ſcrap'd ſmooth with a Lenticular.

This is the chief of the Operation of the Trepan; the only thing remaining to be done is with an Elevator introduc'd at the Orifice, to raiſe the Depreſſion or broken Splinters, if they cannot otherwiſe be laid hold of, and to draw out the grumous Blood, or any other extraneous Body. If the Dura Mater be not wounded or tore, an Inciſion muſt be made through it to give way to the Blood or Matter, which almoſt certainly lies underneath it, if the Symptoms have been bad, and none has been diſcharg'd from between the Cranium and Dura Mater.

I have uſed the Word Trepan all along, ſays *Sharp*, for the ſake of being better underſtood; but the Inſtrument he recommends is a Trephine, the Advantages of which, as alſo that of a cylindrical Saw, are above deſcribed in the Quotation from *Sharp.*

With regard to the Dreſſings of theſe Wounds, I think, ſays *Sharp*, it is very certain, that, as the greateſt Part of the Evil proceeds from the Quantity and Preſſure of the Matter, whatever approaches towards the Nature of a Tent, and increaſes its Quantity and Preſſure by locking it up, muſt be pernicious. I would therefore exclude the Uſe of all Syndons whatever; the haſty Application too of Spirits of Wine, which is ſo commonly adviſed, cannot be proper, as they are not only unfit for Inflammations in general, but alſo criſp up the Veſſels of the Dura Mater and Brain; and ſtopping the Suppuration, ſometimes produce a Gangrene. Since then a cloſe Application is inconvenient, and whatever Good there may be in topical Medicines, it cannot, for the moſt part, be communicated to the Abſceſs, by reaſon of its Extent beyond the Orifice; the beſt Remedy will be dry Lint only, which muſt be laid on looſely to give Vent to the Matter, and be repeated twice a Day, till the Diſcharge is leſſen'd, when once in twenty-four Hours will be ſufficient to the finiſhing of the Cure, which will be ſomething retarded by the Exfoliations that ſometimes follow this Operation. The Patient afterwards may wear a Plate of Tin upon the Scar, to defend it from Blows, or any accidental Injury. *Sharp.*

Treatment of the Accidents ſubſequent to the Operations of the Trepan, from Boerhaave.

The Inflammation, Suppuration, Gangrene, or Fungus of the Membranes, or even of the cortical Subſtance of the Brain itſelf, which will ſometimes ariſe, are remov'd by Remedies which are proper for the reſpective Diſorders, by the Application of Antiphlogiſtics, Detergents, and Antiſeptics; by a Thread, and a Plate of Lead.

It now remains, that we conſider thoſe Symptoms which are ſometimes ſubſequent to the Operation of the Trepan, and which are often accompanied with the greateſt Danger: For ſince after the Bone is taken away, in conſequence of the Fulneſs of the Cranium, the contain'd Brain, together with the Dura Mater, ariſe through the Perforation made, unleſs this Accident be prevented, the Dura Mater will be preſſed againſt the Margins of the Bone; by which means a free Circulation of the Blood thro' its Veſſels will be obſtructed, and an Inflammation, with all its ſubſequent Symptoms, eſpecially a Suppuration and Gangrene will be produc'd. The unaccuſtom'd Acceſs of the Air, eſpecially if cold, contributes very conſiderably to this Misfortune. The ſame Accident may happen in the Veſſels of the Pia Mater, and in the cortical Subſtance of the Brain, by which means all its Functions may be injur'd. By the general Method of Cure in Inflammations, of which we ſhall ſpeak under its proper Article, the preſent Diſorder may be remov'd; but it is always ſafer to prevent it before it appears. Liberal Veneſection, Epiſpaſtics applied to the Soles of the Feet, Lenitive Clyſters, a ſpare Diet, and liberal Draughts of Whey, or Milk and Water, will reduce the Body to a State not in the leaſt ſubject to Inflammation. Theſe Remedies will alſo be able to remove the Inflammation after it is brought on, and may be boldly repeated, if the Symptoms are urgent; for in this Caſe it is not to be doubted, but a Suppuration is highly dangerous, and a Gangrene generally mortal. Hence theſe bad Conſequences of an Inflammation are with the greateſt Care and Skill to be prevented.

A common, but, at the ſame time, a very terrible Symptom, generally enſues the Operation of the Trepan; which is a fungous, and ſuddenly increas'd, Dilatation of the Brain. This, indeed, rarely or never happens, ſo long as the Dura Mater is entire. But when this Membrane is cut or corroded, the Pia Mater is ſo ſlender, that it is not able to reſtrain the riſing Subſtance of the Brain, which will ſtill ſooner protuberate, if at the ſame time the Pia Mater is wounded. Theſe Protuberances, on account of the Quickneſs of their Growth, and their Figure, are call'd Funguſes, as we have before obſerv'd. *Celſus* ſeems to have taken Notice of this Accident, but he believ'd that it was a Swelling of the Dura Mater: For, ſays he, "After the Cranium is laid open, and the Dura "Mater expoſed to View, if that Membrane is inflam'd and "tumid, tepid Oil of Roſes is to be pour'd into the Wound. "But if it is ſo tumid as to protuberate without the Bone, it "muſt be reſtrain'd by well triturated Lentils, or the Leaves "of the Vine triturated, and mixed up with freſh Butter; or "the Fat of a Gooſe." But it ſeems to be confirm'd by all the Obſervations hitherto made, that theſe Funguſes are produc'd by the pulpous cortical Subſtance of the Brain, when diveſted of its ſurrounding Membranes, and the bony Covering of the Cranium, immenſly dilated by the Fluids driven to it by the Arteries; and more eſpecially when a Fever has increaſed the Velocity of the Circulation. But ſince the cortical Subſtance of the Brain naturally contains no red Blood, hence theſe Funguſes, when cut or corroded, rarely diſcharge any Blood, unleſs by a violent Dilatation the Diameters of theſe ſmall Veſſels ſhould happen to be ſo enlarg'd, as to admit the red Blood. Though this, indeed, rarely happens, yet there are ſome Inſtances of its having occurr'd: Thus, in that ſurpriſing Caſe we have before related, ſuch a fungous Maſs ariſing thro' the fractured Cranium, had a ſtrong Pulſation in its Arteries; and when rudely handled, diſcharg'd a large Quantity of Blood: For this Reaſon theſe Funguſes generally ſubſide before the Death of the Patient, in conſequence of the Force of the Circulation being impair'd, as was obſerv'd in the ſame Caſe ſome Days before the Boy's Death; for the Fungus, which was as large as a Walnut, of a cineritious Colour, and without Pain, ſpontaneouſly ſubſided, and a large Chaſm, in the Subſtance of the Brain itſelf, appear'd. *Sculletus*, in *Armament. Chirurg. Obſervat.* 19. gives us an Account of a Man, who, receiving a Wound in the Head with a Hanger, had a pretty large and wide Fiſſure made in the Cranium, with two Funguſes ariſing out of it. But when, after the Patient's Death, he was inſpecting the Wound, he found that the Funguſes had ſubſided very much. All theſe Circumſtances prove, that theſe Funguſes ariſe from the Dilatation of the cortical Subſtance of the Brain, by the Humours driven to it.

We now come to inquire what is to be done in ſuch a Caſe. Whefe ſuch a Fungus protuberates it cannot be repreſſed; ſince by that means the Brain would be compreſſed, and the pulpous ſmall Veſſels, of which the Fungus conſiſts, would be deſtroy'd by a very gentle Preſſure; from which Circumſtance a violent Putrefaction, and the moſt terrible Symptoms, would ariſe. On the contrary, to cut off or corrode the Subſtance of the Brain itſelf, may poſſibly ſeem an Attempt attended with too much Danger. Numberleſs Obſervations, however, inform us, that ſuch Funguſes have been cut off, whilſt the Lives of the Patients were not only ſaved, but alſo all the Functions of the Brain preſerved entire. Thus *Hildanus*, in *Obſervat. Chirurg. Centur.* 4. *Obſerv.* 3. gives us an Account of a Boy of fourteen Years of Age, thro' whoſe Cranium, after the Application of the Trepan, ſuch a Fungus aroſe. It was cut off by the Application of a Thread about it; but another of the ſame Kind aroſe, and was cut off in the ſame manner. When this Method had been follow'd for ſeveral times, it appeared that a Quantity of the Brain, as large as one's Fiſt, had been loſt. The Patient, however, recover'd, though, in conſequence of his Poverty, he eat any thing that came in his Way, and had his Wound but indifferently taken care of by the Women who had the Charge of him in the Surgeon's Abſence. In the firſt Century of the ſame Work, *Obſerv.* 15. we have an Account of a Boy of the ſame Age, who, by a Stroke from a Stone, which fell from a conſiderable Height on the Right Side of his Head, had a large Fracture made in his Cranium, when, after extracting ſeveral Splinters of the Cranium, every thing ſeem'd to have a good Appearance; and when that Part of the Dura Mater, which had been lacerated by the Splinters, was ſeparated, on the twenty-firſt Day there aroſe from the Wound a Fungus, which, in the Space of twenty-four Hours, appear'd as large as a Hen's Egg, without the Cranium. By ſprinkling it, however, with drying aromatic Powders, and applying a Plaiſter made of the like Ingredients, the Fungus entirely ſubſided in the Space of fourteen Days, and the Patient was afterwards thoroughly cur'd. More Inſtances occur in the ſame Author, by which we are taught, that ſuch Funguſes may ſafely be remov'd. But to attempt the Removal of theſe Excreſcences by acrid Medicines ſeems dangerous. And in the ſame Place *Hildanus* gives us an Account of a Surgeon, who deſpiſing the Advice of another, who had more Skill than himſelf, ſprinkled the Powder of Vitriol and burnt Alum upon ſuch a Fungus; which Practice was immediately ſucceeded by a violent Pain, an acute Fever, an Inflammation, a Delirium; and a few Days after Death enſued.

If we conſider that wonderful Apparatus, by which the Arteries diſtributed to the Brain every-where communicate with each other, after they have enter'd the Cranium; and if at the ſame time we conſider, that as anatomical Injections have taught us, the Arteries of the Pia Mater are every-where united to each other by Anaſtomoſes; and that from Analogy it is highly probable, the ſame obtains in the laſt villous Veſſels of the cortical Subſtance of the Brain; the Reaſon will be obvious, why 'tis poſſible, that when a large Portion of the cortical Subſtance of the Brain is remov'd, the Functions of the Brain may ſtill remain entire. 'Tis alſo to be obſerved, that tho' the cortical Subſtance of the Brain is but of a ſmall Bulk, yet, when freed from the Integuments which confine it, it may eaſily be extended to an immenſe Largeneſs, as it conſiſts of Veſſels ſo tender, and ſo eaſily dilatable.

It ſeems then of all other Methods the moſt proper, to cut off large Funguſes with a Thread apply'd near the Orifice of the Cranium, where they are always ſmalleſt; and to keep down ſmaller ones by drying Medicines, which Intention ſeems to be excellently anſwer'd by Spirit of Wine digeſted with Maſtich or Olibanum; or the Powder of Maſtich, or of Sarcocolla, may be alſo ſprinkled upon the Fungus.

But though the Fungus is removed, yet it ſoon riſes again, as we are taught by numberleſs Inſtances, unleſs ſuch an equable Preſſure is reſtored, as may prevent the exceſſive Diſtention of the luxuriant Veſſels; and unleſs the Velocity and Force of the Circulation are at the ſame time ſo moderate, that the eaſily dilated Veſſels may not be too much diſtended. The former of theſe Intentions is anſwer'd by filling the Hole of the Cranium with Lint, or by applying a Leaden Plate, and with proper Bandage ſecuring it ſo, that it ſhall remain in the intended Situation. The latter Intention is anſwer'd by Veneſection, in order to diminiſh the Quantity of the diſtending Liquid; by Eaſe of Body and Mind; by diluent antiphlogiſtic Liquors, copiouſly drank; by mild and attenuating Aliments; and by gentle Anodynes, the exceſſive Velocity of the Circulation may be quell'd. And Clyſters made of the like Ingredients, Fomentations apply'd to the inferior Parts, and Epiſpaſtics, will derive the Impetus of the Blood to the inferior Parts.

From the Whole of this Hiſtory of Wounds of the Head, as alſo from what is ſaid concerning Wounds in general, it is ſufficiently obvious, that ſlight Wounds of the Head have often prov'd mortal; and on the contrary, that very ſevere Wounds, not only of the Cranium, but alſo of the Brain itſelf, have ſometimes been happily cur'd, without any Abolition or Injury of the Functions. Various Obſervations have been related from the beſt Authors, which confirm this. Hence it

ſeems reaſonable to lay it down as a Maxim, That no Wound of the Head, however ſlight it may appear to be, is to be treated in a ſuperficial and careleſs Manner; and that we ought not to deſpair, in the moſt terrible and apparently dangerous Caſes.

The Malignity of Wounds of the Head is eſtimated,

Firſt, By their Situation. Thus a Wound in the Occiput, Vertex, Parietal Bones, or upon the Sutures, are the worſt of all.

A Wound in the Occiput is highly dangerous, becauſe here very ſtrong Muſcles are inſerted into the Cranium: The Cerebellum, on which Life totally depends, is ſhut up here. Large tranſverſe Sinuſes alſo occur in this Part. Blood, diſcharg'd from ruptur'd Veſſels, is hence evacuated with the greateſt Difficulty; and if extravaſated Humours are lodg'd under the expanded Veil of the *Dura Mater*, which covers the Cerebellum, and defends it from the Preſſure of the incumbent Brain, their Evacuation ſeems to be entirely impracticable.

Wounds in the Vertex are alſo highly dangerous, ſince that Part of the Cranium is, of all others, the ſloweſt in acquiring a bony Hardneſs. In Children this Part, which is call'd the Fontanella, remains long of a membranaceous Texture. Here the Falciform Proceſs of the Dura Mater adheres pretty ſtrongly, and the longitudinal Sinus lies under it: Hence it is ſufficiently obvious, that Wounds, inflicted on this Part, muſt be accompany'd with great Danger.

Wounds of the Parietal Bones muſt alſo be highly dangerous, becauſe generally the Oſſa Bregmatis, eſpecially about their Middle, are found to be very ſlender; and the Furrows, impreſs'd upon theſe Bones, inform us, that conſiderably large Arteries of the Dura Mater are ſituated in this Place. Beſides, theſe Bones of the Head are generally only cover'd with the common Integuments. Hence *Hippocrates*, in the third Section of his Treatiſe on *Wounds of the Head*, concluded Wounds inflicted on this Part to be highly dangerous; becauſe the Bone is weak, cover'd with little Fleſh, and has a large Quantity of the Brain lying under it.

Wounds on the Sutures are alſo dangerous, becauſe, where theſe occur, the Pericranium ſeems to be united with the Dura Mater; and ſince, in theſe Parts, the Dura Mater adheres ſtrongly to the Cranium. Hence the Diſorders ariſing in the external Parts may, in conſequence of the Continuity of Subſtance, be eaſily propagated to thoſe which are internal. When, in conſequence of the Operation of the Trepan, the extravaſated Humours are to be evacuated, the Trepan, in this Caſe, ought never to be apply'd to the Sutures themſelves; and, when the extravaſated Blood is lodg'd between the Cranium and Dura Mater, it is always dubious on which Side of the Suture the Trepan ought to be apply'd; ſince the Dura Mater, adhering firmly to the Sutures, may place the extravaſated Fluids, as it were, in ſeparate and diſtinct Cells, as we have already obſerved.

Secondly, By the Symptoms. As a Fever, appearing after the ſeventh Day, attended with Coldneſs and Tremors; a Paleneſs, Dryneſs, and Lividneſs of the Wound; an Aſperity or Yellowneſs of the Bone; a Hemiplegia, or Convulſions.

The Symptoms, ſubſequent to the Infliction of a Wound, inform us, what Functions are injur'd, and what Degrees of Danger are to be dreaded: The more numerous, therefore, and the more ſevere theſe are, the Danger muſt be proportionably the greater. But we before obſerved, that violent Symptoms, appearing immediately after the Reception of the Wound, were often leſs formidable than thoſe which appear ſome Days after; and this Obſervation was confirm'd by the Authority of *Hippocrates*. A Fever ariſing on the ſeventh Day, after the Infliction of the Wound, was always look'd upon as an unlucky Prognoſtic, ſince it almoſt always portends a new Inflammation or Suppuration, which, in this Caſe, are ſo much to be dreaded. And *Hippocrates*, in the thirty-firſt Section of his Book on *Wounds of the Head*, pronounces this Fever to be a Sign, that the Cranium is corrupted, and that the Cure of the Patient has been neglected. But when the red Colour of the Wound is chang'd, and becomes pale or livid; as alſo when the Lips of the Wound become dry, and appear like wither'd Fleſh, or that which has lain long in Salt; theſe Signs denote, that the Parts have a Tendency to a Mortification and Corruption, as we have already obſerved. But ſince the Cranium is naturally ſmooth, and of a whitiſh Red, or ſomewhat bluiſh Colour, its Roughneſs, and the Change of its Colour into Yellow or Brown, teach us, that it is corrupted; and that the Part thus affected muſt be ſeparated, either by Nature or Art, as we have already more fully explain'd. But Hemiplegies and Convulſions inform us, that the Brain itſelf is affected, whether it is compreſs'd by the depreſs'd Cranium, as has been already obſerved; or whether it is injur'd by the Preſſure or Corruption of the Humours, extravaſated under the Cranium; or whether, by the Force only of a powerful Concuſſion, without any conſiderable Extravaſation of Humours, the tender Fabric of the Brain is remarkably chang'd or deſtroy'd; as we have already taken Notice.

Thirdly, By the Age of the Patient.

In young Perſons the Bones eaſily yield, and are leſs capable of reſiſting wounding Inſtruments. In Adults they are more firm; and in old Men the Bones are, indeed, hard, but, at the ſame time, very brittle. Beſides, in a youthful State, all the Bones are of a more vaſcular Texture, and, for that Reaſon, abound more with Moiſture; whereas, in a more advanced Age, many Veſſels are obliterated, as *Hippocrates* has juſtly obſerved, in the twenty-ninth Section of his Treatiſe on *Wounds of the Head*. "The Bones, ſays he, of Children are more "thin and ſoft, becauſe they abound more in Blood, &c. "Hence, by the ſame or a ſlighter Wound, the Bone of a "Child will become more and ſooner purulent, than the Bone "of an Adult. And, if both Patients are to die of the "Wound, the young Perſon will be cut off ſooner than the "Adult." The whole nervous Syſtem is, in young People, eaſily put in Motion; for which Reaſon they eaſily become convulſed by very ſlight Cauſes; ſo that, at this Age, Wounds of the Head are ſo much the more dangerous: But, in old Perſons, the Separation of the affected Bone, and the Regeneration of that which is loſt, are always obſerved to be more difficult; becauſe, at this Age, the Number of vital Veſſels in the Subſtance of the Bone is ſmaller; and it often happens, in a very advanced Age, that the Diploë, which is almoſt entirely vaſcular, is totally obliterated.

Fourthly, By the Conſtitution of the Patient.

The Conſtitution of a Patient may be conſider'd in two different Lights, either as ſound, or morbid; for the Health of every individual Man is peculiar to himſelf, and can be ſaid to be Health, with reſpect to his Body alone, ſince we obſerve, that different Bodies are ſtill healthful, tho' the Compages of their Solids, and the Qualities of their Fluids, differ very widely. This is what is meant by Soundneſs of the Conſtitution, which the Antients divided into hot and cold, moiſt and dry. It is ſufficiently obvious, that, in conſequence of this, there muſt be a conſiderable Difference betwixt the Wounds of different Perſons, eſpecially thoſe inflicted on the Head; for, in Men of hot and bilious Conſtitutions, a ſtronger Inflammation, and a greater Degeneracy of the extravaſated Humours, are to be expected; whereas in Men of cold, mucous, weak Conſtitutions, the contrary obtains. But a morbid Conſtitution is known from the predominant Cacochymy; and, in Wounds of the Head, that morbid Conſtitution is worſt, which generally affects and corrupts the Bones; ſuch as a ſcorbutic, rickety, or venereal Habit, for Inſtance.

Fifthly, By the Seaſon of the Year.

Exceſſive Heat, and its ungrateful Oppoſite, pinching Cold, are always injurious to Wounds of the Head; but the genial Spring is, of all other Seaſons, moſt friendly to them. *Hippocrates*, however, in the fourth Section of his Book on *Wounds of the Head*, condemns the ſcorching Heats of the Summer, as more noxious than the nipping Colds of the Winter: "For, "ſays he, if any one has receiv'd ſuch a Wound as will prove "mortal in any Part of the Head, he will live longer under "it in the Winter than in the Summer." And, in the thirty-firſt Section of the ſame Book, after having recounted the Signs by which it is known, that a Patient wounded in the Head will die, he ſays, "In the Summer they die before the ſeventh Day, "and in the Winter before the fourteenth." It is alſo much eaſier to correct an intenſe Cold, by kindling a Fire, than to render an exceſſive Heat moderate. Perhaps, for this Reaſon, in the warmer Climates, Wounds of the Head have been obſerved to be more difficultly cured than in colder Countries: Thus, in *Italy*, *Ludovicus Duretus* informs us, that this actually happens; but we have already aſſign'd another Reaſon for this Phenomenon.

Sixthly, By the Malignity and Impurity of the circumambient Air.

We have already obſerved, that the free Acceſs of the Air, eſpecially when cold, was noxious to Wounds of the Head: And, in the Article VULNUS, it is demonſtrated, that a pure Air, often renew'd, and free from putrid Exhalations, is highly advantageous to all Wounds in general: Hence, after Battles, which are generally fought in the Summer, whilſt a large Multitude of the Wounded are laid in the Hoſpitals, the Air is fill'd with ſo many putrid Exhalations, that many die, eſpecially thoſe who are wounded in the Head. Hence that ſkilful Surgeon *Belloſte*, among the ſeveral Advantages attending his Method of making ſmall Perforations in the Cranium, which we have already deſcrib'd, eſteems this one of the moſt conſiderable; that the Patients are, by this means, much ſooner cured than they would otherwiſe be, and conſequently are not oblig'd

to

to languiſh long in the Hoſpitals; where, 'tis obvious, from numberleſs Inſtances, that the ſoundeſt Conſtitutions are conſiderably affected by the malignant Exhalations: And he affirms, that he has an hundred times ſeen thoſe Patients who were already cured, and thinking of their Departure, ſeiz'd with putrid Fevers, Hæmorrhages, and Diarrhœas, which cut them off.

I muſt appriſe the Reader, that nothing I have ever met with gives a greater Inſight into the Nature of Diſeaſes of the Head, from an internal Cauſe, than a Knowledge of what happens in Diſorders of the ſame Part, from an external Cauſe: The preceding Treatiſe on the Head will, therefore, be of much Importance in Phyſic, as well as in Surgery.

CAPUTPURGIA. A barbarous Word uſed by ſome Phyſicians to ſignify ſuch external Remedies as purge the Head, which are either *Sternutatories*, by *Galen*, *S. M. F. l.* 5. *c.* 20. call'd ἑρρίνα, "*Errhines*;" or Maſticatories, which he calls ἀποφλεγματίζοντα, "Apophlegmatiſms." See ERRHINA, and APOPHLEGMATISMUS.

CAPUUPEBA, *Braſilienſibus*, *Gramen dactylon plumeum*, *Luſitanis Pes Gallinaceus dictum*. A ſort of Graſs in *Braſil*, two or three Foot high, with a round ſmooth Stalk, jointed, and with Leaves, at the Joints, above half a Foot long. At the Top the Stalk is branch'd into twenty, twenty-four, and ſometimes thirty leſſer ones; each of which, towards the Top, is cover'd with a Silver-colour'd Pinacle, three or four Fingers Breadth in Length, containing a graſſy Seed. The Stalks are of a fine reddiſh Colour.

The Natives commend the Root, drank in any convenient Liquor, againſt Poiſon. *Raii Hiſt. Plant.*

CARA *Braſilienſibus*, Inhame de S. Thome, *Congenſibus Quiquoaqui Congo*, Margg. *Igname ſive Inhame Luſitanorum*, Cluſ. *Papum Braſilianum ſive Americanum alterum*, C. B.

It is a Species of Convolvulus, with a ſquare Stalk, pennated at the Angles, green, but here-and-there reddiſh, and a little contorted. It creeps a long Way upon the Ground, and propagates itſelf ſo vaſtly, that one ſingle Plant will eaſily fill up a Plot of a hundred and twenty Feet ſquare; for the Stalk and Branches, as they here-and-there touch the Ground, take Root; and, even when they cannot touch the Ground, ſhoot forth Fibres for Roots; but theſe, for want of due Nouriſhment, cannot grow to a juſt Bigneſs. The Leaves are like thoſe of our *Sagittalis:* The Stalk, when cut, ſheds Plenty of a Liquor like the Tears of a Vine: The Root is above a Foot in Thickneſs, and eight, nine, twelve, or more Fingers Breadth in Length, cover'd with a thin Skin of a duſky Aſh-colour, under which it is yellowiſh. The Subſtance is white, juicy, and, as it were, milky, and not ungrateful to the Taſte. [According to *Cluſius*, the Roots are cover'd with a rugged and uneven Rind, like the Roots of the true long Ariſtolochia, and ſhoot forth many ſmall Fibres.] Boil'd with Butter, or ſeaſon'd with Oil and Pepper, it is of a good Taſte, but dry and mealy, whence it ſerves the Inhabitants of *Guiney* for Bread. *Margg.*

Cluſius mentions another Species, which has a rough Rind, ſet with prickly Tubercles, which they call *Yeam Peru*. *Margrave* alſo ſpeaks of another Species, call'd, by the *Braſilians*, *Carainambi*, which has a Stalk that creeps a long Way, with ſolitary Leaves, ſet at Diſtances, of which ſome are of the Figure of a Heart, others have Lobes: The Root is white. *Raii Hiſt. Plant.*

CARAB. A Pod. *Johnſon.*

CARABE, *Succinum*, Offic. *Succinum*, Worm. 31. Charlt. Foſſ. 14. Boet. 321. Calceol. Muſ. 180. Aldrov. Muſ. Metall. 403. Mer. Pin. 219. Gæbal. 10. AMBER. See AMBRA.

CARABUREA, καραβυρία, in *Myrepſus*, *Antidot.* 304. as *Fuchſius* ſays, is a corrupt Word, of which he knows not the Meaning, unleſs it be a Species of *Carui*, which the modern *Spaniards* call *Caroneia* and *Caraneia*.

CARABUS, κάραβος, ſometimes ſignifies an Inſect which lives in dry Wood, and belongs to the Genus of *Scarabæi*. Sometimes is taken for the *Cammarus* or *Aſtacus*, and ſometimes for the *Locuſta marina*, which ſee. *Caſtellus*, *Rieger*.

CARACALLA. The Name of the *Phaſeolus Americanus perennis*, *flore cochleato odorato*, *ſeminibus fuſcis orbiculatis*.

CARACOSMOS. A Name for the *Oxygala equinum*, or ſour Mare's Milk; accounted, by the great Men among the *Tartars*, a delicious Food. *Caſtellus.*

CARAGUATA, *Margg.* is the Aloe of *Braſil*. Some, in their Account of the *Indies*, have written, that Ambergriſe is the concreted Juice of ſome ſort of *Caraguata*, *Manguey*, or *Metl*, growing in great Plenty among the Rocks, which, being torn away by the Violence of the Waves, is toſs'd from Place to Place, and at laſt coagulated: Sometimes there are formed great Lumps by the Concurrence of ſmaller ones.

Thus *Ray*, from Dr. *Tancred Robinſon*, who adds, that Dr. *Trapham* obſerved the Leaves of this ſucculent Plant to be turgid with a kind of viſcous, thick, and bituminous Matter, very like Ambergriſe. See AMBRA.

CARAGUATA, *ſecunda*, Margg. differs little from the former.

CARAGUATA, *guacu*, Margg. is a larger Species than the two preceding. Of the Leaves of this Plant may be made very good Cloth, and better than Linen. The white Filaments of the Subſtance of the conic Corpuſcles, before they open into Flowers, may be drawn out like Cotton. The Root, or the freſh Leaves, bruiſed and thrown into the Water, render Fiſhes ſo ſenſeleſs, that they immediately riſe to the Surface, and may be taken up with the Hand. The dried Wood burns like a Rope dawb'd with Sulphur; and Fire may be got out of it, by the Attrition of a hard Piece of Wood.

CARAGUATA, *acanga*, Margg. bears a Fruit five Fingers Breadth in Length, which may be eaten.

This Plant, ſays *Ray*, ſeems to be very much of the Nature of the *Mexocotl* or *Maguei* of *F. Hernandez*, ſo that it may be doubted whether they are the ſame. However, it does by no means belong to this Genus; but, becauſe of the Similitude of its Leaves, we have ſuffer'd it to keep its Place, till we ſhall more certainly know under what Head it ought to be diſpoſed. *Raii Hiſt. Plant.*

CARAMBOLAS, *Malus Indica*, *Pomo anguloſo Carambolas dicta*, *Tamara tonga*, *ſeu Carambolas*, H. M. *Carambolas*, Park. *Carambolas Acoſtæ*, J. B. *Mala Goenſia*, *Fructu octangulari*, *Pomi vulgaris magnitudine*, C. B. *Erroneè*; *Fructus enim quadrangularis eſt aut pentagonus.*

It bears an oblong Fruit, with a ſmall Umbilicus; but ſtanding out, at the Top, ſulcated with five pretty thick Ridges, which are moſt prominent in the Middle, and cover'd with a thin Rind, ſticking very cloſe to the Pulp, ſmooth, ſhining, firſt green, afterwards yellowiſh, ſurrounding a Pulp, which is firſt whitiſh, then yellowiſh, tender, juicy; of a harſh Taſte at firſt, but afterwards of an acid Sweetneſs. In its pentagonal Middle are contain'd ten oblong Seeds, blunt at one Extremity, and ſharp at the other, red, ſmooth, ſeparated by ſome hard and membranaceous Pellicles in ſuch a manner, that one Cell holds two of them. *Garcia* and *Acoſta* make the Fruit quadrangular, and divided, as it were, into four Parts, and to be of about the Size of a large Hen's Egg.

It is cultivated in Gardens and Orchards; bloſſoms and bears ripe Fruit thrice in a Year, from three Years after grafting or planting the Seed till fifty.

The Juice expreſs'd from the Roots, being taken inwardly, aſſwages feveriſh Heats. Of the bruiſed Leaves, together with an Infuſion of Rice, they make a Cataplaſm, which effectually mollifies and diſſolves all Sorts of Tumors: Of the ſame, boil'd or macerated in an Infuſion of Rice, is prepared an excellent vulnerary Decoction. The expreſs'd Juice of the Fruit cures the Itch, Impetigo, Pſora, and the like cutaneous Affections, if Linen Cloths be moiſten'd with it, and now-and-then applied to the affected Places. The ſame, drank with burnt Wine of the *Indian* Nut, commonly call'd *Arac*, eaſes Pains in the Belly, and ſtops a Diarrhœa. Of the Leaves bruiſed, together with the expreſs'd Juice of the Flowers of the Date-tree, is prepared a Cataplaſm, which cures all Kinds of Inflammations. Of the dried Fruit, together with the bruiſed Leaves of *Betel*, is prepared a Powder, which, being drank in burnt *Arac*, promotes the Pains of Child-birth, and expels the dead Fœtus and Secundines. The ripe Fruit is delicious Food: The unripe is preſerved with Sugar, or in Pickle with Vinegar. The Juice of the unripe Fruit, falling on Cloaths, takes off the Colour with its Acidity; and is frequently uſed for taking Spots out of Linen: Colours alſo are prepared of it, for the Staining of Linen; and it is cuſtomary for Goldſmiths to take the unripe Fruit, and boil it with Silver Veſſels for their Depuration. There are two Species of this Tree, which can hardly be diſtinguiſh'd, but in that the Fruit of one of them is altogether of a ſweet Taſte. *Raii Hiſt. Plant.*

CARAMBU. A Species of *Lyſimachia*, growing in *Malabar*. See LYSIMACHIA.

CARANAIBA. A Species of the *Palma*, or Date-tree. See PALMA.

CARANDAS, *Garciæ*, C. B. *Carandas Indica*, J. B. An *Auzuba Oviedi?*

This, according to *Garcias*, is a Shrub of the Bigneſs of the *Arbutus*, and with Leaves like it. Its Fruit very like a little Apple, blackiſh when ripe, of a very grateful Taſte, like that of Grapes, out of which ſome preſs a vinous Juice. The green Fruit is about the Size of a Haſle-nut, or larger, and ſometimes diſtils a viſcid and milky Juice. The ripe Fruit is ſometimes eaten with Salt, but is uſually pickled green with Vinegar; and is of Uſe to excite a languiſhing Appetite. It grows in the Iſland of *Balagate*, and alſo on the Continent.

The *Auzuba* is deſcrib'd, by *Oviedus*, to be a large beautiful Tree, growing in the Iſland of *Hiſpaniola*, of a firm and uſeful Subſtance; bearing a Fruit, which, in reſpect of its extraordinary Sweetneſs, is like the *Pyra Apiana*, which they call *Moſchatellina* (*Muſk-pears*); but, being full of a viſcid and glutinous milky Juice, ſuch as is in unripe Figs, lies heavy on the

the Stomachs of thoſe who eat it; except they firſt throw it into Water, and, with their Fingers, preſs out the milky Juice, which ſubſides to the Bottom.

The *Carandas* of *Bontius*, tho' he takes it to be the ſame, ſeems to be a different Tree from the foregoing. The Leaves, he ſays, of the Tree, which the *Malayans* call *Caraudie*, are exactly like thoſe of the Tamarind-tree; but the ripe Fruit is incloſed in Shells, like Nut-kernels, one in a Shell, and not after the manner of Tamarinds. The Fruit, when the Shell is open'd, appears of an Orange-colour; and its outer Pulp is very grateful to the Taſte, and not ſo ſubject to ſet the Teeth on Edge as that of Tamarinds, but participates of a Sweetneſs; and, beſides, is not endu'd with a laxative Virtue, as are the Tamarinds. *Raii Hiſt. Plant.*

CARANNA, Offic. C. B. Pin. 503. J. B. 1. 319. Chab. 74. Park. Theat. 1576. Raii Hiſt. 2. 1847. Jonſ. Dendr. 356. *Caranna ſeu Caragna*, Geoff. Tract. 356. *Tlabuclloca Quahuitl*, i. e. *Arbor inſaniæ*, *Caragna nuncupata*, Hern. THE CARANNA-TREE. *Dale.*

Hernandez, according to *Konigius*, in his *Regnum Vegetabile*, deſcribes the Caranna-tree to be tall, with a yellow, ſmooth, ſhining, and odorous Trunk, and oleaginous Leaves, diſpos'd in the Form of a Croſs. According to *Des Marchais*, in his *Voyage en Guinée*, the Caranna-tree is a Species of Palm, and ſpontaneouſly pours out its Reſin or Gum, when an Inciſion is made in its Bark. This Gum or Reſin is externally of a cineritious or blackiſh Colour, but internally of a Colour reſembling that of Pitch, of a bitter, pinguious, and oleaginous Taſte, of a fragrant Smell, reſembling that of Lavender.

This Gum is imported in ſoft Maſſes, wrapt up in the Shreds of Reeds or Bulruſhes, from *Carthagena*, a Province in the *Weſt-Indies*, or of *New-Spain*.

The whiter the Caranna is, the better it is thought, eſpecially if it is ſoft, and of the Conſiſtence of a Plaiſter. In Virtues it agrees with the Tacamahac, but is more efficacious. The *Indians*, according to *Monardes de Simplicibus Medicamentis*, uſe it in Tumors, and Pains of all Kinds. It is recommended in the ſame Diſeaſes in which Tacamahac is proper; but exerts its Virtues in a ſhorter Time, and cures thoſe Diſorders which prove too obſtinate for Tacamahac. Of this, ſays *Monardes*, I have ſeen an Inſtance in a Patient, who, in conſequence of a violent Pain of his Shoulder, could not move his Arm for a great while, tho' he had uſed Tacamahac; but, after he began to apply Caranna, his Diſorder was removed in three Days. This Gum is of ſingular Efficacy in Pains of the Joints, which, when apply'd, it eaſily removes; except in Caſes where there is a Defluxion of hot Humours. It diſcuſſes inveterate Tumors, and puts a timely Stop to Defluxions of cold or mix'd Humours. It is highly beneficial in any Pains of the Brain and Nerves; and, without an Admixture of any other Medicine, cures recent Wounds, eſpecially of the Nerves and Joints. If apply'd to the Ears and Temples, it ſtops Defluxions on the Eyes and other Parts. Theſe are the Virtues which *Monardes* aſcribes to Caranna. *Ettmuller*, *Tom.* 1. informs us, "that, "in Cardialgias, Pains, and other Diſorders of the Stomach, "it is often apply'd, by way of Plaiſter, to the Region of the "Stomach. The Method of preparing it for this Purpoſe is, "to put it in a warm Mortar, and, with a warm Peſtil, to "mix it with a ſufficient Quantity of Balſam of *Capivi*. "Nothing is better than this Plaiſter in continued, malignant, "and intermitting Fevers, where the Patients complain of an "Uneaſineſs of the Præcordia. It is alſo proper for ſtopping "Vomitings, when made up with the diſtil'd Oils of Nut-"meg and Mace. This Plaiſter is highly beneficial in Pains "of the Joints, commonly aſcrib'd to catarrhous Defluxions, "in Caſes where the Joints have been expoſed to Cold, either "during a Diaphoreſis, or after it is over. When moiſten'd "with Oil of Amber, it is an excellent Remedy againſt arthri-"tic Pains, and thoſe of the Joints; as alſo for Wounds of "the Nerves, and Contuſions of every Kind. It is alſo uſed "in Cephalic Plaiſters, and thoſe apply'd to the Bregma. The "Moderns apply a Plaiſter of it, as big as a Dollar, to the "Temples, as a Preſervative againſt the Tooth-ach; but, for "this Purpoſe, Maſtich is by moſt preferr'd to it. In Inflam-"mations of the Eyes, apply'd in the ſame manner, it is an "excellent Remedy for preventing Defluxions, and giving a "Check to the Lymph, which often abounds too much in "Ophthalmies and Tooth-achs." In *Schroder's Pharmacopœia* there is a celebrated Plaiſter againſt the Gout, prepar'd of one Ounce of Gum Caranna, and half an Ounce of yellow Wax, made up with Oil of Mullin. *Faber*, in his *Myrothecium Spagiricum*, *L.* 2. *C.* 41. orders the Quinteſſence of Caranna to be prepar'd in the following manner:

> Digeſt Caranna with highly rectify'd Spirit of Wine, in a moderately warm Heat, for fifteen Days, that it may be diſſolved: Then diſtil; but obſerve the Degrees of the Fire ſo carefully, that firſt a Spirit, then a yellow Oil, and laſtly a reddiſh Oil, may be yielded: Rectify theſe Oils three or four times: Calcine the remaining Fœces. With theſe Oils mix, in a moderate Bath-heat, the Salt, lixiviated from the calcin'd Fœces, after it has been often calcin'd and diſſolved.

This Medicine he highly recommends for external Uſe, either alone, if the Part affected be anointed with it moderately warm; or, mix'd with other Ointments, in arthritic Pains, ariſing from a cold Cauſe; as alſo for diſcuſſing or ſoftening hard, cold, and ſcirrhous Tumors; and for healing old and inveterate Ulcers: As alſo in colic Pains, ariſing from Phlegm, and glutinous or flatulent Humours. It is alſo good in a Hemicrania, and Pains of the Head, ariſing from a cold Cauſe. He recommends it to be taken internally from ten to twelve Drops, in a poach'd Egg, Syrup of Violets, or Syrup of Poppies. In *America* there is a celebrated Balſam, made of Caranna, for Wounds, and the Hæmorrhoids. *Pomet*, *L.* 2. orders it to be prepar'd in the following manner:

> Take of the beſt Turpentine, half an Ounce; of liquid Amber, three Ounces; of Balſam of Capivi, Tacamahac, and Caranna, each two Ounces; of Maſtich, Myrrh, Aloes, Frankincenſe, Dragon's-blood, and Sarcocol, each one Dram: When the Gums and Reſins are melted over a Fire, the other Ingredients, reduced to a Powder, are to be mix'd with them.

Geoffroy obſerves, that this is term'd a Gum, but very unjuſtly, becauſe it is diſſoluble only in Spirit of Wine, which is the Property of reſinous Subſtances.

CARA-NOSI. An *Indian* Shrub. The ſame as NEGUNDO, which ſee. *Ray.*

CARAPATINA. The ſame with BUFONITIS, which ſee.

CARARU *Braſilienſibus*, *Blitum Braſilianum Luſitanis*, Bredoſ. Margg. A Species of Blite growing in *Braſil*, which has in it nothing remarkable. *Raii Hiſt. Plant.*

CARA-SCHULLI, H. M. *Frutex Indicus ſpinoſus*, *Capparis Forma*, *Siliqua bivalvi brevi.* An *Indian* Shrub, like the Caper-ſhrub. As to its medicinal Uſes, being reduced to Powder by the Fire, and mix'd with Vinegar, and rubb'd on the Part, it diſſolves Tumors. Beaten to Powder, and mix'd with the Liquor call'd *Surie*, made of the Cocoa-nut, it ſerves to ripen and break Abſceſſes. The Decoction of the Root is good in a Suppreſſion of Urine; taken with a little Rice, it is effectual in a Tumor of the Belly. A Decoction of the Leaves, with a ſmall Quantity of Rice, taken inwardly, is good to extenuate tumefy'd Limbs. *Raii Hiſt. Plant.*

CARATA, or KARAT. This was a Weight antiently uſed by the Workers in Gold, and Lapidaries. With reſpect to Gold, twenty-four Karats made a Marc; but, in our Times, it is only uſed for judging of the Purity of Gold. But, with reſpect to precious Stones, the Word *Karat* imported a Weight only of four Grains. *Rieger.*

CARAUCIA. See under CARABUREA.

CARBASUS, κάρβασος, ἄρμενον. Thin Linen, or Threads of fine Linen, on which Surgeons lay their Powders, or ſpread their Ointments, to be apply'd to diſeaſed Parts; or uſe to dry up the ſuperfluous Moiſture in ulcerated Places. The Wordis uſed by *Scribonius Largus*, N°. 227.

CARBO. A Coal; properly, I think, Charcoal, which is generally meant by Authors, when uſed without the Epithet *Foſſilis*. Foſſil Coals are thus diſtinguiſh'd.

CARBO FOSSILIS, *Lithanthrax*, Offic. Mer. Pin. 216. *Lithanthrax ſeu Carbo foſſilis*, Charlt. Foſſ. 14. Boet. 339. *Carbo foſſilis*, *ſeu Lithanthrax*, Worm. 31. Gæbal. 26. PIT-COAL, or SCOTCH COAL.

Upon the Subject of foſſile Coal, *Hoffman* has given us the following curious Remarks.

To diſcover the Elements or Principles of foſſile Coals, by means of a chymical Analyſis, ſays he, is our preſent Deſign. Theſe Coals, then, diſtil'd from a Retort by an open Fire, yield firſt a Phlegm, then a ſomewhat acrid ſulphureous Spirit, then a ſubtile Oil, then a groſſer Oil, which ſubſides to the Bottom of the Receiver; and, laſtly, by a briſker Degree of Fire, a certain acidulated Salt, reſembling that of Amber. In the Retort there is left a light black Earth, which, upon the Application of Fire, emits neither Flame nor Smoke. I ſhall here give a brief, but accurate Deſcription of the ſeveral Experiments I made, in order to inveſtigate the Nature of theſe Principles.

The Spirit yielded in Diſtillation is at firſt white, but afterwards appears ting'd with a reddiſh-brown Colour; which Phenomenon may alſo be obſerved in the Spirits yielded by Woods, Tartar, Myrrh, and other Subſtances of a like Nature. Upon an Affuſion of the acid Spirit of Salt, a large Number of Bubbles immediately appear'd at the Bottom of the Veſſel, which, becoming gradually and ſucceſſively more numerous, aſcended to the Surface of the Liquor, but without any remarkable Perturbation of the Mixture. With Spirit of Nitre the Conflict was greater, and the Liquor was render'd more turbid.

Upon a ſufficient Quantity of Quick-lime being thrown into this Spirit, a ſtrong volatile Spirit immediately affected the Noſe in a forcible manner. Upon an Affuſion of Spirit of Nitre to this Mixture, a thick white Fume was forthwith emitted; which we always obſerve to happen, when we add Spirit of Nitre to volatile Salts or Spirits. The fetid Oil, intimately united and incorporated with Salt of Tartar, alſo diffuſed a Smell like that of volatile Salt. Upon Diſtillation, this Mixture yielded an alcaline, volatile, and oleous Spirit, which immediately became green with Syrup of Violets, as all Alcalis do; but, when mix'd with an Acid, raiſed a ſudden Effervеſcence, and immediately aſſum'd a perfectly red Colour.

The groſs empyreumatic Oil of theſe Coals, obtain'd in the firſt Diſtillation, emitted a ſulphureous Smell. When put into a Silver Spoon, to which a gentle Heat was apply'd, it immediately ting'd it of an obſcure blackiſh Colour; a ſure Proof, that a true mineral Sulphur is diſſolved in it; for common Sulphur, diſſolved in Oil of Turpentine, tinges Silver Veſſels with the ſame Colour.

The acid Salt, upon an Admixture of Oil of Tartar per Deliquium, aſſum'd a near Affinity to that obtain'd from Amber by Diſtillation. Spirit of Sal Ammoniac excited a large Number of very broad Bubbles, which collected themſelves in the Bottom of the Glaſs: But, immediately after, the Mixture, which was before limpid, aſſum'd a reddiſh Colour; and, upon the Affuſion of an Acid, return'd to its former Tranſparence.

'Tis rarely obſerv'd, that an Acid is thus ting'd by an Alcali. That I might, therefore, trace the Cauſe of this Phenomenon more accurately, I mix'd diſſolved volatile Salt of Amber, which I thought of a like Nature with the Salt of which we now ſpeak, with vinous Spirit of Sal Ammoniac; by which means, after ſome Conflict, the Mixture in a little time aſſum'd a beautiful browniſh-red Colour; and an excellent Medicine, of Virtues not inferior to ſuccinated Spirit of Hartſhorn, was produced.

Theſe are the principal Experiments I made, in order to inveſtigate the Nature of foſſile Coals; from which, I think, it is obvious, that no deleterious Principle, nothing offenſive to the Maſs of Blood, and the minuteſt Parts of the Body, in a Word, no noxious Mineral, no Quantity of Arſenic, are found in them.

That a mineral Sulphur is not ſo fatal as is commonly believed, is ſufficiently atteſted by thoſe Men who prepare, fuſe, and boil the Sulphur of *Goſlar*, who are ſound and vigorous, in compariſon of other Metal-workers. Nor is there, in the *German* Coal, a very conſiderable Quantity of this Sulphur, otherwiſe it might be eaſily obtain'd dry, and in the Form of Flowers, by Sublimation; for theſe mineral Coals are a porous and ſpongious Earth, richly and intimately impregnated with a bituminous and ſubterraneous Juice. Bitumen is their conſtituent Principle, without which they would neither emit Flame nor Smoak: But the Bitumen they contain, like all the other Species of Bitumens, of which Amber is one, conſiſts of oleous, ſulphureous, acid, and fine alcaline Parts, as is obvious from the chymical Analyſis of Amber, Bitumen Judaicum, Naphtha, Petroleum, and all other reſinous Bodies.

So far, then, are theſe Principles from proving prejudicial to the vital Juices, that, by drying up the ſuperfluous Humidity, they rather defend the Maſs of Blood, and the Body, from Corruption and Putrefaction; for, according to *Galen*, all Bitumens are endow'd with a balſamic Virtue. Beſides, that bituminous Bodies, ſet on Fire, correct the bad State of the Air, and diſſipate its ſuperfluous Humidity, are Points admitted by moſt modern Phyſicians; and the Antients uſed Sulphur and Aſphaltus, in order to correct and purify the Air, when Plagues and contagious Diſeaſes raged.

Places in which the Atmoſphere is very moiſt, and impregnated with aqueous Exhalations, which weaken its Force and Elaſticity, are not wholſome; becauſe, by that means, Perſpiration being obſtructed, a Load of recrementitious and ſaline Sordes are retain'd in the Body, and communicate a depraved and ſcorbutic Intemperature to the Blood and Humours, from which terrible chronical Diſorders ariſe. 'Tis therefore obvious, that the ſulphureous Vapour of foſſile Coals is of ſingular Service in Countries where the State of the Air is moiſt and unactive, as is evident from the City of *Halle*.

An immenſe Quantity of aqueous Exhalations, ariſing not only from the River *Sale*, diffuſed into many Branches, but alſo from the Salt-works, whilſt each Day at leaſt ten thouſand Pounds of Water are evaporated into the Atmoſphere ſurrounding that City, muſt of courſe beſet the Town, at Morning and Night, with Clouds, which every one muſt perceive to be prejudicial to Health, unleſs an Eaſterly or Northerly Wind diſpel them. And, in Times paſt, no City was more obnoxious to Scurvies, Conſumptions, purple and malignant Fevers, than *Halle*; but ſince, about twenty Years ago, they began to burn foſſile Coals for boiling the Salt, the Atmoſphere is ſo purify'd, that theſe Diſeaſes are ſcarce heard of in that City. In former Times the Phyſicians, who practiſed in it, complain'd, that no Diſeaſe occur'd to them, which was not accompany'd with a ſcorbutic Taint. Numbers of young Men were cut off by Conſumptions and Dyſenteries; and petechical and ſpotted ſcorbutic Fevers raged exceſſively; but now theſe Diſorders happen rarely, and then only a few are affected with them.

But I am well appris'd, that it is by ſome objected, that the Exhalations of foſſile Coal are rather pernicious than advantageous to Health; becauſe they prey upon Metals, eſpecially the Iron and Lead of Windows, which they conſume; and becauſe, in Gardens which are near them, and thick ſet, they render the Trees and Shrubs barren and ſapleſs. 'Tis alſo objected, that in *England*, and eſpecially *London*, a Conſumption is produced, peculiar to that Country, by a preternatural Dryneſs of the Veſicles of the Lungs, in conſequence of this Smoak; as alſo, that its Smell is fetid, and highly diſagreeable.

But to all theſe Objections we anſwer, That tho' the Smoak ariſing from a mineral Sulphur, and from Vinegar, are poſſeſs'd of a powerful Virtue, by which they conſume thoſe lighter and more porous Metals, Iron and Lead; they are not, for that Reaſon, leſs proper for purifying the Air, when a Plague rages, or diſſipating its ſuperfluous Moiſture, ſo prejudicial to Health. Beſides, that this Smoak does not, in the leaſt, injure the Health of thoſe People who inhabit the Houſes expoſed to it, and in which the Leads of the Windows are corroded, is a Fact atteſted by daily Experience, ſince few of them labour under any Diſorders of the Breaſt.

That this Smoak, however, may prove prejudicial, when thick and denſe, is a Fact of which I am firmly perſuaded; for as a large Quantity of Exhalations from a balſamic Gum, which is friendly to Nature, for Inſtance, from Maſtich, Benjamin, or *Peruvian* Balſam, is ungrateful; ſo 'tis not to be doubted, but the denſe Vapour of Bitumen, which is not very grateful, may create Diſorders; which, however, ſeems to be owing not ſo much to its Nature, as to the Exceſs of its Quantity. 'Tis not, therefore, to be wonder'd at, if in *London*, where a groſs State of the Air, Gluttony, and exceſſive Drinking, eſpecially of ſpirituous Liquors, induce a morbid State of the Humours, an exceſſive Quantity of the Smoak, ariſing from foſſile Coals, ſhould prove prejudicial, and produce a Dryneſs of the Lungs.

As to that Objection of the Smoak being fetid, diſagreeable, hurtful to the Nerves, and membranous Parts, and prejudicial to thoſe who labour under a Weakneſs of the Nerves and Head, we anſwer, That tho' the Smells of fetid Subſtances are not always grateful to the Delicate, yet they are not, for that Reaſon, prejudicial to Health; as is obvious in the Spirits of Soot, Worms, and Hartſhorn, which are all highly fetid. But how much theſe Spirits contribute to repair the Strength, and to preſerve and purge the Maſs of Blood and Humours, is known to almoſt every one concern'd in Phyſic. It muſt alſo be obſerved, that the Smell, even of Perfumes, is ungrateful to many; as we obſerve in Women who have weak Nerves, and who not only bear Fetids more chearfully, but receive a Kind of Relief from them. *Hoffman's Obſer. Phyſico-chymicæ ſelectiores.*

It would be happy for the *Engliſh*, if their Conduct would permit me to contradict, with Truth, the Charge which *Hoffman* has brought againſt them.

Of Vegetable Coals.

All vegetable Subſtances, eſpecially Woods, when treated with a cloſe Fire, are converted into Coals, which are porous, light, black Bodies, retaining the Figure of the original Body, and which eaſily take Flame; and, by a ſtrong Degree of Fire, partly fly off in the Air, and partly are reſolved into Aſhes.

The Coals moſt frequently in Uſe are thus prepared:

A Pile of Wood is rear'd up, and cover'd with Earth. Fire is then put under it. Thus it is kept from flaming openly; and the Fire, gradually and gently ſeizing the Wood, thoroughly extracts all its Moiſture; as alſo its acid Principle, and the ſubtile Oil it contains. The remaining thick Oil is indeed extracted, but afterwards penetrates more deeply into the Pores of the Parts.

In conſequence of this Oil being diſengaged, and ſet at Liberty, they eaſily take Flame; juſt as we ſee Linen Cloth, ſo gently burnt, that all their Oil is not extracted, afford a Baſis, and prove, as it were, a Nouriſhment to the Fire. This is what we call Tinder, which is uſed for renewing the Sparks of Fire ſtruck from Steel and Flint. Not only all Vegetables, but alſo all the Parts of Animals which preſerve their Blackneſs, may be converted into Coals of this Kind, fit for taking Flame.

But 'tis to be obſerved, that no Kind of Coals, even by the greateſt Force of Fire, will either burn, or be converted into white Aſhes, in a cloſe Veſſel; which eaſily happens in the free and open Air, where they are reſolved into a fine Smoak, leaving Aſhes, which, when lixiviated, afford an alcaline Salt, if the Coal has been taken from the Vegetable Kingdom. If theſe Aſhes, which are impregnated with Salt, are boil'd in Water,

Water, the Salt becomes more cauſtic; which Effect is alſo produced, if they are form'd into ſmall Balls with Water, dried, and again ſubjected to the Fire. Tho' this Species of Coal is generally uſed for Fewel, yet it is of more extenſive Uſe for anſwering the various Purpoſes of Mechanics, Chymiſts, and Metal-workers.

But as there is a great Difference between Vegetables, ſo the Coals produc'd from them vary proportionably from each other. Beech-wood is prefer'd to all others for Fire, and the Coals prepar'd of it are better and more valuable than all others, for which Reaſon they are us'd for converting Iron into Steel; for the more ſolid and ponderous Coals are, the fitter and more proper they are for this Purpoſe. *Becher*, in his *Phyſica Subterranea*, mentions an Experiment, by which Coals may be reduc'd to an inflammable inſipid Spirit, by being mix'd with diſtil'd Vinegar; but as little Credit is to be given to the Experiments of this Author, ſo we have ſome Reaſon to doubt of the Succeſs of this.

'Tis, however, certain, that Coals, by a lively briſk Flame, are diſſolv'd into a very fine and ſcarce viſible Vapour, and are diſſipated into the Air without any ſenſible Smell; but this Vapour or Smoak immediately becomes viſible, if with a clean Pen Letters are made on a Piece of Paper with a Solution of Alum, or with Spirit of Vitriol; for when the Letters are dry, and the Paper held over the Smoak of the Coals, they appear as black as if they had been wrote with the blackeſt and beſt ſaturated Ink.

If in a Room, eſpecially one with a low Cieling, the Air is impregnated with this ſubtile Vapour ariſing from kindled Coals, eſpecially in cold Weather, it is as fatal to Animals, eſpecially to Man, as Poiſon, and induces an apoplectic Stupor and Drowſineſs, which, if due Meaſures are not taken, kill the Patient in a ſhort time; innumerable Inſtances of which every-where occur, eſpecially if, in cold Winters, too large a Quantity of theſe Coals are incautiouſly put into the Stove. The noxious and prejudicial Quality of this Vapour has been obſerved by the antient as well as the modern Phyſicians, and numberleſs Examples of its bad Effects are ſpecify'd by them.

But, tho' the noxious Quality of this Vapour has long ago been prov'd by uncontroverted Facts, it is ſurpriſing, that it ſhould be ſo much overlook'd, and ſo little adverted to, by moſt of our modern Phyſicians, that few of them have taken the leaſt Notice of it, or laid down the Precautions which an Affair of ſuch Importance ſeems to require; much leſs has the Cauſe of this noxious Quality been inquir'd into, or the Reaſon inveſtigated, why this Smoak, drawn in with the Breath, throws the Patient into a profound Sleep, a Stupor of the Senſes, a Palſey, a Hemiplegy, and, if ſeaſonable Relief is not afforded, induces Death itſelf.

But ſince almoſt the ſame Effects are obſerv'd to be produc'd by the Smoak of common Sulphur, whilſt a very ſmall Portion of it, ſet on Fire in a little Room, kills ſome Animals, we are to inquire whether Coals and mineral Sulphur are poſſeſs'd of one common Principle, by which they produce ſo ſudden and ſo fatal Effects.

'Tis well known, that a few Grains of Sulphur, ſet on Fire, will diffuſe a large Quantity of a very fine, but fetid Fume thro' all the Parts of a large Room. 'Tis not to be doubted, but by the Fire almoſt the whole Subſtance of the Coal may be diſſipated in the Air, in a fine inviſible Smoak or Exhalation, which alſo becomes viſible when Letters are wrote upon a Paper with a Solution of Alum, and apply'd to the Smoak of the Coals, as we have already obſerv'd.

This thin and ſubtile Vapour, then, being carried into the Air, and, by Inſpiration, convey'd thro' the Noſtrils into the Head, and thro' the Aſpera Arteria into the Lungs, by the Tenuity of its Parts intimately inſinuates itſelf into the Pores of the ſolid Parts and Veſſels, and penetrates the minuteſt Pores of the Nerves, Meninges, and Brain, where, conveying a Taint into that fine ſubtile Fluid, by means of which Senſation and Motion are perform'd, it diſturbs and inverts the animal Actions. It alſo happens, that the Air being impregnated with a great deal of theſe Vapours, when it is received into the Lungs, loſes a great deal of that Force and Elaſticity by which it ought to diſtend and inflate the pulmonary Veſſels.

Now ſince mineral Sulphur, the Vapour of which is as prejudicial as that ariſing from live Coals, conſiſts of two Subſtances, one of which is of an acid, and the other of a pinguious earthy Nature, which takes Fire; and ſince this ſomniferous and narcotic Virtue does not reſide in an acid Spirit; the Cauſe muſt be ſought for in that exhalable, ſulphureous, or phlogiſtic Subſtance, ſuch as is alſo found in Coals, from which, as is well known, Sulphur may be obtain'd by means of an Acid. Hence it happens, that the Vapour of Coals produces the ſame Effects, and the ſame Train of Symptoms in Animals, with the Smoak of Sulphur, the phlogiſtic Part of both being nearly the ſame. But every one knows, that all ſedative, narcotic, and anodyne Virtues, are to be deduc'd from Sulphur reſolv'd into very fine Vapours, as is obvious in Saffron, Opium, Nightſhade, Thorn-apple, Poppies, and Mandrake. Theſe Effects may be produc'd, tho' the Smell of the Coals is not really perceiv'd, becauſe the Smell ariſes not ſo much from the Sulphur alone, as from that, and a Mixture of the Salt which exalts it.

We ſhall now recount the various Phenomena produced by throwing various kinds of Salts and Minerals upon live Coals. Firſt, then, Nitre, fus'd in a Veſſel by a very intenſe Fire, does not burn; but, upon throwing live Coals into it, immediately takes Flame; which greatly increaſes the Fire of the Coals themſelves, juſt as if a Bellows were apply'd to them.

Common Salt, when thrown upon live Coals, not only decrepitates, but alſo animates and invigorates their Fire, and raiſes a whitiſh Smoak, which, when adhering to any Veſſel, is with Difficulty taken off, and taſtes ſomewhat ſaltiſh.

Vitriol, which partakes of the Nature of Copper, when thrown upon live Coals, emits a beautiful azure-colour'd Flame. If Alum is thrown upon them, it firſt boils, and riſes in a white Froth; and, upon increaſing the Fire, loſes all its Taſte, and remains an earthy, ſpongious, and white Body. When a few Drops of Oil of Vitriol are thrown upon live Coals, a Vapour, of a Smell reſembling that of Sulphur, is forthwith emitted.

Borax thrown upon them is firſt converted into a white Froth; and afterwards, by rendering the Fire more intenſe by a Pair of Bellows, it immediately runs into a Mucilage, which is ſoon turn'd into a vitreous pellucid Maſs.

I alſo made an Experiment with *Epſom* Salt, that of *Glauber*, depurated Aphronitre of *Gena*, as alſo with the *Sedlitz* Salt in *Bohemia*, the native *Schemnitz* Salt in *Hungary*, and that prepared from the Fountains of *Egra*. Theſe I threw ſeparately into the Flame, expecting a ſulphureous Smell to be emitted, but no ſuch Phenomenon appear'd; for they were firſt rais'd into a thick Froth, which, when all the Humidity was evaporated, ſunk down into a white earthy Maſs, of a ſaline ſubaſtringent Taſte, and which, with Spirit of Vitriol, neither produc'd an Ebullition, nor emitted any conſiderable Smell. But we obſerve a very ſignal Difference between theſe Salts, if they are not put directly and immediately upon the Fire of Coals, but are mixed with their Duſt, and Fire is afterwards apply'd to them in a Crucible; for, by this means, they are partly carry'd off into the Air, like the Fume of Sulphur, and partly leave behind them a ſulphureous alcaline Maſs.

By this Experiment alone we are ſufficiently taught the different Effects produc'd by treating ſome Bodies, even of the mineral Kind, with the Flame of Coals, and by ſubjecting them to the Fire, when mixed with the Powder of Coals in a cloſe Veſſel.

The Arcanum Duplicatum, vitriolated Tartar, and all neutral Salts with which the Acid of Vitriol is join'd, when thrown upon live Coals, firſt decrepitate gently, and afterwards fly off in the Air, without any viſible Exhalation or Smell, and without almoſt leaving any perceptible Traces of themſelves; whereas, when expoſed to the Fire in a Crucible, and mix'd with Powder of Coals, they are, by the Addition of a ſmall Quantity of an alcaline Salt, converted into Liver of Sulphur.

In Metal-working it is a remarkable Circumſtance, that Tin, Iron, Copper, and Lead Ore, as alſo the Calxes of Antimony, the Scoriæ and Glaſſes of Metals, are not converted to a pure Metal, unleſs Coals are intimately mix'd with them, and they are then fuſed by an open Fire. Whether by this means, as ſome think, any Part of the phlogiſtic Principle of the Coals paſſes into the Mixture of the Metal, and reſtores that which is carried off in Calcination by the Fire, or by the Addition of any other Subſtances; or rather, whether, by this means, that which prevents and hinders the Fuſion of the Metals is only remov'd, are Points that deſerve a more accurate Diſquiſition.

The Phenomenon is, in my Opinion, to be accounted for in another manner. The Acid of the Sulphur inheres in the metallic Ore, becauſe, by the previous gentle Calcination, the oleous and inflammable Part flies off. The Calxes alſo, and Glaſſes of Metals and Minerals, are produc'd by an Acid, which intimately penetrates their Pores, and changes the Figure and Situation of their Parts; but when this acid Salt, which is the Cauſe, is remov'd, they return, and are reſtor'd to their former State and Contexture. For theſe Purpoſes, then, ſuch Subſtances are indicated as penetrate intimately, and poſſeſs a Power of abſorbing an Acid, among the Number of which are Coals, which, when in a Flame, not only afford an immediate Fire for reducing Bodies, but alſo, by their oleous, rarefactive, alcaline, and volatile Principle, enter the minuteſt Pores where the Acid lurks: This Acid they abſorb, and, by that means, reſtore the Metal. That the Smoak alone of Coals is of a very penetrating Nature, and fit for correcting Acids, is ſufficiently proved by the Obſervation of *Stahl*, who found, that the fix'd and acid Oil of Vitriol cannot be obtain'd, if in the Retort there are any Fiſſures, by which the penetrating Smoak of the Coals entirely changes and deſtroys the acid Vapour of the Vitriol, ſo that a highly volatile Spirit is yielded inſtead of a corroſive Acid.

'Tis worthy our Obſervation, that the ſolid and highly lucid *Engliſh* Phoſphorus cannot be prepared in ſo large a Quantity, unleſs Powder of Coals is added to the putrid and inſpiſſated Urine.

How beneficial Powder of Coals is in rendering the Ground fruitful, is well known to Gardeners, who for that Purpoſe uſe Coal Duſt, Marls, and old Mortar taken from Walls. 'Tis incredible how ſurpriſingly Lemon and Orange-trees, as alſo Clove-gilly-flowers, thrive by this means.

The Duſt of Coals renders moiſt Soils ſo fruitful, that the Strawberries produc'd in them are by this means render'd much larger than they would otherwiſe be; and all Plants are conſiderably enlarged; for that earthy and ſulphureous Alcali lodg'd in the Coal Duſt, being reſolved by the Rain, and the Heat of the Sun, renders the Earth ſo fruitful, that the nutritive Juice, percolated thro' it, not only quickly enters the minuteſt Pores of the Vegetables, but is more eaſily converted into their Subſtance.

From this Experiment it is obvious, that the chief Principle of Fecundation is rather to be ſought for in a ſulphureous than in a ſaline Subſtance, which, if it is of an alcaline Nature, produces no other Effect than to attenuate and reſolve the ſulphureous Matter more, and to change and abſorb the Acid, which greatly obſtructs Vegetation.

Not only the Duſt of Coals, but much more the Bones of Animals calcin'd to black Aſhes, impart a certain Fruitfulneſs to the Ground, becauſe they contain in them a larger Quantity of Oil than Coals do; ſo that they may very properly be us'd, in Conjunction with other Subſtances, to forward the Growth of Vegetables.

We have no Reaſon to doubt of the anodyne Virtues of Coals in ſpaſmodic and convulſive Diſorders, ſince Coals of the Lime-tree make the principal Ingredient in the black antiepileptic *Saxon* Powder, which has acquir'd ſo extenſive a Reputation for the ſurpriſing Effects it produces. *Rulandus*, in his *Theſaurus Medicus*, informs us, that Epilepſies, Gripes, Colics, and Fluxes, are cur'd by the Coals of the Lime-tree. *Hoffman. Obſervat. Phyſico-chymicæ.*

I muſt take the Liberty of adding to what *Hoffman* relates concerning the deleterious Vapour of vegetable Coals, that foſſile Coals, eſpecially thoſe half burnt, which are uſually call'd *Cokes*, will have a like Effect, if the Fumes thereof are confin'd in a ſmall Room. Of this I met with Inſtances in two Servant-maids, who took ſome Coals in a Warming-pan into a damp Room where they lay, in order to warm it during the Night. The Conſequence of this was, that the next Morning they were found, in all Appearance, expiring, being ſenſeleſs and ſtupid. The Method I took for their Relief was, immediately to expoſe them to the freſh Air, to bleed them, and to attempt to reſtore the Circulation of the Blood by Frictions, and every thing which would ſtimulate ſtrongly, either adminiſter'd internally, or applied externally. By theſe means they both recover'd in a few Hours; being more fortunate than two other Servants of the ſame Sex, who were found actually dead in the Morning, on account of the ſame Imprudence, in the Neighbourhood where I at that time reſided.

CARBUNCULUS, ἄνθραξ, a Carbuncle.

Of Ulcers which ariſe from internal Cauſes, and corrupt a Part of the Body, there is none worſe than a *Carbuncle*, the Characters of which are as follow: There is a Redneſs, with an Elevation of Puſtules, though to no great degree of Eminence. Thoſe Puſtules are generally black, ſometimes livid, or pale: They ſeem to contain a Sanies, and are black within. The Part poſſeſs'd by the Carbuncle is dry, and harder than in its natural State, cover'd with a kind of Cruſt, and environ'd by an Inflammation. In that Place there is no raiſing of the Skin, which ſeems fix'd to the ſubjacent Fleſh. The Patient is oppreſs'd with Drowſineſs, and ſometimes is ſeiz'd with a Shivering, or Fever, or both. The Diſeaſe ſpreads underneath, and out of Sight, ſometimes ſlowly, ſometimes ſwiftly, and propagates itſelf, as it were, by Roots. Above, as it takes its Progreſs in open View, it appears firſt whitiſh, then livid, and ſurrounded with ſmall Puſtules; and if it happens about the Stomach or Fauces, it often ſuddenly ſtrangles the Patient. *Celſus*, *Lib.* 5. *Cap.* 28.

Carbunculus is defin'd by *Galen*, or whoever is the Author of the *Definitiones Medicæ*, Ἐξαρώδης ἕλκωσις, μετὰ ἰχῶρος καὶ φλεγμονῆς, ἐνίοτε καὶ βυθώνων, καὶ πυρετοῦ. "A cruſty ſpreading Ulcer, "attended with a Conflux of Humours, and ſometimes with "Buboes and a Fever." *Galen*, *Com. ad Aph.* 45. *Lib.* 6. gives a ſhorter Definition, tho' not diſagreeing with the former, as follows: Ἄνθραξ ἐστὶν ἕλκος ἐξαρῶδες ἅμα πολλῇ τῇ περὶ τόπῳ συμπτώσει φλεγμόνος. "A Carbuncle is a cruſty Ulcer, attended "with a great Inflammation of the adjacent Parts." It derives its Original, according to the ſame Author, *Lib.* 2. *de Præſag. ex Pulſ. Cap.* 1. from melancholy Blood putrefying, and inflam'd to ſuch a degree as to burn the Skin. And, in his *Comment.* 3. in *Lib.* 3. *Epid.* he ſays, Ὁ ἄνθραξ ἐν θερμῇ μὲν τοῖς πυρώδεσι, φαχέως δὲ καὶ κατὰ τὸν σύσταν ἔχει τὴν γένεσιν· "A Carbuncle is generated of a groſs Matter, and attended "with a fiery Heat."

Paulus Ægineta gives the following Original and Deſcription of a Carbuncle: Τὸ αἱματῶδες μελαγχολικαθὲν ζωμοῦται, &c. "When the Blood becomes atrabilious to an immoderate Degree, and, being put into an Efferveſcence, falls upon any "Part, there is generated what they call a Carbuncle, which "is a cruſty Ulcer, beginning, for the moſt part, with a "Puſtule (φλυκταίνης) like a Burn, and ſometimes without it. "At firſt the Patient falls a ſcratching the Part, when ariſes "ſometimes one Puſtule, ſometimes more, like Grains of "Millet for Smallneſs, which breaking there becomes a cruſty "Ulcer, as if it were produc'd by an actual Cautery. The "Cruſt appears ſometimes of an Aſh-colour, and ſometimes "black, and alſo adheres, and is fix'd on its Baſe, to the Part, "and dilates itſelf by its phagedenic Property. The Fleſh all "around is very much inflam'd and black, and ſhines like "Pitch or Bitumen. This exactly anſwers the Nature of "black Bile. Carbuncles in the Fleſh are but of ſhort Duration; but thoſe which affect the Membranes and Nerves are "of longer Continuance, and communicate their ill Effects, "by Conſent of Parts, to the neighbouring Places, ſo as to "affect them with eryſipelatous Inflammations, many of which "come to a Suppuration, but moſt of them are attended with "a Fever. Carbuncles, alſo, ariſe from epidemic Cauſes." Thus *P. Ægineta*, *Lib.* 4. *Cap.* 25. whom *Actuarius* copies Word for Word.

A Carbuncle is an Inflammation, which, in peſtilential Times, riſes with ſuch Veſicles as are the uſual Effects of a Burn. This Inflammation, for the moſt part, ſuddenly degenerates into a Sphacelus, and corrupts the ſubjacent Parts to the very Bones, rendering them as black as a Coal; and this ſeems to be the Reaſon why the *Latins* call this ſort of Puſtules or Veſicles *Carbunculi*, and the *Greeks* ἄνθρακες, *Anthraces*.

A Carbuncle almoſt always breaks out very ſuddenly and unexpectedly, in an Hour or two at the moſt, and is attended with a Pain and Heat. As ſoon as it is opened, it diſcharges a livid Sanies, or ſometimes a limpid Water. It is black within, which is a Sign, that the Sphacelus has already ſeiz'd the ſubjacent Fleſh, and is making its Progreſs; but in thoſe who recover, there is by degrees a Separation made between the corrupt and the ſound Fleſh, by means of Suppuration. Thoſe peſtilential Veſicles are more or fewer, larger or leſs, at different Times, on the ſame Perſon; and there is ſcarce a Part of the Body but is ſubject to be infeſted by them, and they are ſeldom or never obſerv'd without Buboes.

The proximate Cauſe of a Carbuncle is, no doubt, a violent Inflammation excited in the Blood by the Virulence of the peſtilential Contagion. The Conſequence of this Inflammation is a ſudden Corruption of the Part, or a Sphacelus; for there is no Generation and Maturation of Pus in this as in other Tumors, but all the corrupted inward Parts are immediately ſeparated, and fall off: Or, in other Words, the adjacent Parts by degrees receive the Inflammation, and, unleſs ſudden Death happens, are converted into a Suppuration, in which Caſe the Carbuncle is ſeparated from the ſound and living Fleſh, and by degrees wholly ejected.

A Carbuncle is a very dangerous Diſeaſe, as Experience ſhews, and much worſe than a Bubo, eſpecially if the Puſtules turn black or livid immediately after Eruption; for the Diſorder is of a milder Nature, when the Puſtules are at firſt red, and gradually become of a Lemon-colour. The worſt are obſerv'd to be thoſe which ariſe in the Face or Neck, on the Breaſt, or under the Arm-pits; for they almoſt conſtantly deſtroy the Patient. *Heiſter*, *Chirurg.*

There is another kind of Ulcer, which ſome call a Carbuncle, different from this above deſcrib'd. *Van Swieten*, in his Commentary on *Boerhaave*'s *Aphoriſms*, thus deſcribes it: A Carbuncle, he ſays, is a Name which our modern Surgeons give to an Ulcer, when after a violent, and commonly very painful Inflammation, there happens a Rupture of the Skin in ſeveral Places, and Fragments of the corrupted Panniculus adipoſus are diſcharg'd at the Orifices.

Celſus, *Lib.* 2. *Cap.* 18. takes Notice of a Carbuncle on the Penis, which ſhould ſeem to be a ſort of *Chancre*; but his Deſcription is not very diſtinct. *Ætius* and *Paulus Ægineta* likewiſe mention it.

There is no better Way of treating a Carbuncle than by immediate Application of an actual Cautery; nor need we be apprehenſive of the Pain, for it has no Feeling, becauſe the Fleſh is dead; and we muſt continue to cauterize till the Pain be thoroughly felt in all Parts, after which the Ulcer is to be treated like other Burns: Thus, when corroſive Medicines have induc'd a Cruſt over the Part, the ſame, being duly ſeparated from the living Fleſh, draws with it all the corrupt Particles, ſo that the Sinus, being now freed from Impurities, may be heal'd with Incarnatives. If the Diſeaſe be only ſuperficial, or ſeated on the Surface of the Skin, it may be cur'd by Corroſives alone, or, if Neceſſity requires, by cauterizing,

which

which is to be more or leſs ſevere, in proportion to the Greatneſs of the Diſtemper; but whatever Remedy you apply, if throughly effectual, it will immediately ſeparate the corrupted from the ſound Parts.

And we may generally depend upon a Cure, if the corrupt Fleſh falls off whenever the corroſive Medicine exerts its Virtue; but if this does not happen, and the Diſeaſe proves too ſtrong for the Remedy, we muſt have ſpeedy recourſe to Cauterizing. In theſe Caſes we muſt abſtain from Food and Wine; but it is good to drink plentifully of Water. Theſe Directions are to be obſerved with the greater Strictneſs, if the Diſorder be attended with a Fever. *Celſus, Lib.* 5. *Cap.* 28.

The Cure is to begin with opening a Vein, if there be no Contra-indication; and Bleeding till the Patient faints, proves beneficial in this and the like Caſes. As to the Part affected, the Inflammation ſeems to require Refrigerants, did not the Groſſneſs and Malignity of the Humour potently reſiſt Repellents; or were there no Danger, if they ſhould prove ſucceſsful, of diverting the Courſe of the peccant Humours inwards upon the noble Parts. However, the Afflux of the Humour is to be checked; for which End ſuch Medicines are required, as being moderately repellent, are alſo digeſtive. Of this Nature are Cataplaſms of Plantain, or boiled Lentils, mixed with ſoft Crums of Bread bak'd in the Oven, which has neither too much of the Bran, nor is wholly cleanſed from it; for what is quite pure is ſubject to ſtick, and obſtruct the Pores of the Skin; and the furfuraceous, or branny, is of too groſs Parts. To the Ulcer we muſt apply ſome powerful Medicine, ſuch as thoſe of Andron, Paſion, or Polyidas, [*ſee them under their proper Articles*] which are to be diſſolved in ſweet Wine to a ſtrigmentitious Conſiſtence: The proper Wines for this Purpoſe are the Theræum, or Scybelites; or for want of them Sapa, which we call Hepſema [*ſee what theſe are under their proper Articles*]. Digeſtives and Suppuratives, which are uſually apply'd to other Ulcers, are improper here; becauſe they would augment the Putrefaction of the Part. But after Bleeding, it may be proper enough to ſcarify ſuch kinds of Tumors, and to make the Inciſions pretty deep, becauſe of the Craſſitude of the Humour. The Inflammation being removed, the Ulcer muſt be cicatrized by the ſame Means as other Ulcers. *Galen, M. M. Lib.* 14. *Cap.* 10.

Paulus Ægineta, after having tranſcribed the Method of Cure quoted above from *Galen*, goes on thus:

The Powder of Maſſaliotes [*ſee the Word*] dry, or diluted with Paſſum, is to be uſed about the Ulcer; or the Root of Dracunculus, or of Birthwort, or the Juice of Silphium, may, any one of them, be uſed with Vinegar to anoint the Place. A Carbuncle, which appears like an Eryſipelas, muſt be anointed with ſomething adapted to that Diſeaſe. Thoſe Parts which are ſuſpected to ſuffer by Conſent, are to be embrocated with Wine and Oil, in unwaſh'd Wool. When the Heat is allay'd, cephalic Cerates diluted, and ſpread upon Linen, are properly apply'd to the Carbuncle. If the Hardneſs continues, the *Emplaſtrum melinum Serapionis* [ſee MELINUM] muſt be apply'd; and we muſt endeavour to bring the Carbuncle, as ſoon as poſſible, to a Suppuration; for which End the Cataplaſms, and other Medicines, muſt be changed, twice in the Day, and once in the Night. To eradicate a Carbuncle, and totally prevent its ſpreading, boil ſour Pomegranates in Vinegar, and when they are ſoft, ſpread them upon Linen, and apply them to the Place; when they are dry, moiſten them with Vinegar. Suppuratives and Breakers of Carbuncles are old or young Walnut-kernels, the Leaves, Buds, and freſh and tender Nuts of the Cypreſs-tree, with Polenta, Raiſins of the Sun ſtoned, dry'd Figs boiled in Wine, the Flowers of the yellow horned Poppy, the Juice of Silphium with Rue and a little Honey, and Tar mix'd with Raiſins and Hogs Fat.

An excellent Receipt for a Carbuncle is as follows:

Take of Spuma Argenti, one Pound; old Oil, one Pound and an half; Orpiment, one Ounce: Boil the Spuma Argenti and the Oil together, till it will not ſtain; then taking it off, put in the Orpiment, and boil them again, 'till the Mixture becomes black; and beating it in a Mortar, uſe it ſpread upon Linen.

For Carbuncles, eſpecially in the Eyelids, and alſo for Gangrenes, old Chironian Ulcers, ſtrumous Swellings, and the Gout:

Take of Opium, Acacia, Miſy torrefy'd, Squama Æris, each two Drams; Copperas, one Dram; Seeds of Henbane, one Dram: Bruiſe them, and uſe them in Water. The Plaiſter called the Tetrapharmacum is alſo a good Remedy, with an Addition of a fifth Part Frankincenſe.

For a Carbuncle in the Pudenda:

Take of Chalcitis, Copperas, each eight Drams, twenty Grains; of Aphronitrum, two Drams: Bruiſe them, and uſe them with Water. Sheeps-dung torrefy'd and Honey is alſo a good Remedy.

In *Alexandria* they make a Cataplaſm of green Serapias, which is alſo called Orchis and Triorchis, and Crums of Bread, which they make uſe of for Carbuncles, and all cruſted Sores. When the Cruſt is fallen off, the Cure is the ſame as for common Ulcers. *P. Æginet. Lib.* 4. *Cap.* 25.

The Cure of a Carbuncle by internal Means, ſuch as proper Diet and Medicines, muſt be regulated in the ſame manner as we have directed in the Caſe of a peſtilential Bubo (ſee BUBO); for the principal Part of the Cure conſiſts in keeping the Patient in a gentle and continual State of Perſpiration, or under a very gentle Sweat.

The external Cure is directed principally with a View to accelerate, as much as poſſible, the Separation of the Carbuncle or corrupted Fleſh from what is ſound. Therefore ſome of our modern Surgeons immediately, and not without Succeſs, betake themſelves to Scarification, making frequent Inciſions in the corrupted Part; by which means they evacuate the acrid and peſtiferous Matter, together with the corrupted Blood and Sanies. Others only open the Puſtules with the Sciſſars; and after Emiſſion of the Sanies, make repeated Inunctions of the Carbuncle with warm camphorated Spirit of Wine, or Spirit of Wine in which Theriaca Andromachi has been digeſted; and then apply a maturating Cataplaſm, ſuch as the following:

Take of Honey, four Spoonfuls; Leaven, three Spoonfuls; two Yolks of Eggs; and half an Ounce of Soap: Mix them well together, and apply them warm: Or,

Take of Meal of Wheat or Rye, two Ounces, with half an Ounce of Vinegar: Boil them in Water or Butter-milk, and, making of them a Cataplaſm, mix therewith an Ounce of Honey, and a Dram of Saffron; apply it warm, changing it very frequently.

The Cataplaſms or Malagmas above recommended, are to be continually apply'd till the Carbuncle be ſeparated from the ſound or quick Part, and fall off; for it is better to reſolve and looſen the Carbuncle from the other Parts by degrees, than to cut it out all at once. And there are not wanting Examples of ſuch, as by an unſeaſonable Exciſion of the Fleſh have killed their Patients; for we are taught by Obſervation, that the moſt exquiſite Pains, and other very dangerous Symptoms, are the uſual Conſequences of this extraordinary and over-doing Remedy. However, when the greateſt Part of the Carbuncle is looſen'd, and ſeparated from the quick Fleſh, the reſt of it which remains unlooſen'd, may be cut off with the Knife without much Danger.

When by too haſty an Exciſion, or elſe ſpontaneouſly, a bad Kind of luxuriant Fleſh grows within, it will be neceſſary to exterminate it by ſome Corroſive, as *Unguentum Ægyptiacum*, or the *Unguentum fuſcum Wurtzii*; or by what follows:

Take of Honey, two Spoonfuls; two Yolks of Eggs; burnt Alum powder'd, Gentian, Birthwort, each one Ounce: Mix them, and make them into an Ointment.

If the Inflammation, as is not unuſual, inclines towards a Gangrene, it will be proper to apply the following Ointment:

Take of Oil of Wormwood, an Ounce and an half; Scordium, Flowers of Elder, Flowers of Chamomile, each one Handful; pure Water, two Pints and an half: Boil them well together; ſtrain them, and inſtil therein ſix Ounces of the beſt Spirit of Wine, or camphorated Spirit; and two Ounces of Venice-treacle. Let this be apply'd in folded Linen Cloths or Bolſters to the Carbuncle, warm; and be very frequently repeated, till the Violence of the Inflammation be abated.

But in Caſes where theſe bad Symptoms do not appear, it will not be improper, after ſeparating the Carbuncle from the ſound Fleſh, to deterge the Ulcer with the *Unguentum fuſcum Wurtzii*, or with ſome ſuch Digeſtive as we have deſcribed under the Article BUBO. This Deſign ought to be executed with the greateſt Care and Dexterity, leſt any Part of the Poiſon remaining within, ſhould lay a freſh Foundation for the Diſorder. For this Reaſon we are to continue deterging the Ulcer, till the leaſt Symptoms of the Plague are no longer to be diſcover'd. After this the Wound is to be conglutinated like other Abſceſſes, eſpecially by applying the Eſſence of Myrrh and Aloes upon Lint; as alſo the *Emplaſtrum de Lithargyro*, or others of a like Nature, till the Ulcer is entirely conſolidated.

Some Surgeons, indeed, of diſtinguiſhed Characters, maintain, that nothing is more effectual than the actual Cautery, either for the Extirpation or Cure of the Carbuncle; for they

forthwith order the mortified Fleſh to be cauterized, till a Senſe of Pain is excited in all the Parts contiguous, that no Remains of the Carbuncle may ſeem to be left. And *Hodges* informs us, that, during the Plague in *London*, he obſerv'd this to be the moſt expeditious Method of curing Carbuncles. But not only the Horror of the Patients, but alſo many other Circumſtances, ſuch as the Importance of the Parts affected, ſometimes concur to render the Method of Cure by Cautery not only improper, but palpably abſurd; and in theſe Caſes the other Method of Cure is to be purſu'd.

The celebrated *Sylvius* is of Opinion, that the moſt expeditious Method of extirpating Carbuncles is, by anointing the adjacent Parts with Butter of Antimony; ſince, according to that Author, by its Means alone the Diſorder is not only hinder'd from ſpreading, but alſo an Eſchar is generated, which gradually divides the ſound from the corrupted Part, and at laſt procures a total Separation. But the later Phyſicians, who have wrote upon the Plagues of *Vienna* and *Ratisbon*, have affirm'd, that Butter of Antimony is ſo far from being beneficial in the Cure of Carbuncles, that it rather induces a fatal Train of Symptoms, and for the moſt part procures the ſudden Death of the Patient. *Batticherus*, however, in his *Loimographia Haffnienſis*, agrees with *Sylvius*, and beſtows very large Encomiums upon Butter of Antimony, as a Medicine of all others the beſt calculated for anſwering the Purpoſe. But notwithſtanding the Character of theſe Authors, who have recommended the actual Cautery, and Butter of Antimony, for extirpating Carbuncles, I cannot forbear thinking, that the other Method is milder, ſafer, and conſequently preferable. If, however, any one intends to uſe theſe Methods of Cure, he muſt remember to deterge and conglutinate the Wound, in a proper Manner. *Heiſter.*

CARBON *humanum*, in *Paracelſus*, according to *Schroder*, *Lib.* 5. *Claſſ.* 1. N° 23. ſignifies human Dung.

CARBONES *Cæli.* The Stars. *Rulandus. Johnſon.*

CARBUNCULATIO, ἀνθράκωσις, properly ſignifies a Carbuncle incident to the Eye, and is deſcribed by the Author of the *Definitiones Medicæ*, aſcribed to *Galen*, ἕλκος ἰσχαρῶδες μελᾶ νομῆς, καὶ ῥεύμαλος, καὶ βυβῶνος, ἐνίοτε καὶ πυρετῶν γινομένων, περὶ τὸ ἄλλο πᾶν σῶμα. ἔστι δὲ ὅτε περὶ ὀφθαλμούς. "A cruſty, phagedenic Ulcer, attended with a Flux of Humours, and a Bubo, and ſometimes with a Fever; and, among other Parts of the Body, incident to the Eye." And *Paulus*, *Lib.* 3. *Cap.* 22. defines it to be a malignant cruſty Ulcer, affecting ſometimes the Ball of the Eye, ſometimes the Eyelid, as well as any other Part of the Body.

CARBUNCULUS *Rubinus*, Offic. Worm. 103. Schrod. 329. Mont. Exot. 14. Schw. 390. De Laet. 11. Calc. Muſ. 235. Geoff. Præfect. 83. Charlt. Foſſ. 37. *Rubinus verus*, Boet. 144. *Carbunculus*, Kentm. 50. *Carbunculus, ſive Rubinus*, Aldrov. Muſ. Metall. 957. THE RUBY.

It is a glittering diaphanous Gem, of a red Colour, and Proof againſt the File; the moſt beautiful are found in the Iſland of *Ceylon*.

They ſay, that being worn or drank it reſiſts Poiſon, is a Preſervative againſt the Peſtilence, expels Sadneſs, reſtrains laſcivious and evil Thoughts, prevents frightful Dreams, exhilarates the Mind, and preſerves the Body in Health. *Schroder.*

It is preſcrib'd in Medicine in our Shops, but I know not how it comes to be omitted in the Catalogue of Simples. *Dale.*

CARCAPULI, Park. J. B. C. B. *Fructu Malo aureo æmulo coddam Pulli*, H. M. THE INDIAN YELLOW ORANGE OF MALABAR.

This is a tall ſpreading Tree, the Trunk as much in Compaſs as two Men together can incircle with their Arms; the Leaves ſtand by Pairs on the Sprays, at the Extremities of which appear fleſh-colour'd and yellowiſh tetrapetalous Flowers, which are void of Smell, but of a ſouriſh Taſte. The Calyx conſiſts of four pale concave Leaves; and the Fruit, which hangs by a Pedicle an Inch long, is big, round, and diſtinguiſh'd by eight, nine, or ten Extuberances like Ribs, with a ſmall Head at the Top, ſtriated in like manner with ſmall Ribs; it is firſt greeen, then yellow, and when ripe whitiſh, and has an acid Sweetneſs of Taſte; the Seeds are contained in the Middle of the Pulp, and are oblong, flattiſh, and of a dark azure Colour.

This Fruit, according to *Acoſta*, as to Size and Shape, is like a Quince with the Rind taken off, and conſiſts in like manner of grumous Parts, but not ſeparable, as in the Quince; it is cover'd with a thin, light, and ſhining Rind. It is dry'd, and exported from *Malabar* to other Countries.

It is commonly eaten, and the Inhabitants commend it much for medicinal Uſes; but it is moſt eminent for ſtopping a Flux of the Belly of what Kind ſoever, eſpecially contracted by exceſſive Venery. The ripe Fruit is either eaten alone, or its Juice, or the Powder of it dry'd, is taken in ſour Milk, mixed with which, and boiled Rice, it mightily recovers a loſt Appetite. The Juice and Powder aforeſaid are efficacious in Specks and Cataracts of the Eyes. The Powder is much uſed by Midwives for expelling the Afterbirth, for increaſing the Purgations, and to procure Plenty of Milk; and they ſay it is very ſerviceable in facilitating the Birth.

CARCAPULI *Linſchotani. Carcapuli de Bry.*

C. Bauhine confounds this with the preceding; but they differ in Flower and Fruit, though agreeing in other reſpects. The firſt bears an acid, ſulcated, gold-coloured Fruit, as big as an Apple; this latter produces a round ſweet Fruit, of the Bigneſs of a Cherry; the firſt by the Natives is called ſimply *Ghoraka*, the other *Kanna Ghoraka*; both afford Gum Gutta, but the *Kanna Goraka* the beſt. But this Gum Gutta, ſays *D. Syen*, muſt not be confounded with the common Gum Gutta, which, as *Bontius* aſſures us, is collected from a Plant which is near akin to the *Eſula Indica*, and is called by the *Indians Lonam Cambodia*, becauſe it grows plentifully in the Country of *Combodia*. *Raii Hiſt. Plant.* See GUTTA GAMBA.

CARCAROS, κάρχαρος. A kind of Fever, which is attended with a Horror, or Shivering. See QUERQUERA.

CARCAX. A Species of Poppy, which has a Head large enough to contain a Pint and an half of Liquor. *Gaſtellus from Hartman de Opio.*

CARCER, in *Paracelſus*, *Tract.* 2. *de Morb. Ament. C.* 3. ſignifies a Remedy proper to reſtrain the looſe and diſorderly Motions both of Body and Mind, as in curing *Choreas*; for Inſtance the *Chorea Sancti Viti.*

CARCHARIAS, καρχαρίας. The Fiſh called the *Canis marinus*, or Sea-dog. See CANIS.

CARCHARODONTA, καρχαροδόντα, from κάρχαρος, ſharp, and ὀδὼς, a Tooth, ſharp-toothed, is an Epithet, in *Galen*, *de Uſu Partium*, *Lib.* 8. *Cap.* 2. apply'd to ſuch Animals as have ſharp and ſerrated Teeth, as the Lion and Bear among Quadrupeds, and the *Canis marinus*, or Sea-dog, among Fiſhes; for which Reaſon it is called *Carcharias.*

CARCHESIUM, καρχήσιον. *Foeſius* thinks the *Greek* Word ſhould rather be render'd *Carcheſia*, which is the *Latin* Name for thoſe Perforations at the Extremity of the Maſt, through which the Ropes are tranſmitted. Thus *Lucilius*, in *Nonius*, ſays *Mali Carcheſia ſumma*; and *Catullus* has almoſt the ſame Expreſſion. *Galen*, in his *Exegeſis*, expounds it to be the Top of the Maſt where the Pully is plac'd. *Athenæus*, *Pollux*, and *Heſychius*, give much the ſame Explication.

Carcheſii, καρχήσιοι, in *Galen*, *Com.* 3. *in Lib. de Art.* and in his *Exegeſis*, is expounded the Ropes which are extended from the Top of the Maſt, and ſupport the Sails.

Carcheſius Laqueus, καρχήσιος βρόγχος, is the Name of a Bandage taken Notice of by *Galen*, *Cap.* 3. *in Lib. de Art.* of which there are two Sorts, called the ſingle and the double *Carcheſius Laqueus*, which are both deſcribed by *Oribaſius*, in his Book *de Laqueis*, *Cap.* 9. 10.

Carcheſium, καρχήσιον, is alſo a Cup, deſcribed by *Athenæus*, *Lib.* 11. and we meet with *Carcheſia Bacchi Pocula*, in *Virgil*, *Lib.* 5. *Æneid.* and *Georg. Lib.* 4.

CARCHICHEC *Turcarum, ſive primula Veris Conſtantinopolitana*, Cornuti. *Primula Veris Turcica Tradeſcanti, Flore purpureo*, Parkin. BLUE PRIMROSE.

The Leaves are like thoſe of the common Sort, only ſofter; from the Midſt of them ariſe a Multitude of Pedicles, about an Inch in Length, ſupporting greeniſh Calyces, ſtriated with as many Sinuſes as the ſucceeding Flower is to conſiſt of Leaves, which are ſeldom above five, ſhaped like a Heart, and of a faint purple Colour, except at the Bottom, or Unguis, which is like a Ray of Gold ſhaded with Saffron. The Umbilicus, or Middle of the Flower, is ſtellated with five very effulgent Radiations. From the Centre of the Star riſes the Pointal, of the ſame Colour. The Herb bears Flowers almoſt during the whole Year, which are ſucceeded by white Seeds like thoſe of the white Poppy, and are incloſed in a thin Capſule.

Carchichec, with the *Turks*, ſignifies Snow-flower; which Name they give it on account of the Vivacity of its Flowers, which exalt themſelves above the Snows in the Middle of Winter; they are of an infinite Variety of Colours, as Sky-coloured, of a faint or deep Purple, or Violet, Carnation, Iron-coloured, of a dead Pale, Vermilion, white, and many others, all owing to the Management of its Propagation by Seed.

It is hot and dry, and conſiderably aſtringent to the Taſte. It is of good Effect in the Cure of atrabilious and pituitous Affections, and is very ſerviceable in putting a Stop to a Looſeneſs, corroborating the Stomach, and by conſequence the whole Inteſtines. *Raii Hiſt. Plant.*

Carchichec polyanthes is a Primroſe of *Conſtantinople*, which bears upon one Stem a Multitude of Flowers, diffuſed in the manner of an Umbella, and ſomewhat leſs than thoſe of the preceding, but of the ſame Variety of Colours, and often double like the other. *Raii Hiſt. Plant.*

CARCINADÆ. A Name in *Aetius*, *Tetrab.* 1. *Serm.* 2. *Cap.* 139. for a very ſmall ſort of Sea Fiſh, reſembling Crabs, which he condemns as fetid and unſavoury, hard of Concoction, and of bad Juice.

CARCI-

CARCINETHRON. A Name in *Oribaſius*, *Med. Coll. Lib.* 12. for the *Polygonum Mas*, or common Knot-graſs.

CARCINODES, καρκινώδης, from καρκῖνος, a Cancer, and εἶδος, a Form or Likeneſs, a Tumor reſembling a Cancer.

CARCINOS, CARCINOMA, καρκῖνος, καρκινώδης ὄγκος, καρκίνωμα. A Cancer.

When black Bile ſettles in the Fleſh, if it be of an acrimonious Quality, it corrodes the circumjacent Skin, and breaks out in an Ulcer; but if it be of a milder Nature, it generates a Cancer, without an Ulceration. *Galen. de Tum. præternat. Cap.* 11.

Cancerous Tumors are generated in all Parts of the Body, but moſtly in the Breaſts of Women whoſe natural Purgations are ceaſed, which, while under due Regulation, preſerve a Woman in Health. All preternatural Tumors, therefore, of this Kind, are generated of a Superfluity of black Bile, of which we have ſpoken in our Treatiſe of *Natural Powers*, where we ſhew'd, that this Humour was generated in the Liver, in Sanguification, after the manner of Lees in Wine; but was purged by the Spleen, whoſe natural Aliment it was. And, a little after, he ſays, We have often obſerved, in the Breaſts of Women, a Tumor very much reſembling the Animal call'd a *Crab* (καρκῖνος, *Cancer*); for as this Creature is furniſh'd with Claws on both Sides of its Body, ſo, in this Diſeaſe, the Veins, which are extended from the Tumor, repreſent with it a Figure much like a Crab. *Galen. de Art. Curat. ad Glaucum*, *Lib.* 2. *Cap.* 10.

A Cancer is an unequal Tumor, with very elevated Edges, loathſome to Sight, ſomewhat livid, and painful, ſometimes without an Ulcer, which Sort *Hippocrates* calls *occult*, κρυπτὸν and, if it be chirurgically treated, it grows the worſe. Sometimes it is attended with an Ulceration; for, being generated of black Bile, it is, for the moſt part, of a corroſive Quality. It riſes in many Parts of the Body, but principally infeſts the Uterus and Breaſts of Women, having Veins around it extended in manner of the Claws of a Crab, whence it took its Name [καρκῖνος, *Cancer*, ſignifying a Crab]. *P. Æginet. Lib.* 6. *Cap.* 45.

A Cancer may be generated in moſt Parts of the Body, as in the Eyes, the Uterus, and other Places, but eſpecially in the Breaſts of Women, as being of a lax Contexture, and very ſuſceptible of the groſſeſt Matter. Cancers owe their Original to black Bile put in a State of Effervеſcence; and, if there be any thing of an acrid and corroſive Quality mix'd with this Humour, the Cancer is attended with an Ulceration. Cancers are blacker than other Inflammations, but not ſo hot. The Veins all around it are bloated, and diſtended in the manner of the Claws of a Crab, whence it has its Name *Cancer* (a Crab); or, as others will have it, becauſe it adheres with ſuch Obſtinacy to the Part it ſeizes, that, like that Animal, it cannot, without great Difficulty, be ſeparated from it. *P. Æginet. Lib.* 4. *Cap.* 26. tranſcrib'd almoſt verbatim by *Aëtuarius*.

Καρκῖνοι κρυπτοὶ, occult and ſecret Cancers, in *Hippocrat. Aphoriſm.* 38. *Lib.* 6. are either ſuch as are not exulcerated, or ſuch as are ſeated in the inner Parts of the Body; ſo *Galen* explains it in his Comment on that Place. By οἱ κρυπτοὶ καρκῖνοι οἱ ἀποβεβυσμένοι, "ſecret Cancers, which are deeply ſeated," *Lib.* 2. *Prorrhet.* are meant ſuch Cancers as are not exulcerated, and are profoundly ſeated in the Body; for Example, thoſe which infeſt the Anus, Inteſtines, Uterus, the Breaſts, and Palate. Oppoſite to theſe are, *ibid.* οἱ καρκῖνοι οἱ κρυπτοὶ καὶ οἱ ἀκρόπαθοι. "Cancers not ulcerated, and ſuperficially ſeated." And this is *Galen*'s Explication of the Paſſages above, in his Comment on the aforeſaid Aphoriſm; tho' κρυπτὸς, in itſelf, ſignifies either *not exulcerated*, or *deeply ſeated*, as we firſt obſerved out of *Galen*.

Καρκῖνος κρυπτὸς, in *Galen*, *Lib. de atra Bile*, is a ſecret and occult Cancer, not exulcerated, but generated by a melancholy Juice, which has inſinuated itſelf into the Habit of the Body, and is neither acrimonious, malignant, nor corroſive, ſo as to cauſe an Exulceration.

Philoxenus, in *Aëtius*, *Tetrab.* 4. *Lib.* 4. *Cap.* 43. ſays, that by κρυπτοὶ καρκῖνοι are peculiarly meant thoſe Cancers which infeſt the Uterus and Inteſtines; which *Paulus* alſo, *Lib.* 3. *Cap.* 67. ſeems to hint, when he, in ſome meaſure, appropriates the above-mention'd Aphoriſm to Cancers of the Uterus, tho' it may be underſtood of Cancers in general.

CARCINΩMA, καρκίνωμα, is the ſame as καρκῖνος, and defin'd, by the Author of the *Definitiones medicæ*, a malignant and very hard Tumor, with or without an Ulcer, and taking its Name from a Crab. And, again, he ſays, a *Carcinoma* in the Uterus is a Tumor without an Ulceration, unequal, and with very tumid Edges.

A *Carcinoma* principally infeſts the upper Parts, as the Face, Noſtrils, Ears, Lips, and the Breaſts of Women. It has its Original from the Liver or Spleen. There is a kind of pungent Senſation about the Part; and the Tumor is immoveable, unequal, and ſometimes without Senſation. The Veins about it are inflated, and, as it were, retorted, of a pale or livid Colour, and ſometimes inviſible. Some feel a Pain, if the Part be touch'd, others not; and ſometimes the Place affected is harder or ſofter than in its natural State, without an Ulceration; and ſometimes all the before-mention'd Symptoms attend an Ulcer of the Part. Sometimes it has nothing ſingular to diſtinguiſh it; and ſometimes, by its Bulk and Aſperity, it reſembles what the *Greeks* call a *Condyloma* [κονδύλωμα]. The Colour of it is red, or like that of a Lentil. *Celſus*, *Lib.* 5. *Cap.* 18.

A *Carcinoma* is an Affection of the Cornea Tunica of the Eye, with a Pain and Tenſion, a Redneſs of the Tunics, accompany'd with a throbbing Pain, which reaches to the Temples, eſpecially upon any Concuſſion. *P. Æginet. Lib.* 3. *Cap.* 22.

Καρκίνωμα is uſed by *Hippocrates*, *Lib.* 5. *Epid.* where he ſays, καρκίνωμα περὶ τὸ στῆθος ἐγένετο "She had a *Carcinoma* "in her Breaſt." And again, *Lib.* 7. *Epid.* he ſays, ὁ τὸ καρκίνωμα τὸ ἐν τῷ φάρυγγι καυθεὶς ὑγιὴς ἐγένετο ὑφ' ἡμῶν "One "who had a *Carcinoma* in the Fauces, was cured by our apply-"ing an actual Cautery to the Part."

CARCINODES CHOIRADES, καρκινώδεις χοιράδες, are ſtrumous Swellings of a malignant Quality, which are painful to the Touch, and exaſperated by Application of Medicines. *P. Æginet. Lib.* 6. *Cap.* 35. See STRUMA.

See that Part of the Article BUBO, which relates to a cancerous Bubo.

Before I begin the modern Accounts of a *Cancer* or *Carcinoma*, I muſt appriſe the Reader, that he is to conſider what follows as the Sequel of the Article SCIRRHUS.

Among all the Diſorders incident to the human Body, none is more juſtly terrible than a Cancer; ſince it has not hitherto been known, that the Calamity has been remov'd without the Extirpation of the affected Parts: Nor is this Diſorder only to be dreaded on account of its Obſtinacy, which is Proof againſt all Medicines; but it is alſo terrible on account of the racking Pains, and intolerable Putrefaction, by which it gradually preys on the Body, whilſt the Patient is yet alive. To all theſe unhappy Circumſtances we may add the Duration of the Pains, which, for ſeveral Months, and ſometimes for ſeveral Years, afflict the miſerable Patients, before Death, that laſt, but ungrateful Remedy to all the Calamities of human Life, puts an End to their wretched State, by the moſt intolerable Agonies; for, unleſs they die of an Hæmorrhage, in conſequence of the larger Blood-veſſels being corroded, they lead a long and miſerable Life before the Diſorder ſpreads thro' the whole Body, and procures them a grateful Relief, by placing them beyond the Reach of Pain.

In a Scirrhus, if the ſtagnating Matter, which forms it, being increaſed by its Duration, begins to move; or if the Humours in the adjacent Parts are moved in ſuch a manner, as to inflame the Veſſels ſituated on its Margin; it becomes malignant, and is then call'd Cancer, or Carcinoma.

This Diſorder is by the *Latins* call'd *Cancer*, and by the *Greeks* καρκῖνος, and καρκίνωμα. *Galen* thinks, that this Name was affix'd to it on account of a certain Reſemblance it bore to the Animal we commonly call a Crab. As this Animal ſtretches out its Claws on both Sides, ſo Veins, turgid with black Blood, are every-where ſent off from that Species of Tumor we call a Cancer. *Paulus Ægineta*, in the twenty-ſixth Chapter of his fourth Book, adds, that a Cancer firmly adheres to the Parts it affects, juſt as a Crab ſecurely holds its Prey in its Claws; and thus he found out another Inſtance of Similitude between them. 'Tis plain, that *Celſus*, under the Name *Cancer*, deſcrib'd a Gangrene and Sphacelus: But he uſed the Word *Carcinoma* to denote that Diſorder which modern Phyſicians and Surgeons call *Cancer* and *Carcinoma* promiſcuouſly; for though, in the twenty-eighth Chapter of *Celſus*'s fifth Book, the Deſcription of the Carcinoma is ſomewhat obſcure, yet, from his Words, it may be known, that he gave this Name to the Diſorder we now ſpeak of; for he affirms, that it principally happen'd about the Face, the Noſe, the Ears, the Lips, and Breaſts of Women; and that the Veins about it were, as it were, retorted. He alſo took notice of its uncommon Malignity, and of its being eaſily irritated, when it was cut or cauteriz'd. He alſo aſſerted, that, in this Caſe, Medicine was never ſerviceable to any one; ſince, when cauteriz'd, they were forthwith exaſperated, and augmented till they became mortal; and, when extirpated, they return'd, after a Cicatrix had been form'd, and proved the Cauſe of the Patient's Death: From all which Circumſtances it is ſufficiently evident, that, under the Name *Carcinoma*, *Celſus* deſcrib'd what the Moderns call *Cancer*.

A Cancer is ſubſequent to a Scirrhus, or rather a Scirrhus is chang'd into a Cancer. But it is another Queſtion, Whether a Cancer never ariſes in the Body, without a previous Scirrhus. It will appear, by what ſhall be hereafter ſaid, that this Diſorder may be found in many Parts of the Body, accompany'd with equal Malignity, and the ſame direful Effects, tho' no Scirrhus has preceded. But we muſt conſider, how a Scirrhus

paſſes

paſſes into a Cancer, and by what Signs it is diſtinguiſh'd from that Diſorder: By the common Conſent of all Phyſicians, a Scirrhus is ſaid to be *a hard Tumor, without Pain:* But when a Scirrhus is degenerating into a Cancer, the Tumor indeed remains; but then Pain, which was before abſent, begins to rack the Patient. Pain, therefore, is the Sign by which a Cancer is diſtinguiſh'd from a Scirrhus. But ſince there is a great Difference between a Scirrhus beginning to degenerate into a Cancer, and an exulcerated Cancer; and ſince this Diſorder paſſes thro' ſeveral Degrees before it arrives at its higheſt Malignity, Authors have, for this Reaſon, ſometimes retain'd the Name of Scirrhus, even after lancinating Pains began to rack the Patient. But in this State of the Diſorder, for the ſake of Diſtinction, it is better to call it an occult or latent Cancer than a Scirrhus.

A Scirrhus has for its Cauſe whatever can inſpiſſate, coagulate, or dry the Juice prepar'd by the Glands, in the ſecretory or excretory Ducts, or in the Follicles which receive it. Whilſt, at the ſame time, the intricate Structure of the Veſſels which conſtitute the Glands, or the Humour lodged in the Follicles, as it were, without the Laws of the Circulation, hinder the Impetus of the arterial Blood from acting upon theſe obſtructed Veſſels or Receptacles, and upon the obſtructing Matter, in ſuch a manner, that the Concretions may be reſolved; or that ſuch Concretions as can no longer obey the Laws of the Circulation, may be ſeparated by a gentle Suppuration. The coagulated Juice, then, remains in the Veſſels, or in the Cavities of the Follicles, whoſe Sides conſiſt of Veſſels of all manner of Kinds; and it may remain long in theſe without undergoing any Change, or without any conſiderable Detriment to the Patient, as is ſufficiently obvious from Inſtances which daily occur. The Function of the ſcirrhous Part alone is injur'd, or ſometimes the Action of thoſe Parts, which are compreſs'd by the adjacent Scirrhus, is diſturb'd: But when, by any Cauſe, the Motion of the Humours is increaſed thro' the live and pervious Veſſels, which lie contiguous to the Subſtance of the Scirrhus, 'tis evident, that an Inflammation may eaſily be here produced; ſince theſe Veſſels, compreſs'd and render'd narrow by the ſcirrhous Concretion, cannot freely tranſmit the Humours when put in Motion, but are entirely obſtructed by an Acceleration of the Circulation. But the Inflammation ariſing here will be follow'd with all the Conſequences of an Inflammation, which are Pain, a violent Attrition, and the different Degrees of Heat produced by it. Now 'tis demonſtrated, under the Article ALCALI, that an Acceleration of the Motion of the Humours, and an Increaſe of Heat, highly diſpoſe to Putrefaction. The ſcirrhous Concretion, therefore, which has hitherto remain'd mild, and like an inert Body, in the infarcted Veſſels or Receptacles, will begin to putrefy, and acquire a greater Acrimony: Thus it will become capable of irritating and corroding the Parts in which it is contain'd. In this State, therefore, 'tis no Wonder, that a Pain ſhould be produced, which, as we have already ſaid, diſtinguiſhes a Cancer from a Scirrhus. The ſame Effect will be produced, if the adjacent Veſſels ſhould become inflam'd, in conſequence of their being preſs'd by the contiguous Scirrhus; for, in this Caſe, 'tis obvious, that the like Diſorder will ſoon be produced in the Scirrhus itſelf: Hence it ſo often happens, that a Scirrhus is chang'd ſo ſuddenly into a Cancer in the Breaſts of thoſe Women who gain their Livings by Working; for, in this Caſe, the hard Scirrhus is preſs'd againſt the neighbouring Veſſels, which by that means are inflam'd; and thus the Scirrhus ſoon degenerates into a Cancer. When, therefore, a Scirrhus, becoming gradually larger, compreſſes the adjacent Parts, a Cancer will ſoon be produced. But, beſides, the ſcirrhous Concretion itſelf may, in Proceſs of Time, become acrid ſpontaneouſly, and produce the ſame Train of cruel Symptoms; for, in the Article SCIRRHUS, it is ſhewn, that the atrabilarious Matter of the Blood greatly promotes the Production of ſcirrhous Tumors. The Antients deduced the Origin of Scirrhuſes almoſt entirely from this Cauſe: Accordingly their whole Intention of Cure, in treating a Scirrhus, was to reſolve and evacuate this Matter from the Body.

But it will appear, from what is ſaid under the Article MELANCHOLIA, that this atrabilarious Humour, which is almoſt of the Conſiſtence of Pitch, may, by its long Stay and Stagnation, become acrid and corroſive, in conſequence of which it will produce the moſt terrible Symptoms. The ſame Accident may, therefore, happen in a Scirrhus, and more eſpecially in Men of atrabiliarious Conſtitutions: Thus it may become malignant, or be chang'd into a Cancer, by its Age alone, without the Concurrence of any other Cauſe whatever.

In a Cancer, the Degree of the neighbouring Inflammation, the Exceſs of putrid Acrimony in the Part affected, the Importance of the Part, the Number and Condition of the Glands connected with it, and the whole Conſtitution, determine the Degrees of Malignity in the firſt State.

When the Scirrhus firſt begins to degenerate into a Cancer, it is then ſaid to be malignant, and very deſervedly, on account of the terrible Symptoms which afterwards enſue: But this Malignity is greater or leſs, and ſooner or later arrives at its worſt State, according to the various Conditions following.

As for the Degrees of the neighbouring Inflammation, a ſlight Eryſipelas, or gentle Inflammation in the Neighbourhood of the Scirrhus, or in its Integuments, may be often carried off by a ſeaſonable Application of a Plaiſter, in which Lead is an Ingredient; or by Vinegar of Litharge, diluted with a large Quantity of Water, and other Things of a like Nature: Thus the Scirrhus may be hinder'd from degenerating ſoon into a Cancer. But when a violent Inflammation appears either in the Integuments of the Scirrhus, or in the adjacent Parts, the moſt formidable Symptoms are ſoon to be look'd for.

As for the Exceſs of putrid Acrimony in the Part affected, the principal Malignity of a Cancer conſiſts in this, that the Subſtance of the Scirrhus, as yet remaining in the live Veſſels or Receptacles, becomes putrid, and, by a virulent Sanies, corrodes and exulcerates all the adjacent Parts. But, even in exulcerated Cancers, the Diſorder does not immediately arrive at this laſt Stage of Malignity, but proceeds to it gradually. The greater, therefore, the Putrefaction is, the more terrible all the Symptoms will be. In open Cancers, the Degrees of the Putrefaction are ſufficiently known, from the fetid Smell of the diſcharg'd Sanies, and the Corroſion of the adjacent Parts: But in occult or latent Cancers, the Itching, the Heat, the lancinating Pains, and the ſudden Increaſe of the ſcirrhous Tumor, indicate various Degrees of Putrefaction now begun.

The Importance of the Part is likewiſe a Circumſtance of great moment; for if the Pancreas, for Inſtance, the Stomach, the Liver, or the Inteſtines, are affected with a Cancer, far more cruel Symptoms muſt enſue, and the Prognoſtic muſt be far more unfavourable, than when this Diſorder is only lodged in the Breaſts.

As for the Number and Condition of the Glands connected with the Part affected, a ſingle Cancer may be longer tolerable, and afflict the Patient leſs, than when the ſame Diſorder ſeizes different Parts of the Body. The Diſeaſe muſt, of conſequence, be worſe when it ſeizes ſuch a Part, as, by propagating the Diſorder, may affect the adjacent Glands. It ſcarce ever happens, that a Scirrhus, ſo conſiderable as already to threaten a Cancer, is long lodged in the Breaſt, but the axillary Glands of the ſame Side begin to grow ſcirrhous, as is obvious from daily Experience. It alſo frequently happens, that, when one Breaſt has been long ſcirrhous, the other becomes in like manner affected: And, ſince there is ſo great an Affinity and Communication between the Breaſts and Uterus, this latter often begins to labour under the like Diſorder. The celebrated *Boerhaave* ſaw a melancholy Caſe, which confirms this: A Cancer, not yet exulcerated, was extirpated from the Right Breaſt of a Lady of Diſtinction. A Year after, another of a like Nature was cut out of her Left Breaſt: But ſhe afterwards languiſh'd, and had all the Signs of a Cancer in the Uterus; till at laſt, being rack'd with the moſt violent Pains, ſhe died. In the Hiſtory of a Scirrhus it is obſerved, that it is evident, from the Obſervations of Phyſicians, that, when all the Glands of the Neck are become indurated, thoſe of the Meſentery are in like manner affected: 'Tis therefore in vain to attempt a Cure, in Caſes of this Nature, ſince the Diſorder is convey'd to the communicating Glands.

As to the Conſtitution of the Patient, the atrabilarious Conſtitution is ſubject to produce ſcirrhous Tumors, as is obſerved under the Article SCIRRHUS: The ſame Conſtitution may, therefore, increaſe and augment a Scirrhus already formed; but a Scirrhus is, by an Increaſe of its Bulk, changed into a Cancer, as we have already obſerved. 'Tis, therefore, evident, that, when a Scirrhus happens in theſe dry, emaciated, and atrabilarious Conſtitutions, there is the greateſt Dread of its being changed into a Cancer, eſpecially if this atrabilarious Juice, which predominates in the Blood, begins to be reſolved, and become acrid; for, as we ſhall afterwards ſhew, every acrid Subſtance, mixing with a Scirrhus, converts it into a Cancer. The ſame Obſervation will hold good in Caſes where a putrid Scurvy afflicts the Patient; for, in ſuch Conſtitutions, Scirrhuſes generally ſoon become malignant.

If a Cancer is confined within its own Membranes, it is called an occult Cancer; but, if theſe are broke and ulcerated, it is called a manifeſt, or ulcerated Cancer; the laſt being the Offspring of the firſt.

A Scirrhus is a hard Tumor, unaccompanied with Pain, and ſituated in a glandular Part; but when a Titillation, Itching, Pain, and Heat, are perceived in this Tumor, it is no longer call'd Scirrhus, but aſſumes the Name of Cancer. So long as the Integuments of the Cancer are not corroded, it is called a latent or occult Cancer; but when it has degenerated to that Degree of Malignity, as to corrode the Integuments, and diſcharge a Sanies, it is then denominated a manifeſt or ulcerated Cancer. *Ætius*, in *Tetrabibl.* 4. *Serm.* 4. *Cap.* 43. informs us, that *Philoxenus* called that a latent or occult Cancer, which was lodg'd in ſuch Parts of the Body as were hid from our Sight, ſuch

ſuch as the Uterus or Inteſtines. Others, after him, have advanced the ſame thing: But *Hippocrates* ſeems to have been of a different Opinion; for, as may be ſeen under the Article SCIRRHUS, he calls this Diſorder, when ſituated in the Breaſts, an occult Cancer; for, when he treats of a Retention of the menſtrual Diſcharges, in conſequence of a Diſtortion of the Mouth of the Womb, he ſays, that the retained Menſtrua are convey'd to the Breaſts, and delude Women with a ſpecious Appearance of Pregnancy: And he afterwards adds theſe Words: "And in the Breaſts hard Tubercles ariſe, ſome of "which are large, and others ſmall. Theſe Tumors never "come to Suppuration, but always become harder, till at "laſt occult Cancers are produced from them." *Hippoc. de Morb. Mulier. Lib.* 2. *Cap.* 20. Hence 'tis ſufficiently evident, that *Hippocrates* diſtinguiſhed a Scirrhus from an occult Cancer, and that he gave this laſt Name to the Diſorder, tho' lodged in the external Parts of the Body. An occult Cancer is always previous to one of the ulcerated Kind, as is evident from what has been ſaid.

The Cauſe of a Cancer is, whatever is capable of forming a Scirrhus; an Acrimony of any kind introduced into a Scirrhus; a Change induc'd in the Circulation of the Blood, from a Retention of the menſtrual Flux, the Hæmorrhoids, or any habitual Hæmorrhage; Sterility; Celibacy; the Age in which Women ceaſe to be prolific, generally from forty-five to fifty; an auſtere, acrid, and hot Diet; Melancholy and bilious Affections of the Mind; any external Irritation, whether by Motion, Heat, or Acrimony, or by emollient, ſuppurating, cauſtic, or veſicating Applications; or internal Remedies producing the ſame Effects.

We now come to treat of the Cauſes by which a Scirrhus, which is unattended with Pain, is chang'd firſt into an occult, and then into an ulcerated Cancer. Every Cauſe, therefore, which contributed to the Production of the Scirrhus, may be conſidered as a remote Cauſe of the Cancer; but this Cauſe, continuing to act, may increaſe the Scirrhus, and ſo change it into a Cancer.

As to Acrimony introduc'd into the Scirrhus, whether the Matter of the Scirrhus itſelf is, in Proceſs of Time, converted into an acrimonious Subſtance, and corrupted; or whether, by Diſeaſes, the mild Nature of the ſound Humours is perverted and depraved; the Scirrhus, which before was free from Pain, will be irritated, and degenerate into a Cancer. The ſame Effect will be produc'd, if acrid Subſtances, which cannot be corrected by the Action of the Veſſels and Inteſtines, are uſed as Food: Of this kind are moſt Spices, but more eſpecially the acrid Bulbs of Onions and Garlick; for the Sweat and Urine of thoſe who uſe theſe Roots daily ſmell of them. Hence 'tis obvious how treacherous a Diſorder a Scirrhus, even of the ſlighteſt kind, is; for tho' all acrid Subſtances were abſtained from, yet no one can at all times ſecure himſelf againſt the Attacks of epidemical Diſeaſes, which often rage, and by which the mild Nature of the Humours is ſo often changed: It alſo happens, that acrid Subſtances prove hurtful by increaſing the Velocity of the Circulation, by which alone a Scirrhus may be converted into a Cancer, as we have already obſerv'd. Many Inſtances evince how dangerous the Uſe of acrid Subſtances is in Caſes of this Nature, but one is ſufficient for our Purpoſe. *Hildanus*, in his *Obſerv. Chirurg. Cent.* 3. *Obſerv.* 1. gives us an Account of a Gentleman of Diſtinction, whoſe Eye, after an Ophthalmy, broke, and diſcharg'd the Humours: Upon this the Eye-lids, collapſing, grew together. In this Condition he lived fourteen Years, without the Appearance of any malignant Symptom: But as at that time he wantonly indulged himſelf in the Uſe of Wine, and greedily eat Foods of hard Digeſtion, Spices, Onions, Garlick, Leeks, and Radiſhes, the Diſorder, which had been latent ſo long, broke out on the optic Nerve; for the cloſed Eye-lids began gradually to be opened, and there grew from the Bottom of the Orbit a Tumor, which was hard, livid, malignant, and at laſt became a monſtrous Spectacle, by riſing without the Eye-lids as large as a Gooſe's Egg. *Hildanus*, however, ſucceſsfully cut this cancerous Tumor out of the very Bottom of the Orbit, and cur'd the Patient. For this Reaſon *Galen*, in his *Meth. Medend. Lib.* 2. *Cap.* 12. when ſpecifying the Aliments proper for thoſe afflicted with Cancers, recommends Cremor of Piſan, Whey, the ſofteſt Pot-herbs, Mallows, Arrach, Blite, and Rock-fiſhes.

As to a Change induc'd in the Circulation of the Blood from a Retention of the menſtrual Flux, the Hæmorrhoids, or any habitual Hæmorrhage, the Reader may conſult the Article SCIRRHUS; for there 'tis evident, not only from the Authority of *Hippocrates*, but alſo from the Obſervations of the beſt Authors, that ſcirrhous Tumors have not only been produced by an Obſtruction of theſe accuſtomed Evacuations, but alſo that Scirrhuſes, when they have been formed before, have, in conſequence of this Accident, ſoon degenerated into Cancers. Scirrhous Tumors lodged in the Breaſts, or about the Uterus, are more conſiderably irritated by a Suppreſſion of the Menſes than by any other Cauſe whatever.

As to Sterility, under the Article SCIRRHUS, where the Effects of a Scirrhus, formed in various Parts of the Body, are enumerated, it is obſerved, that Sterility is often produced by a Scirrhus in the genital Parts of Women; and, ſo far as appears from the Obſervations of Phyſicians, it ſeems to be one of the moſt common and frequent Cauſes of Sterility. In barren Women, therefore, Phyſicians juſtly ſuſpect latent ſcirrhous Tumors, which, by their Duration and Increaſe, generally degenerate into Cancers. Beſides, during the Time of Geſtation, when all the Veſſels which conſtitute the Subſtance of the Uterus are ſo much dilated, it often happens, that the beginning Obſtructions are thus open'd, in conſequence of the Capacities of the Veſſels being enlarged; or, at leaſt, that the Veſſels of the Uterus are ſo diſpoſed, as afterwards to tranſmit the Humors more freely. For this Reaſon Pregnancy has ſo often prov'd beneficial to Women, before labouring under Irregularities and Suppreſſions of the Menſes.

As to Celibacy, and that Age in which Women ceaſe to be prolific, which is generally from forty-five to fifty, 'tis evident, from various Inſtances, that theſe contribute to the Production of Cancers; for, as is obſerved under the Article SCIRRHUS, *Dionis* remarks, that a fourth Part of ſuch Women as are afflicted with Cancers, are ſeized with this Diſorder between the forty-fifth and fiftieth Year of their Age; and he adds, that he has moſt frequently obſerved Nuns ſeized with this Diſorder. This alſo is atteſted by *Veſalius*, in *Chirurg. Magn. Lib.* 5. *Cap.* 16.

As to auſtere, acrid, and hot Diet, we have already obſerved, that an atrabilious Matter often contributes to the Production of ſcirrhous Tumors. It is alſo obvious, from what was there ſaid, that Scirrhuſes are increaſed, and diſpoſed to the Malignity of a Cancer by it. All Subſtances, therefore, which increaſe the atrabilious Juice in the Blood, or which render it more acrid by a new Acceſſion of Heat and Motion, muſt in theſe Caſes be highly prejudicial. But, as is obſerved under the Article MELANCHOLIA, auſtere, dry, hard, earthy Aliments, together with great Reſt, and Inactivity of Body, generate an atrabilious Juice in the Blood, and, conſequently, muſt increaſe the Cauſes of a Scirrhus, and the ſubſequent Cancer. All acrid hot Subſtances are alſo to be abſtained from, becauſe, as we obſerved before, they prove hurtful by increaſing the Motion of the Humours.

As to melancholy and bilious Affections of the Mind, when Men of high and generous Tempers entertain a deep and troubleſome Senſe of Injuries done them, and boundleſly indulge themſelves in Sorrow, they generally fall into a deplorable Melancholy, and at laſt die, after having ſtruggled with the moſt terrible chronical Diſorders. 'Tis, therefore, no Wonder, that, by this means, ſcirrhous Tumors ſhould be generated where they were not before; and that, where they were, they ſhould be converted into Cancers; ſince the atrabilious Habit of Body, produced by theſe melancholy Affections of Mind, is very ſubject to generate theſe Diſorders. But Sorrow, which may be juſtly called a bilious Affection, is highly prejudicial to ſcirrhous Tumors; for, whilſt Sorrow is exceſſively indulg'd, a great Heat is excited in the Body, the Motion of the Humours is increaſed, a violent Fever is often brought on, and the whole Body ſwells, and becomes red: Hence, in conſequence of the increaſed Motion, the Scirrhus is in Danger of degenerating into a Cancer.

As to an external Irritation, whether by Motion, Heat, or Acrimony, all theſe, under whatever Denomination they may come, are always prejudicial in theſe Caſes; for no prudent Surgeon will attempt the Cure of a Scirrhus which is confirm'd, and not capable of being reſolved by any other Method than Extirpation. But where this cannot be attempted, the only remaining Means of Safety is, to keep the Scirrhus as long as poſſible from undergoing a Change; for every Change of ſuch a Scirrhus is for the worſe. Where there are any Hopes of a Reſolution left, Friction is an excellent Remedy; but it ſoon changes a malignant Scirrhus into a Cancer. Heat, by diſſipating the moſt moveable Parts, will render the Scirrhus intolerably hard, or promote a Putrefaction, ſo much to be dreaded in this Caſe. How hurtful emollient, ſuppurating, and corroſive Medicines are, is obſerved under the Article SCIRRHUS. Hence it is a general practical Rule, in the Cure of ſuch a Scirrhus, to exhibit nothing internally which can either augment the Motion, or the Heat; and to apply nothing externally which can irritate the Scirrhus. A ſoft Piece of Leather, or a Plaiſter in which Lead is an Ingredient, in order to prevent the Attrition of the Clothes, are the moſt proper Applications.

The Parts ſubject to a Cancer are the ſame as thoſe affected by a Scirrhus.

Since a Cancer generally ariſes from a Scirrhus, it is ſufficiently evident, that it muſt poſſeſs the ſame Place. The Obſervations of Phyſicians ſeem, however, to evince, that a Diſorder, entirely

tirely ſimilar to a Cancer, may be produced in ſome Parts of the Body, tho' no Scirrhus preceded: In the Lips, for Inſtance, when that thin Membrane which covers their Surface is either fiſſur'd by the Cold, or lacerated by any other Cauſe, a fungous Tumor begins to ariſe, which is often pretty ſoft to the Touch, which, gradually increaſing, is extended to a large Bulk, and which, with reſpect to its Pain, the malign Ichor diſcharg'd, the Corroſion of the adjacent Parts, the Hæmorrhage, and its rebellious Nature againſt all Medicines, in every reſpect reſembles a true Cancer. This Tumor, unleſs ſeaſonably extirpated, preys upon all the adjacent Parts, juſt as an exulcerated Cancer does. In the Tongue likewiſe the nervous Papillæ, diveſted of their reſtraining Integuments, expand themſelves into a fungous Maſs, which degenerates into the ſame Degree of Malignity, as is obvious from many deplorable Inſtances. In the human Penis the like terrible Depravations of the nervous Papillæ are alſo obſerv'd: Memorable Inſtances of this Nature are to be met with in *Hildanus*, who, in *Obſerv. Chirurg. Cent.* 3. *Obſerv.* 88. gives us an Account of a Smith, who, from his Infancy, had a Wart on the Glans of his Penis, not exceeding the Bulk of a Lentil, and which he bore without any great Trouble ſo long as he was unmarried; but, after he entered into a matrimonial State, the Pain of it became ſo violent and uninterrupted, that he was obliged to abſtain from the Embraces of his Wife for the Space of thirteen Years. In Proceſs of Time the Wart degenerated into a monſtrous Cancer, as large as the Head of a new-born Child. His whole Penis was transform'd into a fleſhy, rough, and livid Maſs, corroded here-and-there with Ulcers, thro' which his Urine was diſcharg'd. The Smell of the Part affected was ſo highly fetid, that his Friends and Acquaintance could not come near him. When, after uſing many Remedies to no Purpoſe, he was by all concluded to be paſt Recovery, *Hildanus* amputated his entire Penis, and cured him ſo effectually, that he became robuſt, worked at his Employment, and lived ten Years after the Operation. See AMPUTATIO. But 'tis obvious from Anatomy, that in the Tongue, the Lips, and the Glans Penis, there are a prodigious Number of nervous Papillæ, which, when deprived of the Membrane which covers them, are highly ſenſible of Pain; and theſe Papillæ ſeem to degenerate into theſe terrible Diſorders moſt frequently in the Places now mentioned, and others of a like Nature, where they are only cover'd with a tender Membrane. Nor have Diſorders of this kind been only obſerved to happen in theſe Parts, but alſo in others cover'd with the Skin. Accordingly *Van Swieten* informs us, that in an adult Virgin he ſaw a pretty large Wart, which ſhe had on her Back from her Infancy, by the Attrition of her Stays, which were made of Whale-bone, ſo increaſed as to degenerate into a Cancer; but, as it hung by a narrow Neck, the Surgeon apply'd a Thread tightly about it, by which means the Wart ſoon dropt off, upon which he apply'd Lapis Infernalis to its Root. But ſoon after a large and malignant Fungus aroſe, and the adjacent Skin became indurated; and when the Surgeon intended the Extirpation of this terrible Diſorder, the Patient was ſeized with another Diſeaſe, of which ſhe died. The ſame Author informs us, that, in conſequence of a Surgeon's raſhly paring the Nail of a Country Girl's great Toe, and wounding the tender nervous Pulp ſituated there, he ſaw a like Fungus ariſe; and whilſt the ſame Surgeon attempted to conſume it with Corroſives, he ſo irritated it, that it degenerated into a monſtrous Cancer, which they were afterwards forced to extirpate. Now, if any one ſhould aſſert, that the harder Warts, which generally ariſe in Parts covered with Skin, may be comprehended under the general Diſtinction of a Scirrhus, yet it may be anſwered, that, in the Lips and Tongue, ſoft Funguſes often ariſe, which, however, are not of a leſs malignant Nature. Perhaps Diſorders of this kind, ariſing from Depravations of the nervous Papillæ, may, for the ſake of Diſtinction, be properly called fungous Cancers.

But ſince, from the Injections of the celebrated *Ruyſch*, it is certain, that the nervous Papillæ conſiſt not only of a nervous Pulp, but alſo of a pretty large Number of ſmall Blood-veſſels, all theſe degenerate together, and are increaſed in Bulk. Hence it is that dangerous Hæmorrhages ſo often happen in conſequence of the imprudent Extirpation of malignant Warts. Nor is it improbable, that the Subſtance of the Nerves, properly ſo called, degenerates in this manner alſo; for the highly acute Pain, both in theſe fungous Cancers, and in a Scirrhus when degenerating into a Cancer, demonſtrates, that the Nerves diſtributed thro' this Maſs remain alive. And, from what is ſaid under the Article CAPUT, it is ſufficiently evident, how eaſily the Subſtance of the Brain, when diveſted of the Cranium, and its reſtraining Membranes, riſes in a fungous Maſs. The Nerves diſtributed to various Parts of the Body are defended and confined by pretty thick Coats; but when, after having laid aſide theſe, their ſoft Subſtance is more unfolded, as in the Tongue, for Inſtance, the Glans Penis, and the internal Surface of the Eye-lids, they are reſtrained by a Membrane which covers them: When this Membrane is corroded, or injured by any Cauſe, ſuch fungous Excreſcences ariſe. 'Tis, therefore, neceſſary, that Phyſicians and Surgeons ſhould know, that a Cancer is often to be dreaded, tho' no Scirrhus preceded it.

An occult Cancer is known to be formed, when, after the Signs of a preceding Scirrhus, enumerated under that Article, a Titillation, Itching, Heat, a lancinating, burning, pungent Pain are perceived; when the Colour of the Part becomes reddiſh, red, purple, bluiſh, livid, or black; when it feels conſiderably hard, ragged, and rough, with a riſing Apex; when the Tumor increaſes; and when the adjacent Blood-veſſels become tumid, knotted, varicoſe, thick, and black.

The Signs by which a Scirrhus is known are laid down under the Article SCIRRHUS; but that a Scirrhus may become a Cancer, and that a Cancer may, when formed, be known and diſtinguiſh'd from a Scirrhus, ſome new Symptoms, which were before abſent, muſt appear. A Scirrhus, then, is never ſuddenly converted into the worſt of Cancers, but, changing gradually, degenerates into higher and higher Degrees of Malignity. The Changes, therefore, which happen to a Scirrhus, are ſucceſſive, and are here enumerated in the Order in which they generally follow each other. An ulcerated Cancer, or even an occult Cancer, when juſt about to be changed into one of the ulcerated Kind, are ſufficiently known by every-body; but, when a Scirrhus firſt begins to afford Signs of its degenerating into a worſe State, it ſeems ſomewhat more difficult to know it. *Galen*, when treating of this Diſorder, in *Meth. Med. Lib.* 14. *Cap.* 9. gives a Caution with reſpect to this: "For," ſays he, "where all the Symptoms are violent, no-"body is at a Loſs what Appellation to give the Diſorder; and "all unanimouſly agree to call Indiſpoſitions of this Nature by "the common Name *Cancer*. But it is reaſonable to think, "that a beginning Cancer may not be known by every one; "juſt as in Agriculture, Roots, when firſt beginning to appear "above the Ground, are only known by thoſe who are tho-"roughly ſkill'd in them." For ſince a Scirrhus is defined a hard Tumor unattended with Pain, it may retain that Name ſo long as no Pain is perceiv'd; but when a Titillation and Itching begin to ariſe, it then degenerates from its eaſy State, nor does it as yet deſerve the Name of a Cancer properly ſo call'd, tho' it will ſoon be changed into that Diſorder. But tho' there were any Doubt remaining with reſpect to the Denomination of this Diſorder at the time a Scirrhus is degenerating into a Cancer, yet this Doubt will lay no Foundation for an Error in the Method of Cure, ſince both an inveterate Scirrhus, and a beginning Cancer, require the ſame Remedy, which is Extirpation, or the Uſe of ſuch Medicines as will alleviate the new Symptoms, prevent future ones, preſerve the incurable Diſorder in the ſame State, and prevent its degenerating into a worſe. That a Scirrhus is degenerating into a Cancer, may be known by the following Signs, as is ſaid above.

By Titillation and Itching.

This, in inveterate ſcirrhous Tumors, is a bad Sign, and indicates, that the Nerves diſtributed thro' the Subſtance of the Scirrhus are either not ſufficiently tenſe, or elſe that they are irritated; but ſoon after, the Diſtention of the Nerves being increaſed to ſuch a Degree as to threaten their Deſtruction, the Itching is ſucceeded by Pain, a Sign, as we have before obſerv'd, that the Scirrhus is changed into a Cancer. The Danger of this Symptom is increaſed by the Patient's being oblig'd, contrary to his Inclinations, to ſcratch the itching Part, by which means the Malignity of the cancerous Scirrhus is augmented, ſince any external Irritation, as was before obſerved, is ſufficient to change a Scirrhus into a Cancer. And as the ignorant Vulgar are perſuaded, that an Itching, in Diſorders of this kind, is the Sign of a beginning Cure, they are often overjoy'd when the greateſt of Evils, a Cancer, is juſt approaching. Thus *Van Swieten* tells us, that he ſaw an impudent Mountebank congratulate a miſerable Woman, when ſhe perceived ſuch an Itching in an incurable Scirrhus, on which he had laid a Plaiſter compoſed of very hot Ingredients; but, a few Weeks after, a highly malignant ulcerated Cancer miſerably prey'd upon the whole Breaſt, and all the adjacent Parts. But, tho' ſkilful Phyſicians and Surgeons unanimouſly pronounce theſe Diſorders incurable, yet the Patients, notwithſtanding all the Cautions they can receive to the contrary, liſten to the vain Boaſtings of theſe Villains, ſince it is natural for the human Mind to be eaſily perſuaded of the Truth of what it earneſtly deſires.

By the Heat and Redneſs.

So long as a Scirrhus is benign, it is of the ſame Colour, and the ſame Degree of Warmneſs, with the adjacent Skin. When Heat and Redneſs, therefore, happen, the worſt is to be dreaded; for theſe are Signs, that an Inflammation is begun in the live Veſſels diſtributed thro' the Subſtance of the Scirrhus, or, at leaſt, in the Integuments of the Scirrhus, and the adjacent Parts. For it is obvious, from what is ſaid under the Article INFLAMMATIO, that Redneſs and Heat are juſtly to be claſſed among the

the Effects of Inflammation. And we have obſerv'd before, that, when the Redneſs and Heat are increas'd, the Scirrhus degenerates into a Cancer: The Danger is increas'd by this Circumſtance; that the greater Degree of Heat diſpoſes to Putrefaction, as has been taken Notice of under the Article ALCALI. It has been alſo obſerv'd, under the ſame Article, that the Putrefaction begun creates an uneaſy Senſation of Heat: Heat, therefore, perceiv'd in a Scirrhus, either denotes a Putrefaction already begun, or indicates, that it will ſoon happen: Hence 'tis, in theſe Caſes, always a dangerous Symptom.

By a lancinating, burning, and pungent Pain.

This Sign, as we have before obſerved, diſtinguiſhes an occult Cancer from a Scirrhus. Firſt, Pains are perceived, which are not of the continued Kind, but only ſeize by Intervals, and ſuddenly go off, juſt as if a ſharp Lancet were ſuddenly thruſt through the Scirrhus. It often happens, that when Scirrhuſes are not irritated by the Application of prepoſterous Medicines, theſe lancinating Pains are not again perceived for a great while, and the Diſorder lies latent for ſome Years. But when theſe lancinating, and at laſt pungent Pains, return almoſt daily, and do not go ſoon off, 'tis highly to be dreaded, leſt the latent or occult Cancer ſoon be changed into one of the ulcerated Kind. That Species of Pain is, of all others, the worſt, which excites the Senſation, as it were, of a live Fire, preying upon the internal Part of the Scirrhus; for then the Integuments of the occult Cancer are gradually torn from its ſwell'd Maſs, and corroded by a higher Degree of Acrimony.

By the reddiſh, deeper red, purple, bluiſh, livid, black Colour.

The various Degrees of Malignity, in an occult Cancer, are known from the Change of its Colour. A reddiſh Colour denotes the ſlighteſt Degree of the Diſorder, and a black Colour the worſt and moſt malignant kind; whereas the other Changes of Colour indicate the intermediate Degrees of Malignity; for a reddiſh Colour denotes only a ſlight Inflammation; a deeper red, a ſtronger Degree; and a purple Colour, a ſtill higher, together with a beginning Mortification. But, when the Integuments of the Cancer are rendered thin, and begin to be corroded, the Colour of the ſubjacent Cancer becomes tranſparent, and appears firſt bluiſh, and afterwards, when the Diſorder is increaſed, livid; and, when it is juſt ready to become exulcerated, a blackiſh Colour is perceived, through the thin and diſtended Skin of the Cancer.

By its feeling conſiderably hard, ragged, and rough, with a riſing Apex.

Whilſt an occult Cancer, in conſequence of its Integuments remaining entire, is not, as yet, changed into one of the manifeſt and ulcerated Kind, it always appears hard like a Stone; and the greater this Hardneſs is, the more fatal Conſequences are to be expected. But, when it is exulcerated, a Part of the contained Matter protuberates through the Integuments, and it appears leſs hard. The Surface of ſuch a Tumor never appears ſmooth and equal, but rough and ragged, with knotty Eminences. In that Part, where the Integuments are more diſtended or corroded, they are capable of making leſs Reſiſtance, and a ſmall prominent Apex appears, which is a certain Sign, that the Cancer will ſoon be exulcerated: Afterwards the Integuments on this Apex are excoriated, gradually recede from each other, and generally the Cancer firſt becomes ulcerated in this Part.

By the Increaſe of the Tumor.

A benign Scirrhus often remains, for ſome Years, without any remarkable Increaſe of its Bulk: But when it begins to become malignant, it often, in the Space of a few Weeks, becomes four times as large as it formerly was; and then we certainly know, that it is degenerating into an exulcerated Cancer. This never appears more evidently, than when a Scirrhus, which has before appeared benign, but at the ſame time incapable of being reſolved, is irritated by a prepoſterous Application of Medicines.

By the adjacent Blood-veſſels becoming tumid, knotted, varicoſe, thick, and black.

A Cancer of this kind is a very ſhocking Spectacle; and the Name Cancer was principally given to this Diſorder, becauſe, by extended Veins on every Side, it reſembled the Figure of that Animal, as we have already obſerved; for this hard Tumor, as yet confined within its Integuments, but increaſed in its Bulk, compreſſes the adjacent Veins, which, in conſequence of the Blood's paſſing with Difficulty through them, are diſtended, and appear varicoſe; and whilſt the thinneſt Part of the Blood only is forced thro' the compreſſed Veſſels, the Collection of thicker Blood, which ſtagnates, has almoſt a blackiſh Colour. But it is always obſerved, that the Veins of the Skin are much enlarged, when diſtended by any Humour whatever. Thus, in dropſical Patients, and Women big with Child, the Skin of the diſtended Abdomen has its Veins varicoſe, and very large: But, when theſe varicoſe Veins are preſſed upon by a ſubjacent Tumor, they appear ſtill larger, than when they retained their round Figure. The Veins appear knotted, becauſe the rough and ragged Surface of the Cancer, in ſome Parts, compreſſes them more, and in others leſs. This black Colour of the Veins made the Antients ſuſpect, that a melancholic Humour, here lodg'd, acted as a Cauſe. But whence this black Colour proceeds, is ſufficiently evident from what has been ſaid.

By theſe Signs, an occult Cancer, lodged in the external Parts of the Body, may be known; but it is, with more Difficulty diſtinguiſhed, when ſituated in the internal Parts. The Signs of a preceding Scirrhus, together with a Heat and Pain in thoſe Parts, in which there was only, before, an indolent Senſe of Weight perceived, afford us ſome Light in theſe obſcure and dubious Caſes.

Ætius, in *Tetrabibl.* 4. *Serm.* 4. *Cap.* 43. when deſcribing an occult Cancer in the Breaſt, enumerates all theſe Signs in the following Words: "When an occult Cancer is lodged "in the Breaſt, a large Tumor appears, which reſiſts the "Touch, is unequal, intenſely painful, deep ſeated, extending its Roots far and wide; it is ſurrounded with Veins, "which are every-where varicoſe. It is of a cineritious Colour, ſomewhat inclined to red, and ſometimes livid; and "tho', to ſuch as look at it, it appears to be ſoft, yet it deceives the Sight, and feels highly hard to the Touch. It "induces a pungent Pain, which is often ſo intenſe, as, by "Conſent, to excite malignant Inflammations of the Glands "in the Arm-pits. Theſe Pains alſo reach to the Clavicle "and Scapulæ."

An ulcerated Cancer is diſtinguiſhed by the Opening of a preceding occult Cancer; for then the Skin is laid bare by a kind of Excoriation, and a thin acrid Ichor, as it were, tranſudes through it.

An ulcerated Cancer only differs from an occult one, in the Corroſion of the Integuments, and in its being ſubſequent to the occult one, as we have already obſerved. Hence it may be eaſily known; for it ſuppoſes a previous occult Cancer, and its becoming open. But the Integuments are never broken ſuddenly, nor, when they are broken, is the contained Liquid copiouſly diſcharged, as it is obſerved to be in ripe Abſceſſes, which open ſpontaneouſly. But the Skin and Epidermis are gradually excoriated and ſeparated, and ſomething of a thin Ichor is preſſed through the ſlender Integuments, the ſeveral Strata of which are thus torn with racking Pain, till the Subſtance of the Cancer is gradually preſſed through the Aperture made. But, how an exulcerated Cancer runs through the various Degrees of increaſed Malignity, till at laſt it terminates in Death, we now proceed to deſcribe.

The Progreſs of a Cancer is thus: The ſound Veſſels, about the Edges of the hard Cancer, being weakened by the perpetual Attrition of the circulating Fluids, and diſtended by the Neighbourhood of the Tumor, at laſt break; hence a Putrefaction, and thence a ſubtile, acrid, fetid, cadaverous Sanies, which corrodes the circumambient Parts, preys upon thoſe which are near it, and makes a Progreſs all around; whilſt it propagates its malignant Roots every Way deep into the adjacent Parts, by which it adheres ſtrongly. The Lips then become ſwell'd, retorrid, and diſmal; an intolerable burning, pungent, corroding Pain is perceived; the Colour becomes cineritious, livid, or black; occult Cancers appear in the Glands, which communicate with the Part affected; the next Stage is attended with Hæmorrhages, Convulſions, a ſlow Fever, Extenuation of the whole Body, a Loſs of the Senſe of Smelling, callous Tubercles in the Ears unattended with Pain, Faintings, and laſtly, Death, in conſequence of the Corroſion and Conſumption brought on by the Diſeaſe.

To this horrid Train of Symptoms give me Leave to add a violent Pain in the Back and Loins, not unfrequent in the laſt Stage of a malignant Cancer.

As to the ſound Veſſels about the Edges of the Cancer, it has been already obſerved, that the Increaſe of the Tumor, together with its Hardneſs, are Signs of a Scirrhus degenerating into a Cancer. There is, therefore, an Attrition of the ſound Veſſels about the Edges of the Cancer, as alſo about all its Surface. The ſame Thing alſo happens to thoſe Veſſels, which, being diſtributed through the Subſtance of the Cancer, remain pervious to the vital Juices; for theſe, being every-where compreſſed by the hard cancerous Tumor, in which they are lodged, are continually rubbed againſt it. The Inflammation, and what accompanies it, the greater Velocity of the Humours circulating through the Veſſels, increaſe all theſe Symptoms. By this continual Attrition, the Veſſels are ruptured, and pour forth their Contents, which ſoon become putrid.

putrid. But, in this Caſe, there is no Hope of a benign Suppuration, by which this mortified and corrupted Part may be ſeparated from the ſound Parts. This will appear, if we conſider the Symptoms which happen in a Phlegmon, when going off in a Suppuration, and compare them with the Nature of a Scirrhus, and the Cancer formed by it; for, in an Abſceſs, the ultimate tender Extremities of the arterial Veſſels, obſtructed with a coagulated Liquid, which cannot be reſolved, have their Coheſion deſtroyed, and are, as it were, cut aſunder by the Impetus of the arterial Fluid. Theſe obſtructed Extremities being ſeparated, the gaping Mouths of the Veſſels pour forth the ſound Juices, which, mixing together in a cloſe and warm Part, are, in a few Days, converted into a mild and laudable Pus, which is evacuated, either when the Part breaks ſpontaneouſly, or is laid open by Art. Thus, by the Victory of Nature, as *Galen de Febribus*, *Lib.* 1. *Cap.* 7. well expreſſes it, Pus is formed, and the putrefying Humour is, from its very Nature, inclined to ſuch a Change or Alteration; for theſe Extremities of the Veſſels, together with their ſtagnating and obſtructing Fluids, are, as it were, aſſimilated, and converted into an homogeneous Pus, by the Affuſion of the ſound Humours. But, in a Scirrhus, the coagulated Juices often remain, for ſome Years, before it degenerates into a Cancer; and theſe Juices are, at the ſame time, lodged in Places, on which the Efficacy of the arterial Fluid, when put in Motion, can hardly act; that is, in the Cavities of the Glands, or in the intricate Contexture of the ſmall Ramifications, which ſecern the ſeveral Liquors brought from the arterial Blood. The obſtinate Matter, therefore, of a Cancer, and the little or no Efficacy of the vital Humours upon it, never ſuffer us to expect a ſalutary Concoction of the morbid Matter: Hence, a malignant Putrefaction is only to be looked for. *Galen*, in the ſeventh Chapter of his firſt Book, *de Febribus*, very juſtly obſerves, that Putrefaction may ariſe from two Cauſes, either a Weakneſs of the concoctive Faculty, which is not able to induce a Change for the better on the putrefying Subſtance, or the great Malignity of the putrefying Humour, which cannot be ſurmounted and corrected by a very ſtrong concoctive Faculty. Now, both theſe Cauſes concur in a Cancer; for, in this Caſe, the Efficacy of the vital Fluid, on which the concoctive Faculty, meant by *Galen*, depends, is very weak, or none at all; and the Malignity of the Matter to be corrected by this Faculty is very great. They, therefore, tantalize and delude the miſerable Patients, who pretend, that, by their boaſted Secrets, the Matter of a Cancer can be reſolved, and brought to a Suppuration. But it may be aſked, Whether the whole Cancer may not become mortified, and afterwards, as happens in a Gangrene and Sphacelus, be ſpontaneouſly ſeparated from the live Parts, by a Suppuration ariſing all around? The Man, who could bring about this happy Effect, would certainly deſerve well at the Hands of Mankind, and have Reaſon to boaſt of his ſuperior Art. Tho' this may ſeem to have ſome faint Shadow of Poſſibility in it, yet 'tis obvious, that the Difficulties to be ſurmounted are very great. For the entire Cancer does not become mortified, but the Veſſels pervious to the vital Humours, and the live Nerves, are lodged in the Middle of this mortified and corrupted Maſs: Of this we are ſufficiently informed by the intenſe Pain, and the continual and copious Diſcharge of Sanies. But, in a Gangrene and Sphacelus, the Parts, being totally mortified, feel no Pain, tho' they be deſtroyed with the Knife, or the actual Cautery, as is obſerved under the Article GANGRÆNA. In a Cancer, therefore, the mortified and corrupted Part, furniſhed with intercurrent live Veſſels and Nerves, excites the ſevere Calamities now to be enumerated. Nor does it appear poſſible ever to ſurmount this Diſorder, unleſs the mortified Part could be removed, or the live Veſſels become mortified, without propagating the Diſorder to the adjacent Parts; for, in this Caſe, all vital Influx and Efflux thro' the Part being deſtroyed, a Gangrene or Sphacelus would be produced inſtead of a Cancer, and the Part affected would indeed be deſtroyed, but the Progreſs of the Diſorder might be ſtopt, and the corrupted ſeparated from the ſound Parts. In very ſmall Cancers deſtroyed all at once, either by violent Corroſives, or the actual Cautery, this Method of Cure has ſometimes ſucceeded. Thus the celebrated *Boerhaave* cured a ſmall, but malignant Tumor, on the external Part of a Clergyman's Noſe, by corroding it all at once by highly acrid Oil of Vitriol: For thus a dead Eſchar is produced, which, if it covers the whole Cancer, may be afterwards ſeparated from the live and ſound Parts by a benign Suppuration. *Celſus* has a beautiful Paſſage, concerning this Uſe of corroſive Medicines, as follows. "An Eſchar, "ſays he, is induced by corroſive Medicines, which, when "ſeparated every-where from the ſound Fleſh, draws along "with it whatever was corrupted; and the Sinus, when thus "rendered pure, may be filled with incarning Medicines." But it is impoſſible ſo to deſtroy large Cancers, by the momentaneous Action of the moſt acrid Corroſive, or by the actual Cautery itſelf, as entirely to change them into dead Eſchars; for the ſmalleſt Thing of a cancerous Nature, which is not by this means mortified, and remains under ſuch an Eſchar, will afterwards rage with boundleſs Fury: Hence, little is to be expected from this Method, except in ſmall Cancers, which may, at the ſame time, be more ſafely extirpated with the Knife. But no one ever aſſerted, that any Remedies were known, which could reſtrain the preying Putrefaction of a Cancer, and ſeparate it from the live and ſound Parts. In the third Book of *Herodotus* we read, that *Democedes*, in conſequence of his having cured a dangerous Luxation in King *Darius*, which had been in vain attempted by the *Egyptian* Phyſicians, was employed to cure *Atoſſa*, the Daughter of the celebrated *Cyrus*, and Queen of *Darius*, of an Ulcer, (φῦμα) which aroſe in her Breaſt, and which, breaking, ſpread itſelf as a Cancer does. This Ulcer, ſo long as it remain'd ſmall, *Atoſſa*, from a Principle of falſe Modeſty, conceal'd; but, when her State became worſe, ſhe diſcovered her Diſorder to *Democedes*: But in the Progreſs of this Cure, there is not the leaſt Mention made, either of Inciſion, or the Uſe of the Cautery. *Helmont*, *in Capitulo de Ideis Morboſis*, informs us, that there was a Man in the Duchy of *Juliers*, who by ſprinkling a Powder, which created no manner of Pain, upon all kinds of Cancers, cured them, and afterwards conſolidated them by an incarning Plaiſter: And he adds, that this Art was buried with its Owner. Whatever Truth there may be in Accounts of this Nature, for any thing we can find, no ſuch Remedy is known at preſent.

As to the ſubtil, acrid, fetid, and cadaverous Sanies, the mortified Maſs of the exulcerated Cancer is, by the Acceſs of the Air, and the Heat of the adjacent live Parts, ſoon converted into a terrible Putrefaction, and diſſolved, as it were, into a highly fetid Sanies. But the live Veſſels, diſpers'd thro' the Subſtance of the Cancer, bring freſh Fluids, which are ſoon corrupted, whilſt they waſh theſe putrid Parts: The Nerves, which are alive, and highly ſenſible of Pain, being continually irritated by this acrid Sanies, are, perhaps, the Occaſion of a larger Quantity of thin and acrid Serum being derived to theſe Parts. 'Tis obvious, from what is ſaid under the Article VULNUS, that tenſe Nerves, Tendons, and nervous Membranes, wounded by a ſmall Puncture, produce the worſt of Symptoms; and eſpecially, that a copious Evacuation of thin and acrid Serum often accompanies theſe Accidents. 'Tis, therefore, highly probable, that this Cauſe concurs in an ulcerated Cancer, from which a large Quantity of a thin Fluid is often diſcharg'd: But the Fluid convey'd to the Cancer ſeems to degenerate, and acquire ſo malignant a Nature in the Place affected, tho', before, it was mild and benign; for *Van Swieten* tells us, that he ſaw an exulcerated Cancer in a Woman, otherwiſe ſound and healthy, diſcharge ſuch an acrid Sanies, which did not, therefore, pre-exiſt in the Blood, but was generated in the Part affected. Hence, in an exulcerated Cancer, ſuch an acrid Sanies is not immediately diſcharg'd, but its Malignity gradually increaſes, in proportion as the Putrefaction daily augments. We alſo obſerve, in other Diſorders, that Fluids, lodg'd in ſome Parts of the Body, and degenerating from the Nature of the ſound Humours, aſſimilate, and change into their own Condition, other Fluids convey'd to them. When, for Inſtance, after the Extirpation of a Breaſt, a large Wound has remain'd, Phyſicians and Surgeons often complain, that, in conſequence of the large Quantity of Humours convey'd to the Part, and chang'd into a laudable Pus, the whole Body is exhauſted and dry'd up, as it were, by a true Maraſmus. Where a Liquor, degenerating from laudable Pus, is lodg'd in the Cavity of a fiſtulous Ulcer, a white Pus, of an equal Conſiſtence, is never collected in that Part, but either an Ichor, or a Sanies. When a fiſtulous Ulcer ariſes, for Inſtance, from a carious Bone, the Nature of the Fluid, collected in its Cavity, will ſtill be worſe; from all which it ſeems to be obvious, that the putrefy'd cancerous Maſs converts the Humours convey'd to it into the ſame Nature with itſelf, tho', before, their State was very good. *Helmont*, in his Treatiſe intitled, *Scabies & Ulcera Scholarum*, ſeems to have been of this Opinion, when he ſays, "Sanies "and Pus are not the Excrements of an Ulcer, or any "Part affected, nor the Effects of a natural Digeſtion; but "they are produced by the Seeds or Roots of the Ulcer, &c. "— Whilſt the proper Principle of Corruption is lodg'd in "the Ulcer, and corrupts the alimentary Blood, before it is "fit for Digeſtion, &c. — Sanies, therefore, and Pus, are "not the Excrements of the Ulcer, but the Effects of a cor"rupting Principle, and they are, at once, the Indications, "Signs, and Effects, of a Blood degenerated and deprav'd into "a noxious Matter." He afterwards treats of this Doctrine at large, and confirms it by Arguments. The above Quotation ſufficiently evinces, that he thought the ſound Humours convey'd to an Ulcer degenerated into the ſame Degree of Malignity with the Humours lodg'd in the Bottom, and at the Lips of the Ulcer.

But, that this Sanies, diſcharg'd from an ulcerated Cancer, may acquire an intolerable Acrimony, is certain from numberleſs Inſtances. Thus *Van Swieten* informs us, that he ſaw the

Linen

Linen Cloths, apply'd to a cancerous Part, wet with ſuch a Sanies, eat away, and corroded in the ſame manner, as if they had been touch'd with Aqua Fortis. Hence *Ætius*, in *Tetrabibl. 4. Serm. 4. Cap.* 43. juſtly ſaid, "That an ulcerated "Cancer continually corrodes, penetrates deeper, cannot be "ſtopt, and diſcharges a Sanies more deleterious, than the "Poiſon of venomous Animals, and which is abominable, "both on account of its Quantity and Smell." 'Tis, therefore, no Wonder, if this highly acrid Poiſon corrodes and preys upon all Parts near it. Thus *Van Swieten* informs us, that he ſaw an exulcerated Cancer of the Breaſt, which had eaten as far as the Arm-pit, when, the larger Blood-veſſels being corroded, the Patient died of a profuſe Hæmorrhage. *Hildanus*, in *Obſervat. Chirurg. Centur.* 3. *Obſer.* 87. informs us, that, in the Space of four Months, he knew an ulcerated Cancer corrode the whole Breaſt, and all the adjacent Parts, as far as the Sternum and Axil. *Stalpart Vander Weillæ*, in his *Obſervat. Rarior. Centur. Poſt. Part* 1. *Obſ.* 26. informs us, that he found a Hole, as large as one's Fiſt, eaten in the Stomach by a cancerous Tumor: The Lobe of the Liver, which lay upon the Stomach, and the adjacent Diaphragm, were in like manner corroded. In the *Miſcellan. Curioſ. Dec.* 1. *A.* 1. *Obſerv.* 99. we are inform'd, that, by means of a cancerous Pancreas, the Diaphragm was perforated, the Spina Dorſi corroded, and the Kidneys become entirely corrupted and putrid. Many Caſes of a like Nature occur in practical Authors.

As to the Diſorder's making a Progreſs all around, and ſpreading its malignant Roots every Way deep into the adjacent Parts; if an exulcerated Cancer was, by this acrid Sanies, corroded to the live Parts, and thus conſumed by its proper Sanies, there would ſtill remain ſome Hopes of a Cure, after ſo many Calamities. But this terrible Diſorder changes all the adjacent Parts into a like Malignity, firſt indurating them, and then corroding them by a true and genuine Propagation of the Diſorder. This happens not only in the Circumference, but the Diſorder, breaking the Pellicles, penetrates deep, and is, for this Reaſon, ſaid to ſend forth malignant Roots, by which it adheres very ſtrongly to the adjacent Parts; for theſe indurated Ramifications of an exulcerated Cancer are generally diſtributed every Way, and, if the ſmalleſt Portion of them remains after the Extirpation of the Cancer, it ſoon ſprings up afreſh, and brings on a Diſorder equally terrible.

As to the Lips being ſwell'd, retorrid, and diſmal; whilſt a Scirrhus is beginning to be chang'd into a Cancer, a great Hardneſs and Increaſe of the Tumor are obſerv'd, as has already been taken notice of: But when, by a Conſumption of the Integuments on that riſing Apex, which uſes to appear in a malignant Scirrhus, a Way is open'd for the Cancer, every Way preſs'd upon, to expand itſelf all round the Aperture, to thruſt back the Lips of the Ulcer, and to grow out in a fungous Maſs, ſometimes of a livid, and ſometimes of a blackiſh Colour: Hence theſe terrible Lips of an ulcerated Cancer are conſtituted.

As to the intolerable burning, pungent, and corroding Pain; the Skin, as yet entire, is gradually burſt by the ſwelling cancerous Maſs. Hence, in conſequence of the cutaneous Nerves being ſlowly lacerated, the moſt violent, and at the ſame time the moſt continued Pain is produced; beſides, the Nerves diſtributed thro' the Subſtance of the Cancer remain alive, and are every Moment corroded by the acrid Sanies, which alſo diffuſes itſelf thro' the adjacent Parts, and preys upon them. In conſequence, therefore, of the continual Laceration, and ſlow Corroſion, a violent Pain, almoſt without any Intermiſſion, racks the miſerable Patients. 'Tis, therefore, evident, how much more ſevere a Cancer is, than a Gangrene and Sphacelus; ſince theſe laſt Diſorders, in conſequence of all the Parts being deſtroy'd by a perfect Mortification, are entirely free from Pain.

As to the cineritious, livid, or black Colour; when the Fleſh of the ſoundeſt Animal, after it is ſlain, is ſuſpended in a warm Air, the red Colour is ſoon chang'd into a pale and cineritious one; then, when a Putrefaction begins, it becomes livid, then blackiſh, and is at laſt reſolved into a putrid Sanies. In a Gangrene and Sphacelus, the ſame Change of Colours is obſerv'd in the affected Parts of the human Body. Since, therefore, in an ulcerated Cancer, the greateſt Part of it is mortified, and become putrid by the Heat of the adjacent Parts, and the Acceſs of the Air, 'tis ſufficiently evident why the Colour muſt thus be chang'd, according to the various Degrees of Corruption. Hence, a cineritious Colour is beſt, a livid one worſe, and that which is black worſt of all, becauſe it implies the higheſt Degree of Putrefaction.

As for occult Cancers appearing in the Glands, which communicate with the Part affected; it is ſufficiently plain, from phyſical Obſervations, that whilſt the Glands, in certain Parts of the Body, are diſorder'd, others are alſo affected in different and remote Parts. Thus, under the Article SCIRRHUS it is obſerv'd, that when the Glands of the Neck are ſcrophulous, thoſe of the Meſentery are generally affected with the like Diſorder; whence theſe Glands are juſtly ſaid to communicate or correſpond with each other. In inveterate Scirrhuſes, and particularly in Cancers of the Breaſt, the ſubaxillary Glands, almoſt always becoming indurated and tumid, degenerate into occult Cancers.

As to Hæmorrhages; when the Blood-veſſels, diſtributed thro' the Subſtance of the Cancer, are diſſolv'd, or when the remarkable arterial Ramifications are corroded, by the Diſorder preying upon the adjacent Parts, as in Cancers of the Breaſts, it has often been obſerv'd, that the axillary Artery, or its larger Ramifications, being corroded, an Hæmorrhage has been brought on, which ſoon prov'd mortal. Such an Effuſion of Blood is with the greateſt Difficulty ſtopt, ſince, either by Compreſſion, or the Application of acrid Styptic Liquors, the Cancer is generally much irritated: Nor may a large Hæmorrhage only happen from a Corroſion of the large adjacent Veſſels; but the Veſſels diſtributed thro' the Subſtance of the Cancer are often ſo dilated, that the greateſt Danger is to be dreaded from a Rupture of them, tho' in a ſound State they were ſufficiently minute. In that terrible Cancer of the Eye, before mentioned from *Hildanus*, the dilated Veſſels happening to break, ſeventy Ounces of Blood were diſcharged in the Space of two Days; and tho', from ſo great a Loſs of Blood, the Patient was become very weak, yet next Day, when the Bandage, with which the Rupture was cover'd, was remov'd, the Blood burſt out with a more terrible Force than before. It ſometimes happens in barren Women, that after all the Signs of a Scirrhus of the Uterus have preceded, a fixed and continued Pain ſeizes the Pubes, Hypogaſtrium, and Loins, and a ſanious Ichor is diſcharged from their Pudenda: At this Time, a violent Hæmorrhage of the Uterus generally enſues, by which, when they are render'd very weak, they feel an Alleviation of their Symptoms for a little time, 'till at laſt, upon a Recovery of their Strength, they return with the ſame Violence. In this Caſe there ſeems to be a cancerous Diſpoſition about the Parts of the Uterus, which corrodes the dilated Veſſels.

As to Convulſions; theſe are generally produced, either by a previous Evacuation of Blood, or an Irritation of the Nerves, or an intolerable Pain.

As to a ſlow Fever; this is produced by the perpetual Watching, and the intenſe Pain felt: Beſides, that acrid and putrid Sanies, always waſhing the Surface of the Cancer, inſinuates itſelf into the ſmall corroded Veins, and corrupts the whole Maſs of Blood with a putrid Taint. For which Reaſon, a Cancer is enumerated as one of the particular Cauſes of a Fever: For if mild Pus, too long retain'd in a cloſe Abſceſs, and entering the Veins, is capable of producing the Symptoms enumerated under the Article ABSCESSUS, how much more may they be produc'd by a cancerous Sanies reabſorbed into the Veſſels?

As to Extenuation of the whole Body; how much Pain long endur'd, and an uneaſy State of Mind, are capable of extenuating the Body, is obvious from daily Experience. Since, then, ſuch Patients are rack'd with continual Pain, and dread the worſt Symptoms, 'tis no Wonder they ſhould be extenuated. Beſides, a large Quantity of Liquor is evacuated from the Body, whilſt an exulcerated Cancer continually diſcharges this acrid Sanies. A gentle hectic Fever, in the mean time, and protracted Watchings, prey upon the Body; and, at the ſame time, thoſe Functions which are ſubſervient to the Reſtoration of the loſt Juices, by preparing laudable Humours from the Aliments taken, are deprav'd.

As to the Loſs of the Senſe of Smelling, and callous Tubercles in the Ears, unattended with Pain; an ulcerated Cancer diffuſes a Smell ſo fetid and intolerable, that the By-ſtanders can ſcarce endure it: The miſerable Patients are, however, oblig'd to bear it Day and Night; hence their Senſe of Smelling is entirely loſt. *Hippocrates, de Morbis Mulier. Lib.* 2. *Cap.* 20. reckon'd the following among the Symptoms of a Cancer: "The Patients have their whole Bodies extenuated, "their Noſtrils are dry and contracted, they breathe ſhort, "and their Senſe of Smelling is entirely loſt: They have, in"deed, no Pain in their Ears, but ſometimes callous Tuber"cles are form'd in them." *Van Swieten* informs us, that he had often obſerved thoſe afflicted with Cancers to be depriv'd of the Senſe of Smelling; but ſays, he never ſaw callous Tubercles, unaccompanied with Pain, form'd in the Ears of ſuch Patients; and where they happen, he ſuppoſes them to be begining Scirrhuſes of the Follicles, which are lodg'd in the *Meatus Auditorius*.

As to the Faintings, and at laſt Death; the Faintings may proceed from the Strength being impaired by Hæmorrhages, Pains, Watchings, or a Fever; and, at laſt, a welcome Death puts an End to a miſerable Life.

From what has been ſaid 'tis obvious, how deplorable a Diſorder a Cancer is, when it cannot be amputated; as alſo what terrible Effects it muſt produce, when it preys upon the internal Parts of the Body. In this Caſe, the only Comfort which the Patients can have is, that they ſhall ſoon die, in conſequence

ſequence of their Viſcera being corroded; whereas, when the Diſorder is ſituated in the external Parts, it only corrodes ſlowly, and often requires ſome Years to kill the Patient. From what has been ſaid it alſo appears, how carefully a Scirrhus, which is, as it were, the Foundation of a future Cancer, ought to be treated; for if no Hopes of a Reſolution are left, it is forthwith to be extirpated, however little prejudicial it may ſeem to be in conſequence of its Freedom from Pain.

An occult Cancer, in a Body of a good Habit, may be ſometimes endur'd without great Inconvenience; but if once mov'd in the manner above deſcribed, it will infallibly cauſe a great deal of Pain and Trouble.

As to the Prognoſtics, therefore, all the Diſorders before enumerated may juſtly be feared, if the Cancer be ulcerated: For as long as it is occult, and reſtrained within its Coats, it may be endured, provided it be left at Reſt, and irritated by no Remedies, which may increaſe the Motion of the Humours through the Veſſels, in the very Subſtance of the Cancer, or in the adjacent Parts; under which Circumſtance the Cancer would ſoon be enraged. This was very well obſerv'd by *Celſus*, who ſeems in a manner to have deſpaired of the Cure of a Carcinoma, or Cancer, and for that Reaſon recommends only a palliative Cure. "None of them," ſays he, "was ever the better for Medi-"cines; but when cauterized, they have been exaſperated; "and increaſed, till they have deſtroy'd the Patient; and "when cut out, and after the Wound has been cicatrized, "they have returned, and brought the Cauſe of Death with "them. On the contrary, many who uſe no violent Means "to free themſelves from ſo troubleſome a Diſorder, but apply "gentle Medicines, which ſooth, as it were, and ſoften the "Diſtemper, have lived under it to extreme old Age." *Lib.* 5. *Cap.* 28. The Hiſtories of Medicine inform us, that occult Cancers have been many Years in the Body, without doing any conſiderable Injury. *Tulpius*, *Obſerv. Med. Lib.* 1. *Cap.* 7. relates, That a Woman carry'd a Cancer about fifty Years and more, without any great Inconvenience. Being afflicted afterwards with her Huſband's ill Fortune, the Pain and Itching, of which ſhe had hitherto been ſcarce ſenſible, increaſed; and upon the Application of Cauſtics, which was adviſed by an Empiric, the Diſeaſe was converted into a very bad kind of ulcerated Cancer.

Hildanus, *Obſerv. Chirurg.* relates, That a Citizen of *Lauſanne* had a cancerous Tumor, as big as a Hen's Egg, near his Left Breaſt, for many Years. By the Advice of ſome Phyſicians he apply'd to it Plaiſters of Mucilage, Melilot, and the like, with an Intention of gradually mollifying the Tumor: But a Pain and Inflammation ſoon following, he removed the Plaiſters, and mitigated the Symptoms by an Application of Refrigerants. Some time afterwards he again apply'd the Plaiſter, but with the ſame Effect as before; wherefore he abſtain'd from the Uſe of them for the future, and lived a long time afterwards. Hence appears the Truth of that Aphoriſm of *Hippocrates*, quoted before, which determines, that it is better not to meddle with thoſe who are troubled with occult Cancers; becauſe if they are treated with Remedies, they die in a ſhort time; but being left to themſelves, endure the longer; which *Hildanus* confirms by ſeveral Examples.

We cannot expect that an occult Cancer ſhould lie long without giving any Moleſtation, unleſs the Body of the Patient be full of good Humours, or that his Blood, and all his Humours, be of a mild and benign Temperature, as they are in thoſe who enjoy perfect Health: For under any remarkable Predominance of a Cacochymy, by which the Humours degenerate from their natural Temperament into an immoderate Acrimony, as in the acrid Scurvy, a confirmed atrabilious or a hot bilious Temperature, the occult Cancer will ſoon degenerate into an ulcerated one, as was before obſerved.

A beginning Cancer, if ſmall, moveable, ſituated in a proper Place, not adhering by any conſiderable Veſſels, proceeding from an external Cauſe, in a young and otherwiſe ſound Body, and being the only one in the whole Body, is immediately to be extirpated by the actual Cautery, or cut out.

Though it appears from what was ſaid under the preceding Head, that occult Cancers may be ſometimes endur'd for a long time; yet, ſince even a Scirrhus ſtill threatens the Patient with the Fear of a worſe Evil, as was obſerved before, far greater is the Danger of which we ought to be apprehenſive from a Cancer; we may therefore eſtabliſh it as a practical Axiom in Medicine, that all Cancers are to be extirpated, if it may be done with the Safety of the Patient, and without Fear of a Return: For though *Celſus* writes, that no Remedy ever did Good to a Cancer, yet we are convinced, by innumerable Obſervations, that a Cancer may often be ſafely and ſucceſſfully ſeparated from the other Parts by Cutting. But *Celſus*, as we have already obſerved, has given but an obſcure and confuſed Deſcription of a Cancer; and if we conſider his Directions in the Cure of it, we ſhall eaſily ſee the Reaſon why it prov'd unſucceſsful. For he adviſes the immediate Application of Cauſtics; and if by theſe means the Diſorder is leſſen'd, and the Symptoms abated, you may then, he ſays, proceed in the Cure with the Knife and Burning. But it ſufficiently appears, that by this Method the Cancer is extremely irritated before you proceed to its Extirpation; and if we conſider what the other antient Phyſicians have directed, concerning the Deſtroying of a Cancer, the Reaſon will be evident, why the worſt of Events ought to be expected from their Management. Thus we read in *P. Ægineta*, *Lib.* 6. *Cap.* 45. that ſome conſum'd all the corrupt Parts with Cauteries, others cut off the entire Breaſt, and then cauterized the Wound; but he adds, that *Galen* only approved that Section in which the Cancer could entirely be cut out. *Aetius*, *Tetrab.* 4. *Serm.* 4. *Cap.* 45, 46. giving an Account of *Leonidas*'s chirurgical Treatment of a Cancer, ſays, that the ſound Part of the Breaſt is to have an Inciſion made in it, and then to be cauterized, till, by inducing a Cruſt, the Hæmorrhage be ſtopped; ſoon afterwards the Cutting is to be renewed, and then the Cauterizing as before; and thus are we to proceed by alternate Cutting and Cauterizing, till the Cancer be quite conſumed. And when the Work of Amputation is perfectly performed, all the Parts are to be cauterized over again to a Dryneſs; and he ſays, that the firſt Cauterizings are made for the ſake of ſtopping the Blood; but the laſt, with an Intention of conſuming the Reliques of the Diſeaſe. Yet he obſerves, that a Scirrhus may be extirpated by Section alone, without a Cautery; for he believed there was no Danger of an Hæmorrhage in that Caſe, and therefore no need of Burning. But how dangerous this cruel Method of curing a Cancer muſt be, will ſufficiently appear hereafter; and alſo if it be conſider'd, that Convulſions are to be feared at the very Time when the Ulcer is under Repurgation. But when the Cancer is to be deſtroy'd by Section alone, according to the modern Practice, the Cure does not ſeem to carry much Danger in it, provided the Cancer be qualify'd according to the following Conditions:

Firſt, that it be in its Beginning; for the longer it continues, the worſe, every thing conſider'd, muſt be the Event; ſince it is to be feared, that the Cancer has fixed its malignant Roots in the neighbouring Parts underneath.

Secondly, that it be but ſmall; for a large Cancer carries more Danger in the Operation; and the Cure of a great Wound, which muſt then be inflicted, cannot but be difficult; for it frequently happens, that by the copious daily Diſcharge of Pus, the exhauſted Patients fall into a true Maraſmus; or the Pus, continuing too long within a Wound of a conſiderable Compaſs, is reſorb'd into the Blood; by which means a purulent Cacochymy is generated in the Fluids, which often proves mortal.

Again, in the third Place, the Cancer muſt be free and diſengaged, or moveable; for unleſs it can be removed, Root and Branch, at once, the leaſt Reliques of it will ſprout forth anew with more Malignity than ever; and if it be firmly united by Accretion to the ſubjacent Parts, it cannot be entirely taken out. How to know when a Cancer is free and diſengag'd, ſee SCIRRHUS.

Fourthly, it ought to be ſituated in a proper Place, and not united by Accretion to large Veſſels. On this Subject ſee the Article SCIRRHUS: Where alſo it appears how far the Dexterity and Intrepidity of a ſkilful Surgeon will go in the moſt dangerous Caſes; for even ſcirrhous Parotides, and ſubaxillary Glandules, which are ſo much to be dreaded, on account of the Vicinity of very large Veſſels, have been extirpated by a ſkilful Section, with all the Succeſs that could be deſired. However, the worſt of Conſequences are doubtleſs to be apprehended from the Accretion or Growing of a Cancer to large Veſſels; tho' we are of Opinion, that a doubtful Remedy ought to be try'd, if there be but the leaſt Hope of delivering the Patient from this moſt dreadful of all Evils, a Cancer.

A fifth Qualification requir'd in a Cancer, in order to its happy Extirpation, is, that it be produced by an external Cauſe in a young and ſound Body. For where there is a Scirrhus from a latent Diſpoſition, and a Cancer generated of that Scirrhus, it is greatly to be feared, that, after the Extirpation of the Cancer, the ſame Cauſe remaining, another ſhould ariſe; but when, for Inſtance, it owes its Original to a Contuſion of the Breaſt, there is no Fear of its growing again. Since alſo a very good State of Health is required, in order to the Conſolidation of the Wound after Extirpation, it is eaſy to infer how great Reaſon there is to hope for a Cure, when the Operation is performed on a young and healthful Body. But in Perſons of an advanc'd Age, eſpecially the Female Sex, and in atrabilious Temperaments, the Conſtitution is diſpoſed to the Production of Scirrhoſities and Cancers.

Laſtly, the Cancer which is to be extirpated, muſt be the only one in the whole Body; for we learn by Obſervation, that when a Cancer is taken off, if there be but a ſmall Scirrhus in another Part of the Body, it will increaſe in a ſhort time, and degenerate into a Cancer. Therefore we muſt carefully examine all the glandulous Parts of the Body, and find whether they contain any latent Scirrhoſity. And becauſe, by Obſervations made

on

on a Scirrhus, it appears, that Diſorders of this Kind may be latent in the interior Parts of the Body, we are to be no leſs ſolicitous, whether there be any Signs to be diſcover'd, by which we may know, that the internal Parts of the Body are affected with a Scirrhus, or a Cancer. Thus, for Example, they who have almoſt all the Glandules of their Neck affected with the Scrophula, generally labour under the ſame Diſorder in the Glandules of the Meſentery. And ſince there is a ſurpriſing Communication or Correſpondence between the Breaſts and the Womb, before we proceed to the Extirpation of a cancerated Breaſt, we muſt carefully examine, whether there be any Suſpicion of the like Diſorder about the Uterus. For if there be a Senſe of an unuſual Weight about the Hypogaſtrium, or a Pain in thoſe Places; or the Patient be frequently afflicted with a Hæmorrhage of the Uterus, or a Diſtillation of ſanious and acrimonious Matter from the Vagina, or the like Symptoms, it is greatly to be feared, that after Extirpation of the Breaſt, tho' moſt ſucceſsfully perform'd, a worſe Diſeaſe will ſucceed in the room of the other, and infeſt the Uterus.

Emollient, emplaſtic, ſuppurating, acrid, excoriating, veſicating, and cauſtic Applications, convert an occult into an ulcerated Cancer: All theſe are, therefore, to be avoided.

The many fatal Events, which have been known to happen after Application of the like Topics, are a ſufficient Proof that a Cancer can never be cured, but only irritated, by ſuch Remedies; for which Reaſon they are prohibited, by the unanimous Conſent of all prudent Phyſicians and Surgeons, ſince the only Cure for a Cancer is Extirpation. All Emollients, Emplaſtics, and Suppuratives, only diſturb the incorrigible Matter of a Cancer, and diſpoſe it to the worſt ſort of Putrefaction, but can never reduce it to Suppuration. Acrid, excoriating, veſicatory, with actually and potentially cauſtic Applications, diſſolve the Integuments of an occult Cancer, and, in a ſhort time, render it open, and ulcerated, in the worſt manner. Accounts of the ill Effects of ſuch Medicines are given above, and alſo under the Article SCIRRHUS. I ſhall only give here one Example from *Paré, Livre 7. Chap.* 31. A noble Virgin, who was Maid of Honour to the Queen Mother, had a Tumor, of the Size of a Walnut, in her Left Breaſt, which manifeſted the Malignity of its Nature, by the racking Pains it gave her. *Paré* was of Opinion, that a Palliative was the only proper Cure, which was alſo the Sentiment of a very experienced Phyſician, with whom he conſulted. After two Months, the Diſeaſe continuing in the ſame State, the Patient, being diſſatisfy'd, conſulted another Phyſician, who confidently promiſed her a perfect Cure, tho' he was told, that the Diſeaſe was by others accounted incurable. He apply'd heating and mollifying Things to the Tumor, by which, in a ſhort time, the Breaſt was ſwelled to a vaſt Bigneſs, and was at the ſame time affected with a moſt acute Pain, and a violent Inflammation. At length the Tumor broke, and a great Hæmorrhage follow'd; which the Phyſician endeavouring to reſtrain by cauſtic Powders, all the bad Symptoms were extremely exaſperated, and the Patient dy'd in a ſhort time after. How unhappy is the Man whoſe Conſcience reproaches him with having, by his own wilful Raſhneſs, precipitated his Neighbour into the like Deſtruction!

A Cancer which is large, of long ſtanding, adherent, ſituated in any Part inconvenient for Extirpation, growing to or lying upon any conſiderably large Veſſels, proceeding from an internal Cauſe, in a Body which is old, of a bad Habit, and diſpoſed to cancerous Diſorders, and which is accompany'd with Cancers in other Parts, muſt neither be touch'd with the Knife, nor any of the topical Medicines abovementioned.

Here are enumerated all the Marks or Qualifications which forbid the Extirpation of a Cancer, and which are oppoſite to thoſe before recited, and are eaſily underſtood by what was there ſaid. Now it is requir'd, that, in the like Caſes, when Deliberation is taken about extirpating a Cancer, all things be ſeriouſly weighed; for if a Cancer, which may be extirpated, be ſuffer'd to continue, the Health of the Patient is very ill conſulted; and if we remove a Cancer, when it requires to be left at Reſt, all the bad Symptoms are increaſed, and the unfortunate Patient endures the Torment of a cruel Operation to no Purpoſe. Whenever, therefore, a Cancer is to be dreaded, either for the Greatneſs of its Bulk, or the Length of its Continuance, or when it is grown to the adjacent Parts, we can hardly expect a good Event from an Extirpation, which alſo ſufficiently appears to be impoſſible in a Situation which is inacceſſible to the Hands and Inſtruments of the Surgeon. But where the Danger of the Operation is demonſtrated by the Vicinity of large Veſſels, the Cure is not to be attempted, unleſs we could infallibly reſtrain the dreaded Hæmorrhage by Ligatures, or ſome other way. It appears from what has been ſaid above, that no good Event is to be expected from the Extirpation of a Cancer proceeding from internal Cauſes, eſpecially if old Age, or a remarkable bad Habit, obſtruct the Conſolidation of the Wound; for, as it appears by Obſervations on Wounds, the Reſtitution of loſt, and the uniting of ſeparate Subſtances, muſt be effected by good Humours convey'd thro' ſound Veſſels in a due Quantity, and with a proper Force. But when we meet with ſeveral Scirrhuſes, or occult Cancers, in diſtant Places, it is an evident Sign, that the Body is diſpoſed to the Generation of Cancers; and therefore it would ſignify nothing to extirpate a bad Stock in one Place, the Shoots of which appear in other Places, and will ſoon ripen into the ſame Malignity. It muſt, however, be confeſſed, that it may be ſometimes moſt adviſable to extirpate a Cancer, tho' attended with ſome Symptoms which ſeem to prohibit an Extirpation as dangerous, and ſometimes as unſerviceable; for the high Malignity of this Diſorder renders a dubious Remedy preferable to a certain and terrible Death, provided the fainteſt Hopes of a happy Event are left; or, at leaſt, after Extirpation, it may be long hindered from appearing afreſh in other Parts. All theſe Degrees of Danger ought, however, to be laid before the Patient, and his Friends, leſt the Phyſician ſhould either appear to have been ignorant himſelf, or to have impoſed upon thoſe with whom he had to do. Thus, under the Article SCIRRHUS, it is obſerved, that Extirpation has ſucceeded happily in Parts highly dangerous, on account of the Vicinity of large Blood-veſſels. *Hildanus*, as we have related from his Obſervations, extirpated a Breaſt, tho' ſeveral pretty large Scirrhuſes were lodg'd under the Armpit on the ſame Side, which he cut out at the ſame time. 'Tis the Duty of a conſcientious Phyſician, to adviſe nothing to be done to his Patients, but what, were he in the like Circumſtances, he would order to be done to himſelf. When, therefore, after a due Conſideration of the Caſe, 'tis obvious, that the Extirpation is entirely impoſſible, or uſeleſs, if it could be performed, nothing remains but to alleviate the Symptoms, and preſerve the incurable Diſorder in the ſame State as long as poſſible. But the Method of obtaining this End will be laid down in what follows.

Unleſs a Cancer can be entirely extirpated, together with its Roots and Seeds, any Attempt to take it off by Inciſion will exaſperate it, make it recur to the inward Parts, and there generate others, or increaſe thoſe already found.

Any Part of the Subſtance of a Cancer, which grows to the adjacent Parts, and is diſtributed through them, is call'd the Root of the Cancer; for we have already obſerv'd, that an ulcerated Cancer ſends off malignant Roots very deep everywhere, by means of which it adheres ſtrongly to the adjacent Parts. This Name is very properly given to theſe Ramifications of a Cancer; becauſe from theſe, when left, the Diſorder ſoon ſprings up afreſh, as it were, from Roots. *Hildanus*, in *Centur.* 3. *Obſerv.* 84. informs us, that whilſt he was examining a ſcirrhous Tubercle of the Tongue, he, by the Touch, perceiv'd Roots like a large Thread, diſtributed from this Scirrhus thro' the Subſtance of the Tongue. Unleſs, therefore, the Cancer, together with its Roots, can be extirpated, the ſame Diſorder will ſoon ſpring up afreſh. *Ruyſch*, in *Obſervat. Anatom. Chirurg.* gives us an Account of ſuch a bold Cure, in which, after an Extirpation was made, the actual Cautery was apply'd to the Part, in order entirely to deſtroy the Roots of the Cancer. An old Woman had for a long time been afflicted with an indurated malignant Tumor in her Tongue, and, after repeated Inciſions, her Diſorder ſtill return'd. Upon this the celebrated *Ruyſch*, and a ſkilful Surgeon, unanimouſly concluded, that nothing remain'd but again to extirpate the Diſorder, and apply the actual Cautery to the Part. The courageous old Woman eaſily ſubmitted to this cruel Cure, and bore it bravely, almoſt without a Shriek, tho' the Cautery was at different times pretty forcibly apply'd. When the Eſchars were ſeparated, the Place was ſoon brought to a Cicatrix, and the Patient afterwards remain'd ſound.

That Cauſe, whatever it is, which laid the firſt Foundation of the Scirrhus, is call'd the Seed of the Cancer. Now, if either from a Suppreſſion of the Menſes, or of an accuſtomed hæmorrhoidal Diſcharge, an atrabilious Habit of Body, a ſorrowful Life, or an hereditary Taint, the Scirrhus, of which the Cancer is afterwards form'd, draws its firſt Origin, unleſs theſe Diſorders are corrected, the Cancer will in vain be extirpated; ſince whilſt the Cauſe remains, 'tis juſtly to be dreaded, leſt the ſame Diſorder ſhould ſoon appear afreſh in other Parts; and perhaps the Rudiments of the Scirrhus are by this time lodg'd in the internal Parts. But if Scirrhuſes are already form'd in other Parts, upon extirpating the Cancer, they will ſoon be increas'd, and degenerate into a like Malignity, as is evident from many Inſtances. *Tulpius*, in his *Obſervat. Med. Lib.* 1. *Cap.* 46. informs us, that in a Girl, who was ſuffocated in an Hoſpital by ſcirrhous Strumæ of the Neck, he ſaw under each ſtrumous Swelling others of a ſmaller Size ſecretly lodg'd. Twenty of theſe, he ſaid, occurred in one and the ſame Place; and in Figure ſomewhat reſembled the Seeds of Lupins. Theſe latent Seeds of the Strumæ were ſo diſpoſed, that the larger always lay above the leſſer, which were

were gradually ſo diminiſh'd, as ſcarcely to equal the Seed of Seſamum.

The Cauſe of a Cancer muſt be removed, together with the Cancer, or rather before it. And, unleſs a Cancer can be entirely taken away, it muſt be left. A Cancer in the Uterus, Palate, Armpits, or Groin, is incurable (*See* BUBO). A Cancer in the Lips is not cured without Difficulty.

As to the Cauſe of a Cancer; the Reaſon why it ought to be removed with the Cancer itſelf, or rather before it, is obvious from what has been ſaid. The beſt Method is, if the Virulence of the Diſorder will admit of a Delay, to remove the Cauſe of the Cancer by proper Remedies, before the Extirpation is attempted: But, if Circumſtances are ſuch as to render a Delay dangerous, the Cancer may be extirpated; provided there is any Hope, that the cancerous Diſpoſition in the Body may be ſurmounted and corrected.

As to the total Extirpation of a Cancer; it is certain, that the Remains of the extirpated Cancer, tho' very ſmall, will in a ſhort time ſpring up to a like Bulk, and acquire the ſame, and ſometimes a greater, Degree of Malignity. Of this the celebrated *Boerhaave* ſaw a memorable Inſtance in a Lady of Diſtinction, who had a cancerous Breaſt extirpated by a very ſkilful Surgeon. After the Operation, in the Middle of the Wound there appear'd a Mark of a cineritious Colour, and ſcarcely ſo large as the Nail of one's little Finger: But, as this Mark was lodged in the Subſtance of the Pectoral Muſcle, the Surgeon would not venture to cut it out entirely, but thought, by the Uſe of Corroſives, to remove it. The Cure of the Wound ſucceeded ſo well, that all its Surface was almoſt cover'd with a Cicatrix: Upon which the Mark began to riſe in a fungous Maſs, which, with the greateſt Malignity, prey'd upon the adjacent Parts, till the miſerable Patient died. In another Caſe of a like Nature, a more hardy Surgeon, as *Van Swieten* informs us, ventured to cut out the Root of a Cancer left in the Pectoral Muſcle. And, whilſt the Cure ſeem'd to go happily on, the Patient's Jaws, on the fourteenth Day after the Extirpation, began to be contracted; and at laſt became ſo ſtiff, that no Force could draw them aſunder; and, after having in vain try'd the moſt efficacious Medicines, the Patient died convulſed. From theſe Inſtances it is obvious, with how much Care we ought to examine, whether the Cancer is every-where free, and adheres to no Part, before the Extirpation is attempted.

But, in ſome Parts of the Body, the Cure of Cancers is either utterly impoſſible, or highly difficult. It is evident, for Inſtance, that, when Cancers are lodged in the Viſcera, no Cure can be expected, ſince the Surgeon's Hand can have no Acceſs to the Part affected. Cancers of the Uterus, eſpecially of the ulcerated Kind, are alſo generally accounted incurable. *Tulpius*, indeed, in his Obſervations, informs us, that a ſcirrhous Tumor, already degenerating into a cancerous Malignity, was happily extirpated from this Part, as we have before obſerved. But what Surgeon durſt venture on the Extirpation of an exulcerated Cancer from this Organ, ſince it every-where adheres to it with malignant Roots? as the ſame Author, in *Obſerv. Med. Lib.* 3. *Cap.* 34. obſerved in the Carcaſe of a Woman, who died of a Cancer of the Uterus; for a livid and black Tumor, cover'd with Blood and Sanies, was, by membranous Filaments, every-where fix'd to the Uterus. *Aretæus*, *de Cauſ. & Sign. Morbor. diuturn. Lib.* 2. *Cap.* 2. when treating of the Diſorders of the Uterus, makes mention of a cancerous Ulcer in that Part; and informs us, that it proves mortal, after having for a long time afflicted the Patients: "For, ſays "he, a putrid Matter flows from the Ulcer, which is not "tolerable to the Patients themſelves; and the Ulcer is irri-"tated and exaſperated by being touch'd, or by the Applica-"tion of any Medicines whatever." 'Tis obvious, that he here deſcrib'd a true Cancer of the Uterus, tho' he afterwards adds, "But a Cancer is by no means an Ulcer, but a hard in-"corrigible Tumor, which diſtends the whole Uterus." He ſeems to have meant this of an occult Cancer, and to have deſcrib'd an ulcerated one, under the Name of a malignant and corroding Ulcer; for he immediately ſubjoins, "Both theſe "Diſorders are of a cancerous, chronical, and fatal Nature; "but the Ulcer is far worſe, both with reſpect to the Smell, "the Pain, and every other Circumſtance, than the Diſorder "not attended with Exulceration."

As to the Fauces; we have already obſerved, that Scirrhuſes are frequently form'd in thoſe mucous Follicles, which every-where occur in the internal Part of the Mouth, the Fauces, and the Pharynx; becauſe by their means a Mucus, which is viſcid, and from its Nature eaſily inſpiſſated, is ſecreted and collected from the Blood. Beſides, the numerous nervous Papillæ, diſtributed thro' the Surface of theſe Parts, ſometimes degenerates into a malignant cancerous Fungus, as is already obſerved. Thus *Van Swieten* informs us, that he ſaw a great Part of the Palate, and the Whole of its pendulous Veil, become cancerous in an old Man, who, after enduring the higheſt Agonies, died of this Diſorder. When a Cancer has ſpread its Roots deep in the Fauces, 'tis obvious the Diſorder muſt be incurable: But, when it only poſſeſſes a ſmall Part, it may poſſibly be extirpated, if due Care be uſed. In the *Epidemics* of *Hippocrates*, we are inform'd, that a Cancer in the Fauces was cured by the Application of the Cautery.

As to the Palate; the hard and callous Membrane which lines the Palate, as we have now obſerved, ſometimes degenerates into a Cancer, which is generally incurable, unleſs when very ſmall. The Difficulty of the Cure is increaſed, becauſe, when this Membrane is deſtroy'd or corroded, the denudated Bones of the Palate are corrupted; whence the worſt of Symptoms muſt be produced. For this Reaſon *Galen*, when explaining the thirty-eighth Aphoriſm of the fourth Section of *Hippocrates*, which diſcharges Attempts to cure occult Cancers, ſays, "They who cut or cauterize Cancers in the Palate, or "in the Anus, or in the Breaſts of Women, can never bring "the Ulcers to a Cicatrix; but, by the violent Pain of the "Cure, waſte Patients till they die, who, without a Cure, "would have lived longer, and endur'd leſs Pain."

As to the Armpits and Groin; the Vicinity of large Blood-veſſels to theſe Parts renders it almoſt impoſſible to extirpate Cancers from them, without the Danger of a mortal Hæmorrhage. Under the Article SCIRRHUS it is obſerved, that *Hildanus* happily extirpated a ſcirrhous malignant Tumor under the Armpit, after a Pain was perceived in it: But when theſe Diſorders have degenerated into true Cancers, eſpecially of the ulcerated Kind, 'tis ſufficiently evident how dangerous ſuch a Cure would be; ſince the Veſſels about the Cancer are not only varicoſe, but alſo ſince it is greatly to be dreaded, leſt it has already grown to the ſubjacent Veſſels. We may alſo add, that the Taint is often lodged in the adjacent Glands; for which Reaſon, after a dangerous Extirpation, the Diſorder would often appear afreſh.

As to the Difficulty of curing Cancers of the Lips; it frequently happens, that, when the Lips are hurt, thoſe round Bodies, diſperſed thro' their Subſtance, are contuſed: Hence ariſe Scirrhuſes, which often degenerate into the moſt malignant of Cancers. When alſo the tender Membrane, which covers the Lips, is wounded, their nervous Part riſes in cancerous Funguſes: When, therefore, the ſmalleſt Trace of ſuch a Diſorder appears, it is forthwith to be extirpated, either with Corroſives, which Method ſometimes ſucceeds in ſmall Cancers of theſe Parts, or with the Knife, which is far ſafer. So long as Cancers of the Lips have not grown to a great Bulk, they may be ſafely extirpated: But if they are neglected, if the Diſorder is ſuffer'd to ſpread, and has already corroded the whole Lip, and adjacent Parts, it cannot, in this Caſe, be extirpated without great Danger; and, after the Extirpation, a fearful Deformity remains. But it is ſcarce credible, how large Cancers ſkilful Surgeons have ſometimes extirpated from the Lips, and happily cured the Wounds, without leaving any conſiderable Deformity. Thus *Van Swieten* informs us, that he ſaw a Man, two Thirds of whoſe inferior Lip were cut out, and yet a ſufficiently beautiful Cicatrice was form'd on the Wound. He alſo tells us, that in another, who would not ſubmit to an Extirpation, he ſaw the whole Chin gradually corroded, and eaten away, before the Patient died.

In cancerous Tumors of the Lips, Dr. *Harris* recommends a Decoction of Elm-bark, and the Leaves of the Sanicula, to bathe the Part with. He alſo adviſes Turpentine upon a Pledget, apply'd to the Part, till it firſt grows ſofter, and then entirely waſtes.

In caſe, therefore, of a Cancer, which cannot prudently be extirpated, all that can be done is,

Firſt, To keep it quiet.

Secondly, To moderate the Symptoms.

When therefore a Cancer, known by the Signs already enumerated, cannot, by reaſon of the Conditions heretofore ſpecified, be either extirpated by the Knife, or cured by Medicines, the Condition of the Patient is highly miſerable, ſince he lodges a latent Enemy in his Boſom, who, by Cauſes which often no Prudence can prevent, may be eaſily irritated in ſuch a manner as to rage with unrelenting Fury. This fatal Prognoſtic is not, however, to be diſcover'd to the Patient himſelf, but only to his Friends; and the Afflicted himſelf ought to be chear'd with the agreeable Perſuaſion, that the Diſorder, when judiciouſly treated, may be render'd tolerable, till the Patient's Death; for *Galen*, in his Commentary on the thirty-eighth Aphoriſm of the ſixth Section of *Hippocrates*, in which the Cure of an occult Cancer is forbid, excellently obſerves, that we are not to abſtain from ſuch a Cure as mitigates and alleviates the Cancer, but from ſuch Meaſures as have a Tendency to irritate it. The Whole, therefore, that is to be done in this Caſe, is to render the Diſorder tolerable, to prevent its becoming more malignant, and, at the ſame time, to alleviate the Symptoms with which it is attended; the principal of which are Itching, Heat, and Pain;

Pain: But in what Manner, and by what Remedies, theſe Intentions are to be obtain'd, will be ſpecified in what follows.

Such a Cancer is kept quiet,

Firſt, By defending the Part from all external Injuries by Applications, wherein Lead and Narcotics are Ingredients.

We have already obſerved, that, whilſt there is an Attrition of the adjacent Veſſels againſt the hard Margins of the Scirrhus, by an Increaſe of the Motion of the Humours, an Inflammation is produced, and a Scirrhus, which was before benign, converted into a Cancer: And, from what has already been ſaid, 'tis alſo obvious, that the Malignity of a Cancer may be increaſed by the ſame Cauſe; ſo that Reſt muſt, in this Caſe, be abſolutely neceſſary. Abſolute Reſt, indeed, only obtains in a lifeleſs Carcaſe; but a calm and moderate Circulation of the moſt laudable Humours, thro' pervious Veſſels, is only here underſtood; that there may be no Irritation of the Cancer, either from an Increaſe of the Motion, or a Conveyance of acrid Subſtances to the Parts.

How prejudicial any external Irritation is to Scirrhuſes, and the Cancers ariſing from them, we have already obſerved: The Part affected is, therefore, carefully to be defended from the Attrition of the Clothes; and, as is heretofore taken Notice of, great Care is to be had, that occult Cancers of the Breaſts be not too violently preſs'd by tight Stays, or irritated by the powerful Action of the Pectoral Muſcle, which lies under them: Hence public Alms can never be better beſtow'd than in ſupporting thoſe Women, who, tho' labouring under occult Cancers, are yet reduced to a Neceſſity of working for a Livelihood. The beſt Method that can be taken is to cover the Part affected with a Piece of ſoft Leather, in order to prevent the Attrition of the Clothes. Plaiſters are alſo recommended for the ſame Purpoſe; but they ought to be of ſuch a Nature as neither to prove hurtful by ſoftening the Integuments too much, nor moving the Matter of the Cancer. In theſe Caſes, therefore, Plaiſters, in which Lead is an Ingredient, are only proper; and theſe too muſt be prepar'd in ſuch a manner, as not to adhere firmly to the Parts to which they ſhall be apply'd; for, in that Caſe, it is to be apprehended, that the exhaling Liquid, pent up by an adheſive Plaiſter, ſhould macerate the Integuments, and ſoon produce a Rupture in them. With theſe Narcotics are alſo generally mix'd, which, by their Efficacy, a little ſooth the eaſily irritated Nerves diſperſed thro' the Cancer and its Integuments, and thus allay the Itching, and alleviate the lancinating Pains. The *Emplaſtrum Diapompholygos* of the Shops, prepar'd of the Oil of Nightſhade, and Calx of Lead, is of ſingular Service in Caſes of this Nature.

Take of the pure and newly expreſs'd Juices of the Leaves of Henbane, Garden-poppy, and Water-hemlock, each four Ounces: Boil theſe over a gentle Fire; inſpiſſate; and then mix with them, of white Wax, eight Ounces; and of Oil of Roſes, one Ounce. Make up into a Plaiſter. Or,

Take of Sugar of Lead, Ceruſs, and an Amalgama of Quick-ſilver and Lead, each two Drams; of white Wax, four Ounces; of the Oil of Roſes, three Drams. Make up into a Plaiſter. *Boerhaave Mat. Med.*

The following Mixture has been much eſteem'd by ſome Practitioners, for quieting an occult Cancer, and preventing it from ulcerating.

Take four Ounces of Lapis Calaminaris, calcin'd in a Charcoal Fire, and quench'd three times in a Pint of White-wine; one Ounce of white Tutty, calcin'd in a Crucible, and quench'd three times in a Pint of red Roſe-water; then the Lapis Calaminaris and Tutty are to be powder'd ſeparately, and put into their reſpective Liquors, which muſt be mix'd.

Cloths, impregnated with this Mixture, are to be worn perpetually on the Part affected, being frequently renew'd.

Dr. *Harris* approves of the red *Lead Plaiſter* above all others, and ſays, Dr. *Harvey* had a great Opinion of it; and that he has uſed this Plaiſter in Pains of the Breaſt, which have threaten'd a Cancer, with great Succeſs.

The Ochre which is left in the Chanels of ſome mineral Springs, and the Mud of them, are recommended, as doing great Service, as Topics in Cancers.

Secondly, By diminiſhing, correcting, or averting the known Cauſe, which is done by lenient Purges of mild Vegetables, and Mercurials, exhibited in ſmall and frequent Doſes.

For all the Cauſes already enumerated, ſince they change a Scirrhus into a Cancer, may, if they continue to act, or are increaſed, change an occult into an ulcerated Cancer. Theſe Cauſes, therefore, which are known by their Signs, ought to be removed, or at leaſt diminiſh'd; and, if this cannot be obtain'd, their Action ought to be averted from the Part affected as much as is poſſible. Nothing is more prejudicial to a Cancer than the Acrimony of the Humours, ſince by its means a benign Scirrhus may ſoon degenerate into a Cancer, as we have before obſerved. We are, therefore, diligently to inquire, whether there is an Acrimony of the Humours, and of what Kind it may poſſibly be; after which the Acrimony ought to be corrected by Medicines oppoſite to its particular Nature; for different Remedies are requir'd for correcting acid, muriatic, putrid, rancid, and oleous Acrimonies. To avert the morbid Matter lodg'd in the Humours, gentle Purgatives are of excellent Service, and ſuch as, without exciting violent Commotions in the Body, attenuate and evacuate the Humours. The mildeſt mercurial Preparations, mix'd with Purgatives, are principally recommended in theſe Caſes, on account of their reſolvent Quality; but we muſt take care, leſt, by an imprudent Uſe of them, we excite a Salivation, which, in this Caſe, would prove prejudicial. If any Signs of Putrefaction are diſcover'd, as it often happens in a Scurvy, a Decoction of Tamarinds, with Sena-leaves, Cremor, and Cryſtals of Tartar, and other Things of a like Nature, are beneficial. But that the Commotions excited in the Body, even by gentle Purgatives, may be allay'd, it is proper to give a mild Opiate, after the Operation of the Purgatives is at an End. But how great the Uſe of Purgatives is, in preſerving occult Cancers from degenerating into ulcerated ones, we learn from *Galen*, who, in *Libell. quos decet purgare, &c.* tells us, that about the Beginning of the Spring he, every Year, purg'd a certain Woman pretty ſeverely, who had a Diſpoſition or Tendency to a Cancer in her Breaſt, with a Medicine which purg'd black Bile; and he obſerves, that, by an Omiſſion of the uſual Purgation, a Pain aroſe pretty deep in her Breaſt; which was a certain Sign, that the Malignity of the cancerous Humour was then increaſed. *Boerhaave*, in a Cancer, recommends the following Preparations:

Take of Reſin of Jalap, ſix Grains; Diagrydium, ſeven Grains; unwaſh'd diaphoretic Antimony, twenty-four Grains. Make up into a Powder.

Take of Mercurius Dulcis, fifteen Grains; of Diagrydium, twelve Grains. Make into a Powder, to be taken once a Week.

Galen recommends Purging, with Epithymum in Whey, or his own Hiera, which *Aetius* calls *Hiera Galeni*. *Actuarius* commends the Hiera Lagodii for purging off the melancholic Humours. *Harris* ſays the *Confect. Hamec.* is excellent for this Purpoſe.

Thirdly, By diluting, mildly aperient, and ſubalcaleſcent Internals.

The whole Intention is, in this Caſe, to procure a calm and equable Circulation of the Humours, which is obtain'd by diluting them more, and rendering the Veſſels pervious. There are, then, Medicines which dilute and attenuate, without, at the ſame time, increaſing the Motion of the Humours: But Water alone is almoſt the only Fluid which dilutes, as is obſerved under the Article OBSTRUCTIO. To this Water muſt, at the ſame time, be added ſuch Subſtances as are poſſeſs'd of an attenuating Quality, and by their mild Nature correct all Acrimony. This Intention is therefore excellently anſwer'd by Decoctions of the Roots of Burdock, China, Vipers-graſs, Sarſaparilla, and Dogs-graſs; as alſo by Infuſions of Agrimony, Betony, the Flowers of Marſhmallows, Mallows, Mullein, Elder, and red Poppies; for thus a diluting Vehicle is convey'd to the Blood. The Humours are reſolved, and their Acrimony is corrected, by attenuating and gently obtunding Ingredients; and whatever is noxious is carried off by Urine, or a Diaphoreſis: Hence theſe Medicines are, by Phyſicians, call'd Cleanſers of the Blood. But tho' Salts bear a great Character in the Liſt of attenuating Medicines, yet thoſe of the more acrid Kind are not proper in theſe Caſes. Thoſe of a mild and ſubalcaline Nature are only to be exhibited, ſuch as ſtibiated Nitre, and Sal Polychreſton; in which the fix'd Nitre, at that time alcaline, is ſo chang'd by the acid Vapour of the kindled Sulphur, as to become leſs acrid, tho' it ſtill continues to partake of the Nature of an Alcali: Hence theſe Salts are then call'd ſubalcaline Salts. Theſe are principally choſen, becauſe, in the Cure of a Scirrhus, alcaline Salts, corrected by the oleous Acid of *Rheniſh* Wine, have ſo often proved beneficial. But ſince there are, in the Shops, a ſufficient Number of Simples, whoſe mild attenuating Quality is well enough known, the Forms may be varied at Pleaſure; leſt the continued Uſe of a Remedy ſhould create a Nauſea in the Patient, whilſt, in this Caſe, the curatory Indication continues long the ſame.

The Remedies ſpecified in *Boerhaave's Mat. Medica*, are,

Decoctions of Burdock,
China-root,
Fennel,
Parſley,
Sarſaparilla, and
Vipers-graſs. Or,

Take of unwaſh'd diaphoretic Antimony, eight Grains; Sperma Ceti, one Dram: Mix up into a Powder, to be divided into two Doſes, one of which is to be taken in the Morning, and the other at Night.

Venice Soap, diſſolved in any proper Menſtruum, or made into Pills, and given to a Dram for a Doſe, twice a Day, is recommended as a Specific in the Cancer. *Turner's Surgery.*

In this alſo the Leaves of the Solanum Lethiferum, as a Topic, are accounted Specifics.

Dr. *Stahl*, firſt Phyſician to the King of *Pruſſia*, recommends the Eryſimum, or Verbena Fœmina, as a good Medicine for ſcirrho-cancrous Tumors, both when taken internally, and apply'd to the Tumor. Mr. *Bingert*, Surgeon at *Berlin*, communicated two Caſes, wherein its good Effects have appear'd. *Act. Medic. Berolin. Dec.* 3. *Vol.* 1.

That Part of a Walnut, that lies betwixt the Lobes of the Kernels, is ſaid to cure, or at leaſt to prevent Cancers. It muſt be dried and powder'd.

An exact Milk-diet always relieves, and ſometimes cures Cancers. *Wynter's Cyclus Metaſyncriticus.*

Dr. *Harris* ſays he cured a Lady of a Cancer in a few Months, by directing a Powder of Lignum Sanctum, Sarſaparilla, and yellow Saunders, to be taken three times a Day, in common Water. By theſe means the Pain, Tumor, and livid Colour vaniſh'd, and the Cancer entirely diſappear'd. She uſed no Topics but Flannel.

Fourthly, By avoiding whatever may act as a Cauſe, whether taken internally, or apply'd externally.

An Increaſe of Motion in the Humours of the whole Body, or of the Part affected, any Acrimony of the Juices, any Irritation, are, as we have already obſerved, the principal Cauſes which change a Scirrhus into a Cancer. All theſe Things are, therefore, carefully to be guarded again, both by a proper Choice of Diet, and ſuitable internal and external Remedies. And as an atrabilious Viſcidity of Humours not only lays a Foundation for the Generation of Scirrhuſes, but alſo adds Malignity to them, when form'd, we muſt take particular Care to abſtain from ſuch Things in Food as may either produce or increaſe this atrabilious Viſcidity of the Juices. The Diet muſt, therefore, be ſuch as under the Article SCIRRHUS is directed for an incurable Scirrhus. And becauſe, as we have already obſerved, violent Paſſions, eſpecially Sorrow, are, in theſe Caſes, ſo prejudicial, the Patients are to be chear'd with agreeable Hopes, that they may not be rack'd with the conſtant Dread of imminent Danger. If theſe Meaſures are duly obſerved, this dreadful Calamity may be alleviated, and kept under not only for ſome Years, but often till old Age; when, by the common Fate of Humanity, or the Attack of other Diſeaſes, the miſerable Patients are cut off, and ſnatch'd from the Pains which daily threaten'd them. This is all which, in this Diſorder, can be expected from any Art hitherto known.

The Symptoms are moderated by the ſame Means by which the Cancer is kept quiet, except that Opiates are requir'd in caſe of Pain.

For all the Symptoms, which happen in an occult Cancer, depend only on an Increaſe of its Malignity. If, therefore, by the Method above deſcrib'd, the Cancer is preſerv'd in the ſame State, the preſent Symptoms will be alleviated, and future ones prevented. The principal Symptom is Pain, ariſing from a Dilaceration of the Integuments, in conſequence of an Increaſe of the Tumor; or from the Acrimony of the Cancer corroding the live Nerves diſtributed thro' its Subſtance. We cannot often remove the Cauſe of the Pain, in which Caſe nothing remains to be done, but, by the Uſe of Narcotics, ſo to obtund the common Senſory as to remove the Senſe of Pain, tho' its Cauſe continues, and guard againſt ſome Effects of Pain, which, in this Caſe, are to be dreaded; for, unleſs this Method is purſued, the Patient will be ſeiz'd with Watchings, Reſtleſſneſs, Anxiety, and a Fever, and all the Symptoms will ſoon be increaſed.

An exulcerated Cancer, which will not admit of Extirpation, may frequently be mitigated, by keeping it clean, by applying to it extremely mild Preparations of Lead, and by the Methods above ſpecified.

When a Cancer, upon breaking the Integuments, becomes exulcerated, it affords a melancholy Proſpect to Phyſicians, and is often ſo terrible an Appearance, that I have ſeen, ſays *Van Swieten*, old and intrepid Surgeons, who could ſcarcely look upon it without Tears; for the highly fetid Smell, the retorrid Lips, and the abſolute Impoſſibility of a Cure, are Circumſtances which move even thoſe, who, in performing the moſt cruel Operations, are untouch'd with the agonizing Shrieks of the Patients. However, tho' I am of Opinion, that no one would willingly chuſe to be a Spectator of theſe Calamities, yet that Love of our Neighbour, which is interwoven with our Frame, ought to prompt us in our Endeavours to alleviate an incurable Diſorder, and not permit us to render the Miſerable ſtill more ſo, by abandoning them.

An highly acrid Ichor, which becomes daily more malignant, and which, as has already been obſerved from *Aetius*, is more deleterious than the Poiſon of venomous Animals, corrodes the painful Surface of the Cancer, if it is long left upon it; and, diffuſing itſelf thence, preys upon all the adjacent Parts. For this Reaſon the Part affected ought to be cleanſed ſeveral times a Day; and the adjacent Parts defended either with ſoft Ointments, or Plaiſters in which Lead is an Ingredient, leſt they ſhould be corroded by the diſcharged Sanies. The beſt Method is, four times at leaſt in twenty-four Hours, to abſorb the collected Poiſon with Pledgets, gently warm'd: Then let the whole Surface of the exulcerated Cancer be cover'd with the like Pledgets, ſlightly ſpread over with the *Unguentum Nutritum*, compoſed of Vinegar of Litharge and Oil, mix'd together; for tho' dry Pledgets would beſt imbibe the diſcharged Ichor, yet they would adhere to the Ulcer, and, by being afterwards pull'd off, excite the moſt intenſe Pain. Thus the free Acceſs of the Air is prevented, and the Parts are hinder'd from becoming dry; and the Strength of the Vinegar reſiſts Putrefaction, whilſt its Acrimony is corrected by the Addition of the Lead. Pinguious Subſtances are obſerved to be prejudicial, ſince they block up the Pores of the Ulcer, and by that means prevent the Diſcharge of the Sanies. Over theſe Pledgets we are to apply a Plaiſter of the *Emplaſtrum Diapompholygos*, with a large Number of Holes cut in it, that the Sanies may be freely diſcharg'd. Over theſe Holes dry Lint is to be apply'd, in order to imbibe the diſcharg'd Ichor. Theſe Dreſſings are to be ſecured with a gently apply'd Bandage, ſince a ſtrong Preſſure, on the Part affected, would immediately exaſperate all the Symptoms.

But, as a violent Putrefaction generally accompanies an exulcerated Cancer, this is alſo to be prevented as much as poſſible. Vinegar, Sea-ſalt, and Sal Gemmæ, efficaciouſly correct every Kind of Putrefaction; but, at the ſame time, an ulcerated Cancer is highly irritated by all acrid Subſtances. *Hildanus*, in *Obſervat. Chirurg. Cent.* 3. *Obſerv.* 86. informs us, that a Surgeon apply'd to a cancerous Breaſt *Unguentum Ægyptiacum*, in order to correct the fetid Smell, and check the fungous Luxuriance of the Cancer; but the Diſorder was by that means ſo irritated, that, in a ſhort time, the whole Breaſt was corroded to the very Ribs: Hence 'tis evident, how great Prudence and Circumſpection are neceſſary in Caſes of this Nature. But all theſe Medicines are to be apply'd ſo weak to an ulcerated Cancer, as not to prove prejudicial by their Acrimony. Vinegar, diluted with twenty times the Quantity of Water, with an Addition of a ſmall Quantity of Sea-ſalt, may be endur'd by the Patient; and it will be of ſingular Service to waſh the whole Surface of the Part affected with ſuch a Liquor, tepid, every time the Cancer is cleanſed. Since Spirit of Sea-ſalt ſo powerfully reſiſts every Kind of Putrefaction, it will, in this Caſe, be of great Uſe, provided it be diluted with ſo large a Quantity of Water, that it will ſcarce create any Pain when dropt into the Eye. *Van Swieten* informs us, that, by the Uſe of this Medicine, he preſerved an ulcerated Cancer, in the Breaſt of a poor Woman, in other reſpects of a ſound Conſtitution, from degenerating into a worſe State, for fifteen Months; and that, in the Margins, he ſaw ſome Traces of a Suppuration, by which ſome Part of the fungous Maſs, being ſeparated, fell off; whilſt at the ſame time the Bottom of the Ulcer appear'd ſufficiently clean: But his great Hopes were afterwards diſappointed, whilſt, the Malignity being increaſed, he could no longer check the Putrefaction by this mild Remedy; and the Diſorder was forthwith exaſperated by more acrid Applications; upon which the poor Woman died, after having been afflicted with an ulcerated Cancer for two Years.

Hildanus, in his *Obſervat.* ingenuouſly confeſſes, that he was deceiv'd whilſt treating an ulcerated Cancer of the Tongue with various Remedies; the Cure was carried on with ſuch Succeſs, that the Diſorder was not only daily alleviated, but alſo the whole Tumor diſappeared after a plentiful Hæmorrhage, and a copious Diſcharge of a cadaverous Sanies. The Malignity being removed, the Ulcer diſcharged a laudable Sanies, and the Fleſh was gradually growing up, not of a livid Colour, but ſound and reddiſh; ſo that the Place ſeemed almoſt covered with a Cicatrix, a ſmall Fiſſure being only left. When he thought every thing was now ſafe, a ſcrophulous Tumor, lodged under the inferior Jaw, becoming daily larger, communicated a freſh Taint to the Tongue, which in a few Days ſwell'd ſo as not only to fill the whole Cavity of the Mouth, but alſo to hang out beyond the Teeth; ſo that *Hildanus*, before the Patient's Death,

Death, ſaw the Tongue miſerably corroded, and the ſuperior join'd to the inferior Teeth. Theſe lamentable Caſes inform us, how terrible a Diſorder an ulcerated Cancer is, ſince, after ſo ſo fallacious a Truce, it often rages with redoubled Fury. Perhaps, from Inſtances of this Nature, ſome faint Hopes may be conceived, that the Separation of a Cancer from the ſound Parts is not abſolutely impoſſible; tho' the Methods, and various Medicines, by which this Intention is anſwered, are hitherto unknown. How juſtly would the Man be celebrated, who ſhould diſcover this Method! but how juſtly would he deſerve Puniſhment, if, from mercenary Views, he ſhould conceal it from the World!

To theſe Medicines which reſiſt Putrefaction, we may very properly add ſuch as, by their narcotic Quality, are able to mitigate the burning Pain, even when apply'd externally. For this Purpoſe *Galen*, in *Meth. Med. Lib.* 2. *Cap.* 2. recommends the Juice of Nightſhade; others extol Hemlock and Waterhemlock. *Paulus Ægineta*, in *Lib.* 4. *Cap.* 26. for removing the Pain of ulcerated Cancers, orders a double Linen Cloth, ſoak'd in the Juice of Nightſhade, to be apply'd to the Part affected, and ſoft Wool, dipt in the ſame Juice, to be laid over it, taking care that they do not become dry. Various Fomentations, of the like Intention, may be prepared of the Leaves of Henbane, Hound's-tongue, and Poppies, infuſed in Water, with an Addition of Vinegar and Salt, tho' in a ſmall Quantity, leſt by their Acrimony they ſhould augment the Pain, and exaſperate the Diſorder, which is ſo eaſily irritated. With the ſame Intention a few Grains of Opium may be mix'd with theſe Fomentations. With reſpect to Foods, the ſofteſt Pot-herbs are only proper, Fleſh-broths, and Preparations of Milk; but all ſuch Subſtances as are of difficult Digeſtion, or may prove hurtful by their Acrimony, are to be abſtain'd from, as has been already obſerv'd. The liberal Uſe of the Infuſion of the Leaves of Elder and wild Poppies is generally highly beneficial.

Heiſter, in an open or exulcerated Cancer, recommends as Applications, Oil of Myrrh per Deliquium, or Eſſence of Myrrh with Eſſence of Amber, or Lime-water, either alone or with a ſmall Quantity of Sugar of Lead. Or,

Take of the Vinegar of Litharge, an Ounce and an half; and of the Oil of Roſes or Nightſhade, one Ounce: Mix up into an Ointment, in a Leaden or Glaſs Mortar.

Or,

Take of the Waters of Roſes, Elder-flowers, and wild Poppies, each two Ounces; of the Sugar of Lead, and Eſſence of Opium, each one Ounce; and of the Spiritus Vini Theriacalis, two Ounces: Mix all together.

Or,

Take of the Waters of Frogs-ſpawn and Nightſhade, each three Ounces; of calcin'd Lead, one Ounce; and of the Sugar of Lead, half an Ounce: Mix all together.

Inſtead of theſe we may alſo uſe ſome vulnerary Decoction, prepared of Horehound, Agrimony, and Paul's Betony, or the Juices of Nightſhade and Plaintain; for at every Dreſſing the Cancer may commodiouſly be cleanſed with theſe, and Lint dipt in them may be laid over the Dreſſings; but when the Pains are very intenſe, a larger Quantity of Opium, or of the Eſſence of Opium, is to be mix'd with them; or pure Eſſence of Opium, laid on Lint, may be apply'd to the Part affected, ſince, in ſome Caſes, the Pains cannot be alleviated by any other Method. For ſoothing the Pain of the Wound more effectually, we muſt prepare or dilute the Eſſence of Opium, not with Spirit of Wine, but rather with proper diſtil'd Waters, ſuch as thoſe of Nightſhade and the Flowers of wild Poppies. *Dionis* orders a Piece of raw Veal to be apply'd to the Part affected. The ſprinkling dry Powders upon Cancers is found to be a Piece of Practice not ſo advantageous as in ſome other Ulcers; but calcin'd Lead apply'd to the Part, with Mucilage of Linſeed, or of Flea-bane, ſurpriſingly contributes to mitigate the Pain. Tho', in the Application of each of theſe, a grateful Variation were to be deſired, yet the Phyſician is principally to exhibit ſuch as are beſt accommodated to the State and Condition of the Patient. The *Aqua Sclopetaria*, or Eau d' Arquebuſade, diſtil'd rather from Nightſhade-water than Wine, and apply'd warm to the Part affected, is alſo of ſingular Service in anſwering this Intention.

Before the Amputation of a Cancer is perform'd, the Body muſt be prepar'd by a proper Diet, and Medicines which are ſtrengthening, and oppoſite to the Cauſe of the Cancer.

If an ulcerated Cancer is lodg'd in ſuch a Part of the Body that the Surgeon's Hands can have Acceſs to it; if it has not as yet grown to the adjacent Parts; if in other Parts there are not Scirrhuſes found, which cannot be extirpated; and if there is no Suſpicion, that the like Diſorder lies concealed in the internal Parts of the Body; it is, in this Caſe, to be extirpated as ſoon as is poſſible, leſt, by being ſuffered to continue, its Malignity ſhould be increaſed, or the adjacent Glands affected. But, in extirpating a Cancer, the following Cautions are to be obſerv'd:

Since this is often a highly cruel Operation, and ſince, after the Extirpation, a pretty broad Wound ſometimes remains, it is proper, before the Operation, to recruit the Body by mild balſamic Aliments, and to reſtore the Strength which is impair'd with Pain, Fear, and Watchings, by grateful Cordials, which, at the ſame time, do not excite violent Commotions; for, by this means, the Conſolidation of the Wound made will afterwards ſucceed more happily. We muſt alſo remember, that ſuch things are to be exhibited as are oppoſite to the known Cauſe of the Cancer: if, for Inſtance, a putrid Scurvy, predominating in the Body, has chang'd a benign Scirrhus into an ulcerated Cancer, all farinaceous Subſtances, ſoft ripe Fruits, or ſuch as are gently acid, are ſerviceable. If the Diſorder proceeds from an atrabilious Habit, Honey and the Juices of Graſſes are proper, in Conjunction with the former; but if the Symptoms inform us, that an auſtere Acid predominates in the Body, Fleſh-broths and ſoft pinguious Subſtances are to be exhibited. But when the Cancer, from its own Nature, tends to a violent Putrefaction, Aceſcents alone are in this Caſe generally exhibited. But the Virulence of the Diſorder is often ſo great, that there is not a proper Time allow'd for correcting the known Acrimony of the Humours before the Extirpation. Since 'tis to be apprehended, that the ulcerated Cancer may affect the adjacent Parts, or ſpread its Roots deep, and thus render the Extirpation impracticable; in this Caſe it is adviſeable to cut out the Cancer immediately, and afterwards, by proper Food, and well-choſen Remedies, to correct the known Cacochymy of the Humours.

As the various Methods of amputating a Cancer are deſcrib'd under the Article AMPUTATIO, I ſhall only here obſerve, that 'tis *Boerhaave*'s Advice to dreſs the Part, after Amputation, but ſeldom, and to prevent the Bandage from preſſing too forcibly upon it, taking care firſt to evacuate prudently the neighbouring Veſſels of their Blood.

Since the Blood-veſſels adjacent to the Cancer are generally tumid and diſtended with black Blood, as we have already obſerv'd, it ſeems proper, after the Extirpation, to permit this Blood, which in ſome Caſes has ſtagnated long in the Veſſels, to be freely diſcharged, and not immediately to ſtop the Hæmorrhage; for 'tis juſtly to be dreaded, leſt this Blood, lodged ſo near the Cancer, has contracted ſomething of a malignant Nature, by which the like Diſorder may again be produc'd in other Parts of the Body; for it has been already obſerv'd, that an ulcerated Cancer, by propagating the Contagion to the communicating Glands, excites occult Cancers; nor, on theſe Occaſions, will the Patients ſuſtain any Injury, though ſome Ounces of Blood ſhould be diſcharged. *Paré, Lib.* 7. *Cap.* 31. for the ſake of Caution, orders the varicoſe Veins diſtended with black Blood to be every-where preſſed, that they may be entirely evacuated. Then he uſed the actual Cautery, partly with a View to ſtop the Hæmorrhage, and partly in order to deſtroy the latent Remains of the Diſorder, if there ſhould happen to be any. This cruel Method of ſtopping the Hæmorrhage by Cauteries is almoſt out of Date at preſent, ſince the ſame Intention may be ſafely anſwer'd by milder Remedies; and, if the Cancer is entirely extirpated, there is no Neceſſity for cauterizing the crude Wound in order to remove its Remains. We have, however, before obſerved, that the celebrated *Ruyſch* extirpated a Cancer of the Tongue, after it had appeared a ſecond time, and cauterized the Part, with Succeſs.

Upon the Extirpation of the Cancer the Wound is crude, and pretty broad, if the Cancer has been large, and the whole Integuments cut off along with it; but if the Extirpation has been made after laying back the Integuments, the Wound will be ſmaller, and ſooner cured, as is obſerv'd under the Article SCIRRHUS. 'Tis proper to dreſs the Part ſeldom, leſt the neceſſary Nouriſhment of the Body ſhould be ſubtracted by too great a Diſcharge, and the Patients thus die of a Maraſmus. We muſt alſo take care, leſt the Pus, being too long left on the Surface of ſo large a Wound, ſhould be reabſorb'd by the minute Veins, and thus contaminate the Blood with a purulent Cacochymy, whence the worſt of Symptoms would be produced afreſh. But, as by this Method much of the Subſtance of the Body is loſt, all thoſe Cautions are to be obſerved which are proper in Wounds with Loſs of Subſtance. See the Article VULNUS. But, when the Wound is dreſs'd, a mild and gentle Cleanſing of the Part is neceſſary, leſt, by rough handling, the tender Pulp of the ſprouting Veſſels ſhould be deſtroy'd, as is alſo obſerved under the Article VULNUS.

After the Extirpation of a Cancer by Amputation, the Patient muſt perſiſt, for a long time, in the Uſe of the Diet and Medicines which are proper in a preſent Cancer.

Since nothing can happen either more diſgraceful to the Phyſicians, or more terrible and afflicting to Patients, than that, after ſubmitting to a cruel Operation, the ſame Diſorder ſhould again appear in other Parts of the Body; the Patients are, therefore,

therefore, long to perſiſt in the Uſe of the ſame Aliments and Medicines as are known to be oppoſite to the Cauſes of the Cancer, eſpecially if theſe are internal; for when a Cancer is produced in a ſound Body by an external Cauſe, ſuch as a Contuſion, for Inſtance, after its Extirpation there is hardly any Danger of its appearing afreſh. But, even in this Caſe, a rigid Care is preferable to a ſupine Negligence; and Patients, who have once felt the Smart of this Diſorder, are eaſily prevailed upon to obey the Directions of the Phyſician. The Uſe of all thoſe things already mentioned is, therefore, long to be perſiſted in.

From what has been ſaid under this Article, it evidently appears, that very great Diſorders may ſometimes ariſe from Cancers, when ſituated in a Part where they cannot be extirpated.

Since, from what has been ſaid, it is obvious, that Scirrhuſes and Cancers are ſometimes found in the internal Parts of the Body, it is evident, that dreadful Symptoms muſt be produced, whilſt a corroding Sanies flows from the cancerous Ulcer, and preys upon the Viſcera. Many, and thoſe highly obſtinate, chronical Diſorders draw their Origins from Scirrhuſes of the Viſcera; and it is evident, from Inſtances related under this Article, and the Article SCIRRHUS, that intenſe Pains, ſurpriſing Corroſions of the Viſcera, and, after the moſt cruel Torments, ſudden Death, have been produc'd by a Cancer preying upon the internal Parts of the Body.

CARDAMANTICE. The ſame as CARDAMINE, which ſee.

CARDAMELEUM, *καρδάμηλον*. The Name of a Medicine mention'd by *Galen*, *C. M. P. G. Lib.* 7. *Cap.* 7.

CARDAMINDUM. See ACRIVIOLA MAXIMA ODORATA.

This is a ſmall tender Plant, growing about a Foot high, having its lower Leaves pinnated, each Leaf conſiſting of four or five Pair of ſmall roundiſh Pinnæ, not always ſet directly oppoſite, having one ſingle, that at the End larger than the reſt. The Stalk is ſmooth and round, bearing Leaves which are leſs, and have narrower Pinnæ; the Flowers grow ſeveral together at the Top, each conſiſting of four roundiſh Leaves, of a white Colour, or, in ſome Plants, having a Daſh of Purple, with darker Veins running thro' them. The Seed is ſmall and reddiſh, growing in long ſlender Pods. The Root is ſmall and fibrous. It grows every-where in the Meadows, and flowers in *April*.

This Plant, as it ſomewhat reſembles Water-creſs, ſo it agrees with it in its Qualities, being heating and warming, and good for the Scurvy; and, where Water-creſſes cannot be had, may ſupply their Place. It is ſeldom us'd in the Shops. *Miller's Bot. Off.*

CARDAMOMUM. Cardamums.

The beſt Cardamums are imported from *Comagene*, *Armenia*, and the *Boſphorus*: They grow alſo in *India* and *Arabia*. Chuſe what is full, cloſe, and difficult to be broken. What has not theſe Properties, is ſtale and decay'd. It ought alſo to have a piercing Smell, with an acrid and bitteriſh Taſte.

They are of a heating Quality; drank in Water, they are of Service in the Epilepſy, Cough, Sciatica, Palſey, Ruptures; Convulſions, and Gripes, and expel the broad Worm; taken in Wine, they are effectual in Diſorders of the Kidneys, and Difficulty of Urine; and are a Remedy againſt the Poiſon of the Scorpion, and all other venomous Creatures; a Dram, taken with the Bark of the Root of the Bay-tree, breaks the Stone; us'd as a Suffumigation, they deſtroy the Fœtus; and, rub'd on the Parts with Vinegar, they cure the Pſora. They are a common Ingredient in Ointments and Antidotes, and ſerve to inſpiſſate them. *Dioſc. Lib.* 1. *Cap.* 5.

We have three ſorts of Seeds in the Shops called by this Name. The firſt is, The

CARDAMOMUM MAXIMUM.

Grana Paradiſi, Offic. Ger. Emac. 1542. *Grana Paradiſi Officinarum*, C. B. Pin. 413. *Cardamomum majus*, Barr. Icon. 571. Obſ. 1394. Matth. Valg. 27. *Cardamomum Arabum majus*, Ger. 1358. *Cardamomum, Granum Paradiſi, Melleguetta*, Chab. 128. *Cardamomi genus maximum, Grana Paradiſi ſive Melleguetta*, J. B. 2. 204. *Melleguetta*, Jonſ. D. *Melleguetta ſive Cardamomum maximum, & Grana Paradiſi*, Park. Theat. 1576. *Melleguetta, Grana Paradiſi Officinarum*, Raii Hiſt. 2. 1205. GRAINS OF PARADISE. *Dale.*

Theſe are ſquariſh, corner'd, reddiſh-brown Grains, white within, of a hot biting Taſte, but not ſo aromatic as the Cardamums. They grow in roundiſh Pods, in the Shape of an unripe Fig, and come from *Guinea*; but we are ignorant of the Plant they grow upon.

They are hot and drying, warm the Stomach and Bowels, help the Colic, and are of Service in paralytic and nervous Affections. *Miller's Bot. Off.*

They have the ſame Virtues as Pepper, and are a Specific in all paralytic Diſeaſes. *Dale.*

The ſecond is, The

CARDAMOMUM MAJUS, Offic. Bont. 127. Raii Hiſt. 2. 1204. *Cardamomum majus vulgare*, Ger. Emac. 1542. Park. Theat. 1576. *Cardamomum majus Officinarum*, C. B. Pin. 413. Jonſ. D. Ger. 1358. *Cardamomum cum ſiliquis longis*, J. B. 2. 205. Chab. 148. *Cardamomum medium*, Barr. Icon. 571. Obſ. 1595. Matth. Valg. 27. GREAT CARDAMUMS. *Dale.*

Theſe are long, roundiſh, ſomewhat triangular Pods, full of corner'd, reddiſh-brown, hot, aromatic Grains.

They grow in the Iſland of *Java*, in the *Eaſt-Indies*, and from thence uſe to be brought to us; but we have had none come over for many Years, being now grown quite out of Uſe, and not to be met with in the Shops. *Miller's Bot. Off.*

The Seed is the Part in Uſe, which is of a heating and drying Quality, comforts the noble Parts, attenuates, diſcuſſes Flatulences, helps Concoction, provokes Urine and the Menſes, helps Shortneſs of Breath, and removes Obſtructions of the Liver, Spleen, and Meſentery. *Dale.*

The third is, The

CARDAMOMUM MINUS, Offic. Bont. 126. Ger. 1358. Raii Hiſt. 2. 1204. Barr. Icon. 571. Obſ. 1396. Matth. Valg. 27. Boerh. Ind. A. 2. 128. C. Comm. Flo. Mal. 71. Bod. in Theoph. 1014. *Cardamomum minus vulgare*, Ger. Emac. 1547. Park. Theat. 1576. *Cardamomum ſimpliciter in officinis dictum*, C. B. Pin. 414. *Cardamomum cum ſiliquis ſeu thecis brevibus*, J. B. 2. 205. *Elettari* 2. Hort. Mal. 11. 9. Tab. 6. *Enſal*, Herm. Muſ. Zeylan. 66. COMMON CARDAMUM. *Dale.*

Theſe are ſmall triangular Capſulæ or Pods, growing on little ſhort Stalks, tough, and full of Striæ, containing ſeveral corner'd, brown, ſmall Grains, of an hot, ſpicy, aromatic Taſte, and a pleaſant Smell.

They are brought to us from the *Eaſt-Indies*, but we have no certain Knowledge what ſort of Plant they belong to. They are in frequent Uſe, being of a warming Nature, comforting and ſtrengthening the Stomach and Bowels, helping Digeſtion, expelling Wind, and are good in all Diſtempers of the Head and Nerves. They provoke Urine and the Menſes, and are of Uſe in the Jaundice. *Miller's Bot. Off.*

The Seeds are in Uſe, which have the ſame Virtues as the great Cardamums. *Dale.*

The Amomum is reckon'd a Species of Cardamum. See AMOMUM.

CARDAMON. The ſame as CARDAMINE, which ſee. *Blancard.*

CARDEL. Muſtard. *Johnſon.*

CARDIA, *καρδία*. The Heart; but it generally ſignifies the Left and ſuperior Orifice of the Stomach. See VENTRICULUS. Sometimes it is us'd to expreſs the Pith of a Tree.

CARDIACA, in Botany, is a Plant thus diſtinguiſh'd.

CARDIACA, Offic. J. B. 3. 320. Raii Hiſt. 1. 571. Synop. 3. 239. Park. Theat. 41. Tourn. Inſt. 186. Elem. Bot. 155. Ger. 569. Emac. 705. Boerh. Ind. A. 180. Dill. Cat. Giſſ. 122. Buxb. 55. Phyt. Brit. 21. Mer. Pin. 20. Rivin. Irr. Mon. *Cardiaca Lycopus Ruellii*, Chab. 437. *Marrubium Cardiaca dictum*, Hiſt. Oxon. 3. 378. *Marrubium Cardiaca dictum, ſorte primum Theophraſti*, C. B. Pin. 230. MOTHERWORT. *Dale.*

The lower Leaves of *Motherwort* are pretty large and broad, roundiſh towards the End next the Foot-ſtalks, which are pretty long: They are deeply cut in on the fore Part, having three ſharp Points, the middlemoſt being longeſt, ſomewhat hairy and high-vein'd, green above, and whitiſh underneath. The Stalk is four-ſquare, woody, and brittle, having two ſmaller and tripartite Leaves at a Joint, growing likewiſe on long Foot-ſtalks. The Flowers come forth at the Joints with the Leaves, many growing together, Whirl-faſhion, in hard rough Calyces, which end in ſeveral prickly Points: They are of a reddiſh purple Colour, with a Labella cut into three Parts, and a round Galea, and are ſomewhat woolly on the Outſide. The Seeds grow four together in each Calyx. The Root is ſmall and ſlender, creeping in the Ground. It grows in waſte Places and Lanes, and by Wall-ſides; and flowers in *June*. *Miller's Bot. Off.*

This Plant is call'd *Cardiaca*, becauſe it relieves in Faintings, and Diſorders of the Stomach, the ſuperior Orifice of which is call'd *Cardia*; for, according to *Schroder*, in his *Pharmacopœia*, it is of ſingular Service in Diſtentions of the Hypochondria, and Diſorders of the Stomach in Children. The Herb is of a highly bitter and penetrating Taſte, a Circumſtance which indicates its ſtimulating, inciding, reſolvent, and aperient Qualities;

lities; in conſequence of which it is proper in Diſeaſes proceeding from a Redundance of Phlegm or viſcid Juices: Hence it is exhibited with an Intention to provoke Urine, promote the Menſes, and facilitate difficult Labours. A Decoction of Motherwort, and the Powder of it, mix'd with Sugar, are, by *Ray*, ſaid to be Medicines of uncommon Efficacy in Palpitations of the Heart, Affections of the Spleen, and hyſteric Diſorders. *Matthiolus*, on *Dioſcorides*, affirms, that a Spoonful of its Powder, drank in Wine, is of ſingular Service in difficult Births.

Ettmuller informs us, that this Plant, cut down, and, by boiling, reduced to the Form of a Cataplaſm, is, in conſequence of its inciding and reſolvent Qualities, very good againſt thoſe Diſorders of Children produced by a mucous Acid, and the Flatulencies ariſing from it, if applied to the Region of the Stomach and Hypochondria.

A Water diſtil'd from Motherwort, with Oak of *Jeruſalem*, is uſed in Inflations of the Hypochondria of Children. *Simon Pauli*, in his *Quadripartitum Botanicum*, orders its Leaves to be boil'd in Oil of Wormwood, and of bitter Almonds, and applied to the Navel, in order to kill Worms of the Inteſtines.

Motherwort is alſo uſed by Farriers in Diſeaſes of Cattle and Horſes; and, according to *Ray*, in his *Catalogus Plantarum Angliæ*, it was exhibited with ſingular Succeſs when the Murrain raged among Horſes in *England*.

CARDIACA PASSIO. The Cardiac Paſſion, in *Noſology*, is a Diſorder frequently mentioned by the Antients, but by the Moderns more frequently treated of under the Name of *Syncope*.

Cœlius Aurelianus gives the following Account of this Diſorder.

Some divide the Cardiac Paſſion into two Species, one of which they call *common*, and the other *proper*. The former of theſe is, when there is a preternatural Subſtance in the Stomach, and Entrance into the Belly, with a ſubſequent biting Pain of theſe Parts, as we are inform'd by *Hippocrates*, in the firſt and ſecond Book of his Epidemics, and by *Eraſiſtratus*, in thoſe Books he wrote concerning the Belly. The latter Kind, of which we are now to treat, is by them called the *proper Cardiac Paſſion*, and is accompanied with an Eruption of Sweat, and a weak Pulſe. This Diſorder, according to ſome, derived its Name from the Part affected; for they imagine, that the Heart is the principal Seat of the Diſeaſe: Others are of different Opinions with reſpect to this Particular; for the Vulgar have a Cuſtom of beſtowing pompous Names upon Things which are great or important in their reſpective Kinds: Thus they call the Sea, the great and ſacred Ocean; and the Epilepſy, the *Lues Deifica, by which Words, though hard to be tranſlated, they, no doubt, meant a ſtubborn and Herculean Diſeaſe*. Now, as the Heart is the moſt important Organ, and moſt immediate Source of Life, this Diſeaſe, as being of a formidable Nature, deriv'd its Name from that Part.

Soranus declin'd giving Definitions of Diſeaſes. *Artimedorus Sidenſis*, a Follower of *Eraſiſtratus*, aſſerted this Diſorder to be *A Tumor about the Heart*. The Followers of *Aſclepiades*, alſo, define it, *a Tumor about the Heart, produc'd by a Coacervation or Obtruſion of Corpuſcles*. But *Soranus*, whoſe Sentiments I profeſs to deliver, affirms, that there is no perceptible Sign of any Tumor in Patients afflicted with this Diſorder. A great many do not think it probable, that in this Caſe the Heart is affected; and *Soranus* aſſerts, that the Cardiac Paſſion is *a quick and inſtantaneous Solution or Relaxation*, by which he ſuſpects the Corpuſcles, or Atoms, to be diſperſed and driven thro' all the moſt remote and miuute Paſſages of the Body. This Diſeaſe ſeizes more frequently in the Summer, than in any other Seaſon of the Year: Men are more ſubject to it than Women. Young People of hot Conſtitutions, Men of full Habits of Body, and ſuch as are accuſtomed to violent Exerciſes, are more frequently afflicted with this Diſorder, than Perſons of an oppoſite Character. But the antecedent Cauſes of this Diſeaſe are many and various: 'Tis, however, moſt commonly produc'd by Indigeſtion, drinking to Exceſs, bathing after Meals, and vomiting after Supper; or by Sadneſs or Terror, in which Caſe, the Body is, in conſequence of its Conſent and Connection with the Mind, diſſolved into Sweats. In continued burning and inflammatory Fevers, this Diſorder, alſo, frequently ſeizes the Patients on the fifth or ſixth Day.

We may know thoſe who are about to be ſeiz'd with the Cardiac Paſſion, and thoſe who already labour under it, by the following Signs. Thoſe who are juſt about to be ſeiz'd by it, have an acute, violent, and burning Fever, a quick, a denſe, a low, and, as it were, a *moiſt* [*humectus*] Pulſe, during the whole Time of the Acceſſion, and ſometimes till the very End of the Paroxyſm; ſo that, tho' the Heat be in ſome meaſure abated, the Pulſe is not proportionably elevated, but rather depreſſed, in Compariſon of what it was before. The Pulſe is, alſo, ſometimes inordinate, but not quite deficient, ſince it beats quick, confuſedly, and without Order or Meaſure. The Patient has alſo a Loathing of Food, an immoderate Thirſt, little Sleep, from which he is alſo eaſily awaked, a Readineſs to commit Miſtakes, Dulneſs, and a reſtleſs Toſſing of the Body. During the Acceſſion, or even till the End of the Paroxyſm, the Knees, Elbows, and Legs, are cold and numb'd. Theſe Symptoms ſometimes appear as the Conſequences of the Diſeaſe itſelf, even when the Strength of the Patient has not been previouſly impair'd. But it ſometimes happens, that when the Strength is previouſly impair'd, by too liberal Diſcharges of Blood, violent Purging, or an immoderate Evacuation of any kind, and the Fever growing worſe, a great Loſs of Strength enſues. Some, alſo, in this Caſe, have Regard to the Heat of the Atmoſphere, and obſerve, whether Diſeaſes caus'd by it are not epidemical; whether he is of a *lacteous* [*lactea*] Habit of Body, or whether he is weak, whitiſh, large, corpulent, and pale; and laſtly, whether, in Time paſt, he has been ſubject to this Diſorder: But, according to *Soranus*, theſe Signs are uncertain and precarious.

The Patient, actually labouring under the Cardiac Paſſion, is affected with a Coldneſs and Numbneſs of the Joints, ſometimes in both Legs or Hands, and ſometimes all over the Body. The Pulſe is denſe, quick, ſmall, weak, empty, and, as it were, fleeting; as the Fit increaſes, the Pulſe becomes ſunk, obſcure, tremulous, formicating, irregular, and deficient, attended with a Depravation and Deſpondency of Mind, perpetual Want of Sleep, and, in ſome, with a ſudden and plentiful Eruption of Sweat all over the Body. Sometimes a ſmall, thin, and aqueous Sweat breaks out firſt about the Neck and Face, which afterwards becomes, as we find, univerſal and copious; and then it becomes thick, glutinous, viſcous, and of an ill Smell, like Waſhings of Fleſh. Reſpiration is ſmall, ſhort, and very difficult; and, in the Progreſs of the Diſorder, the Speech becomes ſlow and faltering. Add to theſe a Paleneſs of the Countenance, and a Hollowneſs of the Eyes, with an oppreſſive Weight on the Thorax, thro' Weakneſs and Faintings, at the Approach of the Acceſſion. In ſome, tho' the Brain be affected, the Tongue is moiſt; others, where the Diſorder is complicated with a ſmall Tumor in the Viſcera, have their Tongues parched with Drought, and are deſirous of cooling Liquors: The Patient, when he faints, is affected with a Dimneſs of Sight, and a Lividneſs of the Joints, with an Incurvation of the Nails, which the *Greeks* call γρύπωσις (*Grypoſis*); many retain their Reaſon entire, in ſome it fails them, and there is a quick Pulſation of the Heart. After this, if the Lipothymy is violent, the Superficies of the Body becomes wrinkled, and, what is a common Symptom with dying Perſons; there is an involuntary Diſcharge of the Fœces.

Tears flowing involuntarily, that is, without the Patient's having any Reaſon for it; or a ſanious and purulent Lippitude in ſome Part of the Eye; or when there ariſes in the Black of the Eye a whitiſh Spot, of the Figure of a Man's Nail, or the Moon juſt appearing after the Change, which Spot gradually increaſes, and is called by the *Greeks* ὄνυξ (*Onyx*); theſe are fatal Symptoms. Alſo a continued Deglutition of the Food entire and unchew'd, with a ſort of Noiſe, prognoſticates Death, and the more infallibly, when the Things received into the Stomach remain unaltered and undigeſted for a long Time, and when the Belly is moved, and emits, as from a Bladder, that Sort of Sound which the *Greeks* call βόμβος (*Bombus*); for it is a Sign, that the Body is dead, when the Food is depoſited in an inanimate and inſenſible Receptacle. It is a bad Sign, alſo, to nauſeate all manner of Food, and to refuſe any Suſtenance, or to have no Appetite to Wine, or after Eating to feel an Oppreſſion, or to be feveriſh, with a Return of the Fainting; alſo, if after ſome ſlight Refreſhment the Fit ſoon returns, or the Patient throws up what he has taken, or is ſeiz'd with a Diarrhœa, or a Trembling of the Lips. It is an ill Prognoſtic to bite the Spoon, or the Brim of the Cup, in Eating or Drinking; for it is a Sign of a Defect of Spirits, as if they were exhauſted, and not ſufficient to expand the Mouth, but conſtrained to give Way to involuntary Bitings. It is a dangerous Caſe, when the Cardiac Paſſion is attended with a Delirium; becauſe, in ſuch a Circumſtance, we can make no Uſe of Wine, or Choice of Diet, for the Refreſhment and Support of the Patient. It is no leſs dangerous, when, after the Patient has received Suſtenance, and been refreſhed, the Fever returns upon him; for the Spirits are, in ſuch a Caſe, dejected, the Strength exhauſted by Sweat, the Body enervated, and the Tone of the Parts relaxed, attended with Dimneſs of Sight, Roughneſs and Dryneſs of the Tongue, an Attraction of the Præcordia upwards, and an Oppreſſion from the Food. Thus, after a gradual Extenuation, and languiſhing for many Days, the Strength is at laſt quite exhauſted, and the Patient ſinks under the Diſtemper; for neither can the Strength be ſupported by a ſparing or ſimple Diet, nor is the Stomach capable of digeſting much or ſolid Food. Some, without Sweating, languiſh and pine away, and their natural Vigour is exhauſted by a ſe-

cret Way, which the *Greeks* call ἄδηλος διαφόρησις, "an in-"sensible Diaphoresis," when the whole Habit of the Body is relaxed, and in a State of Fluxion and Diffipation.

If the Diseaſe be attended with favourable Symptoms, and the Patient begins to recover, the Pulſe reſumes its Vigour, the Coldneſs of the Parts is ſucceeded by a kindly Warmth, and the Difficulty of Reſpiration is leſſened, which ſalutary Signs are accompany'd with a ſort of Security of Mind; after Eating, the Patient feels his Strength recruited; and when he betakes himſelf to his Reſt, he ſleeps as ſoundly as a Man after Labour. *Cœlius Aurelianus*, *Acut. Morb. Lib.* 2. *Cap.* 32.

It is diſputed, whether the *Cardiac Paſſion* be attended with a Fever: Very many before *Aſclepiades* deny'd it; others, among whom was *Apollophanes*, a Follower of *Eraſiſtratus*, held the contrary. *Aſclepiades* aſſerts, that very many of thoſe, who labour under this Diſeaſe, are free from a Fever; for in thoſe Treatiſes which he wrote upon *Eraſiſtratus*, and which he intitles *contradictory*, "I aſſert, he ſays, "that Perſons affected with the Cardiac Paſſion are under no "Fever." But, in his ſecond Book of *acute Diſtempers*, he ſays, that thoſe who are under this Diſorder, are ſeldom afflicted with a Fever. *Themiſon*, *Theſſalus*, and *Demetrius Aponieus* ſay, that ſome of them are feveriſh, others not. *Demetrius Aponieus*, in particular, aſſerts, that all are feveriſh in the Beginning and Increaſe of the Diſtemper; but, when the Fever begins to be violent, the *Paſſion* is ſaid to remit.

They, then, who aſſert, that none under the Cardiac Paſſion are affected with a Fever, allege, that all Fevers are neceſſarily attended with great Heat, Heavings, and an Indiſpoſition for Motion, together with a Dryneſs, a pungent Senſation in the Pores, Redneſs and a Diſtention of the Præcordia: None of theſe Symptoms, they ſay, affect a Perſon labouring under the Cardiac Paſſion, and conſequently he cannot be ſaid to have a Fever. Again, a Fever, according to *Aſclepiades*, is a violent Heat in all or moſt Parts of the Body, with a raiſing of the Pulſe to a vehement Degree, becauſe of an Obtruſion of Corpuſcles (*Obtruſio*). But in Cardiac Patients, the Pulſe is not fuller but ſmaller; nor ſtronger, but weaker; nor is the Heat exceſſive, but moderate in the interior Parts of the Body, and leaſt in the middle Parts. For theſe Reaſons, he conſtantly preſcribes Clyſters, where there is no Fever.

Some, who aſcribe the Cauſe of Fevers to an Obſtruction of the Pores or Paſſages, ſay, that a Diſſipation, or Diaphoreſis, is effected by a Rarefaction of all the Parts of the Body; and that a Fever happening from a Condenſation of the Parts, the Heat is produced by a kind of Attrition.

Apollophanes tells us, that it was the Opinion of *Eraſiſtratus*, that all who labour'd under the Cardiac Paſſion were feveriſh; for this Diſorder ſeemed to proceed from a Tumor of the Heart, and a great Stricture is the Cauſe of a Fever. Some late Writers ſay, that to be ſick without a Fever, was a Sign, that the Diſtemper was not dangerous; but that malignant Diſeaſes were cauſed by the Acceſſion of a Fever, in which Caſe a Diaphoreſis by Sweat was excited, which ceaſing, the Reliques of the Fever ſtill remained.

But *Soranus* will not admit of either of theſe Aſſertions; for to the firſt he anſwers, that a *Sign* is a different Thing from an *Accident*; for a *Sign* never recedes, but is inſeparable from the Thing ſignify'd; but an *Accident*, which the *Greeks* call "a Symptom," now preſents itſelf, then recedes and diſappears; of which Kind we take to be what they call the *Accidents* of feveriſh Perſons, ſuch as Difficulty of Motion, Heavineſs and a Tenſion of the Præcordia; for ſome Patients, under a Fever, feel none of theſe Symptoms, if the Diſeaſe be owing to a Solution or Relaxation; but ſome Cardiacal Patients are affected with a ſtimulating Heat, which ſeems to be ſeated in the interior Part, and is a Sign of a Fever.

Aſclepiades, in his ſecond Book of acute or quick Diſeaſes, ſays, that the *Cardiac Paſſion* is frequently, tho' not always, excited by a Fever. But if he will have it, that Cardiacal Perſons are free from a Fever, becauſe, in his Opinion, they have not the Signs of ſuch a Diſorder upon them; we anſwer, that his Error ariſes from his not perceiving the true Signs of a Fever. For in the Beginning of the Fit, the Joints are manifeſtly perceived to be cold, and the Pulſe low and weak; and this may ſerve, alſo, as an Objection againſt thoſe who take an Obſtruction or Condenſation of the Pores or Paſſages to be the Cauſe of a Fever.

Some will tell you, that the Cardiac Paſſion, attended with a Fever, is a Complication of Diſeaſes; whence ſome of the Pores being expanded, and others obſtructed, the Rarity of the firſt cauſes a Diaphoreſis, and the Denſity of the reſt, with an Attrition of Bodies, excites a Fever.

As for our Parts, we determine, according to the Judgment of *Soranus*, that a Fever is abſolutely the Effect of a Solution, and a conſequent Laxneſs, of the Pores, as he has taught us in his Treatiſe of Fevers. And to the Followers of *Eraſiſtratus* we anſwer, that it is not true, that all Fevers are cauſed by a Stricture, for ſome are the Effect of a Solution; but if they are not willing to allow this, they will, however, not deny, but the Cardiac Paſſion may be excited without a Tumor: For ſince the Patients have the free Uſe of their Reaſon, and are affected with no Senſe of Pain, or any other Signs of a Stricture, it muſt be very erroneous to aſſert a Tumor or Stricture of the Heart; and that all Cardiacal Patients labour under a Fever. Nor are dangerous Diſeaſes rightly diſtinguiſhed by the Characteriſtic of a concomitant Fever; for the *Cholera Morbus* is a ſevere and dangerous Diſtemper, but never attended with a Fever. It is true, that the Cardiac Paſſion is preceded by a Fever, which ſometimes meets with a Solution by Sweat; as does alſo a Tumor, by being converted into a Collection of purulent Humour. That there are Reliques of a Fever remaining after the Sweating, is contrary to Experience; for very many are found who have no Fever.

We ſay then, as do all our Methodics, that ſome of thoſe, who labour under the Cardiac Paſſion, are free from a Fever; for Example, thoſe, in whom a Solution is caus'd by an Hæmorrhage: Others have a Fever accompanying that Diſorder; for if you apply your Hand to the Hypochondria, and Parts adjacent, or upon any Part upon which the Patient has lain, you will perceive a hot and ſtimulating Vapour aſcending from the interior Parts, which is itſelf a manifeſt Diagnoſtic of a Fever, and is, beſides, attended with a hot and quick Reſpiration, and a Delight in cooling Drinks, and ſometimes alſo with a Dryneſs and Roughneſs of the Tongue. *Cœlius Aurelianus*, *Acut. Morb. Lib.* 2. *Cap.* 33.

The Part principally affected by the Cardiac Paſſion, according to *Eraſiſtratus* and *Aſclepiades*, is the Heart. Some will have it to be the Membrane which ſurrounds the Heart (*the Pericardium*); others the Diaphragm, that is, the Membrane which ſeparates the Inteſtines from the Viſcera (*the Heart and Lungs*); ſome aſſert it to be the Lungs, others the Liver. They who ſay the Heart is the principal Sufferer, argue, firſt, from the Name which is given to this Diſorder; it is called the Cardiac Paſſion, ſay they, becauſe it proceeds originally from the Heart; for the *Greeks* call the Heart καρδία (*Cardia*). A ſecond Reaſon is, that the Palpitation which is felt under the Fit, ſeems to belong to the Heart, and the Weight, or Oppreſſion, to be in the Left Part of the Thorax, near the Breaſt. Thirdly, the Greatneſs of the Diſorder is a good Argument, they think, for their Opinion; ſince the Diſeaſe could never arrive to ſo violent and dangerous a Height, were not ſome principal Part of the Body primarily, and not by Conſent of Parts, affected. Now the Heart is a noble and neceſſary Part of the human Body, as it diſtributes Blood and Spirits to all the reſt.

But to the firſt of theſe Arguments ſome anſwer, that the Diſeaſe is denominated from its Greatneſs, not from the Part affected. In Anſwer to the ſecond, they ſay, that the Palpitation or Pulſation of the Heart and Arteries are alike; and that ſome Cardiac Patients are ſenſible of an Oppreſſion in the whole Region of the Thorax, and not only in the Left Part; or, if this latter were the Caſe, the Oppreſſion might be owing to a Diſorder of the Pleura, or ſome neighbouring Part, if Cauſes are to be aſcribed to Places. As to the Greatneſs of the Diſorder, which is the third Reaſon, they anſwer, that there are many dangerous Diſtempers, of which the Heart is not the Cauſe as the primary Sufferer; for it is not neceſſary, that under every great Diſorder ſome principal [*propriam*] Part of the Body ſhould be affected, ſince all Parts are principal and neceſſary with reſpect to the Integrity of the Body.

Others deny, that the Heart is primarily affected under this Diſorder; becauſe, by the Confeſſion of thoſe who aſſert this, as ſoon as a principal Part, and one that is neceſſary to Life, is affected, Death prevents all Senſation: as, for Inſtance, if it happens to be wounded, Death immediately anticipates all Effects of the Wound; nay, if it receives the ſlighteſt Hurt, it is neceſſarily deprived of Life, and not, like other Parts, withers, hardens, or becomes paralytic.

But to theſe it is reply'd, that a Wound of the Heart is ſuddenly mortal, becauſe it cannot be inflicted, without a previous Penetration of many other Parts, and a very copious Effuſion of Blood, and not from a Solution. That it neither withers, hardens, nor is affected with a Palſy, is no Argument, that it is not at all, but that it is ſlightly affected; for, if it be conſtituted of the ſame Nature with the other Parts of the Body, it muſt of Neceſſity be ſubject to the Influences of the ſame Cauſes.

As to our Opinion in this Caſe, ſince, agreeably to the Judgment of *Soranus*, it appears, that the whole Body labours under a Relaxation, it is neceſſary, we think, that every Part ſhould be affected; but what particular Part is the greateſt Sufferer, we do not care to diſpute, leſt we ſhould be found to contend in the Dark: For neither the Diagnoſtics, nor Method of Cure, will receive any Alteration in this reſpect, ſince Remedies are to be provided ſuitable to all Parts of the Body.

There are others, in the laſt Place, who tells us, that the Cardiac Paſſion or Solution proceeds ſometimes from the Heart, ſometimes from the Pericardium; and that in the latter Caſe the Patient is affected with a Pain, and frequent pungent Senſations; but when the Cauſe is in the Heart, he is only ſenſible of a Weight or Oppreſſion. But to theſe we anſwer, that their diagnoſtic Signs are but imaginary; for when the Parts near or contiguous to the Heart are affected, it is neceſſary that ſometimes a pungent Senſation, ſometimes an Oppreſſion, ſhould be the Conſequence. *Cœlius Aurelianus, Acut. Morb. Lib.* 2. *Cap.* 34.

Becauſe many Perſons labouring under a *Cardialgia* are affected with Sweating, a Coldneſs of the Joints, and a Lowneſs of the Pulſe, with Fainting and Paleneſs, which are all Symptoms of the Cardiac Paſſion, I think we ought to ſhew the Difference between theſe two Diſeaſes.

Aſclepiades, in diſtinguiſhing them, ſays, that Cardiac Patients may be known from thoſe who are affected with a *Cardialgia*, (*Stomachi Supinitas*) becauſe the former have a very low and weak Pulſe, but accompany'd with a great and vehement Beating of the Heart, together with an Oppreſſion at the Thorax, and a Difficulty of Reſpiration; whereas, on the contrary, thoſe who languiſh under a *Cardialgia*, have a ſtrong Pulſe of the Arteries, but their Heart beats weakly; to ſay nothing of other Accidents, which the *Greeks* call Symptoms.

We, for our Parts, have not perceived ſuch a great Pulſation of the Heart in the Cardiac Paſſion; for the Heart itſelf is affected more in Suppoſition than Reality; yet ſome Patients, under that Diſorder, are ſenſible of an Oppreſſion at the Thorax, and a Difficulty of Reſpiration. Some, under a Cardialgia, are only ſenſible of a great Weakneſs; and all Cardiac Patients do not complain of a Difficulty of Reſpiration.

We conclude, therefore, that as the Stomach is affected ſometimes with a Stricture, ſometimes with a Solution or Relaxation, the former State is attended with a Heat and Pain in thoſe Parts of the Thorax which are under the Ribs, or in the oppoſite Parts between the Scapulæ, and ſometimes with the Senſe of a Load or Oppreſſion, after eating. In the latter Caſe, or when the Stomach is relaxed, there follows a Flux of the Saliva, with an aqueous Humidity, and Nauſea, or Vomiting of liquid Subſtances, and ſometimes of the Food, together with a Coldneſs of the Joints; but in the Beginning of the Fit the Patient is cold and hot by turns.

But now in the Cardiac Paſſion there is neither Pain, nor an Oppreſſion after Meat, nor Vomiting; and, beſides, the Coldneſs or Numbneſs of the Joints continues equally the ſame. Moreover the Sweat which proceeds from a Perſon affected with the Cardiac Paſſion is ſometimes thick, and of an ill Smell, ſo as to reſemble Sanies or Blood; but in Cardialgias, quite thin and wateriſh: The Fainting alſo, in the Cardialgia, is more towards the Beginning of the Fit; in the Cardiac Paſſion, towards its Receſs. If both Diſeaſes concur at the ſame time, the Diſtinction between them is render'd the more difficult, but not their Cure, which is perform'd by the ſame Remedies.

The Cholera Morbus, Tetanus, Hyſteric Paſſion, and Aſthma, are all attended with much Sweating, and a cold Numbneſs, but are not deſtitute of proper Symptoms by which they may be diſtinguiſh'd: For the Cholera Morbus is accompany'd with Vomiting; the Tetanus with an Inclination of the Neck; in the Hyſteric Paſſion there is a Tumor of the Matrix; and an Aſthma muſt of Neceſſity be attended with a very conſiderable Stricture. But tho' there ſhould be found none of the preceding Cauſes ſufficient to excite the Cardiac Paſſion, yet ſince there is an actual and evident Solution, which is the Characteriſtic of that Diſorder, we confidently pronounce it the Cardiac Paſſion, without thinking ourſelves of Neceſſity obliged to diſcover the Cauſes of that Solution; for the Method of Cure is not to be alter'd according to the Difference of the antecedent Cauſes.

There is a Diſorder alſo, which ſome call *Cardimona*, and the *Greeks* καρδιωγμὸς (*Cardiogmos*). It is always attended with a Pain at the Mouth of the Stomach, which many ignorant Perſons call a Pain of the Heart.

In general, then, to conclude, the Cardiac Paſſion is a Diſeaſe of *Solution*, and one of the acute and vehement Kind, though ſometimes attended with ſome Symptoms of a *Stricture*, as a Tenſion or Tumor of the Middle Parts, (the Hypochondria, Ilia, and Belly) which are not properly or neceſſarily incident to Cardiac Patients. *Cœlius Aurelianus, Acut. Morb. Lib.* 2. *Cap.* 35.

Becauſe thoſe ſalutary Sweats which the *Greeks* diſtinguiſh by the Epithet *critical*, do, by reaſon of their Profuſeneſs in the Criſis of violent and continued Fevers, bear a certain Reſemblance to the Cardiac Paſſion, we therefore judg'd it neceſſary to aſcertain the Difference and Diſtinction between them, ſince many unſkilful Phyſicians, with an Intention to relieve thoſe who labour'd under the Cardiac Paſſion, have, by repreſſing ſalutary and moderate Sweats, not only render'd the Conſtitutions of their Patients morbid, but even kill'd them. For this Reaſon 'tis abſolutely neceſſary, that a Difference ſhould be eſtabliſh'd between them; and this Difference may be collected from various Circumſtances; as, firſt, from what has preceded; from the different Kinds of the Diſorders; from the Profuſeneſs, the Time, the Nature, the Quantity and Quality of the Sweat itſelf. From what has preceded, we find out the Difference, by conſidering whether any Symptom has prognoſticated a ſalutary Diaphoreſis, or ſuch a preternatural Sweat as the Cardiac Paſſion produces. The Difference between theſe is alſo diſcovered, by adverting to the Kinds of the Diſorders, which are found out by attending to their Qualities. If the Diſorder proceeds from Solution, the Sweat muſt neceſſarily be of the prejudicial Kind, and ſuch as Cardiac Patients are afflicted with. But if the Diſorder proceeds from Stricture, the Greatneſs of the Diſorder is to be adverted to: For in a ſmall Diſorder a Diaphoreſis is not neceſſary; but if the Diſorder is great, Nature's Time for the Eruption of the Sweat is to be waited for. In the Height of the whole Diſorder, and of the particular Paroxyſm, or during the manifeſt Remiſſion, the Sweat is for the moſt part critical and ſalutary; but in the Beginning and Increaſe of the Diſorder, it is hurtful and pernicious. This Difference may alſo be determined from the Nature of the Sweat itſelf: That which is equal, is eſteemed good; whereas that which is unequal, is accounted bad. We may alſo draw a Diagnoſtic from the Quantity of the Sweat; for when it is moderate, it is a good Symptom; but when immoderate, the reverſe. Thoſe who have ſweated to Exceſs have ſometimes fallen into the Cardiac Paſſion. We may alſo draw Diagnoſtics from the Quality of the Sweat, which is to be judg'd of by the Touch. A ſalutary Sweat is warm, thin, and not ill-ſmell'd; whereas a Sweat of the prejudicial Kind is cold, viſcid, ill-ſmell'd, and, in Appearance, reſembling the Waſhings of Fleſh. Our Judgment is alſo to be form'd upon the preſent and concomitant Symptoms; for Cardiac Patients have a Pulſe more ſmall, frequent, weak, and languid. Their Thorax is alſo oppreſſed, and their Reſpiration frequent; they are uneaſy and reſtleſs, dejected, have a ſmall Voice, and become pale; whereas thoſe who ſweat in a ſalutary manner, have a briſker Pulſe, a freer and eaſier Reſpiration, a chearful Propenſity to Sleep, a Diminution of all unfavourable Symptoms, and a Refreſhment both of Body and Mind. *Cœlius Aurelianus, Acut. Lib.* 2. *Cap.* 36.

CARDIACA, in Pharmacy call'd alſo *Cordialia*, *Analeptica*, *Confortantia*, *Confortativa*, *Refectiva*, *Reſumptiva*, Cardiacs, are properly ſuch Medicines as preſerve or increaſe the Strength of the Heart, and by that means the vital Forces, tho' they do not immediately work upon the Heart, nor are particularly appropriated to the Corroboration of that Part. This Effect they perform either by repleniſhing the exhauſted Veſſels with good Humours, or exciting Motion where it was required. Therefore Nutritives, or Repletives, duly choſen, with reſpect to particular Conſtitutions, belong to this Claſs, as well as aſtringent Corroboratives and Stimulants, which are uſually accounted the only Cardiacs. In this Senſe we are to underſtand the Definition given by *Harvey* of a Cardiac, which, he ſays, is ſomething that is endu'd with the Virtue of ſpeedily recollecting the ſcatter'd and broken Spirits, and recruiting them with plentiful Supplies, or of corroborating the flaccid Fibres of the Heart.

Hence it appears, that *Cardiacs* are principally deſtin'd to the Removal of ſome Weakneſs; and that any thing may be called a Cardiac, which removes the Obſtacles to Circulation. Wherefore *Valcarengus* was very juſt in his Notion, when he ſays, that "A Cardiac is whatever deſtroys, or at leaſt blunts the Force of, "the morbific Cauſe, reſtores the loſt Tone of the Solids, and "gives due Motion to the Fluids; and by that means procures "a juſt Equilibrium, which is the only and laſting Principle of "all the Motions in our Body." "Generally what promotes "Motion, ſays *Rega*, in his *Methodus Medendi*, is alſo a "Cauſe of the Heart's acquiring a greater Strength for "Action."

But ſince Weakneſs does not only ariſe from a Defect of good Humours, and a flaccid Indiſpoſition of the Veſſels, but oftentimes from a Redundance of Humours, a thick and ſtagnating Blood, with an Obſtruction of the Veſſels from too great a Rigidneſs, Contraction, or Compreſſion, it follows, that what we commonly call debilitating, refrigerating, relaxing, reſolvent and evacuating Medicines, belong to the Claſs of Cardiacs, inaſmuch as they remove a preſent Weakneſs of the Body, by acting immediately and directly in Oppoſition to the Cauſe of that Weakneſs. *Tralles, de Remediis terreis, Cap.* 12. *Riverius* juſtly obſerves, that as the Heart may be debilitated ſometimes by a hot, and ſometimes by a cold, Intemperature, ſome Cardiac Medicines muſt of courſe be of a hot, and others of a cold Nature. *Lindeſtolpe*, in his Treatiſe *de Venenis*, uſes theſe Words: "The Vulgar indeed are of Opinion, that there are "ſome Medicines which immediately corroborate and exhilarate "the Heart. But I have as yet found out none of this Kind; "for all Subſtances which corroborate the Heart, or occa-"ſion its ſtrong and frequent Contraction, are the moſt viru-"lent Poiſons, and of a Quality moſt unfriendly to the Con-"ſtitution;

" ſtitution; of this Kind are all acrid, metallic, acid, and " alcaline Poiſons, and the putrefactive Poiſons of Animals; " for by large Doſes of theſe Subſtances the Motion of the " Heart is increaſed, and the Ruin of the Conſtitution pro- " moted at the ſame time. And as Diſeaſes ariſe from different " Cauſes, ſo whatever Medicine is contrary to a Diſeaſe, may " be ſaid to be poſſeſs'd of a cardiac or cordial Quality; not " becauſe it corroborates the Heart, but becauſe it proves " grateful and agreeable to the whole Habit. Thus in putrid " Fevers, and ſuch as ariſe from a predominant *Alcali*, all " acid, metallic, and vegetable Subſtances are Cordials; on " the contrary, in Diſorders ariſing from a predominant Acid, " we are to have recourſe to alcaline Subſtances, as the moſt " proper Cordials. In Diſeaſes produc'd by Rage and Wrath, " we muſt injoin Calmneſs and Compoſure of Temper; in " Grief and Sorrow, Joy and Chearfulneſs; and in every Diſ- " eaſe, what ſeems moſt directly oppoſite to it." Volatile and diſſolvent Cardiacs, which ſtimulate the Fibres, raiſe the drooping Spirits, and overheat the Body, univerſally and indiſcriminately exhibited to Patients of all Conſtitutions, are by no means to be approved of. 'Tis, however, become almoſt univerſally cuſtomary, to uſe inflammable Spirits, and balſamic and aromatic Medicines, in order to raiſe the Spirits when ſunk, and render'd languid, by whatever Cauſe. It muſt, indeed, be confeſs'd, that ſuch Subſtances rouſe the Spirits, and procure a momentary Eaſe to the Patient; but when unſeaſonably or exceſſively uſed, they excite too violent Commotions in the Juices, and diſſipate thoſe which are moſt fluid; by which means thoſe which are too thick, and unfit for Circulation, are left behind in the Body. Hence ariſe Dryneſs and Rigidity of the ſolid Parts, and a Weakneſs ariſing from Obſtructions; and if, in Caſes of this Nature, the Uſe of ſuch cordial Medicines is repeated or perſiſted in, the now mentioned Diſorders are augmented and increaſed. In a Word, the Man who fooliſhly ſeeks to reſtore his Strength, or raiſe his Spirits, by this Method, has the Fate of him who, by blowing his Fire, renders it, indeed, briſker, but, at the ſame time, leſs durable, than it would otherwiſe have been. *Paulus Valcarengus*, in his *Medicina Rationalis*, endeavours to ſhew, that what proves a Cordial to one Patient, may prove a Poiſon to another. The Origin and fatal Conſequences of this wretched Cuſtom are, by Dr. *Cheyne*, in his Eſſay of Health and long Life, excellently deſcribed in the following manner, when ſpeaking of the idle Habit contracted by ſome Ladies of drinking Cordials. " A Fit of the Colic, or of the Vapours, a Family Misfortune, " a caſual Diſappointment, the Death of a Child, or of a " Friend, with the Aſſiſtance of the Nurſe, the Midwife, and " the next Neighbour, often give Riſe, and become the weighty " Cauſes of ſo fatal an Effect. A little Lowneſs requires " Drops, which paſs readily down, under the Notion of Phy- " ſic; Drops beget Drams, and Drams beget more Drams, " till they come to be without Weight, and without Meaſure; " ſo that at laſt the miſerable Creature ſuffers a true Martyr- " dom, between its natural Modeſty, the great Neceſſity of " concealing its Cravings, and the ſtill greater one of getting " them ſatisfied ſome-how. Higher and more ſevere Fits of " Hyſterics, Tremors, and Convulſions, begot by theſe, " bring forth farther Neceſſity, upon Neceſſity, of Drops, " Drams, and Gills, till at laſt a kind of Dropſy, nervous " Convulſions, a nervous Atrophy, or a colliquative Diar- " rhœa, if not a Fever or a Frenzy, ſet the poor Soul free."

Give me Leave to remark, that Dr. *Cheyne* might have added as one frequent Cauſe of the horrid Cuſtom of drinking Drams, to theſe above-mentioned; I mean the habitual Uſage of very warm diluting Fluids, ſuch as Tea, which, in conſequence of their Heat, relax the digeſtive Organs; whence Flatulencies, Lowneſs of Spirits, and a Neceſſity for Drops, or ſomething elſe, in order to raiſe the ſinking Spirits.

There are, however, ſome Caſes, in which Cardiac Medicines of this Kind may properly be exhibited. In Palpitations of the Heart, for Inſtance, and Syncopes, when theſe Diſorders ariſe from a cold and aqueous, or an inert and mucous State of the Juices; in which Caſes the diſtil'd cohobated Waters, and the diſtil'd eſſential Oils of Baum and Lemon-peel, are principally proper. See AQUA.

Ettmuller informs us, that the Cephalico-cardiac Medicine, communicated by *Elizabeth* Queen of *England* to the Emperor *Rudolphus* the Second, conſiſted of Amber, Muſk, and Civet, diſſolv'd in Spirit of Roſes. According to the celebrated *Hoffman*, in his *Medicina Rationalis*, " We are not to imagine, " that a true and permanent Reſtoration of Strength is to be " procured by ſuch Medicines as communicate Motion to the " Spirits, and ſolid Parts; ſince, in various Diſorders, eſpe- " cially Fevers and Convulſions, the moving Force of the " Heart, Arteries, and Membranes, is ſufficiently great, and " yet the natural Strength is languid and impair'd; ſo that the " true and genuine Perfection of the natural Strength, for the " moſt part, depends upon proper Aliments and Liquors con- " verted into laudable Juices and Blood, of which is afterwards " generated that highly ſubtile Fluid, which is ſeparated in the " Brain, convey'd thro' the Nerves to the Muſcles and muſ- " cular Coats, and which imparts Strength and Vigour to the " Body, and all its Parts. The beſt Analeptics are, therefore, " thoſe nutritive Subſtances which are poſſeſs'd of the moſt " ſalutary Qualities; of this Kind are Jelly, Broths of Fleſhes, " Capons, Bones, and their Marrow, prepared by boiling in " Water in a cloſe Veſſel, with an Addition of a little Wine, " a few Slices of Lemon, a little Salt, Powder of Mace and " Cloves; of this Kind is alſo the Broth prepared of black " *Weſtphalian* Bread, (ſee BOMPOURNICKEL) Water, Wine, " and Eggs. To this Claſs alſo belongs Chocolate, with or " without Milk; Aſſes Milk, Water diſtil'd from coarſe " Bread, and Lemon-peel; Wine, eſpecially old generous " *Rheniſh* Wine, and genuine *Hungarian* Wine. But theſe " nutritive and alimentary Medicines are moſt proper for " recruiting and reſtoring the Strength not immediately under " the Diſeaſe itſelf, nor when the whole Maſs of Blood and " Humours is highly impure; but in the Decline of Diſeaſes, " and in Caſes where the Strength has been exhauſted and im- " pair'd by the Shocks of a previous Diſorder, the Sallies of " exorbitant Paſſions, exceſſive Watchings, Labour and Fa- " tigue of Body and Mind, or profuſe Hæmorrhages; and " even in theſe Caſes a cautious and prudent Moderation is to " be uſed, becauſe theſe Subſtances very quickly paſs into the " Maſs of Blood, and augment its Quantity." With reſpect to the Uſe of Cordials in hot Diſorders, ſuch as continued Fevers, the incomparable *Sydenham* delivers his Sentiments in the following Words: " Cordials, as I have experienced, when " given too ſoon, do Miſchief; and, unleſs Bleeding has pre- " ceded, may derive the crude Matter of the Diſtemper upon " the Membranes of the Brain, or upon the Pleura: For this " Reaſon I never exhibit them, when either no Blood, or very " little, has been previouſly taken away, or when no other con- " ſiderable Evacuation has been made, or the Patient has not " paſs'd the Meridian of Life; for whilſt the Blood remains " rich enough of itſelf, it ſhould not be rendered richer, to the " endangering the Patient; nor does it require to be raiſed and " exalted, ſo long as no remarkable Evacuations have diminiſh'd " its natural Heat. Patients of this kind have Cordials ſtored up " within themſelves, which render external and adventitious ones " either ſuperfluous or prejudicial. In Caſes of this Nature, " therefore, I either preſcribe no Cordials at all, or thoſe of " the weakeſt Kind. But if the Patient ſhould be greatly " weaken'd and diſpirited by copious Evacuations, or if he " ſhould be in the Decline of Life, I generally admit of Cor- " dials even in the Beginning of the Fever; and on the twelfth " Day of the Diſorder, when the Criſis is juſt approaching, I " think a freer Uſe of the hotter Remedies allowable; and " they may be exhibited ſooner, provided there is no Danger of " the febrile Matter falling upon the principal Parts; for, at " this Time, the more the Blood is heated, the more the " Buſineſs of Concoction is promoted." And a little after he ſubjoins, " In this Diſtemper I uſe the milder Cordials at the " Beginning, when the Exeſtuation is moſt violent, and gra- " dually proceed to the hotter, according as the Fever, or the " Degrees of Ebullition, require, always remembering, where " Venefection has been freely uſed, or when the Patient is ad- " vanc'd in Years, to adminiſter thoſe of a ſtronger Kind, than " when no Blood has been previouſly taken away, or when the " Patient is in the Vigour of Life. The milder Cordials are " ſuch as are made of the diſtil'd Waters of Borage, Lemons, " Strawberries, and the compound Scordium-water, with a " Mixture of the Syrup of Baum, Cloves, or Juice of Le- " mons. But the ſtronger are *Gaſcoign*'s Powder, Bezoar, " Confection of Hyacinth, Venice-treacle, and others of a " like Nature." See ANALEPTICA.

All the modern Diſpenſatories are ſo full of Cardiacs, or Cordials, both of the dry and liquid Kind, that theſe alone would take up a Volume, was I to ſpecify them all, and that to very little Purpoſe, becauſe they are generally very inſignificant and trifling Medicines. The beſt Cardiacs are thoſe Remedies which remove the Diſorder of which Lowneſs of Spirits is the Conſequence; and, next to theſe, is Wine, which, exhibited in proper Quantities, and more or leſs diluted as Circumſtances require, will generally anſwer better Purpoſes than more pompous Cordials, whilſt it is leſs capable of doing Miſchief.

I ſhall conclude this Article with the Opinions of *Harvey* and *Valliſneri*, with reſpect to the Cardiac Powders of the Shops. The firſt of theſe affirms, That there is more of a real cordial Quality in a Spoonful of good Broth, or a few Drops of Brandy, than in a whole Ounce of thoſe officinal Powders, diſtinguiſh'd by the pompous Epithet of *Cordial*. *Valliſneri*, in his *Opere Fiſico-mediche*, *T.* 3. informs us, that thoſe are miſtaken, who imagine that earthy Subſtances, ſuch as *Armenian* Bole, ſeal'd Earth, Samian Earth, Pearls, and Bezoars, are in malignant and peſtilential Fevers properly exhibited, with an Intention to reſiſt that Putrefaction which is generated by an Exceſs of Heat and Moiſture, ſince this Putrefaction ariſes purely from Obſtructions, and muſt be great in proportion to them; and ſince

by

by earthy, cold, and dry Subſtances, Obſtructions, and conſequently the Putrefaction ariſing from them, are augmented.

CARDIALGIA, καρδιαλγία, from καρδία, the Heart, or rather the Deſt Orifice of the Stomach, and ἄλγεω, to be pained, the Pain of the Mouth of the Stomach, or Heart-burn. The Antients call'd the Mouth of the Stomach καρδία, as *Galen* obſerves in many Places, particularly *Lib. 2. de Placitis Hippoc. & Plat.* ὁ μὲν δὴ καρδιαλγία τοῦτο, &c. "This "Word *Cardialgia*," he ſays, "does not ſignify the Pain of "the Heart contained within the Thorax; but there lies an "Equivocation in the Term, as is well known to thoſe who "are verſed in the Writings of the Antients, who call'd that "Principal of the Viſcera which is included within the Tho"rax, and the Mouth of the Stomach, by the common Name "of *Heart*." This he goes on to prove by Quotations from *Nicander*, *Thucydides*, and *Hippocrates*. Thus he expounds καρδίης πόνος, "the Pain of the Heart," *Hippoc. Prorrhet.* by στόμαχος ἢ γαστρὸς πόνος, "the Pain of the Mouth of the "Stomach." Again, *Comment.* 3. in *Lib.* 1. *Epid.* he explains καρδιαλγέειν, "to be pained at the Heart," by τὸ στόμα ἢ κοιλίας ὀδυνᾶσθαι, "to have a Pain at the Mouth of the "Stomach." Thus again, *Comment.* 3. in *Progn.* γινομένης δ' ἐκθέσεως τῶν κατὰ τὸν πνεύμονα τόπων ἀναθυμιάσεως τοιαύτης, &c. "Such an Exhalation, which proceeds from the Lungs, is "diſtinguiſhed from what proceeds from the Stomach; which "is the Cardialgia; for the Lungs have little or no Senſation of "ſuch Humours; but the Mouth of the Stomach, which we "know is alſo call'd καρδία, by reaſon of the Multitude, and "quick Senſation, of its Nerves, cannot but be ſenſible of "every thing which is in it. Thus when, under a biting "Senſation from bitter Bile, there is excited that Diſorder "which is call'd *Cardiogmus*, and is attended with bilious Vo"mitings. Of this *Thucydides* alſo takes notice, where he "ſays, That when it (the malignant Humour) ſettled at "the Mouth of the Stomach (καρδία), it ſubverted that Part; "and what the Phyſicians call'd bilious Purgations moleſted "the Patients." The Place in *Thucydides*, quoted by *Galen*, is in his ſecond Book, where he deſcribes the Plague; where the Scholiaſt alſo obſerves, that the Mouth of the Stomach was called by the Antients καρδία (*Cardia*). See CARDIOGMUS.

The *Cardialgia* is none of the leaſt Evils incident to Mankind, but of the Nature of thoſe Diſorders which affect the Mind as well as the Body; nor is it a Pain of the Heart, as it is commonly reckoned, but of the Stomach, which is a very nervous Part, and of exquiſite Senſation, and principally affects its Orifices, being ſeated near the Pit of the Stomach, and very pungent, attended with great Anxiety, Difficulty of Breathing, Loſs of Strength, Reſtleſſneſs, Strainings to vomit, Trembling and Coldneſs of the extreme Parts, and a ſlight Lipothymy, and owing its Original to a Convulſion or Inflation, and frequently communicating its ill Effects, by Conſent of Parts, to the whole nervous Syſtem.

Every Pain of the Stomach is not to be termed a *Cardialgia*, ſuch, for Inſtance, as is attended with a Preſſure and Anxiety, proceeding from the Quantity and long Detention of crude Aliment in the Stomach, becauſe in this there is not that acute Senſation, nor are the Orifices of the Stomach much pained, nor are there that Toſſing and Reſtleſſneſs, and Loſs of Strength, which are almoſt the proper and formal Diagnoſtics of this Diſeaſe, unleſs any one has a mind to call the fore-mentioned Diſorder a ſpurious Cardialgia. The Pain is more intenſe or remiſs, and attended with milder or more ſevere Symptoms, in proportion to the Greatneſs of the Cauſe.

The Seat of this acute Pain, according to the common Opinion of antient and later Phyſicians, is only in the Left Orifice of the Stomach, which *Hippocrates* and *Galen* of old called *Cardia*, whence the Name *Cardialgia*; but we believe it to be rather ſeated in the Right Orifice called *Pylorus*, and that the whole Stomach is affected on account of its extremely ſenſible nerveo-fibrous Coat; and this appears to be true, as we imagine, becauſe this ſevere Pain always begins and fixes about the Pit of the Stomach, under the Cartilago enſiformis, towards the Right Side, where is the conſtant Seat of the Pylorus; and thence extends itſelf to the Left Orifice, which is ſituated in the Back, near the Spine, and penetrates the Diaphragm near the eleventh or twelfth Vertebra of the Thorax: For, in Diſſections of thoſe who have died of the *Cardialgia*, the Right Orifice has been found more affected than the Left, inſomuch that Ulcers, Abſceſſes, Tumors, and ſphacelous Corruptions, have been obſerved in the Pylorus, which have affected alſo the Duodenum, and the very Bottom of the Stomach itſelf.

But as a painful and uneaſy Senſation cannot be excited in the ſenſitive Part of the human Frame, unleſs the nervous and fibrous Parts, from a violent Cauſe, are either affected with a vehement Diſtention, which threatens a Solution of Continuity, or with a ſtrong and convulſive Conſtriction, we may hence obſerve, that a *Cardialgia* is either flatulent, or ſpaſmodic. In the firſt of theſe Diſorders the whole Stomach is violently diſtended, by Flatulences included within its Cavity; in the other, it is corrugated, and contracted into a narrower Space.

It is of no ſmall Importance to know the proper Signs and Diagnoſtics which diſtinguiſh between the flatulent and ſpaſmodic *Cardialgia*. The firſt is attended with a greater Difficulty and Streightneſs of Reſpiration, becauſe the Stomach, being inflated, intercepts the free Deſcent of the Diaphragm, which is abſolutely neceſſary to an eaſy Inſpiration. Beſides, a Tumor manifeſt enough to Senſe, and like an Egg, is frequently obſerv'd in the Pit of the Stomach, inclining to the Right Side, while the Pylorus is continually elevated by the inflated Stomach. There are alſo frequent Eructations, which, while they are diſcharging, ſeem a little to alleviate the Pain; moreover, after Food, eſpecially of a flatulent kind, the Pain is uſually exaſperated; but when the whole Subſtance of the Stomach is affected with a pretty obſtinate Spaſm, there is a greater Anxiety about the Præcordia, a greater Loſs of Strength, Uneaſineſs, and Coldneſs of the extreme Parts.

If the Cauſe be a Humour of a venomous Nature, the Symptoms are highly exaſperated, and threaten much Danger. Hence the Head is affected with Pain, Vertigo, Dimneſs of Sight; want of Sleep, and ſometimes a Delirium and Convulſions, come on; an Oppreſſion of the Breaſt, a Trembling of the Heart, and Syncope, a ſmall weak Pulſe, ſometimes hard, unequal, and intermitting, attend; the Region of the Abdomen is moleſted with Gripes, Conſtipation of the Belly, and Suppreſſion of Urine; the external Parts labour under Refrigerations, Tremblings, Shiverings, cold Sweat; the Face is livid and contracted, and the Patient has a yelloviſh and unpleaſant Aſpect.

That ſo formidable a Train of Symptoms affecting the whole Body ſhould owe their Original to a diſordered Stomach, cannot ſeem ſtrange to one verſed in Anatomy, who knows, that the Eighth Pair of Nerves, which furniſhes the principal internal and nervous Parts with its Diviſions, communicating to them Vigor, Strength, Senſe, and Motion, ſends off two very conſiderable and remarkable Branches near the Left Orifice of the Stomach, of which the internal paſſes, in form of a ſmall Arch, to the Pylorus, and the external goes to the Bottom of the Stomach. And hence we may very well account for that Conſent which ſubſiſts between this noble Part, the Stomach, and the Syſtem of the Nerves; for there is no other Part in the whole Body, which maintains the like Conſent and Communication with the more noble Parts, as does the Stomach. A clear Proof of this, beſides others which may be alleged, are the Obſervations which are found in the Writings of thoſe Phyſicians who have left us Caſes relating to judiciary Medicine, (*Medicine conſidered as it is concerned in determining judiciary Proceedings; as, for Inſtance to the preſent Purpoſe, whether a Man received his Death by a Blow on the Stomach, in which Caſe the Opinion of the Phyſician or Surgeon is required*) by which it appears, that a violent Blow with the Hand, or any hard Weapon, about the Pit of the Stomach, has excited the moſt terrible Symptoms, as immediate Chilneſs, and Falling to the Ground, Epilepſy, and ſudden Death itſelf.

As there are two Kinds of *Cardialgias*, as well as Colic, which are, the flatulent or windy *Cardialgia*, proceeding from Flatulencies violently diſtending the whole Cavity of the Stomach, and the ſpaſmodic convulſive *Cardialgia*, we are next to inquire by what means theſe Flatulencies, which at other times have a free Paſſage thro' the open Orifices, happen to be firmly included and detained within the Cavity of the Stomach. The Reaſon of this Phenomenon has ſcarce been touched upon by Phyſicians; but we ſhall not ſcruple to aſſert, that all ſuch violent Inflations of the Stomach are effected by a Convulſion, which, however, does not affect the whole nerveo-membranous Subſtance of the Stomach, but only its Orifices, as they are Parts endu'd with a quicker Senſation: Theſe Orifices, then, being ſtrongly compreſs'd and cloſed, no Wonder if Vapours, which are principally generated from a Maſs of crude and indigeſted Aliment, being excited by Heat, and finding no Vent, ſhould, by violently diſtending and ſtretching the whole Cavity of the Stomach after a ſurpriſing manner, be the Cauſe of moſt diſmal Pains, attended with the higheſt Anxiety, and Difficulty of Reſpiration.

Hypochondriacal Perſons, whoſe Stomachs abound with acid and bilious Humours, are principally ſubject to this flatulent *Cardialgia*: Hence is the Patient, ſome Hours after Eating, moleſted with ſtrong Tenſions about the Præcordia, Inflation, and ſevere Pains, with a Difficulty of Reſpiration, which Symptoms, by a Diſcharge generally of acid Eructations, are afterwards, in ſome meaſure, abated; or, by pituitous acid Vomitings, are conſiderably alleviated: and at length the Diſorder, by the gradual Returning of the Heat to the Stomach, and extreme Parts, which were ſhivering with Cold, entirely ceaſes. We have frequently obſerved this Diſeaſe in thoſe who, after a pretty long Indiſpoſition, have contracted a great Infirmity of Stomach, when they have eaten a little too greedily, eſpecially of improper Food, ſuch as what is fat, acid,

and diſpoſed to Fermentation, or of Summer-fruits. In ſuch Caſes the Diſorder has been excited, and made frequent Returns upon the Patient at Intervals, attended with Refrigeration of the Body, and eſpecially of the Feet, or Region of the Loins.

We have obſerved alſo ſuch an Inflation of the Stomach, attended with a Pain and Difficulty of Reſpiration, in ſucking Infants, proceeding from Milk coagulated in the Stomach, and there ſtagnating, and turning acid; whence the whole Region of the Præcordia, under the ſpurious Ribs, has been diſtended and turgid with Flatulencies, in a ſurpriſing manner, which was perceiveable both to Sight and Touch. We remember alſo, on this Occaſion, an Example of a young Man, who, from an immoderate Eating of new and ſoft Cheeſe, and drinking upon it *Rheniſh* Wine, not ſtrong, but ſouriſh, was ſeiz'd with a ſevere Fit of the flatulent *Cardialgia*, (which was miſtaken by a Phyſician for the Colic) ſeated in a much inferior Place, and not attended with ſo great a Difficulty of Reſpiration. And here we are oblig'd to take ſome Notice of the Difference between the Colic ſeated in that Part of the Colon which lies immediately under the Stomach, and the Stomachic Colic, if we may ſo call it, becauſe we have more than once obſerv'd Phyſicians miſtaken in this Affair. Beſides, therefore, the Circumſtances of the pained Places, the antecedent Cauſes, and the Symptoms peculiar to the *Cardialgia*, let the prudent Phyſician always carefully obſerve the Succeſs of the Remedies in theſe Caſes; for I have known the Pain of the Colic, ſeated under the Stomach, removed by only one diſcutient Clyſter.

Though generally the common Cauſe of both the flatulent and tenſive Pain of the Stomach be a vitiated Humour, which, being too long detained within the Cavity of the Duodenum, excites Flatulencies affecting the Orifices of the Stomach with a ſpaſmodic Conſtriction; yet we have known Inſtances of the flatulent Diſorder, where we could diſcover no vitiated Matter either in the Cavity of the Stomach, or of the Duodenum. And we have been enabled to paſs this Judgment by conſidering, that ſuch anxious and flatulent *Cardialgias* very frequently moleſt the younger ſort of Women, on a Stoppage of the Menſes, and even in the firſt Months of their Pregnancy, and manifeſt themſelves by Eructations, and a Pain about the Pit of the Stomach and the Back, which return exactly about the uſual Period of the Menſes. We have obſerved ſomething of the like Diſorder in Men who have laboured under a Suppreſſion of the Hæmorrhoids.

Though it be not ſo eaſy to diſcover the Cauſe of this Diſorder, yet, when we conſider, that a Stagnation of Blood within the Veſſels of the Membranes of the Colon, or Inteſtinum Rectum, excites ſpaſmodic Pains in thoſe Parts, we judge, by Parity of Reaſon, the Cauſe to be no other than that the Blood is thrown upon the Regions of the Stomach and Præcordia, and by overcharging the Veſſels of the Stomach excites thoſe convulſive Strictures which affect that Part, and eſpecially its Orifices. And we are confirmed in our Opinion, when we conſider, that it is found, by frequent Obſervations, that thoſe who have laboured under a ſpaſmodic, flatulent, ſtomachic Aſthma, which is often mortal, and generally follow'd by a Dropſy, have, after their Death, been diſcovered to have their Viſcera, eſpecially the Liver, ſtuffed and obſtructed with Blood, and even polypous Concretions have been found in the Ventricles of the Heart, which, by putting a Stop to the free Circulation of the Blood, might eaſily divert its Impetus upon the Præcordia, which might occaſion the Pain and Anxiety, which are always attended with Eructations.

But becauſe there is a very ſevere *Cardialgia*, or Pain of the Stomach, attended with Anxiety, but with no, or at leaſt no remarkable Inflation, which affects not only its Orifices, but whole Subſtance, on account of its nervous Coat, with violent Convulſions, we ſhall inquire a little more exactly into the Cauſes of ſuch a Diſorder. We ſcarce meet with any thing more frequent in Practice, than for a Perſon, after a vehement Fit of Anger, to be ſeized with a compreſſory and conſtrictive Pain about the Præcordia, and the Pit of the Stomach, which lies more towards the Right, and is attended with Anxiety and Streightneſs of the Breaſt, a Nauſea, and Loathing of Food, and a Bitterneſs in the Mouth. Now it will not be difficult to diſcover the Cauſe of this Diſeaſe, if we conſider, that ſuch is the Nature and Force of Anger, when kindled to a vehement Degree, as to exert its pernicious Effects principally on the Præcordia; under which Term, as *Fernelius*, *de Febr. l.* 4. very well explains it, are comprehended the Region about the Stomach, the Diaphragm, the Cavity of the Liver, and biliary Ducts included therein, the Pancreas, the Stomach in particular, and its upper Orifice, with whatever is contained under the Inflections of the ſpurious Ribs, towards the fore Parts and the Sternum; all which, by the Violence of this furious Paſſion, are ſubject to be affected with ſpaſmodic Conſtrictions. Beſides, it is certain, that, by Anger, the bilious Juice is put in a great Commotion, and the biliary Canals, contracting themſelves to a more intenſe Degree, diſcharge a greater Quantity of Bile into the Duodenum, where, by too long Continuance, it is corrupted, and contracts a corroſive Quality, being the ſole Occaſion of Diarrhœas, Cholera Morbus, Vomitings, and Cardialgic Pains, becauſe it irritates the Pylorus, and the Bottom of the Stomach, by its Acrimony. The *Cardialgia* is alſo frequently cauſed by a Fright; and *Platerus*, *Obſervat.* 2. ſhews by an Inſtance, that Sorrow, by inſenſibly corrupting the Humours, diſpoſes to long and ſevere *Cardialgias*.

The convulſive Affection of the Stomach is frequently ſymptomatical. We have often met with Inſtances where a Stone, ſticking in the Beginning, or, what is worſe, in the Middle of the Ureters, has, beſides other troubleſome Symptoms, excited a violent *Cardialgia*, attended with an intolerable Anxiety. We have obſerved the like Effects from bilious Stones paſſing through, or lodging in, the Cyſtic Duct, or Ductus Cholodochus. Hence it clearly appears, that a Part of our Body, endu'd with Senſation, may ſuffer merely from a diſorderly Motion, by Conſent of Parts, without any material Cauſe exiſting in it.

But the moſt ſevere and dangerous ſort of *Cardialgia* is what is excited by taking Poiſons of a burning and cauſtic Nature. That common and miſchievous Drug, which has been the Bane of Multitudes, Arſenic, and others like it, are mortal on no other Account, than that, by their ſubtile and penetrating venomous Spicula, they inſinuate themſelves into the innermoſt Parts of the nervous Fibres of the Stomach, and, by cutting and corroding them, excite thoſe dreadful convulſive Strictures in thoſe Parts, which, being afterwards, by Conſent, communicated to the whole Syſtem of the Nerves, are not only the Cauſe of thoſe Symptoms which are eſſential to the *Cardialgia*, but of others more formidable and fatal, as a ſphacelous Inflammation, Delirium, and Convulſions.

Emetics prepared of Regulus of Antimony, if given in too large a Doſe, are the Cauſe of Cardialgic Symptoms; and if there be other internal Cauſes concurring, as when the Præcordia are already affected with ſpaſmodical Strictures, they kill in the Operation after the ſame manner as Poiſons: Of this there are but too many Examples. The ſame is to be underſtood of the ſtronger and more acrimonious ſort of Cathartics, which act by a ſubtile, cauſtic, and veſicating Principle, and, being imprudently uſed, deſtroy Multitudes.

The Virulence of the peſtilential Contagion is known to exerciſe its Malignity, firſt, by exciting Spaſms and Inflammations in the Stomach, with ſevere *Cardialgias*, and oftentimes a Syncope. A *Cardialgia*, ſucceeding a Fever with petechial or purple Spots, is accounted a deadly Sign. It is alſo a very bad Symptom when a *Cardialgia* follows the Gout, as it frequently happens, the peccant Matter turning inwards upon the more noble Parts; or when it ſucceeds, as is uſual, foul Exulcerations of the Skin, and the external Parts. For when the offending Matter, of an active and cauſtic Nature, being ſeparated from the Humours, was propel'd to the Superficies of the Skin, and afterwards retires inwardly, and deeply inſinuates itſelf into the nervous Coats of the Stomach and Inteſtines; whether theſe Coats be of a tender or firm Contexture, it acts after the manner of Poiſon, and, if not ſoon expel'd, by inducing Cardialgic Anxieties, throws the Patient into a Lipothymy, which is often ſucceeded by Death itſelf.

Epidemic and malignant Dyſenteries, if imprudently ſuppreſs'd, are follow'd by a *Cardialgia*, which prognoſticates a bad Event; for the acrimonious and cauſtic Matter being, by a retrograde Motion and Impetus, transfer'd from the inferior Parts of the Inteſtines to the ſuperior, and the Stomach, greatly infeſts theſe noble Parts, and ſometimes induces fatal Symptoms.

There is alſo a dangerous *Cardialgia* that owes its Original to Worms, which, as *Trallian* well obſerves, aſcend from the lower Parts to the Stomach, and firmly adhere to its Orifices. Of this we have a remarkable Example, recorded by *Herculas Saxonia*, *Prælect. Prac. Part* 2. *Cap.* 7. "Three Years "ago," ſays he, "I was call'd to a Boy eleven Years of Age, "who was full of Worms. I gave him ſome Pills, but, when "I returned the next Day, he was dead. I took care to have "his Stomach opened, where I found three-and-thirty live "Worms, about nine Inches in Length, which adhered ſo "tenaciouſly to the Mouth of the Stomach, that they could "ſcarce be pull'd away." More Inſtances to this Purpoſe may be found in *Henricus ab Hier*, *Lanciſi de Mort. ſubit.* and *Riverius*, *Lib.* 9. *Cap.* 10. It is very probable, that the Cauſe of ſuch a ſudden Death was no other than an invincible Syncope, proceeding from a ſtrong Conſtriction of the Heart, or rather its adjacent Veſſels. Hence we underſtand the Excellency and Importance of that noble Part the Stomach, for the Preſervation of Life; which *Helmont* thought ſo conſiderable, that for this Reaſon he plac'd the Seat of the ſenſitive Soul in that Part.

There are other, and thoſe occult, Cauſes of thoſe diſmal convulſive Diſorders of the Stomach: For where there is a continual Pain for many Months together, by which the Fleſh is conſumed, and the Strength quite exhauſted, we may rightly conclude, that there is a latent Defect and Diſorder in the ſolid Parts; and this is confirm'd by Diſſections. Thus *Riverius*, *Cent.* 1. *Obſ.*

Obſ. 90. in ſuch a chronical Diſorder found a Scirrhus, which ſurrounded the whole Pancreas, with the Beginning of the Pylorus and Duodenum. And *Haller*, *de Morb. intern.* relates a Story of a Man, who, after he had a long time labour'd under a Fever, Cardialgia, Vomiting, Gripes, and Stools like Pitch, at laſt dy'd; his Body being diſſected, there was found an Ulcer, ſurrounded with Puſtules, which had corroded all the Coats of the Stomach on that Part which leads to the Pylorus.

Another Way of generating this troubleſome Diſeaſe is by Tranſlation. Thus we have known two Examples of this kind in the Female Sex, where a *Cardialgia*, with a Difficulty of Reſpiration, ſucceeded a conſiderable Tumor of the Parotid Glands, which diſappeared after ſome external Applications. I have alſo obſerved, that a Hemicrania and a Cardialgia have appeared, and diſappeared, alternately; ſo that when the Cardialgia was remov'd, the Hemicrania appeared, and *vice verſa*.

That Pain of the Stomach which we call *Cardialgia*, when not attended with an Inflammation, is among the Number of thoſe Diſeaſes which are not generally mortal, except when they continue long. For this Reaſon the Diſorder is dangerous when it ſucceeds other Diſeaſes, eſpecially acute and malignant Fevers; for *Hippocrates*, in the ſixty-fifth Aphoriſm of his fourth Section, juſtly obſerves, "That, in Fevers, a violent Heat "about the Stomach, and a Senſation, as it were, of a gnawing "Pain about the Heart, are bad Symptoms." This Diſorder is alſo to be claſs'd among the Number of theſe which return ſometimes at ſtated Intervals, and ſometimes not; which continue ſometimes for a longer, and ſometimes for a ſhorter Period; and which at one time are mild and gentle, and at another rage with intolerable Fury. As the firſt Approaches of this Diſorder are generally accompany'd with a Coldneſs of the Back, a Chilneſs of the Skin, and ſometimes with a Yawning and Stretching; and as, in its Height, the extreme Parts, eſpecially what we call the lower Extremities, become ſo cold, that a conſiderable Heat, when applied to them, is not perceiv'd; ſo this Indiſpoſition is not remov'd till the Heat returns to the Extremities, and a warm Sweat ariſes over all the Body. And as, during the Cold, the Pulſe is contracted, and ſmall; ſo, in the Decline of the Diſorder, it becomes larger and ſofter, which is a certain Sign, that the Indiſpoſition is going off.

As a wiſe and ſkilful Phyſician ought not invariably to recommend ſtated Remedies for the Cure of a Diſorder, nor at all times to proceed in a beaten Path; but to regard Cauſes of various Kinds, the Conſtitution of the Patient, preceding Diſeaſes and Symptoms, together with other Circumſtances of Importance; ſo 'tis neceſſary he ſhould take the like Meaſures in the Cure of this Diſorder. He ought, however, to keep theſe general Indications of Cure in his Mind, that he may be able to preſcribe ſuch Remedies as will afford Relief. The firſt is, that the Matter, peccant either by its Quantity or Acrimony, and which is lodged about the Stomach, be temperated, corrected, render'd mild, and gently removed, by Diſcutients, or proper Evacuants. The ſecond is, to alleviate and ſooth the violent Pains, which ſurpriſingly impair the Strength, leſt an Inflammation ſhould ſucceed. The third is, if the Diſorder is ſymptomical, to have a due Regard to the primary and original Diſeaſe. The fourth is, by proper Remedies, to reſtore and confirm the Strength and Tone of the Stomach and Inteſtines, which have been weaken'd by the Violence of the Pains and Spaſms.

Since it often happens, that the Saliva and Humours, accumulated and collected in the Region of the Stomach, do, by their long Retention, render the Bile in the Duodenum porraceous, æruginous, and highly corroſive, and, by corroding the nervous Coats, prove the Cauſe of the Cardialgia; and, as this frequently happens in hypochondriac Patients, as alſo in others, by a too liberal Uſe of acid Wines, and the Fermentation of unripe Fruits, it is agreeable to Experience to attempt the Cure only by Abſorbents, and ſuch Medicines as correct Acrimony. For anſwering this Intention, we recommend Powders prepar'd of Crabs-eyes, calcin'd Hartſhorn, Mother of Pearl, Mountain Cryſtal, or rather the Lapis Specularis, (*Muſcovy Glaſs*) prepared; eſpecially if they are exhibited in a gently ſpirituous carminative Water. For correcting and reſtraining the Acrimony, we alſo recommend gelatinous and well ſaturated Decoctions of the Shavings of Hartſhorn, and Water-gruel, qualified with ſweet Almonds, and edulcorated with Syrup of white Poppies.

But when a highly acrid ſulphureous and hot Bile, thrown into Commotions by an Exceſs of any Paſſion, is the Cauſe of this Diſorder, it is adviſeable to mix a few Grains of purified Nitre with the above-mention'd Powders, of which a proper Doſe is to be exhibited in a Decoction. But 'tis ſometimes neceſſary gently to evacuate the corrected Bile by Stool. I have alſo learn'd from Experience, that when this troubleſome Diſorder ariſes from a too hot, effervеſcent, and cauſtic State of the Bile, repeated Exhibitions of half a Pint or more of pure cold Water, covering the Body well, and applying warm Fomentations to the Region of the Stomach, have proved ſingularly beneficial; ſince by that means an univerſal Diaphoreſis is excited, and the Diſorder removed. I have alſo obſerved, that, by the ſame Remedy, the bilious Acrimony has not only been diluted and corrected, but alſo the intenſe Heat allay'd, and the Strength, impair'd by the Heat and Pain, in ſome meaſure reſtor'd. I have alſo ſeen a Cardialgia, accompany'd with a *Cholera Morbus*, conſiderably alleviated by this Medicine. The liberal Uſe of Whey and Emulſions is alſo of conſiderable Service in Caſes of this Kind.

'Tis no uncommon thing, after tertian Fevers, to obſerve Patients afflicted with a troubleſome Pain about the Præcordia, accompany'd with a conſiderable Languor of the Strength, Loathing of Food, Dryneſs of the Mouth, and ſometimes with gentle Swoonings away, and hectic Heats; all which Symptoms were produced by an acrid and peccant Bile, collected in a large Quantity, and ſtagnating long in the Duodenum, when its periſtaltic Motion is impair'd by the Shock of the Diſeaſe. This I learn'd from the Exhibition of an Emetic, two or three Grains, for Inſtance, of emetic Tartar, with a ſufficient Quantity of Water; for by this means a large Quantity of Sordes was diſcharg'd, upon which I immediately obſerved the above-mention'd Symptoms to diſappear. Hence *Hippocrates*, in the ſeventeenth Aphoriſm of his fourth Section, juſtly obſerves, "That, in Patients who have no Fever, Loathing of Food, "a gnawing Pain at the Mouth of the Stomach, a Vertigo, "accompany'd with Dimneſs of Sight, and a bitteriſh Taſte "in the Mouth, denote that Evacuations, by Vomit, are ne-"ceſſary."

In Caſes where, to a bilious Cardialgia, a Vomiting, as it frequently happens, is join'd, I have afforded the Patient inſtantaneous Relief, by an Exhibition of the anodyne mineral Liquor, with cold Spring-water, or the Waters of the Flowers of Chamomile, Yarrow, *Egyptian* Thorn, the Lime-tree, Elder, Lilies of the Valley, and Primroſes. In this Caſe the Phyſician is to be careful not to exhibit the hot ſtomachic or carminative Eſſences, nor to load the Patient's Stomach with the repeated Uſe of hot Infuſions, ſince all theſe rather increaſe than diminiſh the Diſorder.

But when an intenſe, preſſing, and heavy Pain for a long time affects the Region of the Stomach; and when this Pain ariſes from acido-viſcid Crudities, firmly adhering to the Coats of the Stomach and Duodenum, which very frequently happens in thoſe who are juſt recover'd from a Diſeaſe, and in ſuch as, from any other Cauſe, labour under a Weakneſs of the Stomach, then another and a different Method of Cure is to be follow'd; for, in ſuch Caſes, digeſtive Medicines, and thoſe which act by a ſaline, oleous, aromatic, inciding, and corroborating Quality, are neceſſary. For anſwering this Intention we ſhall recommend the following Things, ſince Experience has convinced us of their Efficacy.

Take, then, of the Root of Arum, Burnet, Ginger, Galangals, the external Surface of Orange-peel, Cumin-ſeeds, and Mace, each a Dram; of Sugar-candy, a Quantity equal to all the reſt of the Ingredients: Mix up into a Powder; a proper Doſe of which is to be gently boil'd in the beſt Wine, and drunk.

The following Mixture is alſo very proper in ſuch Caſes:

Take of the Eſſence of Zedoary, of *Wedelius*'s carminative Eſſence, and of the Spiritus de Tribus, each two Drams; and of my Balſam of Life, fifteen Drops.

But ſometimes, before the Uſe of theſe, 'tis neceſſary, that the Collection of ſordid and peccant Humours ſhould be gently evacuated by Vomit, eſpecially if the Patient has any Inclination that way. But, even when this is neceſſary, we muſt not venture upon more powerful Emetics than Ipecacuanha, ſince it neither ſtrongly irritates the nervous Coats, nor, after its Operation, leaves a Diſpoſition to vomit, as the Preparations of Antimony generally do.

If, by a Draught of cauſtic Poiſon, or the Exhibition of a draſtic Purge or Vomit, any one is ſo violently ſeiz'd with this Diſorder, as to have his Life immediately expoſed to Danger, a more efficacious or inſtantaneous Relief is to be expected from nothing, than from the Uſe of ſweet Milk, oleous Subſtances, Oil of ſweet Almonds, and Olive-oil, drank in ſufficient Quantities, exhibiting at the ſame time a Doſe of *Venice* Treacle. But 'tis more adviſeable, at firſt, to give Milk only, or rather Cream, without the Treacle, leſt the Vomiting and Purging, by which the poiſonous and corroſive Matter is often moſt effectually evacuated, ſhould be too ſoon ſtopt.

When a Cardialgia, as a Symptom, attends other Diſeaſes of the acute or of the exanthematous Kind, which rarely happens without Danger of a fatal Inflammation, then bezoardic Powders, with a few Grains of Nitre, and one Fourth or half a Grain of Camphire, are of ſingular Service, in conſequence of their gently diſcutient and diaphoretic Quality. But, that theſe Powders may the more effectually anſwer the Intention, I adviſe them to be exhibited in an Emulſion prepared of ſweet Almonds, the Four cold Seeds, the Seeds of the Carduus Ma-

riæ,

riæ, and Elder-flower-water. And if the peccant Matter, repel'd from the Surface of the Body, and almoſt reſembling the Nature of Poiſon, is again to be ſtruck out to the Skin, I have often found, that the Intention was excellently anſwer'd by my anodyne mineral Liquor, mix'd with a fourth Part of the *Spiritus Buſſii*, or of the Spirit of Tartar, exhibited at different times, as the Condition of the Patient requires: A proper and mild diaphoretic Regimen muſt be uſed at the ſame time.

When this Diſorder derives its Origin from an Obſtruction of the Menſes, in conſequence of which the Impetus of the Blood is directed to the Præcordia, then Veneſection in the Foot affords immediate Relief; provided it is not perform'd during the Paroxyſm, but on its Remiſſion, nor at the Time the Extremities are cold. Afterwards the Cure is to be completed by gentle Anodynes, and Diſcutients, externally apply'd. In all Cardialgias I recommend the Flowers of common Chamomile, and Preparations of them, as Remedies of ſingular Efficacy: Of this Kind is Chamomile-flower-water, diſtil'd Oil of Chamomile, which is delicate, genuine, and not adulterated with Oil of Turpentine, reduced to an Elæoſaccharum. Any proper Eſſence alſo, well ſaturated with moderately ſtrong Spirit of Chamomile-flowers, and made up with an Elæoſaccharum of the Oil of the ſame, is highly efficacious in ſoothing ſpaſmodic Motions. To this Claſs alſo belongs the Extract of Chamomile, which, with other proper Ingredients, may be made up into Pills. A Decoction of Chamomile-flowers, in Ale or Water-gruel, with an Addition of Oil of ſweet Almonds, drank warm, is indeed a common, but at the ſame time an approved Remedy for this Diſorder.

In Cardialgias of every Kind, anodyne and emollient Clyſters never fail to prove beneficial: Of this Kind are thoſe prepared of the Flowers of Chamomile, thoſe conſiſting of the Oil of theſe Flowers, either by Coction or Diſtillation, and thoſe prepar'd of the Four carminative Seeds. They anſwer the Intention beſt, when prepar'd with Milk. But 'tis ſometimes neceſſary they ſhould be twice or thrice injected; for, as in almoſt all violent Pains, ſo in this, they afford a ſingular Relief by their kindly and anodyne Warmth; as alſo by that Quality they poſſeſs, by which they ſoften and relax the rigid Fibres.

In violent Cardialgias, and Pains of the Præcordia, proper Remedies, apply'd externally to the Epigaſtric Region, are always obſerved to be of ſingular Advantage. And, amongſt many others for this Purpoſe, I have often experienced the ſurpriſing Efficacy of the following; the firſt of which is a Liniment, to be prepar'd thus:

Take of Theriaca, and expreſs'd Oil of Nutmegs, each an Ounce; of Caſtor, Saffron, and *Peruvian* Balſam, each one Dram; of the Oils of Cedar and Cloves, each twenty Drops; of Camphire, half a Dram.

The following Powders are alſo of ſingular Efficacy for this Purpoſe:

Take of Mint, of common and *Roman* Chamomile-flowers, and of Elder-flowers, each an Handful; of Bay and Juniper-berries, each half an Ounce; of Cumin and Caraway-ſeeds, of Cloves and Nutmegs, each two Drams. When they are ſufficiently cut, and beat together, let the Species be included in a Bag, and apply'd warm to the Part affected; for Heat, in a certain Degree, has, from its very Nature, a Power of alleviating and diſcuſſing.

If Worms ſhould happen to be the Cauſe of this Diſorder, then a quite different Method of Cure is to be follow'd: But if they are lodged in the Stomach, the ſtronger Anthelminthics, eſpecially thoſe which operate by an acrid, draſtic, and corroſive Quality, ſuch as mercurial Preparations, Vitriol of Copper, Vitriol of Iron, aloetic Purgatives, or even Salts, in other reſpects proper enough, are by no means to be exhibited, becauſe they often exaſperate the Diſorder; but warm Milk, with a ſufficient Quantity of the Oil of ſweet Almonds, is rather to be preſcrib'd. Theſe Subſtances, in conſequence of their anodyne Quality, and their affording Food for the Animalcules, in order to prevent their gnawing the Coats of the Stomach, are highly proper for the Cure of this Diſorder; eſpecially if we conſider, that warm Milk, drank in large Quantities, will make the Patient retch, and diſlodge theſe unwelcome Gueſts by Vomit.

Patients, ſubject to the Hypochondriaco-ſpaſmodic Paſſion, are frequently long afflicted with Returns of theſe uneaſy Pains; in which Caſes, after the Exhibition of other Medicines to no Purpoſe, I have often ſeen the Waters of warm Springs, eſpecially of the *Caroline*, uſed for ſome time, prove highly beneficial. But the Uſe of theſe ought ſometimes to be repeated. That a hæmorrhoidal Diſcharge, contributing greatly to the Relief of the Patient, has been produced by their Uſe, I have often obſerved. Beſides, my *Elixir Balſamicum Viſcerale*, mix'd with Eſſence of Caſtor, as alſo mild gently nitrated antiſpaſmodic Powders, and Veneſections at the Equinoxes, are of ſingular Service in chronical Pains, and Diſorders of this Kind.

Thoſe who are ſubject to Cardialgias, both in and out of the Paroxyſm, ought carefully to abſtain from Medicines of a ſaline Nature; of which Kind are the *Sedlitz* Waters, the Uſe of which I have often obſerved to do more Prejudice than Service in theſe Caſes.

To prevent the Return of this troubleſome Diſorder, ſeveral Circumſtances of Importance are carefully to be obſerved: Firſt, then, they who are ſubject to Cardialgias ought not to uſe the more acrid Purgatives; becauſe theſe, being in their very Nature prejudicial to the Stomach and its Coats, if frequently uſed, produce a Weakneſs of theſe Parts, than which nothing more effectually contributes to a Relapſe. Beſides this Misfortune attending them, they derive the Humours from other Parts of the Body to the *Primæ Viæ*. We are, however, to take care, that the Body be always kept ſoluble; which End is, in this Caſe, more ſafely obtain'd by Aliments than Medicines. The Back alſo, and the Præcordia, where the Stomach and its Orifices are ſituated, are carefully to be defended from the Cold by ſufficiently warm Clothes; for 'tis ſcarce credible how prejudicial Cold is to the nervous Parts, and thoſe Diſeaſes ariſing from a Weakneſs of them. But 'tis difficult to perſuade Mankind of the Truth of this. With reſpect to Aliments, the Patients muſt abſtain from all Subſtances poſſeſs'd of a high and intemperate Quality, Things too ſalt, or ſuch as are indurated in the Smoak, Pepper, Garlick, Things pickled in Vinegar, Horſe-radiſh, and other Things of a like Nature. But we recommend, as proper Aliments, Broths of Fowls and Veal; but order the Patients to abſtain from pinguious Fleſhes, eſpecially when they are to drink any thing which is cold, or when the external Cold has Acceſs to the Region of the Stomach.

The Heart-burn is uſually cauſed either by an alcaline or acid Acrimony prevailing in the Stomach. If by a redundant Acid, which is moſt generally the Caſe, alcaline Subſtances will cure the preſent Diſorder, as teſtaceous Powders, or a Clove chew'd in the Mouth, and ſwallow'd gradually: But, if the Diſorder proceeds from an Alcali, the Cure will conſiſt in the Exhibition of acid or aceſcent Subſtances.

Galen recommends Vinegar of Squills, taken in a Morning, as a moſt effectual Remedy for preventing a Cardialgia: But *Hippocrates*, in the ſecond of his *Epidemics*, orders hot Bread, with pure Wine, to be given in this Diſorder.

I remember an habitual Cardialgia treated ſucceſsfully, by a foreign Phyſician, by a Mixture, in which the only Ingredients were Preparations of Mint, as Mint-water, Spirit of Mint, Salt of Mint, and Syrup of Mint.

CARDIMELECH. A fictitious Term in *Dolæus*, *Encyclop. Lib.* 2. by which he intends to expreſs a ſort of particular active Principle, reſiding in the Heart, appointed to what we commonly call the *Vital Functions*, as Reſpiration, and Diſtribution of the Blood thro' the Body.

CARDINALIS FLOS. The *Trachelium Americanum*, or *American* Throatwort; ſo call'd becauſe its Flower, by the intenſe Redneſs of its Colour, ſeems to emulate the ſcarlet Robes of a Cardinal, eſpecially when the Sun ſhines on it. *Blancard.*

CARDINAMENTUM. A Hinge-like Articulation.

CARDIOBOTANON, καρδιοβότανον. The Name of an Herb in *Myrepſus*, *de Unguentis*, *Cap.* 46. which the *Latin* Copies, as *Fuchſius* ſays, render *Carduncellus*, by which they mean the ſame as *Carduus benedictus*; but he believes, that *Myrepſus*, by καρδιοβότανον, intended what we call *Cardiaca*, or Motherwort; both becauſe they ſeem to agree very well in Name, and alſo becauſe the Herb *Cardiaca* cuts, attenuates, and diſcuſſes groſs Humours.

CARDIOGMUS, καρδιωγμὸς (from καρδιώω, to have a gnawing Pain at the Mouth of the Stomach). A biting or vellicating Senſation at the Mouth of the Stomach, from an acrimonious Humour infeſting that Part. It is a Word frequently uſed by *Hippocrates*, and is thus explain'd by *Galen*, *Comment. ad Aph.* 17. *Lib.* 4. Καρδιωγμὸς, ὄρεξις καρδίας, τυγχάνει τὸ στόμαχος τῆς γαστρὸς, ὀνόμαζον γὰρ οἱ παλαιοὶ καὶ τοῦτο καρδίαν "Cardiogmus is a biting Senſation at the Cardia, that is, Mouth "of the Stomach, which Part the Antients call'd *Cardia*." And again, *Lib.* 8. *C. M. S. C.* Εἴρηται πολλάκις ὡς τὸ τῆς γαστρὸς στόμα καλοῦσιν οἱ ἰατροὶ τοῖς ἰδίοις, ὥσπερ καρδίαν, οὕτω καὶ στόμαχον, &c. "We have often obſerved, that it is cuſtomary "with Phyſicians to call the Mouth of the Ventricle, or Sto"mach, ſometimes *Cardia*, ſometimes *Stomachus*; but for"merly *Cardia* was the more uſual Appellation, whence τὸ "καρδιώσσειν, and ἡ καρδιαλγία, are ſtill in Uſe *(to expreſs the "Pain or biting Senſation at the Mouth of the Stomach)*." *Euſtathius* explains καρδιώσσειν by καρδίας ἀλγεῖν καὶ ναυτιᾶν "To be "affected with a Pain at the Mouth of the Stomach, and a Nau"ſea." *Heſychius* expounds the ſame Word by τὴν καρδίαν ἀλγεῖν but adds, that with ſome it ſignifies δάκνειν στόμαχον ὑπὸ λιμοῦ, "to have a biting Senſation at the Mouth of the "Stomach from Hunger;" and that it is alſo taken for ναυτιᾶν, "to be affected with a Nauſea, or Averſion to Food." But *Erotian* is moſt full to the Purpoſe, in expreſſing the Force of this

this Word καρδιώσεων. "The Antients, he says, call'd the "Mouth of the Stomach *Cardia*, which we now commonly "call *Stomachus*; whence καρδιώσσειν and καρδιαλγῶν signify "to be affected with a Pain and Nausea at the Stomach; and "καρδιωγμὸς is used to express a biting Sensation at the Sto-"mach. There is another *Cardiogmus* [καρδιωγμὸς] which "belongs to the *Cardia*, taken properly as one of the Viscera, "(*the Heart*) being a *Diogmus*, [διωγμὸς] that is, a quick and "vehement Palpitation of that Part." *Galen*, in his *Comment. ad Aph.* 65. *Lib.* 4. explains the Homonymy in the following Words: "Most of those, he says, who have expound-"ed the Aphorisms, have understood καρδιώσεων and καρδιαλγῶν "in the same Sense; but some take καρδιωγμὸς for a palpi-"tating Motion of the *Cardia*, understood as one of the Visc-"cera. Now a vehement Estuation being excited in the Sto-"mach by an Effervescence of yellow Bile within its Coats, "it is agreeable to Reason, that, when the Coats of the Sto-"mach are thus affected, its Orifice should also suffer by a "biting Sensation, which is therefore a bad Symptom. But "if you will have *Cardiogmus* to mean a quick and swift Mo-"tion of the Cardia (*Heart*) most like Palpitation, it is the "worst of Symptoms, as it indicates an Inflammation of the "vital Principle." The Word καρδιώσεων, explain'd by *Erotian* before, is read in the following Passage of *Hippocrates*, (*Lib.* 1. περὶ γυναικ.) εἰκὸς δὲ ἐστι ἐν τῷ μεσηγὺ χειμῶνι πυρεσσαίνειν, καὶ φείσεων, καὶ καρδιώσεων. "It is probable, that, in the interme-"diate Time, the Woman is feverish, shivering, and molested "with a biting Pain at the Mouth of the Stomach." He uses the Word in many other Places of the same Book. See CARDIALGIA.

CARDIOTROTUS, καρδιότρωτος. A Person who has a Wound in his Heart. *Galen.*

CARDIR, Tin. *Johnson.*

CARDIS, *Mars*, Iron. *Johnson.*

CARDO. The Articulation call'd *Ginglymus* is sometimes express'd by *Cardo*, on account of its Similitude to a Hinge.

CARDONIUM. Wine medicated with Herbs, in the Phrase of *Paracelsus.*

CARDOPATIUM. A Name for the *Carlina acaulos, magno flore. Rieger.*

CARDUELIS, Offic. Will. Ornith. 1. 189. Raii Ornith. 256. Ejusd. Synop. A. 89. Aldrov. Ornith. 2. 798. Gesn. de Avib. 215. Jonst. de Avib. 68. Charlt. Exer. 87. Mer. Pin. 175. Schw. A. 233. Bellon. des Oyse, 353. THE GOLD-FINCH.

This Bird roasted, and eat, is said to be a Remedy against Iliac and Colic Pains. *Dale.*

CARDUNCELLUS. It is not certain whether this Word imports the Herb *Carduus Benedictus*, or the *Cardiaca*, Motherwort. See CARDIOBOTANON.

CARDUUS. The Thistle. See ACANTHUS.

Many Sorts of Carduus were taken notice of by the Antients, but it is no easy Matter to distinguish them by their Names. *Pliny*, *Lib.* 20. *C.* 23. informs us, that the Root of every sort of Carduus, boil'd in Water, causes Thirst, and corroborates the Stomach; and that it has some Effect upon the Uterus, causing Males to be generated, according to the Report of *Chæreas* the *Athenian*, and *Glaucias.*

Apicius, *L.* 3. *C.* 19. gives several Methods of preparing these Plants for culinary Purposes; which the Reader who thinks Cookery of more Importance than Physic, may consult.

The modern Botanic Authors have very much embroil'd the Species of Carduus, every one having taken the Liberty of classing those Plants, which were most agreeable to their particular Systems, under the *Cardui*, and banishing others. *Boerhaave* enumerates thirty-three Species.

The Characters of the *Carduus* are:

The Leaves grow alternately on the Branches, and are prickly: The Heads are, for the most part, squamose and prickly; and the Plant is, in every Part, beset with Multitudes of rigid Pickles; and the Plants, at least most of them, are lactescent.

1. *Carduus*; *Pycnopolycephalus*; *Sylvestris*; Triumfett. 100. 103. Ic. M. H. 3. 153. *a. b.*

2. *Carduus*; *spinosissimus*; *angustifolius*; *vulgaris.* C. B. Pin. 385. *Carduus, sylvestris, tertius.* Dod. p. 740. *Carduus, caule Crispo.* J. B. 3. 59. *b. Flore purpureo.*

3. *Carduus*; *spinosissimus*; *angustifolius*; *flore albo. b.*

4. *Carduus*; *caule crispo*; *capitulis minoribus.* b. *Carduus asininus, seu sylvestris.* THISTLE UPON THISTLE.

This Thistle grows to be three or four Foot high, and sometimes to be taller than a Man, if the Soil is agreeable to it. The Root is single, white, and surrounded with numerous capillary Fibres; the Stalk an Inch thick, somewhat hairy, greenish, furnish'd with prickly curl'd jagged Membranes, growing to it lengthwise, hollow, and divided into a Multitude of very long Branches. The Leaves are nine Inches, or somewhat less, in Length, jagged, of a dark Green, hairy, and beset with numerous very sharp Prickles. The Heads of the Stalk and Branches are squamous, set with softer Prickles, and open into purple or white Flowers, follow'd by dark-colour'd Seeds, producing Down at their Top. It grows by the Sides of Ditches, near Hedges, and among Bryars.

Riverius observes, that half an Ounce of the Roots, boiled with two Drams of Liquorice, makes a good Medicine for those who are afflicted with the Stone, cleansing the Bladder and Kidneys from Sand and Gravel.

5. *Carduus*; *lanceatus*; *latifolius.* C. B. P. 385. M. H. 3. 153. *Carduus, lanceolatus, sive sylvestris, Dodonæi.* J. B. 3. 58. *b. Flore purpureo.*

7. *Carduus*; *lanceolatus*; *ferocior.* J. B. 3. 58. *b.*

8. CARDUUS HÆMORRHOIDALIS, Offic. Chom. 762. Cod. Med. 28. *Carduus vinearum repens sonchi folio*, C. B. Pin. 377. Boerh. Ind. A. 136. Dill. Cat. Giss. 113. *Carduus vulgatissimus viarum*, Ger. Emac. 1173. Raii Hist. 1. 310. Synop. 3. 194. Hist. Oxon. 3. 156. Mer. Pin. 21. *Carduus vulgatissimus, radice repente ceanthos Theophrasti*, Merc. Bot. 1. 27. Phyt. Brit. 23. *Carduus ceanthos sive viarum & vinearum repens*, Park. Theat. 959. *Carduus serpens lævicaulis*, J. B. 3. 59. *Cirsium arvense sonchi folio, radice repente, flore purpurascente*, Tourn. Inst. 448. Rupp. Flor. Jen. 151. Buxb. 72. THE COMMON CREEPING WAY-THISTLE.

M. *Herman* had Reason to believe, that this Plant is the same with the *Carduus in avena proveniens*, C. B. Pin. and the *Carduus serpens lævicaulis*, J. B. 3. 59. Mr. *Ray* adds to it the *Carduus spinosissimus, capitulis parum aculeatis*, C. B. Pin. But the Figure of the *Onopyxus alter*, Lugd. does not very well agree with it. Most Authors, that have mention'd this Plant, have taken no notice of the creeping of its Roots: *Columna*'s Figure and Description are excellent. *Martyn's Tournefort.*

The Root is whitish, and now-and-then inclining to black, of a pretty strong Smell, sending forth Fibres as it creeps along under the Ground, and propagating itself to an immense Degree. It grows to the Height of a Cubit and a half, and sometimes more, with a slender, single, round, striated, green, and sometimes red Stalk, which is hairy near the Ground, and furnished with a few small Prickles, which have Leaves growing to them, jagged, like those of the Sonchus, or Sow-thistle, sometimes woolly, sometimes smooth, sometimes narrow; others wider, and not so deeply jagged, with their upper Face green and shining, but paler underneath. The Stalk runs out into Branches, bearing small, oblong, turbinated, squamous Heads, which are furnished with short, but not at all stiff Prickles, and produce Flowers of a faint red Colour, succeeded by small oblong Seeds, of a brown or dark-olive Colour, and involv'd in Down. The Flower often changes its Colour; and the upper Part of the Stalk is sometimes converted into a Body of a thick Substance, and of a nearly oval Figure, which serves as a Matrix for a kind of Insect.

This Thistle is too frequent in Tillage Grounds, and is often found in uncultivated Places, and by the Way-side; it creeps deeply under the Earth, whence it is very difficult to be extirpated; and it flowers in *July* and *August.*

It is called *Hæmorrhoidalis* (Hæmorrhoidal) from its Effects; for the Herb bruised, or boiled in Water, and reduced to the Form of a Cataplasm, mitigates the Pain of the Hæmorrhoids. Some affirm, that the Tubercles arising from the Bitings of Insects on the Stalk, if worn in a Bag, or ty'd in a Patient's Shirt, produce the same Effect; others advise wearing the dry'd Heads of the Plant in a Bag.

9. *Carduus*; *vinearum*; *repens*; *folio sonchi*; *flore albo.* C. B. Pin. 377. *b.*

10. CARDUUS MARIÆ, Offic. Ger. 989. Emac. 1149. Raii Hist. 1. 312. Synop. 87. *Carduus Mariæ vulgaris*, Park. 975. *Carduus Marianus, sive lacteis maculis notatus*, J. B. 3. 52. *Carduus Marianus sive lacteus*, Chab. 348. *Carduus albis maculis notatus vulgaris*, C. B. 381. Hist. Oxon. 3. 155. Tourn. Inst. 440. Boerh. Ind. A. 136. Dill. Cat. 129. Buxb. 56. LADIES THISTLE.

This *Thistle* is distinguished from all others which grow in *England*, in that its Leaves, which are large and long, of a shining green Colour, cut into several Laciniæ, full of sharp hard Prickles, have all the upper Part spotted with long and broad white Spots. The Stalk arises to be four or five Foot high, full of the like Leaves; on the Tops of the Stalks grow large Heads, whose scaly Covers are full of stubborn, hard Prickles, each Scale terminating in one; in the Middle of the Heads, come Thrums of purple fistular Flowers, which are succeeded by white Seed, oblong, and somewhat flattish, inclos'd in a great deal of Down. The Root is thick, growing deep in the Ground: It grows frequently upon Banks and Borders of Fields, and flowers in *June.* The Leaves and Seed are used.

When the Leaves of this Thistle come first out of the Ground, and are young and tender, they are boiled with salt Meat, like Colewort, the Prickles being first cut off, and are esteem'd by many as a Dainty. It is supposed to partake of the Virtues of the Carduus Benedictus, but in a lower Degree. It is commended by some as a Specific for the Pleurisy, especially an Emulsion of the Seeds: It is helpful also for the Jaundice, the Stone, and Stoppage of the Urine. It is but seldom used in the Shops. *Miller's Bot. Off.*

Its Leaves are bitter, aſtringent, and give but a very faint red Colour to blue Paper: They ſeem to contain a Salt, reſembling the *Oxyſal diaphoreticum Angeli Salæ*, that is, an acrid Salt, abounding with Acid; thus it is ſudorific and diuretic. Four Ounces of the Juice of its Leaves give great Relief in the Dropſy. *Martyn's Tournefort.*

The Seed is of a ſtimulating and opening Property; the Doſe is a Dram in Powder, but it is generally uſed in Emulſions, being mix'd with other Seeds for that Purpoſe. Its frequent Uſe in Pleuriſies makes it called by the *Germans Steeb-Korner*, that is, (a Remedy) againſt pungent Pains; and, indeed, an Emulſion prepared of the Seed, with Honey, or a little Syrup of Violets, and drank, is highly to be commended in ſevere pleuritical Pains. M. *Tournefort*, for the Pleuriſy, and that Species of Rheumatiſm which reſembles it, adviſes an Emulſion, prepared of two Drams of the Seeds of Carduus Mariæ, with ſix Drams of the diſtilled Water of the Leaves. "This Medicine, ſays *Pontedera*, gives Relief under all Pains, "mollifies Hardneſſes, evacuates Humours, and maturates "Pus; wherefore it is recommended as a preſent Remedy for "all Diſorders of the Lungs and Throat." The Seed pulverized, and taken in Wine, from one to two Drams, is recommended by *Lindanus*, according to *Ettmuller*, againſt an Hydrophobia, and the Bite of a mad Dog, as being an excellent Sudorific. The diſtilled Water of the Herb is much commended by ſome againſt Diſtempers of the Breaſt, Lungs, Liver, Spleen, Kidneys, and Uterus, and for opening Obſtructions of thoſe Parts. But this Water is ſcarce uſed at preſent, and may very well be ſpared without any Damage to the Sick, becauſe the Virtues of the Plant, which depend on its Bitterneſs and aſtringent Quality, will not aſcend into the Alembic. Externally, they ſay, it is good for Nomæ, and phagedenic and corroding Ulcers, if Linen Cloths be moiſten'd with the ſame, and apply'd to the affected Parts. Whether this be true, I ſhall not determine, but leave every Man at Liberty to think as he pleaſes; tho', to ſpeak my Mind freely, I can hardly believe this Water to be preferable to any other diſtilled Water. *Rieger.*

The Stalk of this Thiſtle is three or four Cubits high, ſtriated, woolly, hollow, furniſhed with Membranes growing to it lengthwiſe, which are very prickly, ſinuated, or bent in, conſiderably prominent, and cover'd with whitiſh Hairs. The Leaves, which are a Continuation of theſe Membranes, are a Foot or more in Length, ſinuated, arm'd with Prickles, and hairy and white on both Sides alike, eſpecially the ſmaller Leaves before the Stalk is grown out. The Tops of the Stalks and Branches are adorned with Heads, which are generally ſingle, large, flat, and broad, and ſcaly or ſquamous, the Scales running out into long ſharp, and ſtiff Prickles, which ſtick out from the Head; the Prickles on the Heads and Leaves are of a deep Yellow. The Flowers are of a purpliſh Red, ſeldom white, and are ſucceeded by large furrow'd Seeds, creſted with Down, and involv'd in a lanuginous Subſtance, and of an acrid and bitteriſh Taſte. The Root is tender, white, of a ſweetiſh Taſte while the Plant is ſprouting forth, but harder and ligneous when the Stalk is grown. It grows every-where by the Sides of Paths, and on the Brinks of Ditches. It flowers in its ſecond Year, from *June* to *Auguſt*; when the Seed is ripe, the Root periſhes.

The Root is ſaid to be opening and diuretic, carminative and ſtomachic, diſcutient and reſolvent. Some commend it for the Tooth-ach, and for epileptical Diſorders in Infants. The Flowers are uſed to curdle Milk; therefore ſome call the Plant *Preſura*.

CARDUUS ERIOCEPHALUS, Offic. Ger. Emac. 1152. Merc. Bot. 1. 27. Phyt. Brit. 22. Mer. Pin. 20. Boerh. Ind. A. 137. Buxb. 56. *Carduus capite rotundo tomentoſo*, C. B. Pin. 382. Hiſt. Oxon. 3. 155. Tourn. Inſt. 441. Rupp. Flor. Jen. 150. *Carduus capite tomentoſo*, J. B. 3. 57. *Carduus tomentoſus Corona fratrum dictus*, THE FRIERS CROWN THISTLE, Park. Theat. 978. Raii Hiſt. 1. 311. Synop. 3. 195. WOOLLY-HEADED THISTLE.

It ſhoots forth a thick ſtriated Stalk, which is divided into numerous Branches, and runs up the Height of three or four Cubits, cover'd with a white woolly Subſtance, not at all prickly. The Leaves are armed with long, rigid, ſharp Prickles, jagged, large, extending a Foot, or a Foot and a half, in Length, but narrow, woolly on the lower Part, but green on the upper, and conſtituting, as it were, four Rows of Leaves, with their Jags, diſpos'd at Diſtances, the two lower Rows being flat and equal, the others elevated. On the Tops of the Stalks are numerous, ſcaly, prickly, round Heads, cover'd with Plenty of a fine white Down, and producing from their Summits Flowers of various Colours; under the Flowers is a white pulpous Subſtance, of a grateful and aromatic Taſte. The Seed is oblong, ſhining, lubricous, aſh-colour'd, ſtriated, moderately flat, of a ſweet Taſte, and involv'd in a woolly Subſtance. The Root is thick, and not of an ungrateful, but aromatic Taſte, as well as the Stalk and Leaves, if you except a white, dry, and inſipid medullary Subſtance; when the Heads are cut off, there appears a milky Juice. It grows by the Sides of Fields, in Meadows, and in mountainous and uncultivated Places. It flowers in *July* and *Auguſt*, and took the Name of *Eriocephalus* from ἔριον, Wool, and κεφαλὴ, a Head; and it is alſo called *Corona Fratrum*, becauſe the Branches, which are of equal Height, and loaden with their woolly Heads, ſtand in a Circle about the large Head on the Top of the Stalk, as Monks uſe to do about their Abbot, or Prior. Some boil the Heads before the Flowers come forth, and ſeaſoning them with Butter and Pepper, after the manner of *Arthichokes*, ſerve them up at Table as a delicious Diſh at a ſecond Courſe. *Rieger.*

Borelli ſays, its Juice, or bruiſed Leaves, cure the Cancer of the Noſe and Breaſt: He calls it *Ornipodon*, and recommends the frequent Uſe of it in thoſe Caſes. *Martyn's Tournefort.*

32. *Carduus*; *leucographus*; *purpureus*; *capitulis acutiſſimis, ferociſſimis, ſpinis eminentibus ſubtus circumdatus*. H. C. *Eſt flore albo*. a.

33. *Carduus*; *paluſtris*. C. B. P. 377. Prodr. 156. Park. *Carduus, polyacanthos*, 3. Ger. *Carduus ſpinoſiſſimus, erectus anguſtifolius, paluſtris*. M. H. 3. 153. *b*.

Dale mentions amongſt the *Cardui*, the

ACANUS, Offic. *Acanus Theophraſti*, Park. 975. Raii Hiſt. 1. 314. *Carduus latifolius acinos obſoletæ purpuræ ferens*, C. B. 380. THEOPHRASTUS's THISTLE.

This grows in *Crete*: The young Shoots, before the Stalk is form'd, are us'd in Food. I find no Virtues aſcrib'd to it.

CARDUUS ALTILIS is the Artichoke. See CINARA.

CARDUUS BENEDICTUS. See CNICUS.

CARDUUS BRASILIANUS, *foliis aloes*, is the ANANAS, which ſee.

CARDUUS CHRYSANTHEMUS is the *Scolymus Theophraſti*, which ſee.

CARDUUS DOMESTICUS, *or* SATIVUS, is the Artichoke. See CINARA.

CARDUUS FULLONUM is the Teaſel. See DIPSACUS.

CARDUUS STELLATUS is the CALCITRAPA, which ſee.

CARDUUS *ſtellatus luteus foliis cyani*, is the *Jacea ſtellata, Spina ſolſtitialis dicta, foliis cyani*.

CARDUUS VENERIS is the DIPSACUS, which ſee.

CARDUUS XERANTHEMUS: It is an Epithet of ſome of the Species of the CARLINA, which ſee.

CAREBARIA, καρηβαρία, from κάρη, the Head, and βάρος, Heavineſs. An uneaſy, and ſomewhat painful Heavineſs of the Head.

CARENA. The twenty-fourth Part of a Drop. *Rulandus*.

CARENUM, κάρηνον, the Head. *Galen*.

CARETTI. A Name of the BONDUCH, which ſee.

CAREUM, Caraway.

CARICA, a Fig, commonly one that is dry'd.

CARICUM, καρικὸν, a cathæretic Medicine, which deterges ſordid Ulcers, and eats away proud Fleſh, *Hippocr. de Ulceribus*. It is prepared of black Hellebore, Sandarach, Squama Æris, waſh'd Lead, Sulphur, Orpiment, and Cantharides; theſe, being mix'd, are made up with Oil of Cedar into a liquid Medicine; ſometimes there is added Arum, in Decoction or Juice, or the Powder of it mix'd with Honey. The dry Medicine, or Powder for the ſame Purpoſe, is prepared of the ſame Ingredients, omitting the Oil of Cedar, and the Honey; it is alſo made of black Hellebore and Sandarach only. Καρικὸν, in *Galen*'s Exegeſis, is thus expounded: Καρικόν τι ἔδεσμα ἔτως ὀνομάζει, ἃ χ' τὴν σκευασίαν ἐν τῷ περὶ ἑλκῶν γράφει. Here *Foeſius*, for ἔδεσμα, which ſignifies ſomething eatable, and therefore, as he ſays, muſt needs be erroneous, will have ſubſtituted σκεύασμα, "Preparation," or ἄλειμμα, "an Ointment," or ſome ſuch Word; and then the Paſſage may be thus rendered, "Caricum is a kind of medicinal Compoſition, ſo called by "him (*Hippocrates*), the Preparation of which he gives us in "his Book of Ulcers." Some write *Carycum*, and fancy it takes that Name from κάρυον, a Walnut; but erroneouſly, for there is no Mention of Walnuts. Καρικὸν is alſo an Oil, in *Athenæus*, *Lib.* 2.

CARIDES, καρίδες, Shrimps. *Galen*.

CARIES. A Diſeaſe of the Bones ſo call'd. See Os.

CARIM-CURINI, H. M. *Frutex Indicus ſpicatus, floribus galeatis, vaſculo bivalvi dicocco*. An *Indian* Shrub, which bears galeated Flowers, of a greeniſh azure Colour, growing in a Spike, with bivalve Seed-veſſels, each of the two Cells containing a very flat roundiſh Seed, cuſpidated like a Heart; when ripe, of a yellowiſh, or pale reddiſh Colour, of a rough Superficies, eſpecially when dry, and quite inſipid.

The Root, which is fibrous, whitiſh, and its Bark of a biteriſh Taſte, drank in a Decoction, is of Service in arthritic Pains; boiled with Oil and Butter, it increaſes the Strength; the ſame bruiſed, and given with the Oil *Sirgelim*, mitigates the Pains of the Gout. The Decoction of the Root and Leaves, being drank, breaks the Stone; and the Leaves bruiſed, and ty'd upon the Belly, have the ſame Virtue; the expreſſed Juice of the Leaves ſerves for the ſame Purpoſe. A Decoction of the Leaves helps the Dyſury; an Infuſion of them in hot Water, being drank, mitigates the Cough, and Pains of the Stone; and works the ſame Effect, if the Belly be fomented with it.

BEM CURINI, H. M. *Frutex Indicus ſpicatus, florum pediculis brevioribus*. It differs from the preceding, only in the Leaves, and ſeminal Veſſels.

A Decoction of the Root is good in Fevers, and Diſorders of the Head. The Leaves fry'd in Oil, and afterwards bruiſed, are apply'd to Ulcers, in order to heal them. *Raii Hiſt. Plant. p.* 1709.

CARIMPANA. A Species of Palm-tree. See PALMA.

CARINA, with the antient Botaniſts, ſignify'd the oſſeous hard Shell of Walnuts: With the Moderns it denotes any thing, whoſe Cavity runs into an Angle, like the Keel of a Ship; whence the under Leaf of a papilionaceous Flower is called *Carina*. In the Account of Gramina, or Graſſes, *Carina* is uſed to ſignify that furrow-like Cavity which runs thro' the whole Length of the Leaves of the Cyperoides, and Cyperus Graſſes, or graminifolious Plants, and ends in an acute Angle; and hence thoſe Leaves, being excavated, or hollowed into an acute Angle, are called *carinated*. Sometimes by *Carina* is to be underſtood the Prominence of this Furrow, which juts out on the Backſide of the Leaf, and runs like a Nerve through the Middle of it. *Rieger*.

CARINA, in Zoology; a Word apply'd firſt, I think, by *Malpighi*, to the firſt Rudiments of the Spine of a Chicken, during Incubation.

CARIUM TERRÆ, Lime. *Rulandus*.

CARLINA. The Carline-thiſtle.

The Characters are;

It hath, for the moſt part, a radiated Flower, from whoſe Diſk ariſe many Florets, which reſt upon the Embryos; but the plain Petals, which ariſe from the Crown, have no Embryos fix'd to them: The Flower-cup is large and prickly, incloſing the Embryos. Theſe Embryos afterwards become Seeds, which have a Down adhering to them, and each is ſeparated by an imbricated Leaf.

Boerhaave takes Notice of ſeven Species of the *Carline-thiſtle*.

1. CARLINA, *Chamæleon albus*; *Carlina*, Offic. *Carlina, ſive χαμαιλέων λευκὸς, Dioſcoridis*. THE WHITE CARLINE-THISTLE OF DIOSCORIDES, WITH THE RED FLOWER, Ger. Emac. 1157. Ger. 995. *Carlina humilis*, Park. Theat. 968. Raii Hiſt. 1. 288. *Carlina acaulos magno flore*, C. B. 380. Tourn. Inſt. 500. Boerh. Ind. A. 101. *Carlina caulifera vel acaulis*, J. B. 3. 64. *Carlina, Carolina*, Chab. 353. *Carlina major*, Schw. 39. *Carduus Xeranthemos, flore albo ampliore acaulis*, Hiſt. Oxon. 3. 162. CARLINE-THISTLE.

The Leaves of the *Carline-thiſtle* are very long and narrow, cut into ſeveral deep Segments, and arm'd with a great Number of ſharp Prickles. They lie flat on the Ground, and encompaſs a large ſtalkleſs Head, ſet about with ſmaller and ſhorter prickly Leaves. Out of this Head ariſes the Flower, conſiſting of a Border of white, ſhining, ſharp-pointed Petala, ſet about a yellow-fiſtular Thrum, which, paſſing into Down, incloſes a great Number of ſmall long ſhining white Seed. The Root is long and large, of a reddiſh-brown Colour on the Outſide, and whitiſh within, of an aromatic Taſte. It grows in *Germany*, and other Parts beyond the Seas; flowering in *July*.

The Root, which is the only Part uſed, is accounted ſudorific, alexipharmic, and uſeful againſt all contagious peſtilential Diſeaſes, and even the Plague itſelf. It is likewiſe diuretic, helps the Dropſy, promotes the Catamenia, and is ſerviceable in hypochondriac Diſtempers. It is rarely uſed in *England*. *Miller's Bot. Off.*

This Plant, as many ſuppoſe, is call'd, by *Dioſcorides* and *Pliny*, *Chamæleon*, from the Variety of its Leaves, which are green, whitiſh, Sky-colour'd, and ſometimes red. It is call'd ἰξία (*Ixia*) from a ſort of Bird-lime which grows on its Roots, and is gather'd thence, and uſed inſtead of Maſtich; for ἰξία ſignifies Bird-lime. The *Germans* call it *Eber Wurtzel*, that is, *Boars-root*, becauſe the Roots of it are greedily coveted by Boars, and not becauſe it kills Swine, if given them in their Food; for this is contrary to Experience. *Pontedera* thinks it is miſtaken for the Chamæleon of *Dioſcorides*, and that it is with more Probability referr'd to his *Leucacantha*, or white Thorn. "The Carlina, ſays *Pontedera*, is an Herb much "valued by Phyſicians. The Root has an aromatic Taſte, "mix'd with ſome Sweetneſs; and is very much celebrated for "its Virtues againſt the Peſtilence, Poiſons, and malignant Fe-"vers. It conſiſts of volatile Parts, for which Reaſon the "Root expels the Matter of Diſeaſes by Sweat; and, on the "ſame account, is ſaid to give Relief in the Beginning of an "Anaſarca, and in hypochondriacal Diſorders, and Weakneſs "of the Stomach." *Philip Melanchthon*, being moleſted with Pains in the Hypochondria, is ſaid, by *Bauhine*, to have reliev'd himſelf by the Uſe of this Herb. *Amatus Luſitanus*, on *Dioſcorides*, commends the Head of the Carline-thiſtle, ſtript of its Prickles, and cleanſed, and then preſerved in Sugar or Honey, as a good Remedy for a cold Stomach. *Johannes Langius*, in his *Medicinalium Epiſtolarum Miſcellanea*, informs us, that this is a Remedy much uſed by the *Italians*. *Ray*, from *Geſner*, tells us, that the ſmall fleſhy Heads of the Carline-thiſtle, when the Calix, Flowers, and Seeds, are cut off, afford a ſweet and agreeable Food, when boil'd in Water, with Butter, Salt, and Pepper, in the ſame manner with Artichokes. *Bodæus* informs us, that the Inhabitants of *Savoy* and *Piedmont* take the young Heads of the Carline-thiſtle, before the Flower appears, and pulling

pulling off the rougher Leaves, and the ſeveral ſmall Laminæ ſhut up within them, cut the Bottoms into Slices, which they boil for Food like Turneps over a Fire, ſeaſoning them with Salt, Butter, and Pepper. When thus prepared, as the ſame Author informs us, they are more delicate and grateful to the Taſte than the Bottoms of Artichokes. *Valentini* informs us, that the Inhabitants of *Switzerland*, and the *Pyrenæan* Mountains, uſe both the Roots and Heads for Food. The Root is kept in the Shops, and is accounted beſt when recent, entire, well dried, of a ſweetiſh Taſte, and of an agreeable and aromatic Smell. It may properly be exhibited in Caſes where Nature is to be irritated, and requires a Stimulus to throw off an excrementitious Load. Hence 'tis obvious, that it muſt be proper for opening Obſtructions, exciting a Diaphoreſis, provoking the Menſes, promoting a Diſcharge of the Urine, and killing Worms, in conſequence of its Bitterneſs. The common Method of exhibiting it is in Powder, from half a Scruple to half a Dram, in a Vehicle accommodated to the Nature of the Diſeaſe, or the Conſtitution of the Patient.

It is alſo preſcrib'd in Decoctions and Infuſions; and for Palſies, eſpecially thoſe of the Tongue, it is generally join'd to Pellitory of *Spain*. In the Plague, a Dram of it, reduced to Powder, is exhibited in Wine, both with a preſervative and curative Intention. With this View it is by ſome given to Cattle, and eſpecially to Hogs, becauſe it is thought an effectual Preſervative againſt peſtilential Contagion. Whether, as an Amulet, it is beneficial in the Plague, is a Point we will not take upon us to determine. In *Upper Germany* the Country-people give this Root to their Dogs, in order to render them more fierce and voracious; becauſe the Veſſels are ſtimulated by it, the Circulation of the Humours accelerated, and the Animal render'd bolder. From this Circumſtance the Obſervation of *Helmont* is probably to be accounted for, That the Carline-thiſtle baniſhes Sleep, and much more prevents preternatural Drowſineſs. A Decoction of it, prepar'd with Vinegar, is recommended for waſhing Parts affected with the Itch, Ringworm, or any other cutaneous Foulneſs of difficult Cure. This ſame Decoction is alſo ſaid to alleviate and relieve the Tooth-ach. If Experience confirms theſe external Uſes, the Reaſon of the Thing may be deduced from the aromatic, acrid, reſolvent, and aperient Nature of this Root. But 'tis ſomewhat more difficult to comprehend, how the Perſon who chews or carries this Root about with him, becomes ſtronger by that means; whereas thoſe about him become weaker. *Valentini*, when ſpeaking on this Subject, ſays, "If any one ſhould happen to be weaken'd by this means, the Accident is to be aſcrib'd to the Smell, which he could not endure. Thoſe, on the contrary, who chew the Root, perceive themſelves recruited and invigorated by its aromatic Quality, which rouſes the animal Spirits." Beſides, by its too ſtrong Fragrance, it excites, in many, troubleſome Head-achs, Vertigos, and Nauſeas, as *Boeclere* has obſerved. Hence we underſtand the Reaſon why *Hoffman*, in his *Clavis Schroder*. affirms, that in Practice he has often obſerved, that Fleſh-broth, in which it had been boil'd, excited a Vomiting in ſome People. 'Tis alſo owing to its Acrimony, that, when mix'd up with Flour, it kills Mice; but this *Hoffman* ſeems to have borrow'd from *Pliny*, who affirms the ſame Thing concerning the Chamæleon.

2. *Carlina cauleſcens flore magno albente*, Cod. Med. 28. Tourn. Inſt. 500. Boerh. Ind. A. 101. *Carlina cauleſcens magno flore*, C. B. Pin. 380. Elem. Bot. 401. Rupp. Flor. Jen. 172. Volck. Flor. Nor. 87. Buxb. 57. *Carlina cauliſera*, J. B. 3. 64. Raii Hiſt. 1. 288. *Garlina cauleſcens*, Park. Theat. 968. *Carduus Xeranthemos, flore albo cauleſcens*, Hiſt. Oxon. 3. 162. CARLINE-THISTLE WITH A STALK.

In medicinal Virtues this agrees with the *Carlina Acaulos*; for which its Root is alſo ſubſtituted.

3. *Carlina ſylveſtris*, Offic. Raii Hiſt. 1. 288. *Carlina ſylveſtris major*, Ger. 997. Emac. 1159. Park. Theat. 969. Mer. Pin. 22. *Carlina ſylveſtris vulgaris*, Cluſ. Hiſt. 156. Tourn. Inſt. 500. Brit. 23. *Carduus Xeranthemos vulgaris annuus*, Hiſt. Ox. 3. 162. COMMON WILD CARLINE-THISTLE.

The medicinal Virtues of this are ſaid to be the ſame as thoſe of the preceding. *Wedelius* recommends it for the Head-ach. *Dale*.

4. *Carlina; ſylveſtris; flore aureo; perennis*. H. L. *Carduus xeranthemus, vulgaris, annuus*. M. H. 3. 162. *Cnicus ſylveſtris, ſpinoſior, flore aureo, perennis*. H. R. Par. 54. H. WILD PERENNIAL CARLINE-THISTLE, WITH A GOLDEN FLOWER.

5. *Carlina; ſylveſtris; minor; Hiſpanica*. Cluſ. H. 157. *Acarna flore luteo, patulo*, C. B. P. 379. *Carduus, Carlina minor ſylveſtris Cluſii, flore luteo*. J. B. 3. 84. *Carduus xeranthemos, flore luteo, patulo, Hiſpanicus, perennis*. M. H. 3. 162. H. LESSER WILD SPANISH CARLINE-THISTLE.

6. *Carlina; flore purpureo-rubente, patulo*. T. 500. *Carlina, annua, purpurea, Monſpelienſium*. Bot. Monſp. *Acarna, flore purpureo-rubente, patulo*. C. B. P. 379. *Carduus xeranthemos, flore purpureo-rubente, patulo*. M. H. 3. 162. *Acanthoïdes, parva, Apula*. Col. 1. 29. a. b. H.

The ſeventh Species of *Carlina*, taken notice of by *Boerhaave*, is the *Carlina patula atractylidis folio & facie*; but this has been already mention'd as one of the Species of CARDUUS.

CARMEN, ᾠδή, ἐπῳδή. Properly a Verſe; but, in ſuperſtitious Medicine, the ſame as *Incantatio*; that is, an Inchantment or Charm, which was uſually perform'd by pronouncing certain Verſes. See AMULETUM.

CARMES *(Eau de)*. The Carmelite-water, famous in *France*, and now in moſt Parts of *Europe*, for its extraordinary cordial Virtues. It is ſaid to be extremely reviving, to be good in all ſort of Fits, Apoplexies not excepted, and to relieve in the Gout, when it attacks the Stomach.

The *Carmelites* at *Paris*, who make a conſiderable Advantage by vending this Water, have endeavour'd to keep the Preparation of it a Secret. But I am pretty well inform'd, that the following Receipt for it is the genuine Preſcription, by which theſe Religious make it.

EAU DES CARMES, *or* MAGISTERIAL WATER *of* BAUM.

Take of the freſh Leaves of Baum, four Ounces; of the freſh external Rind of Lemons, two Ounces; of Nutmegs, and Coriander-ſeeds, each an Ounce; of aromatic Cloves, Cinnamon, and the Root of *Bohemian* Angelica, each half an Ounce. Bruiſe the Leaves, and pound the other Ingredients, and put them into a Glaſs Cucurbit; then pour upon them a Quart of Brandy; Stop the Mouth of the Cucurbit, and leave them to digeſt two or three Days in a warm Place; then add a Pint of the beſt ſimple Baum-water; ſhake them together; fix a Head to the Cucurbit, and to that a Receiver: Then diſtil *in Balneo Mariæ*, with a Heat ſufficient to make one Drop follow another, which continue till the Ingredients in the Cucurbit remain almoſt dry. When the Veſſels are cold, take the Water from the Receiver, and preſerve it in Bottles well ſtopt.

CARMIN. A Droſs or Powder of a very beautiful deep-red Colour; ſeparated from Cochineal by means of a Water, in which are infuſed *Chouan* and *Autour*. *(See the Words.)*

The Cochineal uſed in that Operation is a wild Sort, which is found on the Fig-trees of *India*, naturally produced, without being brought thither; but this Cochineal, which is thus ſpontaneouſly produced, is much inferior to the other, and ſells at a much lower Price. *Carmin* ought to be an impalpable Powder, and deeply colour'd.

It is uſed for Painting in Miniature, and colouring of Draperies red, in Pieces of Value. *Lemery des Drogues*. See COCHINILLA.

CARMINANTIA, or CARMINATIVA. Carminative Medicines.

Quincy ſays, that theſe have a Place among the nervous Simples, by reaſon the nervous Parts are frequently under great Diſorders from Flatuſes, or Wind pent up; and, therefore, what diſſipates and expels ſuch Vapours, muſt be reckon'd of great Service to thoſe Parts.

A great many ſeem to be Strangers to this Term, as it does not appear to carry in it any thing expreſſive of the medicinal Efficacies of thoſe Simples which paſs under its Denomination. This Term had certainly its Riſe as thus apply'd, when Medicine was too much in the Hands of thoſe Jugglers, who, for want of a true Knowledge in their Profeſſion, brought Religion into their Party; and what, thro' their Ignorance, they were not able to do by rational Preſcription, and the Uſe of proper Medicines, they pretended to effect by Invocation, and their Intereſt with Heaven. Which Cant being generally, for the Surprize-ſake, couch'd in ſome ſhort Verſes, the Word *Carmen*, which ſignifies a Verſe, was made alſo to mean an Inchantment; which, as it was a good Cover for their Ignorance as well as their Knavery, was frequently made uſe of to ſatisfy the People of the Operation of a Medicine they could not account for. And as thoſe Medicines, now under this Name, are of ſome quick Efficacy, and the Conſequences thereof, in many Inſtances, very great and ſurpriſing; the moſt violent Pains, which ſometimes ariſe from pent-up Wind, immediately ceaſing upon its Diſperſion; for theſe Reaſons, I ſay, ſuch Medicines as give Relief in this Caſe are more particularly term'd Carminatives, as if they cured by Inchantment; the Complaint removed by them being ſo ſudden, that the ordi-

nary

nary Means of the Operation of a natural Cauſe are not eaſily imagin'd to take place ſo ſoon.

But, howſoever this Term came into the Profeſſion, its common Uſe has ſufficiently determin'd its Meaning; ſo that by it every one underſtands ſuch Things as conduce to expel Wind. How they do ſo, may be conceived, when we conſider, that all the Parts of the Body are perſpirable. *Sanctorius*, in his *Medicina Statica*, determines all we call Wind in the Bowels, to be ſuch perſpirable Matter as makes its Eſcape thro' the Coats of the Stomach and Inteſtines. Between the ſeveral Membranes likewiſe of the Muſcular Parts may ſuch Matter break out, and lodge for ſome time. Now whatſoever will rarefy and render thinner ſuch Collections of Vapours, muſt conduce to their utter Diſcharge out of the Body, and conſequently remove thoſe Uneaſineſſes which ariſe from their Detention. And as all thoſe Things in Medicine, which paſs under this Denomination, are warm, and conſiſt of very light ſubtile Parts, it is eaſy to conceive how a Mixture of ſuch Particles may agitate and rarefy thoſe Flatulences, ſo as to facilitate their Expulſion; and eſpecially when we conſider, what a Help to promote this End thoſe grateful Senſations may be, which ſuch Medicines give to the Fibres; which cannot but invigorate their Tonic Undulations ſo much, that by degrees the obſtructed Wind is diſlodged, and at laſt quite expel'd. But if the Obſtruction is not great, as it ſeldom is in the Bowels, by reaſon of the large Vent both upwards and downwards, the Rarefaction of the Wind, upon taking ſuch a Medicine, is often ſo ſudden, and likewiſe its Diſcharge, that it goes off like the Exploſion of Gunpowder.

All the Things under this Claſs, being warm and diſcuſſive, are much uſed in the Compoſitions of Cathartics, of the rougher Sort eſpecially; for the Irritation, occaſion'd by thoſe, would be ſcarce tolerable without the Mitigation of ſuch grateful Ingredients. Many likewiſe, of this Sort, are in the Compoſitions of diſcuſſive Topics, as they warm, rarefy, and attenuate the obſtructed Humours. *Quincy.*

The Medicines of the Carminative Kind are ſuch as are calculated to diſpel Flatulencies of the Primæ Viæ, Stomach, and Inteſtines, and remove the Pains ariſing from them: For this Reaſon they are alſo call'd *Flatus diſcutientia*, or Medicines capable of diſpelling Flatulencies; and ſuch is their Nature, that they are able to remove Spaſms in the above-mentioned Parts. For this Reaſon, among the *Carminatives*, we may juſtly reckon *Antiſpaſmodics*, of which thoſe are always to be exhibited, which are moſt directly oppoſite to the known Cauſe of any given Diſorder. Thus, for Inſtance, in order to correct a known acrid Acid, an Alcali muſt be preſcribed; but to illuſtrate the thing by a particular Inſtance, after taking a Doſe of Arſenic, Oil of Tartar per Deliquium is, in conſequence of its directly oppoſite Nature, of all other Medicines the moſt proper. When the Diſorder proceeds from a cold mucous Cauſe, or from a dull inactive Phlegm, the Patient can only expect Relief from heating Medicines, ſuch as Mint, Chamomile, Wormwood, Orange-peel, Juniper-berries, the Four greater and ſmaller hot Seeds, the diſtil'd Waters and Oils of theſe, and other Aromatics, ſpirituous Liquors, all Balſamics, and, in a Word, all hot Stomachics, generally comprehended under the common Name *Carminatives*. Thus *Foreſtus*, *Lib.* 18. *Obſ. Med.* 39. gives us an Account of a Man of a weak Stomach, who, in the Autumn, happening to indulge himſelf in the Uſe of flatulent Aliments, and drinking Muſt immediately after, was ſeiz'd with an intolerable Pain of the Stomach, together with an externally apparent Inflation of it. This Diſorder was, however, remov'd, by the Patient's drinking Ale, in which common and *Roman* Chamomile, with an Addition of a few Aniſe and Canary Seeds, were boil'd.

Sylvius, by way of Specimen, recommends to young Practitioners the following Mixture againſt Flatulencies:

> Take of the Waters of Mint and Fennel, each two Ounces; of rectified Spirit of Wine, or of the Aqua Vitæ of *Matthiolus*, or of the carminative Spirit of *Sylvius*, one Ounce; of the beſt Spirit of Nitre, twenty Drops; of Laudanum Opiatum, three Grains; of the diſtil'd Oil of Mace, ſix Drops; of the Syrup of Mint, an Ounce and an half: Mix all together.

Let a Spoonful of this Mixture be given at a time, and repeated as often as the Violence of the Pains and Tenſions requires.

Ettmuller recommends the carminative Water of *Managetta* corrected, which is prepared of ſeveral aromatic Vegetables ſprinkled with Spirit of Nitre, and diſtil'd with Wine, or the Spirit of Wine. But ſuch Medicines are not proper for thoſe whoſe Flatulencies proceed from too large a Quantity of Blood diſtending the Veſſels, from a Plethora, or hot and acrid Subſtances uſed in Food. *Boerhaave's Chym. Vol.* 2. and Obſervations on Proceſs 23. *Sylvius* judiciouſly obſerves, that Aromatics, and volatile Salts of every Kind, which are generally preſcribed againſt Flatulencies, often prove prejudicial to the Patients, becauſe by their means the violent Heat of the Body is augmented; and he thinks, that for diſpelling Flatulencies no Medicine is comparable to the Spirit of Nitre, whether ſimple, or that diſtinguiſh'd by the Epithet *Dulcis*, ſince it not only incides the Matter of the Flatulencies, and glutinous Phlegm, but alſo corrects the exceſſive Acrimony of the Bile. *Boerhaave, in Chym. Vol.* 2. Obſervations on Proceſs 135. among the Medicines calculated for diſpelling Flatulencies, aſſigns the principal Place to the *Spiritus Nitri Dulcis*. Carminatives are principally intended for thoſe who are afflicted with Flatulencies and Rumblings of the Inteſtines, ſuch as thoſe labouring under Diſorders of the Spleen, hypochondriac and hyſteric Patients, and Infants diſorder'd by an acid Milk. The Effect of carminative Medicines is to diſpel Flatulencies, either by Eructations, or by a Diſcharge downwards; nor is it a Matter of any Moment, whether this Diſcharge is upwards or downwards, as *Demetrius* is repreſented to ſay in *Seneca*, *Epiſt.* 91. And, according to *Cicero*, [9 *Epiſt. ad Fam.* 22.] the Stoics affirm'd, that Diſcharges downwards were as decent as Eructations. But in polite Company this would not at preſent be thought conſiſtent with good Manners. The *Arabians*, a People highly delicate with reſpect to their Ears and Noſes, eſteem'd it a Crime for a Man to break Wind in their Preſence. *Memoires du Chevalier d'Arvieux.* 'Tis therefore obvious, that the Uſe of Carminatives ought to be confin'd to certain Times and Places, ſince there is no-where as yet publiſh'd ſuch an Edict as *Claudius* the *Roman* Emperor intended to make, by which every one might freely break Wind at an Entertainment, when he found that the Life of a certain modeſt Man had been endanger'd by Retention. *Sueton. in Claud.* Hence knowing Phyſicians, being ſufficiently appriſed of the bad Conſequences of retaining Flatulencies, have preſcrib'd various Medicines of different Forms, for diſpelling them. Some of theſe are intended for internal, and others for external Uſe; but moſt of them conſiſt of hot Ingredients, as being oppoſite to the cold and pituitous Viſcidity which produces Flatulencies.

CARMOT. The Matter of which the Philoſophers Stone conſiſts. *Caſtellus.*

CARNABADIUM, καρναβάδιον, καρναβάδι, in *Myrepſus*, is the ſame as *Cuminum Æthiopicum*, as he himſelf explains it, *Antidot.* 429. *Simeon Sethi*, and ſome of the more modern *Greeks*, as *Fuchſius* obſerves, call *Carnabadium*, *Caruum*; whence the *Latin* Copies of *Myrepſus*, inſtead of *Carnabadium*, read *Caruum*. They are miſtaken then who expound *Carnabadium* by *Doronicum*.

CARNEOLUS LAPIS, *Sardus*, *Sarda*, *Carneolus*, Offic. *Sardus*, *Sarda*, Geoff. Prælect. 78. *Sardius Lapis*, Schrod. 331. *Sardius Lapis*, *ſive Corneolus*, Aldrov. Muſ. Metall. 923. *Sardius*, *ſive Carneolus*, Boet. 230. *Sarda*, Laet. 60. Kentm. 48. *Corneolus*, *vel potius Carneolus*, Worm. 92. Charlt. Foſſ. 35. *Carniolus*, Schw. 371. *Carneolus*, *Sardius Lapis*, *Sardonyx*, Mont. Exot. 14. *Lapis Sarda aut Corniola*, *ſanguinis diluti coloris*, Cup. Hort. Cath. Supp. 2. 50. THE CORNELIAN.

It is a precious Stone, half-tranſparent, and like the Waſhings of Fleſh, or bloody Fleſh; it is found in *Sardinia*.

The Powder is preſcrib'd to be drank in all manner of Hæmorrhages; being worn, it is ſaid to exhilarate the Heart, expel Fear, confer Boldneſs, avert Faſcinations, defend the Body againſt all manner of Poiſons, and, by a peculiar Property, to ſtop Bleeding in any Part of the Body; ty'd about the Belly, it prevents Miſcarriage. *Dale from Schroder.*

CARNICULA. A Word uſed by *Fallopius*, *Expoſ. de Oſſib.* inſtead of *Caruncula*, to ſignify in particular the Fleſh which ſurrounds the Teeth, and is called the Glue of the Teeth. *Caſtellus.*

CARNIFEX. The ſpagiric Vulcan, or Fire, in the Affair of the Philoſophers Stone. *Caſtellus.*

CARNIFORMIS *Abſceſſus.* An Abſceſs, with a harden'd Orifice, and of a firm Subſtance, or hard Conſiſtence, like a Shell, not much elevated into a Tumor, but broad and expanded, with Membranes, Fibres, and Capillaries, uſually interſperſed. It generally riſes where the Muſcles apply themſelves to the Joints. *Caſtellus from Severinus.*

CARNIVORUS, σαρκοφάγος. Fleſh-devouring, an Epithet of the ASSIUS LAPIS, which ſee.

Animals, whoſe Food is Fleſh, are call'd carnivorous, to diſtinguiſh them from thoſe which eat Vegetables, and are call'd graminivorous.

CARNOSA *Cutis.* The ſame, according to *Caſtellus*, as PANNICULUS CARNOSUS.

CARO, σὰρξ, κρέας, Fleſh. The common Signification of this Word is too well known to require Explication: It is ſufficient to obſerve, in this Place, that what Anatomiſts mean by *Caro*, or Fleſh, is only the red Part, or Belly of a Muſcle.

CARO, in Botany, is the Pulp of a Fruit.

CAROBA, *Siliqua dulcis*, *Caroba*, *Carantia*, Offic. Rand. Ind. 84. *Siliqua*, Mont. Ind. 19. Schrod. 4. 158. Chab. 89. *Siliqua edulis*, C. B. Pin. 402. Jonſ. Dendr. 381. Tourn. Inſt. 578. Elem. Bot. 449. Boerh. Ind. A. 2. 38. *Siliqua dulcis*,

dulcis, Commel. Plant. Uſu. 79. Mill. Cat. 148. *Siliqua dulcis ſive vulgatior*, THE ORDINARY SWEET BEAN, OR CAROB-TREE, Park. Theat. 236. *Siliqua Arbor ſive Carantia*, J. B. 1. 413. Raii Hiſt. 2. 1718. *Ceratia, ſiliqua ſive Ceratonia*, Ger. 1241. Emac. 1429. *Ceratia, ſive Siliqua dulcis & edulis*, Pluk. Almag. 97. *Ceratonia*, Herm. Cat. Hort. Lugd. Bat. 135. THE CAROB-TREE. *Dale.*

It grows in *Sicily*, and the Kingdom of *Naples*; the Fruit is uſed, tho' but ſeldom; it is drying and aſtringent; and is principally uſed in hot Diſorders of the Stomach, and in Coughs. *Dale, ibid.*

It is a tall-ſpreading Tree; the Roots, which are incurvated like a Horn, have procur'd it, among the *Greeks*, the Name of κεράτιον, and κεραλονία, Words derived from κέρας, a Horn. The very Shell of the Pods, as *Pliny* tells us, is eaten, being of a ſweet Taſte like Honey. Eaten green, as *Dioſcorides*, and from him *Pliny*, affirm, they diſturb the Stomach, and looſen the Belly; but dry'd, they bind the Belly, are more friendly to the Stomach, and provoke Urine. Though all who have written of theſe Fruits, ſays *J. Bauhine*, ſay they bind the Belly, yet we at *Venice*, where they are ſold in great Plenty, experience the contrary; for they not only excite a Nauſea, but purge by Stool, like Pulp of Caſſia, ſo that the Stomach loaths them afterwards; though I do not deny but they may agree well enough with thoſe who are uſed to them. The *Egyptians*, according to *Alpinus*, extract a very ſweet Sort of Honey out of the Pods, which the *Arabians* uſe inſtead of Sugar. They make very frequent Uſe of this Honey in Clyſters; and ſome preſcribe it to be taken at the Mouth, in order to looſen the Belly, for which Purpoſe it is as effectual as Pulp of Caſſia; they uſe it alſo both inwardly and outwardly, for Inflammations of the Kidneys. The Pod eaten is an excellent Remedy, according to *Ettmuller*, in the burning Heat and Pain of the Stomach.

Siliqua purgatrix, C. B. *Caroba, ſive Siliqua ex Guinea purgatrix*, Park. Pona. Ital.

This grows to a great Tree in its native Soil, *Guinea*; and, in the manner of its Growth, differs from the preceding; the Pod is ſhort, thick, and incurvated; and, as *Pona* ſays, ſomething like the Anacardium, called *Cajous*, three Inches long, and of a brown Colour, like the common Carob, but of a more acrid Taſte, and almoſt burning the Throat.

Siliqua Africana, fructu minore. The Pod of this is two or three times ſmaller than that of the common Carob, and has nothing elſe remarkable. *Raii Hiſt.*

CARŒNUM, κάρωνον, is ſuppoſed to be a *Latin* Word, and uſed by the later *Greeks*, to ſignify what the Antients called σίραιον, (*Siræum*) and ἕψημα (*Hepſema*). It is made uſe of by *Palladius*, *Lib.* 11. *Cap.* 18. where ſpeaking of the Preparation of *Defrutum Carœnum*, and *Sapa* from Muſt, he ſays, that *Defrutum* is ſo called *a deferuendo*, becauſe it is made of Muſt, reduced by a ſtrong Deſpumation, to a convenient Thickneſs. *Carœnum* is Muſt, boiled to the Conſumption of one Third; and *Sapa* the ſame, boiled to the Conſumption of two Thirds. *Marcellus Empiricus*, *Cap.* 26. mentions *Carœnum* among Remedies for the Stone, and Diſeaſes of the Kidneys; and *Myrepſus* uſes the Word often, and particularly in the Antidote of *Adrian*, *Antidot. Cap.* 5. which, for thoſe who are moleſted with the Sciatica, or Diſtempers of the Kidneys, he preſcribes to be taken in *Carœnum*.

CAROLI. A Term in ſome Authors, ſignifying venereal Puſtuſes on the Pudendum Virile, otherwiſe called *Caries Pudendorum* or *Chancres*.

CAROS, κάρος, is defin'd by *Galen*, *Com. ad Aph.* 5. *Lib.* 5. ἡ παντὸς τοῦ σώματος αἰσθήσεως καὶ κινήσεως ἀναισθησία καὶ ἀκινησία, "a ſudden Deprivation of Senſe and Motion, affecting the "whole Body." *Hippocrates* often expreſſes this Affection by ἀφωνία· for, as *Galen* aſſures us, in the foremention'd Place, it is cuſtomary with him to call τοὺς ὁτιοῦν καρωθέντας ἀφώνους, "thoſe who were any way affected with a *Caros*, *Aphoni*" (ſee APHONIA). The ſame Author, *Lib.* 4. *Cap.* 2. *de Locis affectis*, tells us, that a *Caros* is a Privation of Senſe and Motion, the Faculty of Reſpiration being not at all injur'd; and that it is cauſed by an Affection of the fore Part of the Brain only, the middle Ventricle of the Brain alſo ſuffering by Conſent of Parts, ſo as to diſturb the Actions of the rational Faculty. But if this *Caros*, or Sopor, oppreſſes Reſpiration to ſo violent a Degree, as that the Patient cannot breathe without great Efforts, as thoſe who ſnore under a deep Sleep, it is called an Apoplexy, the Solution of which is generally ſucceeded by a Paraplegy; but a *Caros* is uſually follow'd by a good State of Health. Again, in his *Comment.* 2. *in Prorrhet.* he hints, that κάρος is ſometimes taken for a heavy and profound Sleep, calling it βαθὺν καὶ δυσεγερτον ὕπνον, "a deep Sleep, from which "it is difficult to be rouſed;" which ſignifies that the Brain is oppreſſed with too great a Quantity of benign Humour, which is not prejudicial on account of its Quality, but excites a profound and invincible Sleep, and ſuch as uſually ſeizes on thoſe who are drunk with Wine. A *Caros* of this Nature he acknowledges to be ſometimes beneficial, and that ſuch a profound Sleep has been of great Service, where the Patient has wanted Sleep for three or four Days together. To Infants alſo ſuch a Sleep, which has continued a whole Day, and even two Days together, as he himſelf ſays he has known it happen, has been of great Benefit. There is, beſides this, a κάρος νοσώδης, "a Caros, which is a Diſeaſe," and always hurtful; and this happens when the Brain abounds with a vitiated cold Humour, or is replete with Phlegm, by which means Senſation is deſtroy'd. This *Caros* little differs from a Lethargy, but reſembles a *Coma* or *Cataphora*, and is called a δυσδιεγερτος καθεύδουσις, "a State out of which it is difficult to be rouſed," as *Galen*, in the Place before quoted, informs us; for, ſays he, ὅταν ὑπὸ φλέγματος ὁ ἐγκέφαλος ὑγρανθῇ καὶ ψυχθῇ, &c. "When the "Brain has been moiſten'd and refrigerated with Phlegm, and "ſo diſpoſed to lethargic Affections, there happens a *Coma*, "which, if you pleaſe, you may call a *Carus*. But ſome call "it *Carus*, when the Patient lies for ſome time depriv'd of "Senſe and Motion, tho' you prick or ſtrike him, or call him "with a loud Voice, as it happens when a Perſon has received "a violent Blow on the Temporal Muſcles. We often meet "with this Symptom alſo in feveriſh Diſorders, [καὶ ἐν τοῖς "πυρετώδεσι νόσοις ἐν ἐπισημασίαις] in which the Patients are "inſenſible to Prickings, Blows, or vehement Noiſes." The ſame Author, *Meth. Med. Lib.* 13. diſtinguiſhes καθυπερβὰς βαθείας, "violent Inclinations to a profound Sleep," which are owing to a cold Humour not putrefy'd, and without a Fever, into an *Apoplexy*, *Caros*, and *Catoche*; for ſuch as are attended with a Putrefaction of the cold Humour, and a Fever, produce, he ſays, a Lethargy. *Cœlius Aurelianus*, *Cap.* 5. *Lib.* 3. *Acut.* calls κάρον, *Gravatio*; and *Pliny*, *Cap.* 13. *Lib.* 25. calls it *Gravedo*: For as *Dioſcorides*, *Cap.* 76. *Lib.* 4. ſays, of Mandrake-apples, that being eaten or ſmelled to, they were καρωτικὰ, "diſpoſed to a *Carus*;" ſo *Pliny* ſays of them, *Gravedinem etiam afferunt olfactu.* *Erotian*, on *Hippocrates*, expounds τὸ καρῶδες, by καρηβαρία, ἤ καρώσιν, "a Gravedo, "or Heavineſs of the Head, or what diſpoſes to a *Caros* or "*Sopor*;" where he ſeems to have an Eye to that Paſſage in the *Prorrhet. Lib.* 1. 63. τὸ καρῶδες ἀρά γε παντὶ κακὸν, "it "is to be conſider'd, whether a Diſpoſition to a profound Sleep "or Sopor is to be conſtantly reckon'd a bad Sign." In *Coac.* εἰ μετὰ κάρου ἀφωνίαι, &c. "Loſs of Voice, attended with a "*Caros*, or deep Sopor, threaten Convulſions." In *Lib.* 7. *Epid.* καρώδεα ὄμματα, are Eyes affected with a Sopor, or *Caros*; and ἀτενίζοντες κεκαρωμένῳ ὀφθαλμοί, ſignify Eyes rigid, or fixed in the Head, and affected with a *Caros*.

CAROSIS, κάρωσις, the ſame as CAROS in *Moſchion. de Mulierum Morbis.*

CAROTA. The Carrot. See DAUCUS.

CAROTICUS, an Adjective from *Caros*, ſoporous, ſleepy.

CAROTIDES, καρωτίδες, from κάρη, the Head. The Carotid Arteries, which convey Blood to the Head, mark'd 5. 5. in *Tab.* 5. See ARTERIA.

CAROUM. The *Carum*, Caraway, is call'd thus. See CARUM.

CARPASUS, κάρπασος. An Herb taken notice of by *Dioſcorides*, *Pliny*, *Galen*, and *Paulus Ægineta*, the Juice of which is call'd Opocarpaſon, or Opacarpathon, and is eſteem'd very poiſonous. *Paulus*, *L.* 5. *C.* 153. ſays, it induces Sleep, and ſudden Suffocation. The Antidotes, he ſays, are the ſame as thoſe againſt Hemlock. I don't find that the modern Botaniſts know what Plant is here meant. It was very like Myrrh, ſo as to deceive ſome who took the Carpaſus inſtead of it, and by that means were poiſon'd.

CARPENTARIA. A Name for the PRUNELLA, Self-heal, which ſee. *Gerard.*

Blancard ſays it is the HERBA JUDAICA, which is *Ray's* ſeventh Species of the SIDERITIS, Ironwort.

Lemery ſays it is the MILLEFOLIUM, Yarrow.

CARPESIUM, καρπήσιον. An Aromatic mentioned frequently by the Antients, and ſaid to be endu'd with the Virtues of Cinnamon. The *Arabians* miſtake it for Cubebs. But it is not known what it was.

CARPHALEON, καρφαλέον, dry. *Hipp.*

CARPHUS, κάρφος. This the *Latin* Authors tranſlate Feſtuca. It ſignifies, in *Hippocrates*, a Straw, or Mote, or any very ſmall Subſtance; who pronounces it a bad Symptom, and a Sign of a Phrenſy, when, in acute Diſtempers, the Patients pick theſe ſmall Subſtances out of the Bed-clothes, or from the Walls near the Bed. It alſo ſignifies a ſmall Puſtule; for the Cure of which *Aetius*, *Tetrabibl.* 1. recommends rubbing them with the dry'd Seeds of Mercury.

CARPIA. Lint. *Blancard.*

CARPINUS. The Horn-bean-tree. *Gerard.*

CARPIO, Offic. *vel Carpo*, Schrod. 5. 326. *Cyprinus*, Aldrov. de Piſc. 635. Bellon. de Aquat. 273. Geſn. de Aquat. 309. Charlt. de Piſc. 43. Jonſ. de Piſc. 111. Mer. Pin. 190. Raii Ichth. 245. Ejuſd. Synop. Piſc. 115. Rondel. de Piſc. 2. 150. Salv. de Aquat. 91. *Carpa*, Caſſiod. THE CARP.

See the Article ALIMENTA.

You ought to chooſe that Carp which is large, fat, well fed, not too young, and that has been catched in a River, which is better than that which lives in Ponds.

Carp is eaſily digeſted, affords pretty good Nouriſhment, and is good Food.

Some Authors pretend, that this Fiſh hath many heavy, viſcous, and groſs Juices in it; however, 'tis very commonly eat, and no bad Effects are produced by it.

It contains much Oil, Phlegm, and volatile Salt.

It agrees at all times with any Age and Conſtitution.

The Carp is a freſh-water Fiſh ſo well known, as not to need a Deſcription. You meet with it in Rivers, Ponds, and Marſhes. It does not live in the Sea, as *Pliny* ſays, *Lib.* 9. *Cap.* 16. When they are in a Place where they can get Food enough, they grow to a great Bigneſs. Some Authors ſay, they had ſeen Carps in ſome Lakes, that were ten Feet long. They multiply apace, and are found almoſt every-where in great Numbers. They feed upon Herbs, Mud, and Slime, which, perhaps, has made ſome ſay they are not good Food. They live a long time, which is proved by thoſe great and large Carps, which are often found in Town-ditches, and kept there for a Rarity. *Geſner* aſſures us, that he knew a Man of good Reputation, who affirmed to him, he had ſeen one of an hundred Years old.

Rondeletius ſays, that Carps ſometimes are produced of themſelves, without the Help of Generation; and that, it ſeems, from the Corruption of ſome Matter: And for the proving of his Opinion, he aſſures us, that he had ſeen Carps in the Hollows of Mountains, that received no other than Rain-water: However, with this Author's Leave, it is impoſſible, that this Fiſh, or any other, can be produced in the Way he talks of, without a Male and Female Carp. As for the Matter of Fact he cites, I ſhall not regard it; but have a great deal of Reaſon to ſuſpect what he ſays in this Particular.

The Carp being naturally ſoft enough, and full of phlegmatic Moiſture, you muſt not pitch upon that which is young; for as it grows older, ſo proportionably does its overabounding Moiſture diſappear; and then it becomes firmer, better taſted, and more wholſome; and thoſe Carps which are old enough, and of a yellowiſh Colour, are much eſteemed. We alſo prefer the Male before the Female, becauſe 'tis firmer, and better taſted. Laſtly, the Time of the Year wherein they pretend the Carp is beſt, is *March*, *May*, and *June*.

They find in the Head of a Carp a ſtony Bone, which is looked upon to be good to provoke Urine, to diminiſh the Stone in the Kidneys and Bladder, to ſtop Looſeneſſes, and to waſte ſharp and acid Humours.

The Gall of a Carp clears the Eye-ſight.

The Head of a Carp is the beſt Part of all, eſpecially upon account of the Tongue, which has a moſt delicious Taſte. *Lemery on Foods.*

CARPOBALSAMUM, from καρπὸς, Fruit, and βάλσαμον, Balſam. The Fruit of the Balſam-tree. See BALSAMUM.

In *Egypt*, according to *Proſper Alpinus*, the Carpobalſamum is uſed in all the Intentions for which the Balſam itſelf is apply'd, but is not ſo efficacious. The Doſe is two Drams, with a Decoction of Spikenard. It is alſo uſed in Suffumigations for uterine Diſorders ariſing from a cold Cauſe.

The only Uſe the *Europeans* make of the Carpobalſamum is in the Venice-treacle, and Mithridate: And this is not a great deal; for Cubebs, or Juniper-berries, are generally ſubſtituted for it.

CARPOS, καρπὸς. A Seed, or Fruit.

CARPUS, καρπὸς. The Wriſt. See BRACHIUM.

CARSIA. *Johnſon* explains this by *Aqua ſalis Panis.*

CARTHAMUS. Baſtard-ſaffron.

The Characters are;

This Plant agrees with the Thiſtle in moſt of its Characters; but the Seeds of this are always deſtitute of Down. *Miller's Dictionary.*

Boerhaave enumerates but three Species of this Plant.

1. CARTHAMUS, *Cnicus*, Offic. *Carthamus ſive Cnicus*, J. B. 3. 79. Ger. 1006. Emac. 1169. Raii Hiſt. 1. 302. Synop. 88. *Carthamus Officinarum, flore croceo*, Tourn. Inſt. 457. Boerh. Ind. A. 139. *Cnicus ſativus, ſive Carthamum Officinarum*, C. B. 378. Hiſt. Oxon. 3. 145. *Cnicus ſive Carthamus ſativus*, Park. 259. *Cnicus, Cnecus, Carthamus*, Chab. 354. *Carduus ſativus, Cnicus ſeu Carthamus dictus*, Pluk. Almag. 82. BASTARD-SAFFRON.

This is an annual Plant, having a ſmall woody Root, which runs not very deep into the Earth. The lower Leaves are pretty broad, long, and round-pointed. The Stalk grows to be two or three Foot high, corner'd, and without Prickles, branching into ſeveral Diviſions towards the Top, beſet with leſſer Leaves an Inch broad, and two Inches long, pointed, and having a few not very hard Prickles growing on them. The Flowers ſtand on the Ends of the Branches, conſiſting of round ſcaly Heads, having a few Spinulæ growing on them, out of the Middle of which ſpring Thrums of deep-yellow or Saffron-colour'd fiſtular Flowers, ſucceeded by white, corner'd, longiſh Seed, narrow at one End. It is ſown in Fields and Gardens, flowering in *July*. The Flower is call'd Safflower, and is much uſed in dying Silk. The Seed only is uſed in the Shops.

It is accounted a pretty ſtrong Cathartic, evacuating tough viſcid Phlegm both upwards and downwards; and, by that means, is ſaid to clear the Lungs, and help the Phthiſic. It is likewiſe ſerviceable againſt the Jaundice; though grown pretty much out of Uſe. *Miller's Bot. Off.*

The Seeds of the Carthamus, or Baſtard-ſaffron, are apply'd to medicinal Uſes, and are eſteem'd beſt when thick, perfectly ripe, recent, but thoroughly dry'd; but ſince ſome Impoſtors have the Art of preparing the Seeds of Melons and Cucumbers in ſuch a manner as to reſemble the excorticated Seeds of Carthamus, for which they vend them, we muſt obſerve, that the genuine Seeds of the Carthamus are round at one End, ſharp at the other, and do not appear ſo white as the Seeds of Melons and Cucumbers. But, according to *Pauli*, the Goodneſs of theſe Seeds, before they are decorticated for medicinal Purpoſes, ought carefully to be examined into: What ſubſides, ſays he, in Water is good, but what ſwims is to be thrown away as uſeleſs. With reſpect to its Virtues and Uſes, *Dioſcorides* acquaints us with the following Particulars: The expreſs'd Juice of the triturated Seeds, exhibited in Conjunction with Honey and Water, or the Broth of a Fowl, purges the Inteſtines, but proves prejudicial to the Stomach. Of this Juice, with an Addition of Almonds, Nitre, Aniſe, and boil'd Honey, are prepar'd Cakes which render the Body ſoluble. Theſe Cakes are to be divided into four Parts, as large as a Walnut, two or three of which are ſufficient for a Doſe, to be taken before Supper. The Proportion in which the Ingredients are mixed is as follows:

> Of white Cnicus, a Pint; of blanch'd and excorticated Almonds, three Ounces; of Aniſe, one Pint; and of Nitre, one Dram; with the Pulps of thirty Figs. *Dioſcorides, Lib.* 4. *Cap.* 82.

The Juice of theſe Seeds coagulates Milk, and gives it a ſtronger Virtue of purging the Inteſtines. According to *Guliel-mus Pantinus*, in his *Comment. ad Celſum*, "Some coagulate "Milk with the contus'd Seeds of Cnicus, and, having ſtrain'd "it off, add Salt or Sea-water to it: When thus prepared, it "is an effectual Purge, and a pleaſant Drink. But there is no "Neceſſity for Salt when the Intention is only to ſcour the In-"teſtines, or where the Body is previouſly ſtuffed with acrid "and corroſive Humours. This Preparation of it is proper "for old Men, Children, and People of lax Habits of Body: "But in other Conſtitutions, and in more violent Diſorders, a "more *draſtic Preparation of it is required.*" *Hippoc. de Diæta, Lib.* 2. informs us, that the Cnicus is purgative. *Galen*, according to *Matthiol. ad Dioſc.* affirms, that the Seeds of the Cnicus are only uſed for Purges. *Paulus Ægineta, Lib.* 7. *Cap.* 4. reckons them among the Hydragogues. *Sylvius* alſo does the ſame. *Bauhine* informs us, that the Seeds, bruis'd, boil'd in the Broth of Fleſh or Chiches, and drank, evacuate Phlegm, and tough and viſcid Humours. *Ettmuller* tells us, that "It is proper in Caſes where the Primæ Viæ are loaded with a "thick and viſcid Mucus; as alſo in Diſorders of the Breaſt, "in Aſthmas, and Coughs produc'd by a thick and viſcid "Matter; for which Reaſon it is claſſed among the Medicines "which evacuate Phlegm." Theſe Seeds are found to be a draſtic purgative Medicine, which, by reaſon of its acrid Quality, in Conjunction with its Viſcidity, generally excites violent Gripes, with an Inflation of the Abdomen. For this Reaſon, when Phyſicians preſcribe theſe Seeds, they generally obtund and correct their Force by an Addition of Salts or Aromatics, ſuch as Nitre, common Salt, or Sal Gemmæ, Ginger, Aniſe-ſeeds, Cardamoms, or Cinnamon; for by theſe their Viſcidity is diſſolv'd, ſo that they adhere leſs forcibly to the Inteſtines than they would have otherwiſe done. Some, in preparing Decoctions for Clyſters, in which theſe Seeds ought to be an Ingredient, wrap them up in a ſlender Linen or Muſlin Cloth whilſt the Decoction is preparing, leſt, by their Viſcidity, they ſhould adhere to the Inteſtines, and immediately induce a Hypercatharſis, a Teneſmus, or other Diſorders of a like Nature. When theſe Seeds are to be exhibited in Subſtance, the greateſt Doſe is three Drams; but this is not often practiſed, ſince, for the moſt part, they are exhibited in the Form of an Emulſion, which *Ettmuller* directs to be prepared in the following Manner:

> Take of the Seeds of Carthamus, two Drams, or between three and four; with ſome gently aromatic Water, ſuch as that of Fennel or Aniſe, or a Decoction of the Seeds of Fennel or Aniſe: Reduce them to the Form of an elegant purgative Emulſion, to which add one Dram of Cinnamon-water. Mix for one Doſe.

This is an agreeable Draught, and powerfully evacuates the peccant Matter. Beſides, with an Intention of relaxing, theſe Seeds

Seeds are mixed with Decoctions and Infuſions, from half an Ounce to ſix Drams, but very improperly. Theſe Seeds are generally ordered in Clyſters, when ſevere Purging and Revulſion from the Head are neceſſary in Diſeaſes of the Head, a Carus, an Apoplexy, an Epilepſy, a Lethargy, and that in the Beginning of theſe Diſorders. Others prepare an Extract from theſe Seeds, with a ſpirituous Menſtruum, ſuch as the ſpirituous Waters of Aniſeſeed or Orange-peel, or Spirit of Wine, or Spirit of Aniſe moderately rectify'd. The Doſe of this Extract is from one Scruple to half a Dram, or a Dram, which proves a ſtrong Purge. This Extract may alſo be exhibited in the Form of Pills. The Oil expreſs'd from the Seeds proves purgative, when the Abdomen is anointed with it. From what has been ſaid, I think it is ſufficiently obvious, that, in Caſes where theſe Seeds produce their intended Effects, they act by a reſolvent purgative Quality; for which Reaſon they are recommended by Authors in the Dropſy, Jaundice, Gout, Cough, and for provoking the menſtrual Diſcharges. *Sennertus*, in his *Inſtitutiones Medicæ*, juſtly, therefore, obſerves, "That the Seeds of the Carthamus "evacuate Phlegm and Water, by Vomit and Stool; for this "Reaſon they are proper for Diſorders of the Liver, Spleen, "and Breaſt, and beneficial in Dropſies, Colics, and Aſthmas." The ſame is alſo obſerved by *Meſue*, *de Re Medica*. But what proves thus powerfully cathartic with Men, the Magpyes chearfully eat without any Detriment; for which Reaſon *Averroes* calls them *Semen de Papaga*, and the *Venetians Semen Papagalli*. Beſides that, the Flowers prove an elegant Ornament to Gardens. *Bauhine*, from *Tragus*, informs us, that the poor People uſe them bruiſed by way of Sauce; nor unelegantly, ſince they give a fine Saffron-colour to the Aliments, and render the Body ſoluble. One Dram of the Flowers proves purgative, and they are exhibited, in Conjunction with Marigold-leaves, in Diſorders of the Menſes, and the yellow Jaundice. Apothecaries proſtitute theſe Flowers to the worſt of Purpoſes, when they adulterate the Stamina of genuine Saffron with them, for the ſake of augmenting the Weight. Hence this Plant is called Baſtard-ſaffron. But the Fraud is diſcovered by the Smell, which is leſs aromatic than that of genuine Saffron. According to *Matthiolus*, ſome in *Italy* call it *Crocus Saracenicus*, becauſe, in Country Villages, its Flower is generally uſed inſtead of Saffron.

2. CARTHAMUS; *Africanus*; *fruteſcens*; *folio Ilicis*; *flore aureo*. H. R. D.

3. CHAMÆLEON NIGER, Offic. Ger. quoad Deſcript. 997. Emac. 1160. Chab. 352. *Chamæleon niger verus*, Park. 970. *Chamæleon niger umbellatus*, *flore cæruleo hyacinthino*, C. B. 380. *Chamæleon niger Dioſcoridis Maranthæ*, J. B. 3. 63. Raii Hiſt. 1. 314. *Carthamus aculeatus*, *Carlinæ folio*, *flore multiplici veluti umbellato*, Tourn. Coroll. 33. *Carduus Chamæleon dictus*, *capitulis pluribus minoribus cæruleis*, *corymbatim diſpoſitis*, Hiſt. Oxon. 3. 159. BLACK CHAMELEON.

It grows in *Greece*, and flowers in *June*. The Root is only uſed, which is oblong, thick, browniſh externally, but white internally. It is of ſo acrimonious a Quality, that its Juice burns the Skin; but it is very efficacious in cleanſing malignant Ulcers. *Dale* from *Bellon. Epiſt. ad Cluſ.*

CARTILAGO.

A Cartilage is a whitiſh or pearl-colour'd Subſtance, which covers the Extremities of Bones join'd together by moveable Articulations, increaſes the Volume of ſome of them after the manner of Epiphyſes, unites others very cloſely together, and has no immediate Adheſion or Connection with others.

The Subſtance of Cartilages is more tender, and leſs brittle, than that of Bones; but with Age they ſometimes grow ſo hard as to become perfectly bony. They are pliable and elaſtic, and ſo capable of reſtoring themſelves after having been compreſſed, or bent to a certain Degree; but, when bent beyond that Degree, they break.

All that *Winſlow* has ſaid is comprehended in the ſhort Definition which *Carolus Stephanus* has given of them in his Anatomy. "A Cartilage," ſays he, "is a Part of the Body which truly "deſerves the Name of ſimple or ſimilar. It is harder than all "the other Parts, but ſofter than the Bones, white, ſmooth, "poliſh'd, and pliable or flexible. The Coheſion of its Parts "is different in different Cartilages; and no ſenſible Cavity, "Cell, or Bone, appears in any Part of its Subſtance, except "very ſmall Paſſages for the Blood-veſſels," *&c.*

The Cartilages of the Bones differ from each other in Size, Figure, Situation, and Uſe; and may all be rank'd under two general Heads, thoſe which are cloſely united to Bones, and thoſe which are not immediately connected with them.

The Cartilages united to Bones are of four Kinds. Some cover both Sides of the moveable Articulations, and are very ſmooth and ſlippery.

Some unite the Bones to each other, either ſo firmly as to allow no ſenſible Motion, as in the Symphyſis of the Oſſa Pubis, and ſtill more in that by which the Epiphyſes are join'd to the Bones; or in ſuch a manner as to allow of different Motions, as in thoſe by which the Bodies of the Vertebræ are connected. The firſt grow eaſily hard, the others appear, in ſome meaſure, viſcid, and retain their Flexibility.

Some increaſe the Size and Extent of Bones. Of theſe, again, ſome are articulated with other Bones, as the cartilaginous Portions of almoſt all the true Ribs; or with other Cartilages, as the Septum Narium: Others ſerve only for Borders, as thoſe of the Baſis of the Scapula, and of the Criſta of the Os Ilium, the Supercilia of Cavities, and thoſe of the ſpinal and tranſverſe Proceſſes of the Vertebræ.

Some, in fine, have a ſingular Form, as thoſe of the Ears, and moſt of thoſe of the Noſe, in which laſt their Elaſticity appears moſt ſenſibly.

The Cartilages belonging to the ſecond general Claſs, or thoſe not immediately joined to Bones, are, for the moſt part, plac'd in the moveable Joints, and may likewiſe be ſubdivided into ſeveral Kinds.

Some lie altogether looſe, being join'd neither to the articulated Bones, nor to the Cartilages which cover them, but ſlide freely between them in different Directions; as thoſe which are placed in the Articulation of the Tibia with the Os Femoris, in that of the lower Jaw with the Oſſa Temporum, and in that of the Clavicle with the Sternum. Thoſe between the Clavicle and Acromium, and between the firſt and ſecond Vertebræ of the Neck, are of the ſame Kind.

Some are partly join'd to other Cartilages, and partly ſlide between the cartilaginous Extremities of the articulated Bones; as the Cartilage at the lower Extremity of the Radius.

We might likewiſe reckon among the Cartilages, tho' more improperly, ſeveral of the ſmall Seſamoide Bones, which remain long cartilaginous, and alſo the cartilaginous Portions of Tendons, which do the ſame Office with Seſamoide Bones. *Winſlow.*

There are likewiſe ſeveral Cartilages in the Body, which do not belong to the Bones, as thoſe in and about the Larynx, and others which are either deſcrib'd with the Parts to which they belong, or under the Articles of their particular Names.

In Zoology, cartilaginous Fiſh are ſuch as have the Spine of their Back cartilaginous; as many of the flat Fiſh, and ſome others. See SELACHOS.

CARUI. Caraway. See CARUM.

CARUIFOLIA, J. B. C. B. is the *Carum Pratenſe* of *Parkinſon*.

CARVINUM. *Johnſon* explains this by *Lac quoddam*.

CARUM, Caraways.

The Characters are,

It hath winged Leaves, which are cut into ſmall Segments, and are placed oppoſite on the Stalks, having no Foot-ſtalk: The Petals of the Flowers are bifid, and ſhaped like a Heart; the Seeds are long, ſlender, ſmooth, and furrow'd. *Miller's Dictionary.*

Boerhaave takes notice but of three Species of this.

1. CARUM, Offic. *Carum ſive Careum*, Ger. 879. Emac. 1034. Raii Hiſt. 1. 446. Synop. 3. 213. Mer. Pin. 22. *Carum*, Rivin. Irr. Pent. Dill. Cat. Giſſ. 64. Rupp. Flor. Jen. 227. *Carum vulgare*, Park. Theat. 910. *Carum ſive Carui*, Mor. Umb. 24. Hiſt. Oxon. 3. 296. Hort. Lugd. Bat. 121. *Caros*, J. B. 3. 69. *Caros*, *Carus*, *Carum*, *& Careum*, Chab. 391. *Carui*, Tourn. Inſt. 306. Elem. Bot. 256. Boerh. Ind. A. 59. *Cuminum pratenſe*, *Carui officinarum*, C. B. Pin. 158. CARAWAYS. *Dale.*

The Root of *Caraways* is pretty thick and large, ſinking deep in the Ground, of a white Colour, and of a pleaſant ſweet Taſte, prefer'd by many to Parſnips. The lower Leaves are large and winged, divided into a great many Sections, like the Leaves of Carrots; but finer, ſmoother, and little or nothing hairy. The Stalk grows to be two or three Foot high, ſtriated and divided into ſeveral Branches, having finer Leaves at each Diviſion, thoſe towards the Top being near as fine as Fennel. The Flowers are ſmall and white, of five Leaves each: They grow in Umbels, and are ſucceeded by long, brown, ſtriated Seed, two ſticking together, as in other umbelliferous Plants, of a warm aromatic pleaſant Taſte. They grow wild in ſeveral Places of *Lincoln* and *York* Shires, according to Mr. *Ray*. I have ſometimes found it in the Fields about *London*, but ſuſpect it to ariſe from Seed accidentally ſcattered, which is the only Part uſed, and comes from *Germany*.

The Seed is one of the greater hot Seeds; it is ſtomachic and carminative, expels Wind, and is ſerviceable againſt the Colic and Weakneſs of the Stomach, helps Digeſtion, is good for Dizzineſs in the Head, Weakneſs of Sight, to provoke Urine, and increaſe Milk in Nurſes.

Officinal Preparations are, the Seed candy'd with Sugar, and an Oil diſtil'd from the Seed. *Miller's Bot. Off.*

The Seed only of this Plant is in Uſe, tho' ſome uſe the Root in carminative Piſans and Glyſters. The Seed is ſtomachic, diuretic, and very proper to diſſolve the glutinous Matters which cauſe the Colic. Caraway-ſeeds are put in Bread to avoid this Diſeaſe. Take an hot Loaf, ſprinkled with bruiſed Caraway-ſeeds, dipt in good Brandy, and apply it to the lower

Belly

Belly for that Diſeaſe. Candy'd Caraway-ſeeds diſpel the Wind. The chymical Oil is very acrid and penetrating; five or ſix Drops of it are preſcribed in Oil of ſweet Almonds; ſome Drops of it in Spirit of Wine, imbibed by Cotton, and put in the Ears, may be uſed in the Caſe of Deafneſs, inſtead of Syringing. *Martyn's Tournefort.*

2. *Carui*; *ſemine majore*. Vaill. a.

3. *Carui*; *Alpinum*. C. B. P. 158. Prodr. 84. deſcr. a.

CARUNCULA. A Diminutive from from *Caro*, Fleſh. A Caruncle, or ſmall Piece of Fleſh, or, at leaſt, what has the Appearance of it. Thus there are the *Caruncuiæ Lacrymales* in the Corners of the Eyes. See OCULUS. The *Caruncuiæ Myrtiformes*, which are ſmall Caruncles at the Entrance into the Vagina, ſaid to be formed by the Rupture of the Hymen. The *Caruncuiæ Papillares*, in the Kidneys: And a Caruncle in the Urethra, at the Orifice which opens from the Veſiculæ Seminales; beſides many others. The Uvula is alſo ſometimes call'd *Caruncula*.

Morbid Excreſcences of Fleſh are alſo call'd Caruncles; and ſmall Portions of a fleſhy Subſtance, which are ſometimes diſcharged in a Dyſentery by Stool, or, in Diſeaſes of the urinary Paſſages, by Urine, are call'd Caruncles.

CARUS. See CAROS.

CARYA, καρύα. The Walnut-tree. *Theophraſtus.*

CARYCHUS, κάρυχος. An Ingredient in one of *Myrepſus*'s Antidotes, *Cap.* 295. which *Fuchſius* confeſſes to be unknown to him.

CARYCIA, CARYCE, καρυκεία, καρύκη. *Suidas*, *Erotian*, and *Galen*, informs us, that it was a coſtly ſort of Food, or ſeaſon'd Diſh, invented by the *Lydians*, and prepared of Blood, with other Ingredients. *Varinus* ſuppoſes it was called *Caryce*, becauſe it was of a black Colour, like that of Carya, or Walnuts boil'd. *Gorræus.*

CARYCOIDEA, καρυκοειδία, from καρύκη, the preceding Word, and εἶδος, Reſemblance, in *Hippocrates*, *Epid. Lib.* 4. is expounded, in *Galen's Exegeſis*, ὕφαιμα, "ſomewhat reſem-"bling Blood." The Paſſage, in *Hippocrates*, is as follows: Ὅσα τὰ μέλαινα κατ' ἀρχὰς ἦσαν, ὑπόστρυγα, καρυκοειδέα "Their Stools in the Beginning were black, ſomewhat fe-"culent, reſembling Caryce" (the Culinary Preparation before-mention'd). In the ſame Senſe is CARYCODE, καρυκώδη, in *Actuarius*, *Lib.* 5. *Meth.* to be taken, where he applies this Epithet to the Stools of thoſe who have drank Bulls Blood.

CARYEDON CATAGMA, καρυήδων κάταγμα. A Species of Fracture, the ſame as ALPHITEDON, which ſee.

CARYITES, in *Dioſcorides*, *Lib.* 4. *Cap.* 165. is a Name for the Female Tithymalus.

CARYOCES, CARYOSSE, Names given by the *Portugueſe* to the Fruit of the *Guiney* Palm-tree. *Ray.*

CARYOCOSTINUM ELECTUARIUM.

Take of Cloves, white Coſtus, or Zedoary, Ginger, and Cumin-ſeeds, of each two Drams; of Hermodactyls, clear'd of their Huſks, and of Diagrydium, each half an Ounce; of the Honey of Roſes, three times the Quantity of the Whole: Let them all be powder'd together, except the Diagrydium, and ſtirr'd into the Honey of Roſes with a wooden Spatula; and, at laſt, put in the Diagrydium by itſelf, and make them into an Electuary. *S. A.*

This differs not from any preceding Diſpenſatory of the College, nor the *Auguſtan*, both which have it, unleſs in ordering Honey of Roſes for common Honey, which is an Alteration of no great Conſequence. *Zwelfer* gives this a great Commendation for purging away Choler, and breaking away the Obſtructions of cachectic Conſtitutions; and it is an excellent Purge for ſtrong People. It works very briſkly, and fetches the Humours from the moſt remote Parts; and is therefore found of great Service in Rheumatiſms, and arthritic Complaints. Its Warmth alſo, and Fitneſs to carry watery cold Humours, makes it very good in Dropſies, and ſuch-like groſs Habits. In apoplectic and paralytic Caſes likewiſe, where the Fibres want to be ſtimulated, and ſhook with Briſkneſs, this is a proper Medicine, if Purging be required; but it is too ſmart for weakly People. Its Doſe is from one Dram to ſix Drams. There is in every half Ounce of this, of Diagrydium and Hermodactyls, of each 15 Grains. *Quincy.*

CARYON, κάρυον. A Nut. A Word apply'd to all ſuch Fruit as incloſe ſomewhat eatable within a hard Shell. *Plutarch*, *Sympoſ.* 3. *Quæſt.* 1. writes, That the Antients called the Walnut *Caryon*, becauſe it induces a Heavineſs and Stupidity upon the Spirits, ſo as to affect even thoſe who lie under it; and that the Diſeaſe *Caros* took its Name from this Tree, or the Tree from the Diſeaſe.

CARYON BASILICON, *ſive* EUBOICON, *ſive* PERSICON, κάρυον βασιλικόν, ἢ Εὐβοϊκόν, ἢ Περσικόν. The Walnut.

CARYON HERACLEOTICON, *ſive* PONTICON, κάρυον Ἡρακλεωτικόν, ἢ Ποντικόν. A ſmall Nut, as a Filbert, or Haſlenut, ſo call'd becauſe it was brought from *Heraclea*, in *Pontus*, into *Greece*.

CARYON LEPTON, *ſive* LEPTOCARYON, κάρυον λεπτὸν ἢ λεπτοκάρυον, from λεπτὸς, ſmall. The ſame with the preceding.

CARYOPHYLLATA, *Avens*, or Herb-bennet.

The Characters are,

It hath pennated or winged Leaves, ſomewhat like thoſe of Agrimony. The Cup of the Flower conſiſts of one Leaf, which is cut into ten Segments. The Flower conſiſts of five Leaves, which ſpread open in form of a Roſe: The Seeds are form'd into a globular Figure, each of which have a Tail to it. The Roots are perennial, and ſmell ſweet. *Miller's Dict.*

Boerhaave mentions eight Species of this Plant.

1. CARYOPHYLLATA, Offic. Ger. 842. AVENS, or HERB-BENNET, Emac. 994. Raii Hiſt. 1. 606. Synop. 3. 253. Mer. Pin. 22. *Caryophyllata vulgaris*, ORDINARY AVENS, Park. Theat. 136. C. B. Pin. 321. Dill. Cat. Giſſ. 97. Tourn. Inſt. 294. Elem. Bot. 244. Boerh. Ind. A. 42. Hiſt. Oxon. 2. 430. Rupp. Flor. Jen. 86. Buxb. 58. *Caryophyllata vulgaris*, *Herba Benedicta*, Merc. Bot. 1. 27. Phyt. Brit. 23. *Caryophyllata vulgaris flore parvo luteo*, J. B. 3. 398. *Caryophyllata*; *Janamunda*, Chab. 172. AVENS. *Dale.*

The Root of this Herb (which has its Name *Caryophyllata* from its ſmelling ſomewhat like *Caryophylli* Cloves) is ſlender, hard, and woody, full of ſmall Fibres, of a reddiſh Colour, having a Smell of Cloves. The lower Leaves are made up of about ſeven Pinnæ, whereof the odd one at the End, and the two next it, are much the largeſt: They are hairy, as is likewiſe the Stalk, growing two Foot high, or ſometimes more, beſet with ſmaller Leaves, having two pretty large Alæ or Wings growing cloſe to the Stalk, and ending in three Pinnæ. The Flowers grow at the Tops of the Branches on long Foot-ſtalks, of five ſmall yellow Leaves, with ſeveral brown Stamina in the Middle. Theſe are ſucceeded by Cluſters of little flat hairy Seed, each having a crooked Hook at the End, by which it eaſily adheres to any thing which comes in the Way. It grows in Woods, and by Hedge-ſides; and flowers a great Part of the Summer.

The Roots only are uſed, which, being infuſed in Wine, give it a pleaſant Smell and Taſte, and render it more cordial and chearing to the Spirits. They eaſe Pain ariſing from Cold, or Wind in the Bowels. They are cephalic and alexipharmic; and, being manifeſtly of a binding Nature, are uſeful for all kinds of Fluxes and Hæmorrhages. *Miller's Bot. Off.*

The *Avens* is bitter, ſtyptic, and gives a deep-red Colour to blue Paper. Its Root ſmells like Cloves. Its Salt reſembles the Sal Ammoniac; but is very much loaded with Acid, and involved by a great deal of eſſential Oil and Earth. An Infuſion of *Avens-roots* in Wine is ſtomachic, according to *Tragus*, and removes Obſtructions of the Liver. This Wine is alſo very vulnerary and deterſive. The Extract has the ſame Virtues. It is preſcrib'd in Rheumatiſms. *Martyn's Tournefort.*

2. *Caryophyllata*; *Alpina*; *lutea*. C. B. P. 322. *Caryophyllata*, *Alpina*, *lutea*, *major*. M. H. 2. 430. *Caryophyllata*, *montana*, *flore luteo*, *magno*. J. CARYOPHYLLUS. The Clove-gilly-flower, Carnation, or Pink.

The Characters of the Caryophyllus, according to *Boerhaave*, are:

The Leaves are of an oblong Figure, entire, conjugated, adhering to the Stalks, without Pedicles.

The Calyx, or Flower-cup, is bifoliated, ſmall, including another ſmall bifoliated one; and, above theſe two, ariſes a third cylindrical membranaceous Calyx, quinquefid, or with five Diviſions, on its upper Part.

The Flower is pentapetalous, the Leaves, or Petals, ariſing from the very Bottom of the Calyx, and extending themſelves from a long and narrow Beginning to a conſiderable Breadth, diſpoſed in a Circle, and furniſh'd with ten Stamina.

The Ovary grows to the Placenta ſituated in the Bottom of the Calyx, is furniſh'd with two long erect Tubes, and becomes a cylindrical Fruit, which is incloſed in a Calyx, opens at the Top, and is full of foliaceous Seeds.

Theſe are dark-brown, almoſt black, Fruit, in Shape of a thick ſhort Nail, ſomewhat compreſs'd, with four crooked Horns on the Top, and a round, brittle, hollow Cap in the Middle of them, eaſily falling off. They are of a pleaſant, grateful, hot, ſpicy Taſte. They are the unripe Fruit of a large Tree, with Leaves like the Leaves of the Bay-tree, but of a thicker, firmer Texture. They grow in the *Molucca* Iſlands, in the *Eaſt-Indies*.

Cloves are very heating and drying, cordial, cephalic, and ſtomachic, ſtop Vomiting, ſtrengthen a weak Stomach, expel Wind, prevent Fainting, and are good in malignant Diſtempers. The diſtil'd Oil cures the Tooth-ach, a Bit of Lint dip'd in it being put into the hollow Tooth.

The only officinal Preparation is the diſtil'd Oil. *Miller's Bot. Off.*

There are two Sorts of this Fruit ſold in the Shops; the firſt is the *Cloves* ſo call'd, being the unripe Fruit, which is oblong, reſembling a Nail, angulous, depreſſed, wrinkled, of a dark-ruſty Colour, marked at the Top with four little ſtellated Apices, with a convex, hollow, little Head in the Middle, whence the Flower is to proceed, which is of an acrid, bitteriſh, and grateful Taſte, and of a moſt fragrant Smell. The other Sort are the *Anthophylli*, which are the ſame Fruit with the others, but arrived to perfect Maturity: They reſemble an oblong Nail, are blackiſh, and like the former, only thicker, and more tumid, and including, within a pretty hard Rind, an oblong Grain, of a duſky Colour. You are to chuſe ſuch Cloves as have a fragrant Smell, and, when preſſed, yield an oily kind of Humidity. The *Anthophylli* are rarely to be met with in our Shops.

They are an excellent Cardiac, Cephalic, and Stomachic, being of a heating, drying, and diſcuſſing Quality; for which Reaſon they are ſerviceable in a Lipothymy, the Tooth-ach, Crudities of the Stomach, and the Vertigo, and are expulſive of malignant, uterine, and other Diſorders. *Dale.*

The diſtil'd OIL *of* INDIAN CLOVES.

This *Indian* Spice is very extraordinary: The greater Sort bears its Seed nearly on the Top; and the leſſer, which is without Seed, is ſo rich in a ſharp balſamic Oil, that when perfect, and a little heated, it ſpontaneouſly yields one which is highly odoriferous and corroſive, barely by the Preſſure of the Finger, or the Prick of a Needle. And it is incredible what a large Proportion of Oil theſe Cloves contain, when they firſt come to us from the *Indies*, and are taken from the Middle of the Bags, and immediately examined, ſo that there is ſcarce any thing comparable to them, in reſpect of aromatic Oil. Let a Parcel of theſe, therefore, be choſe perfect, and commit them entire to twelve times their own Weight of Water, and immediately diſtil them briſkly by the Alembic and Worm: There will come over a milky, thick, turbid Water, and, at the ſame time, a large Quantity of Gold-colour'd Oil, which falls and collects at the Bottom of the Water. When two Thirds of the Water at firſt poured on are thus come over, change the Receiver, and add as much freſh Water to the Remains as comes over in Diſtillation, and work as before, whereby there will be obtained a Water ſomewhat impregnated with the aromatic Virtue of the Cloves. Keep all the odoriferous Waters apart, to be uſed inſtead of common Water in future Diſtillations of the ſame Oil. There will now remain at the Bottom a brown, thick, ſcentleſs Liquor, of an acid and ſomewhat auſtere Taſte, but without any of the former Virtue of the Cloves; tho' theſe Remains of the Subject ſo far retain their priſtine Form and Colour, as, when half dried, eaſily to paſs upon the unwary for genuine; and, if mixed with thoſe which have not been rob'd of their Oil, they again acquire their natural Smell and Taſte, by attracting the Oil of the reſt, ſo that they cannot afterwards be diſtinguiſhed from them; in which manner they are often fraudulently adulterated by certain Dealers in Spices. The Oil, thus diſtil'd, always appears ſomewhat mucilaginous: If it, therefore, be required purer at the firſt Operation, inſtead of common Water let Salt and Water be employ'd, and the Diſtillation be performed after a previous Digeſtion of two or three Weeks; but the Remainder, in this Caſe, cannot ſo well be examined.

REMARKS.

The Oil is extremely heating, and even cauſtic; and, therefore, affords a very proper and incomparable Remedy in cold Conſtitutions, and cold Diſeaſes, if prudently uſed. It is alſo a noble Medicine for raiſing the languid Spirits, being uſed either internally or externally. But it is ſurpriſing, that this noble Oil ſhould ſo ſoon loſe its Spirits, by ſtanding expoſed, in a wide Glaſs, in the warm open Air, at the ſame time perfuming the Place with its Odour, and at length changing to an indolent, viſcous, unctuous Subſtance; whereas the Spice ſo long retains this Spirit in the violent Heat of the hoteſt Country. This Oil is alſo heavier than Water, ſo as always to ſink to the Bottom thereof, and remain in full Virtue under it. The like is ſcarce to be found in the Oils of *Europe*, being principally obſerved only in the hoteſt Parts of *Aſia*, *Africa*, and *America*; and chiefly of the aromatic Trees, as Clove, Cinnamon, Guaiacum, and Saſſafras: Yet this Oil, tho' it be ſo ponderous, becomes volatile with boiling Water, and diſtils along with the Vapour thereof. Laſtly, it is remarkable, that the Plants, abounding with ſo hot an Oil, do not appear alcaline in their Remains after Diſtillation, but acid, auſtere, cold, and conſiderably fixed, as if it were to detain this Oil, which, of itſelf, might prove too volatile. *Boerhaave's Chymiſtry.*

Lint, impregnated with Oil of Cloves, diſſolv'd in highly rectify'd Spirit of Wine, is recommended by *Hoffman* as an excellent Application for ſtopping the Progreſs of a Gangrene.

Another Caryophyllus is, The

CASSIA CARYOPHYLLATA, Offic. *Caſſia Caryophyllata, Cortex Caryophylloides*, Mont. Exot. 8. *Caryophyllus folio & fructu rotundo*, Breyn. Laet. 277. *Piper Chiapæ*, Redi Lat. 132. THE CLOVE-BERRY-TREE. *Dale.*

It is produced in great Plenty in the Iſland of *Cuba*, and other Parts of the *Weſt-Indies*. Its Bark, which is uſed for medicinal Purpoſes, is ſlender, of a reddiſh or ruſty Colour when its external Pellicles are removed, and wrapt up in the Form of ſmall Pipes: It is of an acrid, pungent, aromatic Taſte, and of a fragrant Smell, reſembling that of Cloves. The Fruit of this Tree is fraudulently ſold in the Shops for the Carpobalſamum, or, according to others, for the Amomum. This Fruit is a round blackiſh Berry, a little larger than Pepper, umbilicated in the Top, and including, under a ſlender Pellicle, and a fungous Subſtance, two black Seeds, of a Taſte and Smell approaching to thoſe of Cloves. It is cephalic, cordial, and agrees with Cloves in all their Virtues. *Dale. Pharmacolog.*

A third Sort of Caryophyllus is, The

Pimenta, Offic. *Piper Jamaicenſe quibuſdam, odoratum Jamaicenſe noſtratibus*, SWEET-SCENTED JAMAICA-PEPPER, or ALL-SPICE, Raii Hiſt. 2. 1507. *Myrtus arborea, foliis laurinis, aromatica*, JAMAICA PEPPER-TREES, Tranſ. Phytog. 155. Tab. 155. *Piper Caryophyllatum, Piper Jamaicenſe*, Mont. Exot. 9.

Cocculi

Cocculi Indi aromatici, Muſ. Regiæ Societ. JAMAICA PEPPER, or ALL-SPICE. *Dale.*

The *Myrtus arborea, foliis laurinis aromatica, Pimenta*, or *Jamaica Pepper-tree*, has a Trunk as thick as one's Thigh, riſing ſtrait about thirty Feet high, covered with an extremely polite or ſmooth Skin, of a grey Colour, and branched out on every hand, having the Ends of its Twigs ſet with Leaves of ſeveral Sizes; the largeſt being four or five Inches long, and two or three broad in the Middle where broadeſt; and, when it decreaſes to both Extremities, ending in a Point, ſmooth, thin, ſhining, without any Inciſures, of a deep-green Colour, and ſtanding on ſuch long Foot-ſtalks, when bruiſed, very odoriferous, and, in all things, like the Leaves of a Bay-tree. The Ends of the Twigs are branched into Bunches of Flowers, each Foot-ſtalk ſuſtaining a Flower, made up of four herbaceous or pale-green Pelata, bowed back, or reflected downwards, within which are many Stamina of the ſame Colour. To theſe follow a Bunch of crowned or umbilicated Berries, (the Crown being made up of four Foliola or ſmall Leaves) which are bigger when ripe than Juniper-berries; at firſt when ſmall, greeniſh, but when ripe, they are black, ſmooth, and ſhining, containing, in a moiſt, green, aromatic, and biting Pulp, two large Acini or Seeds, ſeparated by a Membrane lying between them, each whereof is an Hemiſphere, and both joined make a Globe or ſpherical (appearingly one) Acinus; whence *Cluſius* makes it one Seed diviſible into two Parts.

It grows on all the hilly Parts of the Iſland of *Jamaica*, but chiefly on the North Side thereof; and where-ever theſe Trees grow, they are generally left ſtanding when other Trees are fell'd; and they are ſometimes planted where they never grew, becauſe of the great Profit from the cured Fruit, ſent in great Quantities yearly into *Europe*.

It flowers in *June*, *July*, and *Auguſt*, but, in ſeveral Places, ſooner or later, according to their Situation, and different Seaſon for Rains; and, after it flowers, the Fruit ſoon ripens; but 'tis to be obſerved, that, in clear open Grounds, 'tis ſooner ripe than in thick Woods.

There is no great Difficulty in the curing or preſerving of this Fruit for Uſe: 'Tis, for the moſt part, done by the Negroes; they climb the Trees, and pull off the Twigs, with the unripe green Fruit, and afterwards carefully ſeparate the Fruit from the Twigs, Leaves, and ripe Berries; which done, they expoſe them to the Sun, from its Riſing to Setting, for many Days, ſpreading them thin on Cloths, turning them now-and-then, and carefully avoiding the Dews, which are there very great. By this means they become a little wrinkled, or rugous, dry, and from a green change to a brown Colour; and then they are fit for the Market, being of different Sizes, but generally of the Bigneſs of black Pepper, ſomething like in Smell and Taſte to Cloves, Juniper-berries, Cinnamon, and Pepper; or rather having a peculiar mix'd Smell, ſomewhat akin to them all; whence the Name of *All-ſpice*. The ripe Berries are very carefully ſeparated from thoſe to be cured, becauſe their wet and plenteous Pulp renders them unfit for Cure; whence theſe Berries always coming unripe dried into *Europe*, has been the Occaſion of Naturaliſts thinking it to be *Fructu umbilicato ſicco*. The more fragrant and ſmaller they are, they are accounted the better.

This Fruit, with Water diſtil'd *per Veſicam*, yields a very odoriferous Chymical Oil, ſinking to the Bottom of Water, like Oil of Cloves. It may deſervedly be counted the beſt and moſt temperate, mild and innocent, of common Spices; and fit to come into greater Uſe, and to gain more Ground, than yet it hath, of the *Eaſt-India* Commodities of this kind, almoſt all of which it far ſurpaſſes, by promoting the Digeſtion of Meat, attenuating tough Humours, moderately heating, ſtrengthening the Stomach, expelling Wind, doing thoſe friendly Offices to the Bowels, as we generally expect from Spices.

It is now commonly ſold by Druggiſts for Carpobalſamum, which, I ſuppoſe, came from *Hernandez*, who ſays it may be its Succedaneum; but it is not altogether like that Fruit, but ſeems more fragrant, and leſs aſtringent and balſamic. *Cluſius* ſays, that it takes away, if chewed, a ſtinking Breath. *John de Barrius* tells us 'tis one of the Ingredients of Chocolate in *New Spain*: And *Franciſcus Vria*, who brought it from *New Spain*, and gave it to *Redi*, ſaid it was there commended againſt the Epilepſy and Gutta Serena; which he in divers Perſons try'd, but without Succeſs; but he, at the ſame time, ſays he thinks it a good ſtomachic and cephalic Medicine, moderately given.

It has been taken by *Cluſius* for *Pliny*'s *Caryophyllon*, and by others for *Amomum*; but it is not likely, that it was known to the Antients, not being known to grow in the *Eaſt*, but *Weſt-Indies*.

It is very likely, that *Hernandez* deſcribes this under the Name of *Kocoxite ſeu Piper Tavaſci*, his Deſcription agreeing in every thing but the Flower, which noways agrees to this. And, perhaps, this is the Tree which *Piſo* deſcribes under the Name of *Anbuiba Miri*. *Philoſ. Tranſ. abr.*

CARYOTI, καρυωτοὶ. A Name in *Galen*, *de Al. Fac. Lib.* 2. *Cap.* 26. for the beſt Dates, or Fruit of the Palm-tree, growing in *Syria* and *Paleſtine*.

CASAMUM, κάσαμον, in *Myrepſus*, and the later *Greek* Writers, is a Name for the κυκλαμινέα (*Cyclamen*). *Fuchſius in Myrep. Antidot. Cap.* 412.

CASCARILLA. A Diminutive from *Caſcara*, which, in *Spaniſh*, ſignifies Bark, or a Shell. The Drug moſt generally known by this Name is the *Peruvian* Bark, which is at this time entered at our Cuſtom-houſe by the Name of *Caſcarilla*. But ſome other Barks have been call'd by this Name, probably at firſt by People unacquainted with the Import of the Word; and this has introduced ſome Confuſion in the Materia Medica.

The Bark, which *Dale* calls by the Name of *Caſcarilla*, is The

Cortex Thuris, Offic. *Cortex Thuris nonnullis dictus, vel Thymiama*, Raii Hiſt. 2. 1841. *Elaterii Pharmacopol. vel Elatherii Cortex, Thymiama*, Schrod. 4. 166. *Caſcarilla*, Ind. Med. 29. *Schakarilla, Chakarilla*, Mont. Exot. 8. *Kinakina Aromatica Palode Calenturas. Caſcarilla, Cortex Elaterii, ſive Scacarilla Officinarum. Cortex Peruvianus griſeus, ſive ſpurius*, Geoff. Tract. 307. *Storax rubra Officinarum*, C. B. Pin. 452. Jonſ. Dend. 127. *Thus Judæorum*, Park. Theat. 1602. INDIAN BARK.

It is imported into *Europe* from the *Eaſt-Indies*, but we have it from one of the *Bahama* Iſlands in *America*, called *Elatheria*. The Bark is cannulated, conſiſting of a Collection of little Tubes or Pipes, and is in ſmall Bits, of the Thickneſs of Cinnamon, of the Colour of ruſty Iron, of an acrid, aromatic, and bitter Taſte, and of a ſweet and pleaſant Smell, eſpecially when it is burnt. It generally wants its outer Rind, which is rough, and of an Aſh-colour. The moſt valuable is what is thick, fat, ſcented, ſmooth, and without the leaſt Aſperities. In Suffumigations, wherein it is a common Ingredient for the ſake of its pleaſant Smell, it helps Contractions of the Uterus.

Tho' this Drug be called *Cortex Thuris*, that is, the Bark of Frankincenſe, in the Shops, yet Naturaliſts are not agreed about the Tree from which it is taken, ſome aſſigning one Tree, ſome another. Some will have it to be the νάσκαφθος, or νάρκαφθος of *Dioſcorides*, *Lib.* 1. *Cap.* 22. which he makes to be a ſort of Bark imported from *India*, like the Bark of the Mulberry-tree, and uſed in Suffumigations for the ſake of its grateful Smell. *Cæſalpinus* takes it for the outer Bark of the Nutmeg-tree; *Amatus*, for that Species of Calambac which the *Portugueſe* call *Lignum Aquilæ*, that is, *Eagle-wood*; *Parkinſon* thinks it is the Bark of that very Tree which bears the Frankincenſe. Whether it be any or neither of theſe Trees, I ſhall not take upon me to determine; tho' I cannot be of the Opinion of *C. Bauhine* and *Bellonius*, that this Bark is the ſame with the red Styrax of the Shops. *Dale.*

I cannot take upon me to determine whether this Bark mentioned by *Dale*, and ſaid to be produced in the *Eaſt-Indies*, is the ſame as the *Weſt-Indian* Bark, which now goes by the Name of *Caſcarilla*, or a different Sort. With reſpect to this latter, *Juncher*, *Valentini*, and ſome *German* Authors, confound it with the *Cortex Winteranus*. The beſt Account of this *Caſcarilla* I have met with is in the *Hiſt. de l'Acad. Roy. des Sc.* as follows:

The *Caſcarilla*, a Medicine little known, and hardly mentioned in any of our Hiſtories of Drugs, is a pretty woody Bark, about a Line, or a Line and an half thick, of a Colour almoſt reſembling that of the common *Quinquina*, but of a ſomewhat paler brown, leſs compact, more friable, of a bitter, and ſomewhat ſtyptic Taſte, pungent, and pretty acrimonious to the Tongue, and leaving at laſt a Senſation of Bitterneſs, mixed with ſomething of an aromatic Nature. This Bark is covered with a Pellicle, which is whitiſh, ſlender, inſipid, wrinkled, and gently furrowed in various Parts. This is the Bark of a *Peruvian* Plant, as yet unknown.

It bears ſo near a Reſemblance to the *Quinquina*, that, as there are at preſent ſix Species of this latter enumerated, it is reckoned as a ſeventh. It is by ſome alſo called *Kina-kina ſpuria*, or *falſa*; or *Kina-kina urens*, or *Kina-kina odorifera*. It is by Druggiſts called *Cortex Elaterii*, no doubt on account of its pungent Bitterneſs, reſembling that of the *Elaterium*. But it is by no means probable, that it is the Bark of the wild Cucumber; for the Name *Chacril*, which we (the *French*) give it, comes from the *Spaniſh* Word *Chacarilla*, or *Caſcarilla*.

Caſcarilla, notwithſtanding its Reſemblance to the *Quinquina*, differs very much from it. The former is more bitter, acrid, and almoſt cauſtic to the Taſte; whereas the *Quinquina* is of a more diſagreeable Bitter, and of a more aſtringent or ſtyptic Quality. The *Caſcarilla*, when heated or burn'd, diffuſes a more aromatic Odour than the *Quinquina*. In a Word, the *Caſcarilla*, when kindled at a Wax Candle, yields a thick Smoak, and a large Quantity of a ſooty Matter; and what remains is only a rarefied and diſtended Coal, like that of burned Reſins; a Circumſtance which ſhews it to contain a large Quantity of a reſinous Matter in compariſon of the *Quinquina*.

Hence Mr. *Boulduc* the younger, when inquiring into the Nature and Effects of *Caſcarilla*, thought that, by means of

the Spirit of Wine, it would yield a large Quantity of a reſinous Extract; and, upon making the Experiment, one Ounce of the *Caſcarilla* yielded five Drams of a reſinous Extract, of a bitter, pungent, aromatic Taſte, like that of the Subſtance before the Proceſs, and of a beautiful purple Colour. Mr. *Boulduc* was not acquainted with any Vegetables which yielded ſo large a Quantity of Extract; for ſcarce twenty Grains can be obtained from an Ounce of *Quinquina*. The Fœces, when dried, weighed three Drams, and conſiſted only of the earthy and fixed Parts of the *Caſcarilla*. From this Circumſtance it appears, that a very ſmall Quantity of the compound Body muſt be poſſeſſed of very conſiderable Virtues.

The deceaſed Mr. *Fagon* often told Mr. *Boulduc*, that when the Quinquina was as yet ſcarce in *France*, he often employed the *Caſcarilla* with Succeſs in intermittent Fevers. In all Probability its reſinous and penetrating Parts divide and attenuate the ill-concocted, thick, and viſcid Subſtance, which is the Fomes of the Fever. This Febrifuge has the Advantage over the *Quinquina* in this reſpect, that it acts in a ſmaller Doſe, and is not neceſſary to be ſo long continued.

Upon the Whole, Mr. *Fagon*, according to the Account of Mr. *Boulduc*, was ſo firmly perſuaded, that, in febrifuge Medicines, it was the reſinous Part which principally contributed to the Cure of the Fever, that he often ordered an Infuſion of the *Quinquina* to be made with *Aqua Vitæ*, as a kind of Aſſiſtant to the ordinary Infuſions, and in order to haſten and accelerate the Effects of the *Quinquina*. Some others, who are of the ſame Opinion, add different reſinous Subſtances.

Apinus, a celebrated Phyſician and Profeſſor at *Altorf*, ſeems to have been the firſt who employ'd *Caſcarilla*, either in Tincture or Infuſion, for the Cure of epidemic and catarrhous Fevers, and in Subſtance for the Cure of thoſe of the ordinary Kind. The illuſtrious Mr. *Stahl*, Phyſician to the King of *Pruſſia*, extended its Uſe farther, and preſcribed it for ſevere and convulſive Coughs, ſuch as thoſe called Chin-coughs. And even in theſe Caſes the *Caſcarilla* produces its Effects, by inciding and attenuating the viſcid Matter. For the ſame Reaſon, it is highly beneficial in Caſes where the Intention is to aſſiſt or augment Tranſpiration.

Mr. *Boulduc* experienc'd the Virtues of *Caſcarilla* in flatulent Colics, and in thoſe hyſteric or hypochondriac Diſorders, commonly call'd Vapours. But it muſt be obſerved, that when the Intention is only to attenuate and render the Humours ſubtile, the Tincture of *Caſcarilla* is ſufficient for that Purpoſe, becauſe it contains all the reſinous Part: Whereas, when the Intention is to reſtore and confirm the Tone of any Parts that have been ſhock'd, agitated, or ſtrain'd, *Caſcarilla* in Subſtance ought to be preſcrib'd; becauſe 'tis in this Caſe neceſſary, that its earthy and ſtyptic Parts ſhould perform the Office of Aſtringents.

Caſcarilla, in Subſtance, is of ſingular Service in the internal Hemorrhoids, which flow with Difficulty, provided the Patient is of a pretty corpulent Habit of Body. This happens, becauſe in ſuch a State the Skin being relaxed, the *Caſcarilla* augments the Tranſpiration, in conſequence of which, the Humours will have more Liberty, and the Hæmorrhoids be opened. Perhaps, alſo, the *Caſcarilla* may contribute to make the Hæmorrhoids flow, by reſtricting and bracing up thoſe Veſſels which contain the hæmorrhoidal Blood. Of this Fact Mr. *Boulduc* himſelf was a Witneſs.

But what he obſerv'd, as more particularly advantageous in the *Caſcarilla*, was the ſingular Service it did in the Dyſenteries which raged in the Year 1719. whether accompany'd with a Fever or not. *Ipecacuanha* on this Occaſion was almoſt brought into Diſrepute, and *Caſcarilla* acquired a great Reputation, which does not at the ſame time prove, that it would have been equally beneficial in any other Year, ſince, to the great Misfortune of Mankind, thoſe Diſeaſes of different Years which go under the ſame Name, are yet of widely different Natures. Mr. *Boulduc* found, that whereas *Ipecacuanha*, and the other emetic Vegetables, left a long Indiſpoſition, and a great Weakneſs in the Stomach, *Caſcarilla* ſpeedily reſtored and confirmed its Tone and Strength. This Bark then has the ſame Virtues with its fellow Medicines the *Quinquina* and *Ipecacuanha*, and perhaps exerts them to greater Advantage than either the one or the other. Mr. *Boulduc Hiſt. de l' Acad. Royale des Sciences, Ann.* 1719.

CASCHU. The ſame as CATECHU, which ſee.

CASEUS, τυρός. Cheeſe.

New Cheeſe, and unſalted, is nouriſhing, agreeable to the Stomach, and eaſily diſtributed; it ingenders Fleſh, and gently mollifies the Belly. Cheeſe differs in Goodneſs according to the Nature of the Milk, of which it is made. Boiled, then preſſed, and afterwards toaſted, it acquires a binding Quality; apply'd as a Cataplaſm to the Eyes, it helps Inflammations and Sugillations. Cheeſe new-ſalted yields leſs Nouriſhment [for ἀνεπιφορώτερος, I read ἀτροφώτερος with *Saracenus*, and the Senſe requires it], diminiſhes the Fleſh, is bad for the Stomach, and diſorders the Belly and Inteſtines; but ſtale or old Cheeſe has a binding Property. Whey is very nouriſhing to Dogs. *Dioſcorides, Lib.* 2. *Cap.* 79.

Cheeſe receives an Acrimony from the Rennet in its making, and depoſits all its Humidity, but more remarkably when it has been long kept; for then it becomes more acrid than before, and is manifeſtly of a more heating and ardent Quality; whence it is render'd more provocative of Thirſt, more difficult of Digeſtion, and of a worſe Juice. Though Cheeſe, therefore, be endued with acrimonious and attenuating Properties, which ought to belong to ſuch groſs Aliments, it cannot be ſaid to be a harmleſs Food; for it is more pernicious on account of the Badneſs of its Juice, and its burning Heat, than beneficial by its attenuating Quality, which does not render this Juice leſs diſpoſed for the Generation of Stones in the Kidneys; for we have ſhewn, that Stones breed in thoſe Bodies, where a Thickneſs of the Juices is accompany'd with an igneous Heat. Such Cheeſe, therefore, is to be avoided, as not at all conducive either to Concoction or Diſtribution, nor promoting Evacuations by Stool or Urine, nor generating good Juices. Cheeſe which is neither old nor acrimonious is bad, but leſs hurtful than the other. Of all new Cheeſe, the beſt is what is made with us at *Pergamus*, and in *Myſia* above *Pergamus*, and is called by the Inhabitants four-milk Cheeſe [ὀξυγαλάκτινος]. It is really a moſt pleaſant Food, not at all noxious to the Stomach, but of all Kinds of Cheeſe the moſt eaſy of Digeſtion and Paſſage, of no vicious Juice, nor conſiderably groſs, which is the common Fault of all Cheeſe. That is an excellent Sort too, which is in ſo much Requeſt at *Rome* among the wealthier People, and goes by the Name of *Bathys*; and there are ſome very good kinds of Cheeſe to be met with in other Countries. Now, ſince there is a very conſiderable Difference in Cheeſe, with reſpect to the Nature of the Animals which yield the Milk, and the Way of Making, beſides the Age, we ſhall here endeavour to ſum up their Properties under a few Heads, which if well conſidered, we cannot be at a Loſs to diſtinguiſh the Good from the Bad. Theſe Properties then in general may be reduced under two Heads; the firſt of which regards the Subſtance of Cheeſe, in which reſpect it is either harder or ſofter, denſer or looſer, glutinous or friable. The other general Head reſpects the Taſte, as ſome Cheeſe is diſtinguiſh'd for its Tartneſs, other Sorts for their Acrimony, Fatneſs, Sweetneſs, or ſome other Taſte, or for an equal Mixture of all theſe Taſtes. With reſpect then to the particular Diſtinctions under theſe two Heads, ſoft Cheeſe is preferable to hard, and that of a rare and lax Subſtance to the denſer and more compact; but ſince Cheeſe which is very glutinous, and what is friable even to Aſperity, are both vicious, a Medium between theſe two Properties is beſt. As to the Diſtinctions which ariſe from Taſte, that is the beſt Cheeſe which has no Quality in Exceſs, but exceeds a little in Sweetneſs; what is mild is better than the ſtrong, and what is moderately ſalt is to be choſen before that which is either very much or not at all ſalted. Moreover, if you would take upon you to examine Cheeſe, you have another Way to know the better from the worſe; and that is from Eructation; for Cheeſe, whoſe Taſte goes off gradually, is the moſt wholſome; but that whoſe Taſte continues long, is not good, for this plain Reaſon, becauſe it is very difficult of Alteration, and therefore very hard to be digeſted; and we know, that Concoction of Aliments is neceſſarily followed by an Alteration of all the before-mentioned Qualities. *Galen. de Aliment. Facult. Lib.* 3. *Cap.* 17.

Cheeſe is nouriſhing enough, helps Digeſtion, and produces ſeveral other good Effects, if you take but a little of it.

When Cheeſe is too new, 'tis hard of Digeſtion, heavy upon the Stomach, and cauſes Wind and Obſtruction; but on the contrary, when 'tis too old, it heats much, by reaſon of its great Acrimony, produces bad Juice, has an unpleaſant Smell, and is binding.

It contains much Oil, an indifferent Quantity of eſſential Salt, and little Phlegm and Earth.

It agrees, at all times, with young People, who are uſed to hard Exerciſe or Labour, and have a good Stomach; but old Folks, and nice Perſons, uſed to an idle Life, and who have ſome Touches of the Stone and Gravel, ought to abſtain from it, or uſe it moderately.

Cheeſe is nothing but the Curd of Milk ſeparated from the Whey, and hardened by a ſlow Heat.

We are to look upon Cheeſe as the groſſer and more compact Part of the Milk; from whence we may eaſily judge, that 'tis nouriſhing enough, and proves ſolid Nouriſhment; but 'tis hard of Digeſtion, when made uſe of to Exceſs, tho' otherwiſe it may help Digeſtion, if taken ſparingly.

Cheeſe is made either of ſkimmed Milk, or that which has the Cream in it; and the laſt is much better than the other, becauſe of the creamy and butteriſh Part remaining in it, which is the moſt exalted Part of the Milk, and moſt full of oily Principles, and volatile Salts.

Cheeſe made of Cows Milk is that which is moſtly uſed. It is of a very pleaſant Taſte, nouriſhing enough, but a little hard of Digeſtion: Some pretend, that Cheeſe made of Sheeps Milk, is to be preferred before the other, becauſe 'tis eaſier of Digeſtion, and is not ſo groſs and compact a Subſtance as the other; however, 'tis not ſo nouriſhing as Cheeſe made of Cows Milk.

They alſo make Cheeſe of Goats Milk, but it is not much valued; however, 'tis eaſily digeſted and diſſolved. There are ſeveral other Animals which yield Milk, of which Cheeſe may be made; but we ſhall not ſpeak of them here, becauſe ſuch ſort of Cheeſes are not in Uſe amongſt us. When Cheeſe is new, it is ſoft, viſcous, and full of Moiſture, and it is then heavy upon the Stomach, windy, and hard of Digeſtion; however, it is nouriſhing enough, and a little laxative: When, on the other hand, Cheeſe that is too old, grows dry, pungent, and burns the Tongue, ſmells ſtrong and unpleaſantly, and produces the ſeveral ill Effects before-mentioned: In a Word, old Cheeſe can hardly be known to be the ſame as when it was new; and *Matthiolus* ſeems to be of Opinion, that it is then only good for gouty Perſons, by being outwardly applied to the Parts where they feel their greateſt Pains; and this Author, to ſupport his Notion, inſtances ſome Perſons, who by the Uſe thereof have been recovered.

We therefore conclude, that Cheeſe which is neither too old nor too new, is the wholſomeſt of any. *Lemery on Foods.*

It is well known, that Oils by Age grow rancid and acrid. This happens in rich Cheeſe, that is, Cheeſe replete with Oil; inſomuch that *Boerhaave* informs us, he has known the Lips, Gums, Tongue, Palate, and Pauces, violently inflamed by the Uſe of it. The Stomach, therefore, and Inteſtines, muſt be very great Sufferers by Cheeſe of ſo acrimonious a Nature.

It is a vulgar Opinion, that old Cheeſe digeſts every thing elſe, but remains itſelf undigeſted. I don't know what Foundation there is for this, nor can I determine whether it is true, or a vulgar Error. But I ſhould ſuſpect, that in caſe of a Viſcidity of the Juices contain'd in the Stomach, old rotten Cheeſe may, by its Acrimony, attenuate theſe Viſcidities, and thus act medicinally.

The particular Averſion, which ſome People have to Cheeſe, is utterly unaccountable, however real.

CASIA. The ſame as CASSIA, which ſee.

CASIBO. Cyprus, (a Species of exotic Privet). *Johnſon.*

CASMNARIS, or CASMUNAR. See CASSUMMUNIAR.

CASSA. A barbarous Word, in *Fallopius de Offib.* for *Thorax.*

CASSALE *Vulnus.* A Term uſed by ſome Phyſicians to ſignify a Wound in the Breaſt; it is derived from the *Arabic Cas*, the Breaſt.

CASSAMUM, κάσαμον, a Name given by ſome to the Fruit of the Balſam-tree. *P. Ægineta, Lib.* 7. *Cap.* 3.

CASSATUM, weak, ſpiritleſs, and grumous Blood in the Veins, hindering the Paſſage and Motion of good Blood. *Paracelſus Archidox. Lib.* 7. *Sect. de Specifico Diaphoretico.*

CASSAVI. A ſort of Bread uſed in the *Weſt Indies*, and made of the Root of the Plant MANIHOT, which ſee.

CASSIA. The Characters of the Caſſia are;

The Flowers are pentapetalous, diſpoſed in an orbicular Order; with a Stylus like a Proboſcis.

The Pods are either long and cylindrical, or flat, divided into many Cells by tranſverſe Partitions, which are lined with a black Pulp, containing hard Seeds.

Boerhaave mentions four Species of CASSIA.

1. *Caſſia; Americana, fœtida; foliis oblongis, glabris.* T. 619. *Pajomiriova.* J. Piſoniſ. Edit. 1658. 185. *Senna, occidentalis, odore Opii viroſo, Orobi Pannonici foliis mucronatis, glabra.* H. L. H. Prægn. THE STINKING AMERICAN CASSIA, WITH OBLONG SMOOTH LEAVES.

2. *Caſſia; Americana; fœtida; foliis ſubrotundis, acuminatis.* T. 619. *Pajomiriova,* II Piſoniſ. Edit. 1658. 185. *Senna, occidentalis, odore Opii minus viroſo, foliis glabris obtuſis.* H. L. H. Prægn. THE AMERICAN CASSIA, WITH ROUNDISH POINTED LEAVES.

3. CASSIA FISTULA, Offic. Ind. Med. 29. Ger. 1242. Emac. 1431. *Caſſia ſolutiva, Caſſia fiſtularis,* Mont. Exot. 10. *Caſſia fiſtula Alexandrina,* THE ORDINARY PURGING CASSIA. Raii Hiſt. 2. 1746. C. B. Pin. 403. Tourn. Inſt. 619. Elem. Bot. 492. Boerh. Ind. A. 2. 58. Commel. Flor. Mal. 73. *Caſſia nigra ſeu fiſtuloſa prima, ſive Caſſia fiſtula Alexandrina.* Cat. Jam. 145. Hiſt. 2. 42. *Caſſia fiſtula Chaiarxambar vocata.* Alp. Ægypt. 7. *Caſſia fiſtula vulgaris flore luteo,* Breyn. Prod. 2. 26. *Caſſia ſolutiva vulgaris,* Park. Theat. 234. *Caſſia purgatrix,* J. B. 1. 416. Chab. 89. *Caſſia fiſtula purgatrix Alexandrina,* Jonſ. Dendr. 382. *Arbor Caſſiam ſolutivam ferens.* Bont. 101. *Canna.* Hort. Mal. 1. 37. Tab. 22. *Quauhayohuatli* 2. *ſive Caſſia fiſtula.* Hern. 87. THE PUDDING PIPE-TREE. *Dale.*

This is the Fruit of a great Tree which grows in *Egypt*, and in both the *Eaſt* and *Weſt Indies:* It bears large winged Leaves, in Shape reſembling the Leaves of the Walnut-tree, among which grow yellow five-leav'd Flowers, each ſucceeded by a long, ſlender, round Pod or Fruit, ſcarce an Inch in Diameter, but a Foot, and often two Foot long, whoſe Outſide is a dark brown, hard, woody Bark, having a large Seam running the whole Length on the one Side, and another leſs viſible on the other: The Inſide is made up of a great Number of thin Plates or Partitions, covered with a black ſweet Pulp, with a flattiſh, ſmooth, oval Seed between every Partition, *Miller's Bot. Off.*

Proſper Alpinus is of Opinion, that thoſe Pods of the Caſſia are the beſt, which, when ſhaken, make a kind of Noiſe by the Motion of the Seeds contained within them; and affirms, that ſuch of them as do not make this Noiſe are deſpiſed by the *Egyptians*, who think that this Accident happens in conſequence of the Pulp being vitiated, and an aqueous Humidity collected within. But *Veſlingius* maintains the contrary in the following Words. "The *Egyptians*, ſays he, who dealt in "Caſſia, perſuaded our Countryman *Alpinus*, that thoſe Pods "were the beſt, which, when ſhaken, made a Noiſe; but I "obſerved the more ſkilful Merchants carefully ſeparate thoſe "which made ſuch a Noiſe, from the more ſolid Pods; and "if one Part of the Pod was ſolid, and the other rattling, "they broke off the latter as uſeleſs; ſince it only contains "dry Seeds, and is deſtitute of a ſweetiſh Pulp, and that thin "Juice with which thoſe that are ſolid abound. But as the "State of all Things is changeable, ſo an unlucky Accident "often deſtroys the Fruit of the Caſſia, when upon the very "Brink of Maturity; for in high Winds the Pods are daſh'd "againſt each other, and fall off in great Numbers; after "which they are of no Uſe for medicinal Purpoſes. The ſe"veral Pods, therefore, of the ſame Branch are tied toge"ther, that they may the better ſuſtain the Shock of Acci"dents. The great Care neceſſary to preſerve them from the "Attacks of Thieves, is a Circumſtance which conſiderably "enhances their Price." Theſe Pods are not to be gathered for medicinal Uſes, till they are entirely ripe: But they are often bought by foreign Merchants, after they are very old, ſince a large Quantity of them is frequently laid up in Store-houſes, and kept ſometimes for forty Years. Theſe Pods, immediately when gathered from the Trees, are ſo diſpoſed of in proper Places, that the Air may not have Acceſs to them; ſince by the ſmalleſt Approach of that Fluid the Caſſia is corrupted. Hence the Caſſia-pods imported to the *Venetians* are generally become acid and vitiated with Age: For this Reaſon, *Proſper Alpinus* adviſes Phyſicians and Apothecaries not to ſuffer themſelves to be impoſed upon for the future, but to make Choice of ſuch Pods as are recent, and whoſe Subſtance is of a ſweetiſh Taſte, rejecting thoſe which are old, and of an acid or ſaline Flavour. The *Egyptians* never uſe the Caſſia-pods till they are four Months old, ſince, when young and recent, they are obſerved not only to be uſeleſs, but noxious. They uſe the Pulp, extracted from the Pod, either in the Form of a Bolus or a Potion, in all the Diſeaſes and Symptoms ariſing from an over-heated Bile; for they are of Opinion, that *Caſſia* exhibited internally, by evacuating and obtunding the hot and parched Parts of the Blood and Humours, cools the Blood, and renders it more pure; they alſo find from Experience, that, by its means, the Stomach is disburdened of any excrementitious Subſtance that may prove offenſive to it. They alſo uſe it with great Succeſs in Defluxions of hot Humours upon the Lungs or Thorax, exhibiting it either alone, or mix'd with Sugar-candy, or with Oil of ſweet Almonds. When either thus prepared, or uſed without any Admixture, they find it ſingularly beneficial to the Bladder and Kidneys. This Pulp of the Caſſia-pod, made up with Sugar-candy and Liquorice, they generally uſe as an Arcanum in Diſorders of the Kidneys and Bladder; for it extinguiſhes an immoderate Heat of the Kidneys, ſcours the Humours from theſe Parts, and diſcharges them by Urine: Hence the frequent Uſe of it prevents the Generation of Stones and Gravel. The Caſſia Pulp, in Conjunction with Agaric, is alſo uſed by the *Egyptians* againſt immoderate Coughs, Dyſpnœas, Aſthmas, and Orthopnœas. They alſo uſe it by way of Plaiſter, to be apply'd to the Parts affected, in hot Pains of the Joints, the Gout, and hot Inflammations. They preſerve, in Honey, or Sugar, the ſmall green Pods of the Caſſia, after having gently boiled them in Water, and dried them in a Shade. Theſe they keep for the Uſe of Children and delicate Women; to the latter of whom they exhibit four Ounces at moſt for a Doſe, and to the former only one. Theſe they alſo preſcribe for the before-mentioned Diſorders. The Flowers preſerved with Sugar make a highly beneficial Medicine for correcting the Heat of the Kidneys, and eliminating the tough and viſcid Recrements lodg'd in the Ureters: Beſides, theſe Flowers are, by the *Egyptians*, uſed for alleviating Pains of every kind, eſpecially thoſe of the Gout. *Proſper Alpinus, Medicina Ægypt. L.* 4. *Cap.* 5.

Acoſta,

Acoſta, in his Treatiſe *de Medicamentis in India orientali naſcentibus*, informs us, that, in the *Eaſt-Indies*, Eryſipelaſes and Inflammations are anointed with the Pulp of the Caſſia. The Caſſia-pods, whilſt as yet green, are preſerved with Sugar, and an Ounce of them, with Succeſs, is exhibited to tender Women and Children. Theſe muſt be choſen when recent, and very tender, before the Bark is indurated. They muſt alſo be macerated in cold Water, before they are prepared with the Sugar. The Flowers, when thus prepared, are gently purgative, and operate without creating any Uneaſineſs.

Bontius, in his *Hiſtoria Naturalis & Medica Indiæ orientalis*, informs us, that the Uſe of the Caſſia-pulp is very frequent among the *Malayans*, in Diſorders of the Kidneys and Bladder, and in all nephritic Indiſpoſitions; as alſo in Gonorrheas, contracted by impure Embraces, when it is mix'd with Powder of boil'd Turpentine. The Caſſia cultivated in *America*, according to *Nicolaus Monardes de Medicamentis ſimplicibus ex occidentali India dilatis*, purges gently, and without any Gripes; and evacuates principally Bile, then Phlegm, and laſtly the Matter which obſtructs the Inteſtinal Ducts. It renders the Conſtitution of thoſe who uſe it temperate, and purifies the Blood. It is beneficial in all Diſorders; but more eſpecially thoſe of the Kidneys, and urinary Bladder, if exhibited two Hours before Supper: It is good againſt Defluxions, if taken two Hours after a light Supper. It is daily uſed, in the Form of a Linctus, againſt Diſorders of the Breaſt and Sides. It is proper in feveriſh Heats, and extinguiſhes Thirſt. The daily Uſe of it, before Dinner or Supper, prevents the Generation of the Stone and Gravel. When mix'd up with the Oil of ſweet Almonds, it is an excellent external Application for alleviating violent Pains of the Lungs and Kidneys. The Doſe of the Pulp is from ten Drams to an Ounce and an half; and of the Pulp, in Conjunction with the Pod, four Ounces. In *America* the tender and newly form'd Pods are preſerved, after having been prepared, and boil'd with Sugar. Theſe purge, without creating an Uneaſineſs, or exciting any of thoſe Symptoms and Gripes which generally attend the Uſe of Purgatives; for they are grateful to the Taſte, and operate eaſily. The Doſe is from two to three Ounces.

The Flower may be preſerved in two Manners; for it may either be triturated with Sugar, like Sugar of Roſes, or the entire Flower may be put in Sugar, and boil'd along with it. When prepared in either of theſe manners, it taſtes well, and evacuates without creating the Patient any Uneaſineſs. Two or three Ounces may be given for a Doſe. If this Medicine ſhould not anſwer the Intention, it is owing to the Coarſeneſs of the Sugar with which it is prepared. The Pods of the Caſſia are at preſent imported into *Europe* from *Egypt*, and the *Eaſt-Indies*; as alſo from *Brazil* and *Antigua*, in *America*. Thoſe are accounted beſt which are blackiſh, ſmooth, weighty, full of a pinguious Pulp, on the Backs of which reddiſh Streaks are conſpicuous, which are recent, ripe, and when ſhaken make no Noiſe. Thoſe imported from the *Eaſt-Indies* are reckon'd worſt, becauſe they are generally corrupted by the Length of the Time required for performing the Voyage; they are, perhaps, alſo gather'd before they are fully ripe, that they may not corrupt ſo ſoon as otherwiſe they would. In the *Pharmacopœia Bruxellenſis*, it is affirmed, that one Ounce of *Braſilian* Caſſia purges more effectually than two of the *Egyptian*, which is the common Caſſia of the Shops, and is generally call'd *Siliqua Ægyptia*, and *Fiſtula Alexandrina*. It was firſt introduced into Medicine by the *Arabians*; but, according to Dr. *Freind*, in his Hiſtory of Phyſic, *Actuarius* was the firſt of them who mentioned and deſcribed it among the milder and more gentle Purgatives. *Actuar. Method. Medend. L.* 5. *Cap.* 2. It is not mentioned by the antient *Greeks*, with whom, for the moſt part, the *καυία σύριγξ*, or Caſſia Fiſtula, imported the Cinnamon of the Moderns. But among the later *Greeks* the purgative Caſſia was call'd *καυία μέλαινα*, *καυία κεκαθαρμένη*, and *καυία καθαιομένη*. When, therefore, in the Compoſitions of the antient *Greeks*, Caſſia is preſcrib'd, Cinnamon is to be uſed. The ſame Rule is to be follow'd, in thoſe Writings of the *Arabians*, in which they recount the Compoſitions of the *Greeks*, as alſo in ſuch Medicines as do not render the Body ſoluble. But if Remedies of a purgative Intention are either deſcribed or ordered by the *Arabians*, we are, in this Caſe, to uſe purgative Caſſia, as is very juſtly obſerved in the *Antidotarium de exacta componendorum Medicamentorum ratione*, by *Matthiolus ad Dioſcor.* and by *Bodæus in Theophraſt.* It is the Pulp of this Caſſia which is applied to medicinal Uſes, and is call'd the *Medulla Caſſiæ*, *Caſſia extracta*, *Caſſia Cribrata*, *Caſſiæ Atramentum*, and *Flos Caſſiæ*. The Extract is made by paſſing it thro' a Sieve with a Spoon, with the Addition of a little Water. Phyſicians generally order this Extract recent, becauſe it ſoon corrupts, in conſequence of its Diſpoſition to ferment. Hence *Boerhaave*, in his *Elementa Chymiæ*, *Vol.* 2. claſſes it among the Subſtances which promote Fermentation. The Apothecaries, in order to preſerve this Extract the longer, and prevent its Fermentation, generally add Sugar to it; but by this means its genuine Virtue is loſt. This Extract, when made from Pods which are fully ripe, is a ſufficiently gentle and innocent Purge; for which Reaſon it is claſs'd among the beſt of the cholagogue Purgatives. It is exhibited either in the Form of a Bolus, or of a Potion. When recent, and in Subſtance, the Doſe of it, for internal Uſe, is from three Drams to an Ounce; and, in Clyſters, from one to two Ounces. When it is not recent, it may be exhibited internally, from half an Ounce to an Ounce and an half, or two Ounces; and, in Clyſters, four Ounces of it may be uſed. *Schulzius*, in his *Prælectiones de Viribus & Uſu Medicamentorum*, ſpeaks of it in the following manner: "It is purgative," ſays he; "but be-"cauſe in Subſtance a large Doſe of it is to be taken, and "becauſe it is obſerv'd to weaken the Stomach, it is rarely "exhibited at preſent with us: But if the recent Extract is to "be uſed, it may moſt properly be exhibited with the Addition "of ſome Carminative, ſuch as Aniſe or Fennel. The Doſe "is from one Ounce to ten Drams." *Hieronymus Capivaccius*, in his *Practica Medicina*, informs us, that its Virtues exceed theſe of Manna, as it powerfully evacuates the thin recrementitious Humours, and thoſe which are moderately thick. Beſides, it refrigerates, obtunds Acrimony, moiſtens, and poſſeſſes ſome nutritive Parts. But it is eaſily converted into Flatulencies, which, by diſtending the Veſſels, excite conſiderable Pains. Caſſia, therefore, according to *Rhaſes*, is to be boiled before it is exhibited; ſince, by the boiling, that Part of it is diſſolv'd, which was ſubject to be converted into Flatulencies, as happens in Barley and Beans, which, by being boiled, loſe their flatulent Part. *Rhaſes* alſo ordered Caſſia to be boiled in the Juice of Succory. But if Caſſia is to be exhibited unboil'd, it is to be corrected with Aniſe, Fennel, or Lemon-ſeeds. *Jacobus Duttelius*, in his *Tractatio Medico-practica de virulenta Purgantium Indole*, informs us, that Caſſia is gently purgative, on account of its ſweetiſh Taſte, and moderately acrimonious Quality. Hence it is highly proper, eſpecially when rightly adminiſtered, to evacuate bilious and acid Humours; ſince it operates, without exciting any violent Commotions, or preternatural Heat. Experience, the moſt powerful and concluſive of all other Arguments, ſufficiently proves, that it is an efficacious Medicine in Diſorders of the Breaſt, in ſaline arthritic Affections, in the Stone, in Caſes where the Primæ Viæ are loaded with ſaline Acids; as alſo in catarrhous Fevers, and ſometimes in thoſe of the tertian Kind. With reſpect to the Exhibition of Caſſia, when the Intention is to purge, we muſt obſerve, that it ought to be uſed in a pretty large Quantity, either alone, or with an Admixture of Manna, otherwiſe it operates little or none at all. It is alſo carefully to be adverted to, that Caſſia operates more ſucceſsfully with the Addition of ſome neutral Salt, eſpecially the *Tartarus Tartariſatus*. Beſides, a Decoction of Caſſia is not to be taken at one Draught, but ſucceſſively, and at different times; and ſome hot Potion is to be uſed after it, leſt it ſhould excite any Uneaſineſs or Vomiting. But hypochondriac and hyſteric Patients, thoſe who are afflicted with a Weakneſs of the Stomach and Flatulencies, and ſuch as are ſubject to the Colic, ought carefully to abſtain from Caſſia. Neither is this Medicine by any means to be preſcribed for pregnant Women. *Duttelius*, in the ſame Work, oppoſes *Sennertus*, who, with *Meſue* and *Actuarius*, aſſert, that Caſſia may be ſafely uſed by pregnant Women. The Reaſon of his Oppoſition is, that as Caſſia is improper in hyſteric Caſes, on account of its flatulent Quality; ſo it ought not to be order'd to pregnant Women, whoſe lower Belly is already diſtended by the Bulk of the Fœtus, ſince, by an Acceſſion of new Flatulencies, the Abdomen might be more diſtended, and various bad Symptoms excited. *Caſpar Hoffman* informs us, that in pregnant Women it powerfully relaxes the Placenta; and *Foreſtus*, in his *Obſerv. Medic. Lib.* 2. *Obſerv.* 28. affirms, that Caſſia is highly improper for pregnant Women, becauſe it principally evacuates from the Kidneys; in conſequence of which an Abortion is the more to be dreaded. The ſame Author, in *Lib.* 10. *Obſ.* 85. *in Scholio*, pronounces Caſſia prejudicial to paralytic Caſes, becauſe it is of too moiſtening a Quality; and, in the ſame Book, *Obſ.* 33. *in Scholio*, he aſſerts, that it is injurious to the Head, by filling the Brain with Fumes, and by that means inducing a *Cataphora*. According to *Rondeletius*, the Uſe of Caſſia is not ſafe in cold and moiſt Weather, eſpecially the former, ſince by its too ſtrong emollient Quality, eſpecially when it is recent, it generally excites Diarrheas, Lienteries, and, at laſt, Dyſenteries. We might poſſibly think, that more weighty Objections could not be made againſt Caſſia, unleſs *Joannes Riolanus*, a celebrated Phyſician at *Paris*, had aſſerted, that a ſmall Quantity of it proves mortal to ſome Patients. But *Michael Boudewyns*, a learned Phyſician of *Antwerp*, in his *Ventilabrum Medico-theologicum*, refutes this Charge, and tells us, that the Caſſia may certainly be abus'd, yet happy Effects are to be expected from the judicious Exhibition of it. Beſides, in this Caſe, the Intention of *Riolanus*, ſays he, is to be conſider'd, which is nothing elſe than to caution the Magiſtracy not to allow every one who profeſſes himſelf a Phyſician, to practiſe; becauſe moſt Medicines in their Exhibition require great Caution,

tion, Care, and Circumſpection. From what has been already ſaid from *Alpinus* and *Bontius*, *Wedelius*, in his Work *De Medicamentorum Facultatibus*, ſeems to be in the right, when he aſſerts, that Caſſia is a Pectoral, beneficial in nephritic Pains, proper for correcting the Acrimony of the Humours, and, for that Reaſon, conducive to the Cure of a Gonorrhea. *Fallopius* atteſts the ſalutary Uſe of this Medicine in the laſt of theſe Diſorders. Some, and among the reſt *Bernardinus Ramazini*, in his *Opera Medica & Phyſiologica*, entirely condemn the Uſe of Caſſia in all Diſorders of the Kidneys, becauſe they think it is poſſeſſed of a certain Virulence. *Zecchius* alſo, in his *Conſultationes Medicinales*, affirms, that, in Diſorders of the Kidneys, Caſſia is not altogether ſafe, unleſs the Stomach and Primæ Viæ are previouſly evacuated, either by Abſtinence, Vomiting, or Purging; adding this as a Reaſon, that it was one of the beſt of the diuretic Medicines. With an Intention, however, to evacuate the Primæ Viæ, he himſelf recommends Caſſia. Hence *Veſlingius* ſeems to have come nearer the Truth, when he aſſerts, that if, in conſequence of the Uſe of Caſſia, the Heat and Impetus of the Urine, which is acrid, are increas'd, and the nephritic Pains by that means augmented, this Accident cannot be charg'd upon the Caſſia which is ſound and good, but only on ſuch as is corrupted and deſtitute of its Virtues. Nor indeed is it poſſible, that a Medicine imported from Countries ſo remote, and which can hardly be preſerv'd for any conſiderable Time in its native Soil, ſhould long retain its Virtues after it comes to our Hands. The Sentiments of *Veſlingius* and *Wedelius*, with reſpect to Caſſia, ſeem to be juſt and well-founded, ſince, from the Practice of the *Egyptians*, and others, it is obvious, that it is a Medicine proper for allaying preternatural Heats, and correcting the Acrimony of the Humours; and ſince *Borelli*, in his *Obſervat. Medico-phyſic. Cent.* 3. *Obſ.* 5. informs us, that Caſſia was highly beneficial in allaying and correcting the preternatural Heats attending epidemic and peſtilential Fevers; for it has this Advantage attending it, that it reſiſts Putrefaction, and, at the ſame time, inclines to an aceſcent Nature. *Caſpar Hoffman*, *de Medicamentis officinalibus*, *Lib.* 2. *Cap.* 7. pronounces the Uſe of Caſſia ſafe, ſo long as it is recent and ſweet; and not only informs us, that Headakes, ariſing after Meals, cannot be more ſucceſsfully remov'd, than by the Uſe of Caſſia, and that by its means obſtinate Inflammations of the Eyes have been cur'd; but alſo, in expreſs Words, pronounces it to be a highly beneficial Medicine in preternatural Heats of the Kidneys. But becauſe the Uſe of it is obſerv'd to promote a copious Diſcharge of Urine, I ſhould think it adviſable not to preſcribe it to Patients who diſcharge bloody Urine, who have been cut for the Stone, who labour under a Diabetes, or other Diſorders of the Parts ſubſervient to the Secretion of the Urine, ſince, in theſe Caſes, it is not ſo beneficial, but ought to be abſtain'd from. *Fallopius* informs us, "That in preternatural Heats of the Bladder, Caſſia is a "very improper Remedy; becauſe, in conſequence of its diu-"retic Quality, it conveys to the Bladder ſmall Concretions "of Sand, together with a ſaline and acrid Matter, which "augment the Heat, which is more troubleſome and uneaſy, "ſo long as the Caſſia operates, tho' it is afterwards ſomewhat "alleviated by that means." *Valliſneri*, in his *Opere Fiſicomediche*, *Tom.* 3. informs us, "That Caſſia and its Pulp are "of a refrigerating and moiſtening Quality, not only when ex-"hibited internally, but alſo in external Applications; ſince, "in the moſt violent arthritic Pains produc'd by Heat, the "Pulp of Caſſia is ſucceſsfully preſcrib'd, and ſurpriſingly alle-"viates the Pains. But it is commonly thought, that it "moiſtens more powerfully than it refrigerates, which is con-"firm'd by the large Quantity of hypochondriacal Flatulencies "generally produced by uſing it; for whilſt the Humidity un-"dergoes a Change by the Heat, it is converted into Flatu-"lencies, which, as they poſſeſs a large Space, diſtend and "relax the Veſſels, and by that means create Pains, and ſome-"times Gripes. Hence Phyſicians, taught by Experience, "generally mix ſome Carminative with Caſſia, in order to "prevent the above-mentioned Accidents." To theſe we may add the Obſervation of *Paulus Valcarengus*, in his *Medicina Rationalis*, that Caſſia is highly prejudicial by exciting Pains of the Stomach and Gripes, when it is exhibited in thoſe Diſorders which proceed from a tough and glutinous State of the Bile. But we now return to ſpeak of the Intention with which Caſſia was firſt receiv'd into Medicine, which was to render the Body ſoluble, and evacuate the Fœces. For this Purpoſe it is generally preſcrib'd two or three Hours before Meals. But *Monardes* aſſures us, that he had learn'd, from the Experience of many Years, that when thus exhibited, it evacuated very little; for, ſays he, as it is very weak, it is reſolv'd into Vapours, which diffuſe themſelves thro' the whole Body; and if the Meal is longer deferr'd, it is converted into Aliments. Hence he adviſes it to be exhibited a very ſhort time before Meals, about half an Hour at moſt; becauſe, when mixed with the Aliments, it exerts its Virtues in Conjunction with them, and by that means operates more eaſily, and with leſs Trouble. But if, continues he, the Intention is not to evacuate, but only to diffuſe Vapours thro' the Kidneys, and the other Parts of the Body, it may be exhibited ſeveral Hours before a Meal. *Aloiſius Mundella*, in his *Epiſtolæ Medicinales*, *Epiſt.* 10. and 26. gave the ſame Directions before *Monardes*. But *Laurentius Jonbertus*, in *Tom.* 1. is of another, and, perhaps, a juſter Sentiment, when he adviſes the Pulp of the Caſſia to be exhibited in the Morning, in order to render the Body ſoluble; and not, as moſt do, an Hour or half an Hour before Dinner: For, ſays he, the lighter the Medicine is, the more ſlowly it operates, and the leſs it is ſuſceptible of an Admixture of the Aliments, by which its languid Energy is eaſily extinguiſhed. That Caſſia may be the more ſafely uſed, we muſt obſerve, from *Sennertus*, in his *Inſtitutiones Medicinæ*, that becauſe this Medicine is improper, in Caſes where the Stomach is weak, and abounds with ſuperfluous Humidity, or where the Inteſtines are too ſlippery; when it is to be exhibited for this latter Diſorder, a proper Quantity of Rhubarb or Myrobalans is to be added to it; whereas, in a Weakneſs of the Stomach, it is to be corrected with Cinnamon or Maſtich; and, in Flatulencies, with the Seeds of Aniſe, Fennel, and Carrot. The ſame Author tells us, that the Medicines which either aſſiſt or correct Caſſia, are generally mixed with it, from half a Dram to a whole Dram; and that it is leſs commodiouſly exhibited in a liquid Form, than in that of an Electuary, or Bolus. To the foregoing Obſervations we muſt add thoſe of *Valliſneri*, in his *Opere Fiſicomediche:* Twelve Drams, ſays he, of the Pulp, are exhibited for a Doſe. Caſſia is alſo exhibited in Potions, after it is diſſolv'd in diſtil'd Waters, Decoctions, or proper Broths; but it is rarely preſcrib'd in this Form, except to thoſe who cannot take a Bolus. The *Venetians* frequently preſcribe this Medicine clarified with Whey, ſo as to loſe its nauſeous Smell, and diſagreeable Sweetneſs, in which Form it evacuates with Succeſs. The Pulp is alſo extracted from the Pods, and exhibited in the ſame Doſe, when cut down together with the Seeds, and the ſmall Laminæ which interſect the Pod. This Method of Exhibition is entirely new; and thoſe who follow it aſſert, that theſe Laminæ do not prevent Refrigeration, Humectation, and the Evacuation of the Bile, but give the Preparation this Advantage, that by means of theſe Laminæ it incides and carries off thoſe thick and pituitous Humours, which adhere to the Coats of the Inteſtines. Thus by the Exhibition of Caſſia cut together with its proper Laminæ, they obtain the Evacuation of the Bile, and of other thick and viſcid Subſtances. *Ettmuller* informs us, that the purgative and evacuating Qualities not only of the Pulp of the Caſſia, but alſo of the woody Interſtices lodg'd within the Pulp, were firſt caſually diſcovered; for a Caſſia-pod being thrown to an Ape, the Animal was violently purg'd by eating it. An Account of this Obſervation is to be found in *Fallopius*. *Monardes*, in his *Epiſtolæ Medicinales*, two Centuries ago, inform'd us, that the Seeds were more effectual for rendering the Body ſoluble than the Pulp. It does not hold univerſally, that the Uſe of Caſſia changes the Colour of the Urine into that of red or black. What is already ſaid is ſufficient, with reſpect to the internal Uſe of Caſſia. Externally the Pulp of the Caſſia is uſed in lenitive and reſolvent Cataplaſms. Thus in arthritic Pains ariſing from a hot Humour, the following Cataplaſm, which is inferior to none, may be applied to the Parts affected:

> Take of the Pulp of Caſſia, half an Ounce; of the Meals of Barley and Beans, each three Drams; of the Juices of Smallage and Quinces, each ſix Drams; of red Sanders, half an Ounce; and of the Oils of Violets, Roſes, and Lilies, each a ſufficient Quantity: Mix up into a Cataplaſm.

Caſſia, according to *Ettmuller*, bruiſed or boiled with Nightſhade, is an excellent Medicine for anointing the Parts affected in arthritic Pains. It may alſo be very properly apply'd to Inflammations in the ſame manner. Caſſia, extracted with Spirit of Wine, is uſed as a Topic for anointing the Parts affected with the Gout. That we may not be ignorant of what has been diſcovered of the Nature of Caſſia by a chymical Analyſis, *Boecler*, in his Continuation of *Paulus Hermannus's Cynoſura Materiæ Medicæ*, informs us, that if the Pulp of Caſſia, which eaſily becomes aceſcent, is diluted in a ſufficient Quantity of Water, and put in a ſmall Veſſel for ſome Months, an eſſential Salt, like Cream of Tartar, will be precipitated; but that if it be diſtil'd, it will be converted into an acid Phlegm, and an Oil. According to *Tournefort*, from two Pounds of Caſſia, half a Pound of an acid Phlegm, and three Ounces of an inſipid Phlegm, may be diſtil'd. And if this Liquor is farther diſtil'd, he ſays, that ſix Ounces of a volatile urinous Spirit, ſix Drams of Oil, and about an Ounce of a fixed Salt, are yielded, a Caput Mortuum remaining.

Officinal Preparations from *Caſſia* are the *Caſſia Extracta cum vel ſine foliis Senæ*, and the *Diacaſſia cum Manna*; it is alſo a principal Ingredient in the lenitive Electuary. The Method of making the Extract of *Caſſia* is already deſcrib'd.

Diacaſſia

Diacaſſia cum Manna.

Take of *Damaſcus* Prunes, two Ounces; of Violet-flowers, an Handful and an half; of Spring-water, a Pint and an half: Let them boil till half is waſted; and then in the ſtrained Liquor diſſolve of freſh Caſſia-pulp, ſix Ounces; of Syrup of Violets, eight Ounces; of the Pulp of Tamarinds, one Ounce; of white Sugar-candy, one Ounce and an half; of the beſt Manna, two Ounces; and make into an Electuary.

This hath continued the ſame thro' all the Emendations of the College, unleſs in the preſent Omiſſion of the Sugar of Violets, no ſuch Thing being now made. Its Author is, by the *Auguſtan Diſpenſatory*, acknowledged to be uncertain. *Zwelfer*, in his Animadverſions upon it, cautions that it ſhould be made but in ſmall Quantities at a time, as indeed all other Compoſitions of the like Kind ſhould, leſt they grow acid, and ferment, by long keeping. *Fernelius* alſo gives the like Admonition; but that may be pretty eaſily prevented, by ſimmering them over a ſlow Heat, and ſtirring all the while with a wooden Spatula to prevent Burning, till they are of a good thick Conſiſtence. It is now wholly neglected in common Preſcriptions.

Caſſia extracta, cum Foliis Senæ: Extract of Caſſia, with Sena-leaves.

Take of the Diacaſſia, with Manna, two Pounds; of Sena-leaves powdered, two Ounces; of Caraway-ſeeds, one Ounce; of Syrup of Violets, a ſufficient Quantity to mix them together into an Electuary. *Quincy's Diſpenſatory.*

Caſſia; ſylveſtris; fœtida; ſiliquis alatis, Plum. Nov. Gen. App. 13. 18. H. Prægn. THE WILD STINKING CASSIA, WITH WINGED PODS, call'd in the *Weſt-Indies* FRENCH GUAVA. *Boerhaave.*

Miller mentions five other Species of the CASSIA. The CASSIA LIGNEA is a Species of CINNAMOMUM, which ſee.

CASSIBOR, CASSIDBOTT, Coriander. *Johnſon. Rulandus.*

CASSIDA.

Scutellaria, Offic. Boxb. 298. Rivin. Irr. Mon. *Scutellaria aquatica, vulgò Tertianaria dicta*, Herm. Hort. Lugd. Bat. 546. Volck. Flo. Nor. 344. *Scutellaria aquatica, anguſtifolia vulgaris*, Herm. Flor. 2. 77. *Scutellaria paluſtris repens cærulea*, Hiſt. Oxon. 3. 416. *Caſſida paluſtris vulgatior flore cæruleo*, Tourn. Inſt. 182. Elem. Bot. 150. Boerh. Ind. A. 117. Dill. Cat. Giſſ. 117. Rupp. Flor. Jen. 180. Raii Synop. 3. 244. *Tertianaria aliis Lyſimachia galericulata*, J. B. 3. 435. *Lyſimachia galericulata*, Ger. 387. n. 6. HOODED LOOSE-STRIFE, Emac. 477. Mer. Pin. 74. *Lyſimachia cærulea galericulata*, Merc. Bot. 1. 49. Phyt. Brit. 71. *Lyſimachia cærulea Galericulata ſeu Gratiola cærulea*, C. B. Pin. 246. Raii Hiſt. 1. 572. HOODED WILLOW-HERB. *Dale.*

This *Caſſida* is hardly of any Uſe in Phyſic; however, *Camerarius* ſays, that the Decoction of it is good for the Quinſey. And *J. Bauhine* relates, that *Turner* affirm'd, that it was call'd *Tertianaria*, becauſe it cured intermitting Fevers. It is bitter, ſtinks like Garlick, and gives ſuch a faint Tincture of Red to blue Paper as the common Scordium, and ſome other febrifugous and aperitive Plants. *Martyn's Tournefort.*

Boerhaave mentions thirteen Species of this Plant.

CASSINE.

There are two Sorts of the Caſſine, which are the third and fourth Species of the ALATERNUS, which ſee.

Miller calls the *Caſſine vera Floridanorum* the South-ſea Tea-tree, and the *Perygua* the Caſſioberry-buſh.

The *Paraguay*, or South-ſea Thea, is accounted by the *Indians* very wholſome, and (as I have been inform'd by ſeveral worthy Perſons, who reſided for ſeveral Years in *Carolina*) is the only Phyſic the *Indians* uſe; and for which, at certain Times of the Year, they come in Droves, ſome hundred Miles diſtant, for the Leaves of this Tree (it not being known to grow at any conſiderable Diſtance from the Sea); where their uſual Cuſtom is to make a Fire upon the Ground, and, putting a great Kettle of Water thereon, they throw into it a large Quantity of theſe Leaves; and immediately ſet themſelves round the Fire, and, with a Bowl that holds about a Pint, they begin drinking round large Draughts, which, in a very ſhort time, vomits them ſeverely: Thus they continue drinking and vomiting for the Space of two or three Days, until they have ſufficiently cleanſed themſelves; then they gather every one a Bundle of the Tea to carry away with them, and retire to their Habitations. But theſe Gentlemen obſerved ſomething very extraordinary in the Operation of this Plant, which was, that, in Vomiting, it gave them no Uneaſineſs or Pain; but came away in a full Stream from their Mouths, without ſo much as declining their Heads, or the leaſt Reaching.

Monſieur *Frezier* alſo ſays, that the *Spaniards*, who live near the Gold Mines in *Peru*, are obliged frequently to drink of the Herb *Paraguay*, or *Mate*, to moiſten their Breaſts; without which they are liable to a ſort of Suffocation, from the ſtrong Exhalations which are continually coming from the Mines.

The ſame Author alſo adds, that the Inhabitants of *Lima*, during the Day-time, make much Uſe of the Herb *Paraguay*, which ſome call St. *Bartholomew's* Herb; who, they pretend, came into thoſe Provinces, where he made it wholſome and beneficial, whereas before it was venomous. This (he ſays) is brought to *Lima* dry, and almoſt in Powder.

Inſtead of drinking the Tincture or Infuſion apart, as we drink Tea, they put the Herb into a Cup or Bowl, made of a Calabaſh, tipp'd with Silver, which they call *Mate*: They add Sugar, and pour the hot Water upon it, which they drink immediately, without giving it time to infuſe, becauſe it turns as black as Ink. To avoid drinking the Herb, which ſwims at the Top, they make uſe of a Silver Pipe, at the End whereof is a Bowl full of little Holes; ſo that the Liquor, ſuck'd in at the other End, is clear from the Herb. They drink round with the ſame Pipe, pouring hot Water on the ſame Herb, as it is drank off. Inſtead of a Pipe, which they call *Bombilla*, ſome part the Herb with a Silver Separator, call'd *Apartador*, full of little Holes. The Reluctancy which the *French* have ſhewn to drink after all Sorts of People, in a Country where many are pox'd, has occaſion'd the inventing the Uſe of little Glaſs Pipes, which they begin to uſe at *Lima*. This Liquor, (he ſays) in his Opinion, is better than Tea: It has a Flavour of the Herb, which is agreeable enough. The People of the Country are ſo uſed to it, that even the pooreſt drink it once a Day, when they riſe in the Morning.

The Trade for this Herb (he ſays) is carried on at *Santa Fe*, whither it is brought up the River of *Plate*. There are two Sorts of it; the one call'd *Yerba de Palos*; and the other, which is finer, and of more Virtue, *Yerba de Camini*. The laſt is brought from the Lands belonging to the *Jeſuits:* The great Conſumption of it is between *La Paz* and *Cuzco*, where it is worth half as much more as the other, which is ſent from *Potoſi* to *La Paz*. There come yearly from *Paraguay* into *Peru* above fifty thouſand Arrova's, twelve thouſand Hundred-weight of both Sorts; whereof at leaſt one Third is of the *Camini*, without reckoning twenty-five thouſand Arrovas of that of *Palos* for *Chili*. They pay for each Parcel, containing ſix or ſeven Arrovas, four Royals, for the Duty call'd *Alcavala*, (being a Rate upon all Goods ſold) which, with the Charge of Carriage, being above ſix hundred Leagues, doubles the firſt Price, which is about two Pieces of Eight; ſo that, at *Potoſi*, it comes to about five Pieces of Eight the Arrova. The Carriage is commonly by Carts, which carry a hundred and fifty Arrovas from *Santa Fe* to *Jujuy*, the laſt Town of the Province of *Tucuman*; and from thence to *Potoſi*, which is an hundred Leagues farther, it is carried on Mules.

What this curious Author has obſerved, on there being two Sorts of this Herb, may very well agree with thoſe two Sorts here mention'd; ſince both of them are generally ſuppoſed to agree in their Qualities, though one is much preferable to the other; therefore I imagine the *Yerba de Camini* is what we call *Paraguay*, or *South-ſea Tea*; and the *Yerba de Palos* to be our *Caſſioberry-buſh*, the Leaves of which are extreme bitter, eſpecially when taken green from the Tree; and the Taſte is hardly to be gotten out of the Mouth for ſome Hours after chewing a Leaf thereof. But as our Author only ſaw the dried Herb, he could no more diſtinguiſh their Difference, than we can the Tea brought from *China*; I mean as to the particular Trees which produce it. *Miller's Dictionary.*

CASSITA. The *Alauda criſtata*, or creſted Lark. See ALAUDA.

CASSITEROS, κασσιτερος. Tin.

CASSIUS. A celebrated Phyſician, who lived in the Time of *Celſus*, or a little before him, and is call'd by him, in his *Preface*, the moſt ingenious Phyſician of his Age. He was a Follower of *Aſclepiades*, and is the ſame whom *Galen* and *Scribonius Largus* quote by the Name of *Caſſius the Phyſician*, and who is the Author of the Problems ſtill extant under his Name. Moſt of the Queſtions in that little Treatiſe of his, M. *Le Clerc* ſays, are curious enough, and the Anſwers to them very ingenious.

CASSOLETA. A Kind of humid Suffumigation deſcrib'd by *Marcellus, de Præſ. Remed. Form.*

CASSOUVARIUS. The Name of an exotic Bird, which Dr. *Grew*, in his *Comparative Anatomy*, affirms to be without a Craw.

CASSUMMUNIAR, Offic. *alias Ryſagon*, Peach. Obſ. *Caſimunar*, Mare. *Riſagon*, Muſ. Reg. Soc. *Zedoaria radice lutea*, Breyn. Prod. 2. 105. *An Zerumbeth, ſeu Zingiber rubrum, ſylveſtre, Ternatenſe*, Camel. Syllab.? CASUMUNAR. *Dale.*

This is a Root which comes from the *Eaſt-Indies*, and has been much in Requeſt of late Years. It is about the Thickneſs of the little Finger, cut into ſhort Pieces; its Outſide encompaſs'd with Circles like Galingal, of a browniſh-yellow Colour, and of a ſomewhat bitter hot aromatic Taſte.

It is not known what Plant this is the Root of; but it is very much commended as an excellent nervous Medicine, and good for the Palſy, Convulſions, Colic, Griping of the Bowels, and Hyſteric Affections. *Miller's Bot. Off.*

This Root is ſaid to be moderately heating and aſtringent, for which Reaſon it is recommended for corroborating the Nerves, recruiting the vital and animal Spirits, ſtrengthening the Stomach, and expelling Flatulencies. It is alſo preſcrib'd in Apoplexies, convulſive Motions, Palſies, Tremors, Hyſteric and Hypochondriac Diſorders, Vertigos, and Gripes. It is highly extol'd for a Loſs of Memory, and eſteem'd a Corrector to the *Peruvian* Bark. *Albertus Seba*, in his *Rerum naturalium accurata Deſcriptio*, under the Article *Radix Caſminaris Mexicana*, affirms, that it bears a pretty near Affinity to the Root of round Zedoary, which, being cut into Slices, reſembles white Jalap; that it is here-and-there rough, with ſmall Fibres, is in part yellow, of the ſame Taſte with Zedoary, and of a cephalic and ſtomachic Quality. The ſame Author alſo informs us, that a ſtrong Tincture of it, prepared with Spirit of Wine, is of ſingular Service in Apoplexies. A Spoonful may be exhibited internally; and the Parts moſt immediately affected may be anointed with it. Its diſtil'd Oil may alſo be uſed as a Liniment.

CASSUTHA. The ſame as CUSCUTA, which ſee.

CASSYMA, κάσυμα, in *Hippoc. Epid. Lib.* 5. is a Shoe, as *Fœſius* renders it; or rather, according to *Cornarius*, the Sole of a Shoe; which is the Senſe alſo, that the Scholiaſt of *Ariſtophanes* puts upon the Word καττύματα (*Cattymata*). We find this Term κάσυμα in a brief Relation of a remarkable Event, which is the forty-fifth Caſe in the ſaid Book, and is as follows: Ὁ σκυτεὺς κάσυμα κεντῶν ὁ ἐπὶ τῷ πίτυϊ ἐκέντησεν ἑαυτὸν, &c. "A Cobler in *Pityum* ran his Awl thro' the Sole of a "Shoe into his Fleſh, above the Knee, almoſt a Finger's "Length; no Blood follow'd, and the Wound immediately "cloſed up. Soon after, the whole Thigh ſwell'd; and the "Swelling extended itſelf to the Groin and Ilia, and the third "Day the Man died."

CASTALTICUM. A barbarous Term for CATASTALTICUM, which ſee.

CASTANEA. The Cheſnut, of which *Boerhaave* mentions three Sorts.

1. CASTANEA, Offic. Raii Hiſt. 2. 1382. Aldrov. Dendr. 294. *Caſtanea ſativa*, C. B. Pin. 418. Tourn. Inſt. 584. Boerh. Ind. A. 2. 178. Jonſ. Dendr. 117. THE CHESNUT-TREE. *Dale.*

Sardinian Acorns, which ſome call *Lopima*, or *Caſtana*, (Cheſnuts) *Mota*, (in *Athenæus Amota*) and *Jupiter*'s Acorns, are of an aſtringent Quality, and therefore work the ſame Effects as the Acorns of the Oak, eſpecially the Coat between the Kernel and the Shell. The Kernel is good for thoſe who have drank the Ephemeron. *Dioſcorides*, *Lib.* 7. *Cap.* 145.

The *Cheſnut* is a handſome beautiful Tree, and frequently planted in Parks for its agreeable Shade. It is thick-ſet with long, ſomewhat narrow, and ſharp-pointed Leaves, deeply ſerrated about the Edges. The Catkins are long, thin, and ſlender; and the Fruit incloſed in a round echinated prickly Huſk or Cover, two or three together; having a thin brittle ſmooth Bark or Coat, of that brown Colour which gives Name to the Cheſnut Colour, and under it a tender fine Skin, immediately covering the white Fruit, which is of a pleaſant ſweet Taſte, eſpecially when roaſted.

Cheſnuts are more uſed for Food, eſpecially in the warmer Countries, than Medicine; though they are but a windy ſtuffing Diet. They are accounted reſtringent and binding, eſpecially the inward Skin, which ſome pretend to be good for all kind of Fluxes, either of Blood or Humours. *Miller's Bot. Off.*

2. CASTANEA, Ind. Med. 30. *Caſtanea ſylveſtris*, Chom. 619. Jonſ. Dendr. 118. *Caſtanea ſylveſtris, quæ peculiariter Caſtanea*, C. B. Pin. 419. Ger. 1253. Emac. 1442. Mont. Ind. 39. Raii Synop. 3. 440. *Caſtanea vulgaris*, THE ORDINARY CHESTNUT-TREE, Park. Theat. 1400. THE WOOD CHESNUT-TREE. *Dale.*

Cheſnuts fatten and nouriſh, but they bind alſo, and ſometimes generate Wind. The Meal, mix'd with Honey, or the *Cheſnuts* themſelves roaſted, and work'd up with Honey and Flowers of Sulphur, make a good Electuary for thoſe who ſpit Blood, or cough much. The Decoction of *Cheſnuts*, or their Shell roaſted, aſſwages the Flux of the Belly; as does alſo the little Skin under the Shell. An Emulſion made of *Cheſnuts*, Poppy-ſeed, and Barley-water, aſſwages the Heat of Urine. *Cheſnuts* are ſweet, a little ſtyptic, and redden blue Paper, which ſhews, that Alum and Sulphur predominate in this Fruit. *Martyn's Tournefort.*

3. *Caſtanea*; *humilis*; *racemoſa*. C. B. P. 419. J. B. 1. 127. *Caſtanea*; *humilis*. Lugd. 33. *Boerhaave.*

CASTOR, Offic. Schrod. 5. 279. Aldrov. de Quad. Digit. 276. Charlt. Exer. 18. Rondel. de Aquat. 2. 236. Jonſ. de Quad. 102. Geſn. de Quad. Digit. 309. *Caſtor ſive Fiber*, Raii Synop. A. 209. *Fiber*, Bellon. de Aquat. 30. *Fiber ſive Caſtor*, Schonef. Ichth. 34. THE BEAVER. *Dale.*

Caſtor, *Fiber*, *Canis Ponticus*, and κάστωρ, are ſo many different Names of that Animal which we commonly call a *Beaver*. This is a ſwift Quadruped, with five Toes on each Foot, and a narrow Claw on each Toe. It has two remarkable *Dentes Inciſores* in each Jaw; its Tail is horizontal, ſmooth, and without Hair; it is an Animal of the amphibious Kind, lives upon Vegetables, and more eſpecially on the Barks, Branches, Leaves, Fruits, and Roots of Trees, particularly of the Willow. Theſe Animals are found almoſt every-where, but are produc'd in greateſt Plenty in *North America*, and *Ruſſia*. They are not at preſent ſeen in *England* and *Wales*, becauſe, according to *Ray*, the Breed was long ago exterminated by the Huntſmen. They were alſo frequently found in *Pontus* by the Antients, for which Reaſon the Animal is call'd *Canis Ponticus*. It is now univerſally believ'd, that the Follicles, containing the Caſtor, are different from the Teſticles; and 'tis, conſequently, a vulgar Error, that the Beaver, when keenly purſu'd, pulls off and throws away its Teſticles, the ſuppoſed Treaſure for which its Life is ſought.

In the *Mem. de l'Acad. Roy. des Sc.* for the Year 1704. Mr. *Saraſin* gives an anatomical Deſcription of the Beaver, and ſubjoins the following curious Particulars, with reſpect to their Method of Living, and Œconomy.

When the large Inundations are over, the Females return to their Habitations to bring forth their Young; but the Males keep the Fields till the Months of *June* and *July*, and do not return home till the Waters are quite low. Then they either repair the Damage done to their Habitations by the Inundation, or build new ones. They change their Places of Abode principally for three Reaſons; firſt, when they have conſumed the Aliments within their Reach; ſecondly, when their Company is too numerous; and, laſtly, when the Huntſmen diſturb them too much.

They chooſe for their Reſidence a Place abounding in Food, watered with a ſmall River, and fit for having a Lake formed in it. They begin by building a Bank of a ſufficient Height to raiſe the Water to the firſt Floor of their Habitations. If the Country is level, and the River deep, the Banks are long, but leſs elevated than in the Valleys. Theſe Banks are ten or twelve Feet thick at the Foundation, and diminiſh gradually to the Top, where they are generally only two Feet thick. As theſe Animals cut Wood with a great deal of Eaſe, they do not ſpare it, but generally cut it into Pieces as large as one's Arm or Leg, and from two to four, five, or ſix Feet long. One End of theſe they drive pretty deep into the Earth, and fix them pretty near each other, interweaving them with ſmall and pliant Twigs, the Vacuities of which they fill up with Clay. They continue this Work in proportion as the Water riſes, that they may tranſport their Materials with the greater Eaſe. At laſt they finiſh theſe Banks, when the retained Water can reach the firſt Floor of the Habitation they intend to make. The Side of the Bank which the Water touches is ſlop'd; and the Water, which gravitates in proportion to its Height, preſſes it ſtrongly againſt the Earth, but the oppoſite Side is perpendicular. They are ſolid enough to ſupport the Animals which tread upon them; and theſe Creatures carefully preſerve them, repairing the leaſt Openings with Clay. If they obſerve, that the Huntſmen perceive them, they either do not work at them but in the Night-time, or they abandon the Place.

When the Bank is finiſhed, they labour at their Cottages, which they always found in a ſolid Manner, on the Brink of the Water, on ſome little Iſland, or on Stakes driven into the Ground. Theſe Lodgings are round and oval, and two Thirds of them appear without the Water; but they have the Precaution to leave an Opening which the Ice cannot ſhut up. Sometimes they build the Lodging entirely upon the Earth, and make Pits five or ſix Feet deep, which they conduct to the Water. They employ the ſame Materials for their Lodgings they do for the Banks, except that the Lodgings are perpendicular, and terminated like a Cupola. The Walls are generally two Feet thick. As their Teeth are as ſharp as the beſt Scythes, they cut all the Ends of the Sticks which jet out beyond the Walls, and apply a Covering of Clay and dry'd Herbs both within and without, and employ their Tails in order to ſecure this Covering.

The Inſide of the Lodging is vaulted, and is capable of containing eight or ten Beavers. Without, this Cottage is eight or ten Feet broad, and ten or twelve Feet long, provided it is oval; within, it is four or five Feet broad, and five or ſix long. If the Number of Beavers is fifteen, twenty, or even thirty, which rarely happens, the Lodging is proportioned to them; and ſometimes there are ſeveral Lodgings oppoſite to each other.

Some

Some Miſſionaries aſſured Mr. *Sarraſin*, that four hundred Beavers were found in Cottages which communicated with each other. Theſe Cottages are diſpoſed in Stories of different Heights, that they may retire as the Water riſes. They have alſo an Opening different from the Door, and from the Place thro' which they deſcend into the Water; and it is by this Opening they go to the Water in order to diſcharge their Excrements.

Thoſe are called Land-beavers which lodge in Caverns made in Earth, raiſed above the Brink of the Water. They begin to prepare their Lodging by making an Opening, which goes more or leſs into the Water, according as the Ice may be more or leſs thick; and they continue this Opening for five or ſix Feet; but it is no larger than to allow them to paſs through it: After which they make a Lake, three or four Foot every Way, into which they deſcend when they pleaſe. Afterwards they cut another Opening into the Earth, which gradually riſes in Stories, in order to keep themſelves dry when the Water riſes. Theſe Openings are ſometimes found more than an hundred Feet in Length. Theſe Beavers cover the Places where they lie with Graſs. In Winter they make Shavings of Wood, which ſerve them as Beds.

All theſe Pieces of Work, eſpecially thoſe made by the Beavers in cold Countries, are generally finiſh'd in the Months of *Auguſt* and *September*, the Time in which they muſt begin to make Proviſions for the Winter. They cut the Wood in Pieces from two or three to eight or ten Feet long. The large Pieces are carried by two or three of theſe Animals, and the ſmaller Pieces by one, but in different Roads, that they may not incommode each other. They firſt uſe a certain Quantity of it, which floats in the Water; then they lay more above it, Piece above Piece, till their Proviſion anſwers to the Number of Animals which deſign to lodge together: For Inſtance, the Proviſion for eight or ten Beavers is twenty-five or thirty Feet ſquare, and eight or ten deep. This Wood is not piled up like that in a Carpenter's Yard, but in ſuch a manner as allows them to take what Parts of it they pleaſe, and they only eat thoſe which are ſoaked in the Water. Before they eat it, they cut it ſmall, and convey it to that Part of the Cottage in which they lie. If they had cut it before they piled it up, the Water would have carry'd it away, or diſperſed it.

The Beaver is hunted from the Beginning of *November* to the Months of *March* and *April*, becauſe, at that Seaſon, theſe Animals are well furniſh'd with Hair.

The Anus of the Beaver, ſituated betwixt the Os Pubis and the Beginning of the Tail, is not, as in other Animals, ſhut by a Sphincter Muſcle, but by a kind of Chink, thro' which both ſolid and liquid Excrements are diſcharged; not in the manner of Birds, whoſe Ureters depoſit their Urine in the End of the Inteſtinum Rectum; but in the Beaver there is a peculiar Duct, terminating in the common Aperture under the Inteſtinum Rectum: For *Wepfer* diſtinguiſhes the Orifice of the Anus from this Chink in the following Words: "In the entire Skin left upon "the Pubes there appeared two remarkable Orifices, the ſupe- "rior of which is the Chink under the Os Pubis, and the infe- "rior the Anus under the Tail." According to *Rondeletius*, "The Female Beaver has one common Paſſage for diſcharging "her Excrements, and bringing forth her Young." On each Side of this Chink, near the Groins of the Animal, whether Male or Female, are two ſmall Bags, the inferior of which is but little, and the ſuperior larger. The ſmaller of theſe Bags, being internally covered with a rough, folded, and glandulous Membrane, and opening, by an excretory Duct, into the Place between the Chink and the Anus, which, by Anatomiſts, is called the Perinæum, is fill'd with an oleaginous yellow Subſtance, of a Conſiſtence ſomewhat more liquid than Honey, and of that nauſeous Smell diffuſed by Caſtor. Hard by the Neck of this Bag or Follicle, in the inferior Part, is a Gland about the Bulk of a Kidney-bean, which being compreſs'd, there is diſcharged from its lower Orifice, which is not much larger than the Punctum Lacrymale, a Subſtance of the Conſiſtence of new Cheeſe, and which ſmells like Caſtor. The other Follicle, lying on the ſuperior Part of this, is larger, in Figure reſembling a dry'd oblong Pear, opening by a pretty large Orifice, which admits one's Finger, into the common Chink, and contains a wax-like, yellowiſh, and friable Subſtance, of a nauſeous and acrid Smell, and which, being afterwards divided into ſmall Portions, of the Bulk of a Pea, or ſomewhat larger, is called Caſtor. Sometimes ſmall Stones of different Bulks, of a laminated Structure like Bezoar, and of the Smell of Caſtor, are probably formed in this Subſtance, inſpiſſated and concreted, juſt as the Stones found in the Gall-bladders of other Animals are produced. From both theſe Follicles, therefore, four Ducts are diſtributed to the Chink, and open their Mouths or Orifices into it. The large Number of Blood-veſſels diſtributed thro' theſe Receptacles, ariſe from the adjacent hypogaſtric and iliac Veſſels, the conglomerate ſebacious Glands form'd of which ſeem to change the Humours they receive into an unctuous Matter, and throw it into the common Emunctory or Follicule. This Matter, when collected in the larger Follicule, and becoming thick by its Continuance there, conſtitutes the Caſtor. In the ſuperior Part of the Chink the Penis of the Male is lodged, in a particular Sinus formed by the Proceſs of the Peritonæum under the two larger Follicules of Caſtor. The Penis of this Animal is a bony Subſtance, as in Dogs. The Teſticles are ſituated under the Os Pubis, near the Caſtor; but it cannot be diſcovered externally in the Groin, either by the Eye or the Touch, that they are lodged there; and tho' they are ſituated pretty near the Caſtor, yet there is no manner of Communication between the former and the latter, nor do they ſmell like Caſtor, either when recent or dry'd. But 'tis falſe, as *Rondeletius* and *Amatus ad Dioſcoridem* affirm, that the Teſticles adhere to the Spina Dorſi. In Figure they reſemble thoſe of a Dog, but are ſomewhat longer, and leſs in proportion to the Size of the Animal. Thus alſo the Epididymis, and all the Veſſels ſubſervient to Generation, are not in the leaſt different from thoſe of a Dog. From what has been ſaid 'tis obvious, that the Follicules containing the Caſtor are different from the Teſticles; and, conſequently, that it is a vulgar Error, that the Beavers, when keenly purſued for the ſake of the Caſtor, pull off their Teſticles, and throw them away, and thus preſerve their Lives by loſing that for which they are ſo eagerly ſought after. And, in *Faber's Lexicon*, we read from *Horapollus*, that the *Ægyptians* paint a Beaver, when they intend to repreſent a Man who caſtrates himſelf, becauſe this Animal, when hotly purſued, throws away its Teſticles, for which it is hunted. *La Hontan*, in his *Nouveaux Voyages dans l'Amerique Septentrionale*, informs us, that theſe Animals never go far from the Water, in order to prevent their being hunted by Dogs; that they plunge themſelves into it upon hearing the ſmalleſt Noiſe; and that they are often more ſought after for their Skins than for the Caſtor: Beſides, the Beaver is unfit for affording Diverſion, when purſued by a Pack of Dogs. *Dioſc. Lib.* 2. *Cap.* 23. affirms that 'tis falſe, that they pull off and throw away their Teſticles when hunted; adding, as a Reaſon, "That they cannot be touched, becauſe they are conceal'd." *Pliny*, in *Lib.* 32. *Cap.* 3. repreſents *Sextius Niger* as entertaining the ſame Sentiments before *Dioſcorides*. But *Salmaſius*, in the *Prolegomena* to his *Exercitationes de Homonymis*, informs us, that it is an Aſſertion of *Pliny*, and not of *Sextius*, that they adhere to the Spine, and cannot be taken away without deſtroying the Life of the Animal. But *Pliny* himſelf, *Lib.* 8. *Cap.* 30. affirms this ſpontaneous Caſtration or Amputation to be real. According to *Wepfer*, this Amputation is, if not impoſſible, yet always ſo highly dangerous, that, inſtead of preſerving the Life, it would rather haſten the Death of the Animal, ſince not only the Teſticles, but the Follicules containing the Caſtor, muſt be ſnatch'd away at one Bite, which cannot happen without a violent Hæmorrhage, on account of the large Baſe of theſe Parts, and the conſiderable Blood-veſſels lodged in them. This Hæmorrhage is the more fatal, becauſe the Blood in theſe Animals is highly fluid, and becauſe, during their Purſuit, they have not the Advantage of Dreſſings and proper Bandage. *Rondeletius*, a Man of great Judgment, ſeems to have been the firſt who made the Diſtinction between the Teſticles of this Animal and the Follicules containing the Caſtor. But, perhaps, he was ignorant, that there were four Follicules, ſince he only deſcribes two which contain the perfect Caſtor. "The Beavers," ſays he, "have two Protuberances in their Groins, one on each "Side, incloſed in its proper Membrane, and as large as a "Gooſe's Egg; betwixt theſe the Penis is ſituated in the "Males, and the Pudendum in the Females. Theſe Protu- "berances are not the Teſticles, but Follicules covered, as I "have already ſaid, with a Membrane. In the Middle of each "of theſe Follicules are Ducts, from which a pinguious and "ſerous Liquor ouſes, which the Beaver itſelf often ſucks out, "and licks. With this Liquor it afterwards beſmears, as with "an Oil, thoſe Parts of its Body it can reach, juſt as Birds do, "eſpecially thoſe trained up for Bird-catching by Fowlers, in "which, above the Anus, or in the depending Part of the "Tail, there is a Bladder, full of a certain pinguious Liquor "like Oil, which they draw out with their Beaks, and with it "anoint firſt their larger Feathers, and then the ſmalleſt. "This Naturaliſts affirm to be a Preſage of Rain; ſince Na- "ture prompts the Birds, living in the open Air, thus to "guard themſelves, that their Feathers, being, as it were, "anointed with Oil, may not become wet. That theſe Pro- "tuberances are not the Teſticles, may be certainly known "from this, that there is no Paſſage nor Duct from theſe to "the Penis, by which any Humour ſhould be conveyed into "its Opening, and diſcharged: Beſides, the Teſticles are "lodged deeper." Probably alſo this Liquor ſerves to defend the Body of the Animal againſt the Coldneſs of the Water; for it is acrid, ſtimulating, and, conſequently, heating: It may alſo contribute to cleanſe the Teeth of the Animal, when clog'd with the Gums of the Trees on which it feeds. Their Opinion is, therefore, falſe, who aſſert, that, in order to excite a languid Appetite, the Beaver, with its Foot, expreſſes the Caſtor from its Follicule, licks it, and ſwallows it down: It is alſo falſe, that the *Indians* anoint the Snares, which they uſe

for

for catching the Beavers, with it. In the *Mem. de l'Acad. Roy. des Sc. Anno* 1704. we are told, that, in *America*, they anoint with this Humour the Nooſes intended to catch the rapacious Animals which deſtroy the Beaver. The commonly received Opinion, that Caſtor, ſwallowed by the Beaver, ſerves to diſſolve and incide the Shreds of its Aliments, is conſidered in the *Commentarii Academiæ Scientiarum Petropolitanæ*. The Mind amuſes itſelf with curious Conjectures, when our Senſes do not enable us to make unexceptionable Experiments. But 'tis obvious, that the Conjecture is groundleſs, which ſuppoſes Caſtor to derive its Name from the Animal's caſtrating itſelf. When we come to inquire into the Origin of theſe two Errors, that theſe two Follicules are taken for the Teſticles, and that the Animal tears them from itſelf when hunted; the former ſeems to ariſe from this, that theſe Follicules or Bags are found in the Groins, where one would expect the Teſticles; and as for the Animal's tearing out any Part of its Viſcera, *Wepfer* thinks this Story firſt falſly invented by the Huntſmen, either becauſe they ſaw the Beavers, wearied by their Flight, lick their Groins, or becauſe they themſelves fraudulently ſtole the Caſtor as a precious Commodity, and endeavoured, under a Pretext of this Amputation, to impoſe upon their Maſters.

Various Parts of the Beaver are applied to different Purpoſes in human Life: The Skin, in conſequence of its Thickneſs, is an excellent Defence againſt the Winter Cold; but its Weight is ſo great, that it is rarely uſed for any other Part of Dreſs than Caps and Gloves. *Rondeletius* affirms, that it is highly beneficial to arthritic Patients to wear Shoes made of the Beaver's Skin. It is by no means probable, that this learned Author aſcribed any ſpecific antiarthritic Virtue to theſe Skins, farther than that they defended againſt the external Cold, and cheriſhed the native Heat; a Circumſtance highly beneficial to gouty Patients. Thus alſo, to whatever Parts of the Body the Beaver's Skin has been apply'd with Succeſs, the good Effects produced by it ſeem to be owing to its guarding againſt the Cold, and preſerving a due Degree of Heat. *Marius* informs us, that a Cap, made of the Beavers-ſkin, when worn, ſurpriſingly increaſes the Memory of the Patient, if every Month he anoints his Head and Spine with the Oil obtained from the Beaver, and twice a Year takes a proper Quantity of Caſtor; but the Man muſt have more Credulity than Philoſophy who can believe this; tho' the *Jew*, who communicated the Medicine to *Marius*, affirm'd that it was a Preſcription of the celebrated King *Solomon*. They who recommend the Hairs of the Beaver for ſtopping Hæmorrhages of the Noſe, and thoſe ſubſequent to Wounds, muſt ſuppoſe the Hæmorrhage ſlight, in which Caſe the Blood may be abſorb'd, and conſequently ſtop'd, by any ſoft Wool or Hairs whatever. The ſurpriſing Efficacy aſcrib'd by *Francus* to the Teeth of the Beaver, in various Diſorders, ſeems, in all Probability, to be derived from their abſorbent Quality, when reduced to a Powder; and, in this reſpect, they agree with the Teeth of other Animals. We ſhall not inſiſt on the medicinal Virtues aſcribed to the Urine, the Blood, the Runnet, or Gall of the Beaver, ſince they poſſeſs no Virtues but what may be expected from the ſame Parts of other Animals. Concerning its Fleſh, *Rondeletius* informs us, that it is hard, pinguious, reſembles Beef, but always ſmells ſtrong, generates bad Juices, in whatever manner prepared, and that it is beſt when roaſted, with Aromatics ſprinkled upon it. According to *Srbizius*, the Huntſmen prefer the poſterior to the anterior Part of the Body. The ſame Author afterwards ſubjoins, that the Tail is accounted a delicate Diſh, and is principally uſed during *Lent*, when the Catholics may alſo eat the Fleſh of the Beaver. It is variouſly prepared by Cooks, and dreſs'd with different Sauces, in order to render it grateful to the Palate. It generates a thick, tough, and phlegmatic Juice, is of difficult Digeſtion, and, in conſequence of its being pinguious, relaxes the Stomach, and creates a Loathing when eaten plentifully. According to *La Hontan*, in his *Nouveaux Voyages dans l'Amerique Septentrionale*, the Inhabitants of *Canada* account the Tail a delicious Diſh; and *Bellonius* informs us, that the Inhabitants of *Lorrain* uſe it during *Lent*, becauſe, when well prepared, the Taſte of it almoſt reſembles that of a Lamprey. *Wormius* to the Tail adds the poſterior Legs; and *Geſner*, according to *Aldrovandus*, thinks that theſe Parts are to be prepared in the ſame manner Eels are. *Francus* informs us, that for Food the poſterior Parts of the Animal ought to be pickled in black Broth; but that the anterior Parts are to be macerated for ſome Days in Vinegar, and then boiled, after which they make an excellent Diſh: Or, ſays he, they may be roaſted on a Spit, when ſtuck with Lard, Cloves, and Lemon-peel. But he directs the following Preparation of the Tail: After ſeparating the firſt Skin by boiling Water, it is boiled, together with the Feet, for two or three Hours, or till it becomes white, and the ſecond Skin is ſeparated; after which the Tail is to be cut in Slices, and fry'd with White-wine, Ginger, Pepper, Cinnamon, Currans, Almonds, and Saffron. But, among all the various Parts of the Animal, none is ſo juſtly celebrated, nor ſo univerſally uſed, as what we call Caſtor, which is an oleous Subſtance, reſembling a Mixture of Wax and Honey, of a dark Colour, of a ſtrong and fetid Smell, of a bitteriſh and nauſeous Taſte, and found in two Bags or Follicules, ſituated in the Groins of the Beaver. This Subſtance is capable of being diſſolved in ſpirituous, oleous, and aqueous Menſtruums. It ſeems to conſiſt of oleous and ſaline Parts, which have an earthy Principle join'd to them. It even ſeems to be a Species of Sal Volatile Oleoſum, in which a large Quantity of earthy Parts are mix'd. It is imported from various Countries, but in the largeſt Quantities from *Poland*, *Ruſſia*, the *Eaſt* and *Weſt Indies*. That imported to *Dantzick* from *Poland*, *Ruſſia*, and *Pruſſia*, is generally accounted the beſt, and is commonly called *Dantzick Caſtor*. In the *London* and *Edinburgh Diſpenſatories*, where-ever Caſtor is to be uſed, that of *Ruſſia* is preſcrib'd. This is equal'd in Goodneſs by that which is obtain'd from the Beavers of the River *Roan* in *France*, and which is often ſold for that of *Dantzick*. That of *Canada* is accounted the worſt, becauſe it is almoſt void of Smell, and that which it diffuſes is ungrateful: Hence many, erroneouſly, believe it to be adulterated. But that which is imported from the *Eaſt Indies* is preferr'd to all the other Species of Caſtor. *Alb. Seba*, in his *Deſcriptio Rerum naturalium*, reckons the *Siberian* Caſtor beſt; and the other Species ſucceed it in the following Order: The *Norwegian*, the *Swediſh*, and the *Polonian*; but that of *Canada* is, of all others, the worſt for medicinal Purpoſes. But, whatever Country it is imported from, that is eſteem'd good which is taken from a full-grown Beaver, has a fetid and diſagreeable Smell, an acrid biting Taſte, a browniſh Colour, and a friable Texture: That which is unctuous and ſoft, is eſteem'd leſs valuable. According to *Dioſcorides*, it is adulterated by mixing Gum Ammoniac and the Blood of the Beaver with the Caſtor. According to *Matthiolus* on *Dioſcorides*, it is adulterated by triturating the Kidneys of the Beaver, and ſtuffing the Follicules with them. In the *Prolegomena* to the *Pharmacopœia Auguſtana*, we are inform'd, that it is frequently adulterated by cutting and bruiſing the Liver of the Beaver ſmall, and making it up with the oleaginous Juice of Caſtor; but that the Fraud may be diſcover'd by this, not only that the genuine Follicules ariſe both from one common Source or Beginning, but alſo from the firmer Conſiſtence and greater Bulk of the Lumps, than the natural Largeneſs of theſe Follicules will admit of: Beſides, the Smell, in this Kind, is not ſo ſtrong as in that which is genuine. But the Difficulty of diſtinguiſhing genuine from ſophiſticated Caſtor is greater than is commonly believed; for that is often thought adulterated, which, in reality, is not; becauſe the Diverſity of the Smell and Conſiſtence is often to be aſcrib'd to the Climate in which the Beaver lives, the Aliments it uſes, and its Age. Beſides, according to *Rondeletius*, in his *Hiſtoria Piſcium*, *Tom.* 2. Caſtor, when recent, reſembles an Oil; but, when older, it aſſumes the Colour and Conſiſtence of liquid Honey. But it is a groſs and palpable Sophiſtication, when Membranes, Pellicles, and Fibres, appear intermix'd with the Caſtor. The Caſtor is dried in its own Follicules for medicinal Purpoſes, that, the watery Part being diſſipated, its Smell may be the ſtronger; as alſo, that it may keep the longer without corrupting. It is better preſerved, when entire, than when reduced to a Powder. It may be dried in two manners; either in a Shade, according to *Geſner*; or in the Smoak, by hanging up the Follicules in a Chimney: This latter Method is generally uſed in the Shops. Without recounting all the fabulous Stories told of Caſtor, we ſhall confine ourſelves ſtrictly to its medicinal Uſes: What Notions, therefore, the Antients entertain'd of its Virtues, we learn from *Dioſcorides*, who aſcrib'd a heating Quality to it; and recommends not only the internal Exhibition of it, but alſo its external Uſe, by Smelling and Fumigation, for provoking the Menſes, expelling the Fœtus and Secundines; as alſo againſt Inflations, Gripes, Hiccoughs, Poiſons, Varices; and for rouſing lethargic Patients, however violent their Diſorder may be. He alſo affirms, that the internal Uſe of it, and Unction with it externally, are ſerviceable in Tremors, Convulſions, and all Diſeaſes of the Nerves. The ſame Sentiments are deliver'd by *Pliny* at greater Length, in *L.* 32. *C.* 3. According to *Matthiolus* on *Dioſcorides*, *Galen* admitted both the internal and external Uſe of Caſtor in Diſorders of the Nerves; but, as it is of a heating and drying Quality, he informs us, that it is highly prejudicial in thoſe Convulſions which are produced by a Want of due Moiſture, or by Inanition. He alſo adviſes it to be abſtain'd from in Hiccoughs proceeding from Dryneſs, Evacuation, or the Stimulus of acrid Humours. But he aſcribes a ſingular Uſe to it, in Caſes where a moiſt Habit is to be dried, or a cold one invigorated, and render'd hot: Then he adds, "Nor does it prove hurtful to any "Part, eſpecially if the Patient is free from a Fever, or does "not labour under a very hot, but only a tepid one, ſuch as "generally attends a Cataphora and Lethargy. And I have, "to many, exhibited Caſtor, with white Pepper, of each two "Scruples, to be drank in Honey and Water; nor did any of "the Patients ſuſtain any Injury by it. In a Retention of the "Menſes, after a moderate Evacuation of Blood from the "Vein in the Ancle, I always found Caſtor exhibited with "Penyroyal, or Calaminth, an effectual Emmenagogue, with-

"out

" out hurting the Patient. It also evacuates the Lochia; and " for all these Purposes it is to be drank in Honey and Water. " But by Patients, whose Abdomens are so distended, as scarce " to admit of a Cure, by such as labour under Gripes, or a " Hiccup, proceeding from cold viscid Humours, or thick and " flatulent Spirits, the above-mentioned Ingredients are to be " most advantageously drank in Oxycrate. As Castor is bene- " ficial, exhibited internally, so it is advantageous, when ap- " ply'd externally with Sicyonian, or old Oil. It ought by it- " self to be rub'd into those Parts which stand in need of a " greater Degree of Heat. The Steam of it, when laid upon " Coals, is also beneficial in moist and cold Disorders of the " Lungs, if drawn in in Inspiration. But it is better in Le- " thargies and Cataphoras, accompanied with a Fever, not " to use any of the above-mentioned Oils, but rather to " anoint the Head and Neck with Oil of Roses." *Paulus Ægineta*, in *Lib. 7. Cap.* 3. more concisely delivers the same Sentiments. *Alexander Trallian*, above all other Medicines, recommends Castor to lethargic Patients, in *Lib.* 1. *Cap.* 14. where he makes the following Observations. If the Disorder is malignant and inveterate, shave off the Hair, and anoint the Head with such Substances, as may exasperate and vellicate the Skin, in Conjunction with Castor. Let the Patient also have a Draught, in which Castor is an Ingredient. Let these Measures be taken an Hour before the Accession; for it attenuates, heats, and cherishes the Body, which was become cold, and almost dead. I know, says he, many labouring under a Lethargy, who, by this Remedy alone, have escap'd Death. It is also beneficial, when exhibited by itself; but it is still more so, in Conjunction with Oxymel. If the Patient is full of recrementitious Humours, it ought to be exhibited with some purgative Medicines, especially Scammony. But one Scruple of Scammony, or a little more or less, according to the Strength of the Patient, is a sufficient Quantity for two Scruples of Castor. *Hippocrates de Morb. Mul. Lib.* 1. among other Medicines, recommends Castor for promoting the Purgations of Child-bed Women; and in his Book *de Natura Muliebri*, he recommends it for provoking the Menses. In his Treatise *De Morb. Mul. L.* 1. he prescribes it for expelling the Fœtus. Hence in his Work *De Morb. Popul.* he affirms, that Castor allays Pains of the Head arising from the Uterus, because it removes those Disorders of the Uterus, that is, Suppressions of the Menses, which are generally accompanied with Head-akes. That among the antient Physicians the Empirics made frequent Use of Castor, may be seen in the Preface. *Actuarius*, in his *Meth. Medend. L.* 6. *C.* 9. informs us, that Castor is a powerful Remedy in all inveterate Disorders. *Vegetius*, *L.* 3. *C.* 24. says, that in his Days the Farriers used the Powder of Castor internally, mix'd with Clysters, and in Ointments, for Cattle seiz'd with Spasms of the Nerves. From what has been said, 'tis sufficiently evident, that the Antients acknowledg'd the heating Quality of Castor. This seems to be evident, from *Hippocrates*, *Epidem. L.* 5. where we have an Account, that the Wife of *Aspasius*, in a violent Pain of her Teeth and Jaw, perceived her Pain mitigated by keeping Castor and Pepper in her Mouth. Now 'tis known, that acrid, heating, and almost caustic Substances, generally prove beneficial in Cases of this Nature. This same Doctrine is confirmed by this, that, according to *Aldrovandus*, *Avicenna* affirms a Mixture of Sweet-flag and Pepper to be an excellent Succedaneum to Castor; and says, that a Dram of Castor, mix'd with Wine, is an excellent Medicine, where stimulating Substances, and such as put the Humours in a Commotion, are requir'd, in order to expel the Poison convey'd by the Bites of venomous Animals. The Disorders against which Castor is used by the Moderns, are at Length recounted by *Ettmuller*: He, therefore, recommends it in painful Disorders of the Nerves and Head; in Dulness of the Senses; in Lethargies, and drowsy Disorders; in Palsies, and Apoplexies; in Epilepsies, and all convulsive Disorders, whether external or internal; as also in Aphonies and Vertigos; and the Reason he assigns for its Efficacy in these Cases is, that it rouses the torpid and languishing animal Spirits. He also asserts, that it is an excellent carminative Medicine in flatulent Colics, hysteric Disorders, and the Fits with which they are attended. He recommends it likewise in Cases where the Primæ Viæ are loaded with peccant Acids; in a Tinnitus Aurium; in a convulsive Asthma; in Epilepsies, arising from Disorders of the Uterus; and in other Indispositions of that Organ; but more particularly for expelling the Fœtus and Secundines; provoking the Menses, when either entirely suppress'd, or flowing with Difficulty; and various Disorders of the Abdomen; for alleviating the Pains of Women after Childbirth; and for evacuating the Lochia. He also thinks, that Castor is singularly beneficial, not only as a Preservative against Small-pox, Measles, and exanthematous Disorders, but also in promoting their Eruption. He affirms, that nothing is more conducive to the Cure of lethargic Disorders than Castor, when a Vomit is previously exhibited, or when it is taken with proper Purgatives, such as Scammony. Externally, according to the same Author, a Sponge dipt in Vinegar, in which Castor is dissolv'd, and apply'd to the Nostrils, rouses lethargic Patients, and those who are rendered drowsy by the narcotic Steams arising from Coals, Ale, or Wine-cellar. In Palsies, griping and flatulent Pains of the Abdomen, such as the Colic, and in hysteric Disorders, it is frequently apply'd externally to the Parts affected. Hence also it is generally added to those Clysters intended to stimulate and make a Revulsion in apoplectic and epileptic Disorders. In a Tinnitus, and the like Disorders of the Ear, it is an excellent Remedy, if wrapt up in Cotton, and introduced.

Rondeletius, in his Book *De Ponderibus*, affirms, that Castor is an excellent Remedy in the most violent Disorders of the Ears. *Hoffman*, in his *Clavis Sebrod.* recommends the following Medicine in Spasms, and assures us, that it will not disappoint the Hopes of the Physician.

Take of the best Wine burnt, half an Ounce, and infuse in it two Drams of Castor cut down. The Method of using this Remedy is to anoint the Spine with it.

According to the same Author, Water distil'd from Swallows, with an Addition of Castor, is of singular Service when apply'd externally in a Tremor of the Parts. *Borelli*, in his *Observat. Medico-physicæ*, *Cen.* 1. *Obs.* 52. affirms, that the above-mentioned Mixture, recommended by *Trallian*, of Scammony and Castor, exhibited in two Doses, and drank in Oxymel, exerts the desired Effect in the Cure of a Lethargy. And *Forestus*, in his *Observat. Medic. L.* 10. *Obs.* 92. *in Schol.* ascribes a surprising Efficacy to Castor, in Palsies of every Kind. In the *Acta Medicorum Berolinensium*, *Dec.* 2. *Vol.* 10. we are told, that Castor is a Medicine singularly powerful in the Cure of Diseases incident to Women. But *Hoffman*, in his Treatise *De prudenti Virium Medicamenti Exploratione*, tells us, " That " for several Ages past Castor has been thought an antihysteric " Specific, as if in a Moment it sooth'd and quell'd the Com- " motions of the Uterus. But," continues he, " if this Re- " medy was possess'd of such signal Virtues, why does this Dis- " order prove so obstinate and chronical, as to afflict the mise- " rable Patients for several Years? It is certain, that by the " Subtilty of its Effluvia, and its lenitive sulphureous Quality, " it sooths the Spasms, and consequently alleviates the Pains: " But this happy Effect lasts only for a short time; for it by no " means removes the Cause, which is deep-seated in the Nerves, " and particularly rooted in the Hypochondria; so that quite " different Measures are to be taken, if we would remove this " obstinate Disorder." From what has been said, we see the Antients recommended Castor in the same Disorders for which the Moderns prescribe it; for it consists of stimulating, and consequently heating and drying Parts, and is of an alcaline Nature. It therefore appears to be a Remedy excellently adapted to the Cure of those cold Diseases which arise from Acidity, too great a Relaxation of the Solids, and a languid State of the pituitous Humours. But where the Vessels require an additional Stimulus, and where Obstructions, arising from the preceding Causes, call for inciding and resolving Medicines, Castor proves an excellent Remedy. For this Reason it is beneficial in Cachochymies, and hypochondriac and hysteric Disorders, which depend upon the languid State of the Vessels, and circulating Fluids. But Castor proves prejudicial to Patients for whom heating Medicines, and such as increase the Motion of the Fluids, are improper. So far is it from being beneficial to all Patients promiscuously, who labour under the same Disease. Hence 'tis obvious in what Sense it may be call'd cephalic, antipoplectic, antiepileptic, antiparalytic, carminative, uterine, antihysteric, antihypochondriac, nervous, arthritic, and antispasmodic. According to *Stenzelius*, in his *Toxicologia*, Castor is neither an uterine, nor an antispasmodic Specific, but a resolvent antiacid Medicine, equally beneficial to Men and Women, who labour under preternatural Relaxations of the Solids, or an acid and serous Dyscrasy. From these Considerations we are to account for the various Effects, sometimes salutary, and sometimes hurtful, produc'd by the promiscuous Use of Castor in Disorders of the Head, Uterus, and Intestines. *Hippocrates* is, therefore, to be understood in a limited Sense, when in the seventh Book of his Epidemics he tells us, that Castor removes Pains of the Head arising from Disorders of the Uterus. *Hoffman de Remed. benign. Abusu*, tells us, that not only Physicians, but the common People, and Nurses, know how celebrated a Medicine Castor is, since in all convulsive and spasmodic Disorders they have recourse to it as to an infallible Arcanum. It is well known, that a promiscuous and indiscriminate Exhibition of the Preparations of Castor has produc'd very unlucky Consequences. Thus they have been known exhibited in hysteric Disorders, where, indeed, by their Means, the Cardialgia and Spasms of the Præcordia at first seem'd to be diminish'd, but they continued the longer. But as soon as the *Primæ Viæ* have, by mild and balsamic Laxatives, been clear'd of the peccant Load of Humours, the Pains have forthwith ceas'd. It is also known, that Castor, exhibited frequently and copiously to Women in Child-bed, has left a considerable

Torpor of the Head, and render'd their Sleep uneaſy and turbulent. Since, from what has been ſaid, 'tis obvious, that thoſe are in an Error who ſeek for a ſpecific Virtue in Caſtor, not only againſt the Diſeaſes of Women, but alſo againſt any Diſorders whatever, and ſince 'tis certain, that the unſeaſonable Exhibition of this Medicine has produced rather bad than good Effects in the human Conſtitution, we muſt conclude, that *Zwelfer* runs counter to Experience, when in the *Pharmacopœia Regia* he aſſerts, that the Smell and external Applications of Caſtor are beneficial to hyſteric Women; but that this Medicine rather proves hurtful, when exhibited internally. *Hoffman*, in his *Clavis Schroder.* affirms, that *Zwelfer*'s Aſſertion is contradicted by Experience, ſince 'tis certain, that in hyſteric, or rather hypochondriac Fits, nothing is more efficacious than Caſtor, both internally and externally uſed. But each of theſe Authors may have had Experience on his Side; for hyſteric Fits, or ſpaſmodic Contractions of the Uterus, are remov'd by Subſtances, whoſe Smell is fetid, and diſagreeable to Nature. Caſtor, apply'd to the Noſtrils in the Paroxyſm, performs its Office, by deriving the Spirits from the Part contracted. Nor in this Caſe can the Uſe of Caſtor be ſaid to be hurtful to thoſe, for whom the Uſe of heating Medicines internally would be improper, ſince the Stimulus convey'd to the Nerves by the Smell laſts little longer than the immediate Application of the Medicine. But if Caſtor was internally exhibited to ſuch Patients, it would prove hurtful, by rarefying the Humours too much, throwing them into Commotions, and producing dangerous Evacuations of Blood, by which *Francus*, according to *Marius*, in his *Caſtorologia*, obſerv'd Abortions to be caus'd. From Caſes of this Kind *Zwelfer* probably drew his Sentiment, that Caſtor was prejudicial to hyſteric Patients. It were to be wiſh'd, that he had wrote leſs generally; ſince, when ſpeaking of the *Pilulæ de Cynogloſſa anodynæ*, he leaves out the Caſtor; becauſe, ſays he, "It is a Compoſition intended not for one Diſorder, or for hyſteric Affections alone, but for many other Diſeaſes, in which Caſtor is improper. ſuch as an immoderate and too long continued Diſcharge of the Menſes, in which Caſe Caſtor rather does Harm than Good." In the mean time, when Women, ſubject to hyſteric Fits, ſuffer by a languid and inactive Mucus, the internal Uſe of Caſtor is not altogether improper for them; for, as we have already obſerv'd, it is an excellent Remedy in Diſeaſes ariſing from a cold Cauſe, by ſtimulating, heating, and reſolving. Beſides, *Bartholine de Medicina Danorum Domeſtica* obſerves, that ſome Women are reliev'd by the Smell of Caſtor, who are injur'd by its internal Uſe. And according to *Schulzius*, in his *Prælectiones*, the illuſtrious *Stahl*, and the other Authors there quoted, every-where almoſt condemn the internal Uſe of Caſtor. Beſides the Methods of uſing Caſtor externally already related, it is alſo mixed with Ointments and Plaiſters. It is alſo exhibited in Powders by way of Errhine. It is moreover exhibited internally in Powder, in Pills, ſometimes in Electuaries, and in a liquid Form; in Eſſences, for Inſtance, and Spirits. The largeſt Doſe is one Dram. Caſtor, according to *Marius*, in his *Caſtorologia*, is apply'd externally to the Head for ſtrengthening the Memory, becauſe it opens Obſtructions, and by procuring a free Circulation of the Humours thro' the Veſſels, aſſiſts the Secretion of the Spirits. Caſtor, according to the ſame Author, is uſed for deſtroying Lice; becauſe either by its Smell, or its Acrimony, it kills them. This Medicine ſeems to be rank'd in the Claſs of Antidotes, becauſe, by heating, it increaſes Perſpiration, which is ſerviceable either by expelling the poiſonous Matter, or by reſiſting the malignant Miaſmata, and hindering them from eaſily inſinuating themſelves into our Bodies. Caſtor is ſaid to correct Opium, becauſe it infringes its Virtues; for, as has already been obſerv'd, it reſiſts a Propenſity to Sleep. It is mixed with Purgatives, in order to promote their Operation, and with a View to incide and evacuate thick Phlegm; for when exhibited by itſelf in a pretty large Doſe, it operates as a Purgative. But the principal Uſe of Caſtor, when mix'd with Cathartics, is to moderate the Virulence of the more draſtic Sorts, and to make them act with leſs Violence. Thus Caſtor, mix'd with white Hellebore, renders its Operation, both as an Emetic and Cathartic, much milder than it is without it.

Avicenna and *Matthiolus* agree, with ſome other Authors, that Caſtor, when grown old, black, and putrid, becomes poiſonous, inſomuch that it brings on Madneſs, attended with a ſwell'd Tongue, and a raging Fever, which frequently puts an End to the Patient's Life in one Day. The Remedies for this Diſorder are, to provoke Vomiting by plentiful Draughts of Hydromel and Butter; and afterwards to take Diamoron, or Juice of Lemon or Citron with Sugar. The parch'd Seeds of Coriander, taken in the Quantity of two Drams, are alſo recommended as an Antidote to this Poiſon.

If we reflect, that when Caſtor, which is an unctuous animal Subſtance, putrefies, it muſt neceſſarily grow rancid, alkaline, and highly acrimonious, we ſhall have ſome Reaſon to believe, that, thus circumſtanc'd, it may act as a Poiſon; and, in ſuch a Caſe, it ſeems, that Acids, together with Subſtances capable of obtunding ſuch an Acrimony, as Butter, ſhould be a proper Remedy. Hydromel, therefore, and Butter, with the Acids mentioned above, appear, in this Caſe, to be capable of doing much Service.

The Axungia Caſtorei is a ſoft unctuous Subſtance, contain'd in two Bags ſituated juſt below the Follicules which contain the Caſtor. It is eſteem'd emollient and penetrating, and conſequently proper in Caſes where indurated Subſtances are to be ſoften'd, and Obſtructions open'd. For this Reaſon, according to *Ettmuller*, it is uſed in Diſorders of the Brain, in Palſies, and the Atrophies ariſing from them; in Tremors of the Joints, and other painful Diſorders of the Nerves; for theſe Intentions the Parts affected are anointed with it. For the ſame Reaſon the Abdomen is order'd to be anointed with it in convulſive Diſorders, Colics, hyſteric Fits, and Gripes after Childbirth. In the *Memoires de l'Academie Royale des Sciences*, for the Year 1704. we are inform'd, that the *Indian* Women anoint their Hair with it by way of Ornament.

Spirit of Caſtor.

Take the beſt *Ruſſia* Caſtor, four Ounces; Flowers of Lavender, one Ounce; of Sage, Roſemary, each half an Ounce; Cinnamon, ſix Drams; of Mace and Cloves, each two Drams; Spirit of Wine, three Quarts: Digeſt, and draw off the Spirit in a Retort with a Sand-heat.

This is exactly in the former Diſpenſatory of the College; and is a much better Medicine for many Purpoſes, than the Tincture of Caſtor, becauſe it is much pleaſanter in taking, both to the Sight and Taſte, but it is not ſo much uſed. It is alſo better for the Aromatics, which make it an extraordinary Cephalic, and good in all Diſtempers whoſe Seat is upon the Nerves; unleſs in hyſteric Caſes, and then the Tincture may be preferable, becauſe it is moſt fetid. This Spirit may be given from five to thirty or forty Drops in any convenient Vehicle, either to Children in Convulſions of any Kind, or to grown Perſons in Epilepſies, Palſies, Head-akes, and all Complaints from the ſame Origin; and, according to the Exigence of the Caſe, it may be repeated two, three, or four times a Day.

Tincture of Caſtor.

Take *Ruſſia* Caſtor, half an Ounce; Spirit of Caſtor, half a Pint: Let them digeſt ten or twelve Days; then decant the clear Tincture, and keep for Uſe.

The Remainder, which is thick, of this Tincture, may be kept for the compound Bryony-water; as indeed may all the Skins, and membranous Parts, which are left in powdering, making proper Allowance for Strength. There are few ſo honeſt to make this with the Spirit of Caſtor, but generally do it with Spirit of Wine. It is good in all Intentions as the Spirit, and given in the ſame Doſes; but it is ſomewhat more unpalatable, and gives any aqueous Vehicle a diſagreeable milky Hue. *Quincy's Diſpenſatory.*

The *Tincture of Caſtor*, in the *Edinburgh Diſpenſatory*, is prepared in a ſomewhat different manner from the preceding, and is order'd to be made thus:

Take of *Ruſſia* Caſtor, an Ounce and an half; Salt of Tartar, two Drams; rectified Spirit of Wine, a Pint: Digeſt them together, in a gentle Heat, for four Days; and afterwards ſtrain off the Tincture.

The Addition of the Salt of Tartar is here well ſuited to unlock the reſinous Texture of the Caſtor; by which means the Menſtruum will take up much more of the Ingredient than otherwiſe; and not leave ſo large a Bottom, as when Spirit of Caſtor, if ever that be applied for this Purpoſe, or Spirit of Wine alone, is uſed to extract the Tincture.

Compound Oil of Caſtor.

Take of Caſtor, Storax, Galbanum, Euphorbium, Opopanax, Caſſia-wood, Saffron, Carpobalſam or Cubebs, Spikenard, and Coſtus, of each three Drams; Cyprus, Schœnanth, long and black Pepper, Savine, and Pellitory, of each two Drams and an half; of ripe Oil, four Pounds; of Canary, two Pounds: Boil all theſe, excepting the five firſt, after due Preparation for that Purpoſe, gently in the Oil and Wine, until the Wine is evaporated. In the mean while diſſolve the Galbanum, Opopanax, and Euphorbium, firſt beaten ſmall, in Part of the ſame Wine, which is to be kept on Purpoſe. After they are ſtrained, let them be carefully mixed, by putting them to the Oil preſſed out, and ſtanding over the Fire, deliberately while hot, and briſkly ſtirring them about with a wooden Spatula. Laſtly, ſtir in the Storax and Caſtor powdered.

This

This is aſcribed to *Jacobus de Manliis*, and is in the *Auguſtan* and firſt Diſpenſatory of the College; but this ſomewhat varies, both in the Proportions of Ingredients, and in the Manner of Preparation, yet the Alterations are of no great Conſequence, eſpecially as the Compoſition hath of late been but little, if ever, wrote for, or made.

Castor Pills.

Take *Ruſſia* Caſtor, one Dram, Salt of Amber, half a Dram, Balſam of Peru, a ſufficient Quantity to make into twenty-four Pills.

Theſe are good in all nervous Diſtempers in either Sex, whether the Origin be in the Head or Uterus: Five may be taken two or three times in a Day, and continued as there is Occaſion. *Quincy's Diſpenſatory.*

CASTRATIO. Caſtration.

The Buſineſs of our Art is to reduce Bodies from a preternatural to their natural Senſe; but Caſtration profeſſes the contrary. However, becauſe we are ſometimes compel'd by our Superiors againſt our Will, to perform this Operation, we ſhall here very briefly give ſome Directions how it may be done. There are two Ways of Caſtration, one by Colliſion or Cruſhing, and the other by Exſection. The firſt is performed on Infants, who are placed in a Veſſel of warm Water, in order to relax their Bodies; which being ſufficiently done, the Teſtes are compreſſed and cruſhed with the Fingers, till they are quite diſſolved, and are no longer perceivable by the Touch. In the Method by Exſection, the Child is placed on a Table in a reclining Poſture, when the Surgeon takes hold of the Scrotum, together with the Teſtes, with his Left Hand, and having diſpoſed them in a right Situation, he makes two ſtrait Inciſions with a Knife, one near each Teſticle; the Teſtes ſtarting forth, he firſt ſtrips them of their Integuments, and then cuts them off, leaving only a very ſmall Continuity of the natural Veſſels. This Method is preferable to Colliſion; for thoſe who have ſuffered Caſtration by Colliſion are ſometimes inclined to libidinous Embraces, ſome Part of the Teſtes, as it is probable, remaining after Colliſion. *P. Ægineta, Lib.* 6. *Cap.* 68.

The Operation of Caſtration was formerly, in *Europe*, much more frequent than at preſent; but, in the *Eaſt*, it is yet much in Vogue, either as a Puniſhment, or for the Convenience of great Men, whoſe Jealouſy will not permit Perſons poſſeſſed of their Virility to approach their Women.

Some there have been, whoſe Profuſion of Enthuſiaſm, and Minuteneſs of Underſtanding, have prevailed on them to undergo this Operation voluntarily, thereby paying no great Compliment either to their Continence or Religion. *Origen* is ſaid to have been one of theſe; but I hope it is not very likely, that our modern Devotees ſhould follow his Example, who ſeem to be neither more nor leſs attached to Pleaſures, than their leſs oſtentatious Neighbours.

At preſent Caſtration is never performed, unleſs in the utmoſt Exigence; generally when an incurable cancerous Diſorder in the Teſticle, or a Sarcocele, renders its Extirpation indiſpenſably neceſſary.

Mr. *Sharp* has given a diſtinct Account of the Method of performing this Operation in a Sarcocele, and has taken Notice of ſome Circumſtances neceſſary to be conſidered, in order to form a Judgment when it is proper to be perform'd, and when not. *Le Dran* has, alſo, given a remarkable Caſe relative to this Subject.

But before I proceed to give a farther Account of Caſtration, I muſt remark, that *Ætius, Tetrabibl.* 4. *Serm.* 1. *C.* 122. informs us, that Caſtration ſtops the Progreſs of a Leproſy; and, upon the Authority of *Archigenes*, that Eunuchs are ſeldom ſeiz'd with this filthy Diſtemper. If the laſt related Circumſtance is true, it lays a Foundation for a Suſpicion, that the antient Leproſy is more nearly ally'd, than is generally allow'd, to the Pox of the Moderns.

This is one of the moſt melancholy Operations in the Practice of Surgery, ſince it ſeldom takes Place but in Diſorders, into which the Patient is very ſubject to relapſe, *viz.* thoſe of a Scirrhus, a Cancer; for under moſt of the Symptoms deſcribed as rendering it neceſſary, it is abſolutely improper; ſuch as a Hydrocele, Abſceſs of the Teſtis, an increaſing Mortification, or what is ſometimes underſtood by a Sarcocele; of which laſt it may not be amiſs to ſay a Word. In the utmoſt Latitude of the Meaning of this Term, 'tis receiv'd as a fleſhy Swelling of the Teſticle itſelf, call'd likewiſe Hernia Carnoſa; or in ſome Inlargements, ſuch as in a Clap, more frequently Hernia Humoralis; but, generally ſpeaking, is conſidered as a fleſhy Excreſcence, form'd on the Body of the Teſtis, which becoming exceedingly hard and tumefied, for the moſt part, is ſuppoſed to demand Extirpation, either by burning away the Induration, or amputating the Teſticle: But this Maxim, too precipitately received, has, I apprehend, very much miſguided the Practitioners of Surgery.

In order to conceive better of the Diſtinction I am going to make, it muſt be remembered, that what is called the Teſticle, is really compoſed of two different Parts; one glandular, which is the Body of the Teſtis itſelf; and one vaſcular and membranous, known by the Name of Epididymis, which is the Beginning of the Vas Deferens, or the Collection of the Excretory Ducts of the Gland.

Now it ſometimes happens, that this Part is tumefied, independent of the Teſticle, and, feeling like a large adventitious Excreſcence, anſwers very well to the Idea moſt Surgeons form of a Sarcocele; but not being aware of the different Nature and Texture of the Epididymis, they have frequently confounded its Diſorders with thoſe of the Teſticle itſelf, and equally recommended Extirpation in the Induration of one or the other. But without tiring the Reader, ſays *Sharp*, with particular Hiſtories of Caſes relating to this Subject, from diligent Inquiry I have collected, that all Indurations of the glandular Part of the Teſticle, not tending to Inflammation and Abſceſs, generally, if not always, lead on to Scirrhus and Cancer; whereas thoſe of the Epididymis ſeldom or never do. It is true, in ſpite of internal or external Means, theſe laſt often retain their Hardneſs, and ſometimes ſuppurate, but without much Danger in either Caſe. 'Twill not be hard to account for this Difference of Conſequences, from Tumors of ſeemingly one and the ſame Body, when we reflect, how much it is the Nature of cancerous Poiſons to fix upon the Glands, and how different the Epididymis is from a Gland, tho' ſo nearly in the Neighbourhood of one.

I would not have it ſuppoſed from what I have ſaid, that the Epididymis never becomes cancerous; I confeſs, ſays he, it may, ſo may every Part of the human Body: But I advance, that it rarely or never is ſo, but from an Affection of the glandular Part of the Teſticle firſt, which indeed ſeldom fails to taint, and by degrees to confound it in ſuch a manner, as to make one Maſs of the two.

Before we caſtrate, it is laid down as a Rule to inquire, whether the Patient has any Pain in his Back, and in that Caſe to reject the Operation, upon the reaſonable Preſumption of the ſpermatic Veſſels being likewiſe diſeaſed; but we are not to be haſty in this Determination; for the mere Weight of the Tumor, ſtretching the Cord, will ſometimes create the Complaint. To learn the Cauſe, then, of this Pain in the Back, when the ſpermatic Cord is not thickened, let your Patient be kept in Bed, and ſuſpend his Scrotum in a Bag-truſs, which will relieve him, if diſorder'd by the Weight only; but if the ſpermatic Cord is thickened or indurated, which Diſeaſe, when attended with a Dilatation of the Veſſels of the Scrotum, is deſcribed by the *Latins* under the Name of *Ramex*, (though it is more now known by the *Greek* Appellations Circocele and Varicocele) the Caſe is deſperate, and not to be undertaken.

But ſuppoſing no Obſtacle in the way to the Operation, the Method of doing it may be this: Lay your Patient on a ſquare Table of about three Foot four Inches high, letting his Legs hang down, which, as well as the reſt of his Body, muſt be held firm by the Aſſiſtants. Then with a Knife begin your Wound above the Rings of the abdominal Muſcles, that you may have Room afterwards to tie the Veſſels, ſince, for want of this Caution, Operators will neceſſarily be puzzled in making the Ligature; then carrying it through the Membrana Adipoſa, it muſt be continued downwards, the Length of it to be in proportion to the Size of the Teſticle. If it is very ſmall, it may be diſſected away without taking off any Part of the Scrotum; but *Sharp* is not very fond of this Method, becauſe ſo much looſe flabby Skin is ſubject to form Abſceſſes afterwards, and very frequently grow callous. If the Teſticle, for Inſtance, weigh twenty Ounces; having made one Inciſion about five Inches long, a little circularly, begin a ſecond in the ſame Point as the firſt, bringing it with an oppoſite Sweep to meet the other in the inferior Part, in ſuch a manner as to cut out the Shape of an Oval, whoſe ſmalleſt Diameter ſhall be two Inches: After this, diſſect the Body of the Tumor, with the Piece of Skin on it, from the Scrotum, firſt taking up ſome of the Blood-veſſels, if the Hæmorrhage is dangerous. Then paſs a Ligature round the Cord, pretty near the Abdomen; and if you have Space between the Ligature and Teſticle, a ſecond about half an Inch lower, to make the Stoppage of Blood ſtill more ſecure. The Ligatures may be tied with what is called the Surgeon's Knot, where the Thread is paſſed thro' the Ring twice: This done, cut off the Teſticle a little underneath the ſecond Ligature, and treat your Patient as in other freſh Wounds.

Sharp ſays, he once caſtrated a Man, whoſe Teſticle weighed above three Pounds, where ſome of the Veſſels were ſo exceedingly varicous and dilated, as nearly to equal the Size of the humeral Artery; however, he took up two or three of the moſt conſiderable, and purſued the Operation, cutting away near Three-fourths of the Skin, by which means he avoided a dangerous Effuſion, as, by dividing the Veſſels before they were much ramified, he had fewer Ligatures to make:

make: The Succeſs anſwered the Deſign, and the Patient ſurvived the Operation and Healing of the Wound; but the cancerous Humour, falling on his Liver ſome time after, deſtroy'd him. In large Tumors, ſuch as the laſt-mentioned, it is very much to be advis'd to cut away great Part of the Skin; for, beſides that the Hæmorrhage will be much leſs in this Caſe, and the Operation greatly ſhortened, the Skin, by the great Diſtention, having been render'd very thin, will, great Part of it, if not taken away, ſphacelate, and the reſt be more prone to degenerate into a cancerous Ulcer.

It may be obſerv'd, ſays our Author, I do not, in order to avoid wounding the ſpermatic Veſſels, recommend pinching up the Skin before the Inciſion, and afterwards thruſting the Fingers between the Membrana Adipoſa and the Teſticle, to tear the one from the other; the firſt is not dextrous, and the other is cruel; and both of them, in *Sharp*'s Opinion, are calculated to prevent what there is little or no Danger of. *Sharp.*

Authors ſay, that when the ſpermatic Veſſels are ſwelled above the Ring of the Muſculus Obliquus in a Sarcocele, Caſtration ought not to be performed. This Law ſhould not be general; for we have ſeen many who have been cured by making a Ligature higher than the Ring, when the ſpermatic Veſſels were neither ſtuffed nor ſwelled above it. It depends upon a Number of Obſervations to inſtruct us, and to ſtate how far we may carry our Ligature with Safety.

Since we can trace the ſpermatic Veſſels, between the Coats of the Peritonæum to their Origin, we have Permiſſion, I think, ſays *Le Dran*, to make the Ligature above the Swelling, be it as high as it will. But two Things require a particular Attention: Firſt, if the Ligature is made very high, an Inflammation of the Peritonæum, and conſequently of the whole lower Belly, muſt be apprehended after the Operation, which deſtroys the Patient. Secondly, if the Swelling of the ſpermatic Veſſels extends very high, ſuppoſe the Patient recovers by the Operation, he periſhes ſome time after, becauſe that Part of the ſpermatic Veſſels which remains ſound, will tumefy in the End, and render the Diſtemper incurable. Mr. *Marechal* told us at the Hoſpital, that he had often ſeen it, and this is to the Purpoſe of our preſent Patient. The following Obſervation may be of ſome Uſe in parallel Caſes.

On the 6th of *April* 1726. a Man was brought to the Hoſpital, who had the Right Teſticle and the ſpermatic Veſſels very much tumefied for nine Months, at which Time his Diſtemper began, as he ſaid, by a Strain. This Teſticle grew hard, and gradually increaſed, till it was bigger than a Man's Fiſt. The ſpermatic Veſſels were ſwelled above four Fingers Breadth beyond the Ring of the Obliquus Externus, and were as thick as a Man's Thumb.

To avoid performing an Operation which ſeemed to be dangerous, I ordered emollient Cataplaſms to be applied to it, for the Space of three Weeks, anointing the Teſticle, and ſpermatic Veſſels, with Unguentum Neapolitanum, and fomenting them with emollient Decoctions. Mr. *Burette*, Phyſician of the Hoſpital at that time, neglected no internal Medicines, that might diſſolve or mollify the Hardneſs; but all our Care was uſeleſs. In three Weeks, I felt a Fluctuation in the Body of the Teſticle, which I opened, in Hopes that, after the Evacuation of the Pus, the ſpermatic Veſſels might relax with greater Eaſe. I found about an Egg-ſhell full of purulent Seroſity, ſcattered between the Teſticle, and the Membranes of the Scrotum, and white Pus formed in the Body of the Teſticle. The Wound was dreſſed the firſt time after the uſual Method, and the Cataplaſms were continued.

The Tumefaction of the ſpermatic Veſſels diminiſhed one Half, but the Wound took an ill Turn, a Fungus ariſing within it in the Shape of a Carcinoma; a Fungus in which the Body of the Teſticle was incloſed. Mr. *Marechal* being come to the Hoſpital, Meſſieurs *Guerin*, *Gerard*, and *Morand junior*, came with him, and examining the Diſtemper together, we concluded, that, ſince the Patient would certainly die, it was better to hazard an Operation, whoſe Event was uncertain, than ſuffer him to periſh without attempting the Cure; and therefore I performed it.

When I had divided the Ring, and the Muſcles of the Abdomen along the ſpermatic Veſſels, whoſe Magnitude diſcovered their Progreſs, I made a Ligature upon them, four Fingers Breadth above the Ring, as high as the Spine of the Os Ilion, where the Hardneſs ended.

The Patient being dreſſed, we examined that Part of the ſpermatic Veſſels I had taken off, which was as thick as a Man's Finger in its whole Extent, hard, and of different Colours, ſo that the Artery was not to be diſtinguiſhed from the Veins.

The Patient was twice bled the Day of the Operation, and again in the Night; but, notwithſtanding this, an Inflammation ſeized the Abdomen, with excruciating Pains, and he died on the ſixth Day.

I opened the Body, and found an inflammatory Inflation throughout the whole Abdomen, and the ſpermatic Veſſels varicous above the Ligature, but without Hardneſs.

REMARK.

This varicous Swelling may make us preſume, that if the Patient had fortunately recovered, the Remainder of the ſpermatic Veſſels might have grown hard in time; which Mr. *Marechal* declared he had ſeen ſeveral times. *Le Dran.*

CASTRENSIS, στρατιωτικὸς, στρατευματικὸς, military, or belonging to the Camp, is an Epithet of ſome contagious and epidemic Diſeaſes, eſpecially Fevers, mentioned by *Helmont de Febr. c.* 10. *n.* 7. and called by him, not improperly, *endemic*, in which the Patients ſuffer not ſo much from an Efferveſcence of Heat, as a malignant Crudity contracted from bad Diet, and an Abuſe of the Non-naturals. *Willis de Febr. c.* 14. reckons them among peſtilential Diſtempers. *Johan. Valent. Willius*, a *Daniſh* Phyſician, has wrote a Treatiſe expreſly on theſe Fevers, printed *Hafn.* 1676. 4*to.*

CASUS. A very equivocal Word; ſometimes it ſignifies the ſame as *Symptoma*, σύμπτωμα, a Symptom; ſometimes it means any thing fortuitous, in which Senſe it is oppoſed to *Art* or *Providence*, and is called in *Greek* τύχη, or τύχης ἔργον, "Fortune, or a Work of Fortune;" it bears alſo the Senſe of the Word αὐτόματον, which is uſed by *Hippocrates de Arte*, and *Galen* in *Prognoſt. Hippoc.* and ſignifies *ſpontaneous*, or what happens without any Deliberation or Conſultation.

CASUS is alſo the ſame as πτῶσις, a Fall from an Eminence; in *Paracelſus Paragr. Lib.* 1. *Cap.* 13. it ſignifies *a preſent Diſtemper*; and, laſtly, it frequently means the ſame as an entire Hiſtory of a Diſeaſe, or empirical Obſervation, which is uſually called *Caſus Medicinalis*, a medicinal Caſe or Obſervation. *Caſtellus.*

CATABLEMA, καταβλημα, in *Hippocrates*, *Lib. de Artic.* is the outermoſt Fillet, which ſecures the reſt of the Bandage, as it is explained by *Galen* on the Place, and alſo in his *Exegeſis.*

CATACERASTICOS, καταχερασικὸς. The ſame as EPICERASTICOS, which ſee.

CATACHLOOS, καταχλοος, from χλόη, Graſs, or green Herb, is expounded by *Galen* in his *Exegeſis* ἀγαν χλοώδη, "of "a very green Colour." The Place he ſeems to regard, is in *Lib.* 7. *Epid. Cap.* 15. where καταχλοα is apply'd to ὑποχωρήματα, "Stools:" But it is to be obſerved, that, for καταχλοα, moſt read καταχολα, "very bilious." Thus alſo, inſtead of γλισχροχροα, *Erotian* reads γλισχροχολα, and ὑδατοχολα is often read for ὑδατοχλοα or ὑδατοχροα.

CATACHRESIS, καταχρησις. The ſame as ABUSUS, which ſee.

CATACHRISTON, καταχριστον, from καταχρίω, to anoint, in *Hipp. de Morb. Mal. Lib.* 1. is a Medicine apply'd by way of Unction.

CATACHYSIS, καταχυσις, from καταχύω, to pour upon; an Affuſion. The Word is uſed by *Hippocrates*, 5 *Aph.* 21. where he ſays, that a plentiful *Affuſion*, καταχυσις, of cold Water in the midſt of Summer, recals Heat into the Parts under a Tetanus, provided the Patient be young, and of a good Habit of Body.

CATACLASIS, κατάκλασις, from καταχλάω, to break, to diſtort, ſignifies Breaking or Diſtorſion in general, but is particularly ſpoken of the Eye. Thus ἐπανάκλασις ὀμμάτος, *Lib.* 6. *Epid. Sect. Aph.* 19. is explained by *Galen* to be an Affection of the Eye, ὅταν διαστρέφηται τὰ βλέφαρα, "when "the Eyelids are diſtorted" [See CAMPYLON]. And καταχλάσιες τῶν ἄρθρων, in the preceding Aphoriſm, ſignify Diſtorſions of the Joints, when they are not well adjuſted, but are either involuntarily contracted and interfolded, or relaxed and thrown abroad in a looſe and diſorderly manner. *Foeſius.*

CATACLEIS, κατάκλεις, Subclavicle, is a cartilaginous Bone, or the Cartilage ſeated where the Scapula joins with the Clavicle. *Galen Lib. de Oſſibus*, *Cap.* 14. ſays, it is only found in Man. In another Place, he calls it the firſt ſmall Rib of the Thorax. *De Diſſect. Muſc. Cap.* 12.

CATACLINES, κατάκλισις, from κατακλίνω, to lie down as in a Bed. One, who, by reaſon of Weakneſs, and the Violence of a Diſtemper, keeps his Bed. The Word κατάκλισις ſignifies the ſame as κατεσκληκώτες, κλινήρης, and κλινοπετὴς, *Clinicus*; and is oppoſed to τὸ ἐβδομάδιον ἐνοχλεῖσθαι, "to be "ſo gently ſick, as to be able to keep upon one's Legs." *Lib.* 1. *Epid.*

CATACLYSMA, κατάκλυσμα, from καταχλύζω, to waſh. The ſame as CLYSTER, which ſee.

CATACLYSMI, κατακλυσμοὶ, are Embrocations. *Cœlius Aurelianus*, in many Places, expounds *Cataclyſmi* by *Illiſiones Aquarum*, "Daſhings of Water."

CATACORES, κατάκορὴς, in *Hippocrates*, ſignifies full, abundant, ſatiated; and, when apply'd to Evacuations by Stool, means purely or intenſly bilious. Thus κατάκορώτερα μᾶλλον τῷ καιρῷ, *Lib. de Rat. Vict. in Morb. acut.* "(the Excre-

"ments)

" ments) are more bilious than they ought to be," or " co-" lour'd and ting'd with pure Bile to an immoderate Degree." And ſo *Galen* explains the Words by ἰκανῶς ἐμπίπλα, χολώδη, τὰ τυφλὰν ἢ ξανθὴν ἐχοῦσα ἢ πάχος χολήν, " purely bilious " to an Exceſs, containing a red, yellow and groſs Bile." So, in *Coac.* τὰ καλαχυρία, expreſs'd alone, without the Addition of Humour or Colour, ſignify Excrements deeply ting'd with Bile, or purely bilious.

CATÆONESIS, καταίονησις, from καταιόω, to irrigate; Irrigation, by a plentiful Affuſion of Liquor on ſome Part of the Body, which is uſed when the Patient is for ſome Reaſon obliged to abſtain from the Bath. It differs from Embrocation, as *Gorræus* ſays, only in that, after a *Cataeneſis*, we cover the Part with Wool or Linen, or ſome other Thing, which is not done after Embrocation.

CATAGLYPHE, καταγλυφὴ, from γλύφω, to cut in Wood or Metal. An Excavation, Hole, or Pit. The Word is uſed in *Hippoc. de Art. & de Morb.*

CATAGMA, κάταγμα, a Fracture, is defin'd by *Galen* a Solution of Continuity in a Bone. And, in his ſecond Commentary on *Hippoc. de Art.* he ſays, " That ἄλυσις is a Solution " of Continuity in the Fleſh, as a *Catagma*, or Fracture, is of " that of a Bone; but when it happens in a Cartilage, there is " no proper Name for it; tho' *Hippocrates*, by a Catachreſis, " or Abuſe of the Name, improperly calls it alſo *Catagma*."

CATAGMATICA, καταγματικὰ, from κάταγμα, a Fracture, are Remedies in Surgery for the Cure of Fractures.

CATAGOGE, καταγωγὴ, in *Hippoc. Lib.* 7. *Epid.* is what we uſually call Region, including the circumjacent Parts; as when he ſays μισον δ' ὀμφαλὸ καὶ χόνδρου καὶ τοῦτον τὸν καταγωγὸν ἀπτομένῳ τῇ χειρὶ τοιοῦτος παλμὸς ἦν, &c. " So great a " Palpitation might be felt about the Region of the Umbilicus " and the Chondrus," (the Cartilage of the Breaſt) &c.

CATALENTIA. A Word coin'd by *Paracelſus*, to ſignify a kind of Epilepſy. *Caſtellus.*

CATALEPSIS, καταλήψις, from καταλαμβάνειν, to occupy, detain, ſeize, or interrupt. This has many Significations. *Galen* uſes it to expreſs the Perception or Knowledge of a Thing, in which Senſe it was uſed by the *Stoics*. It alſo ſignifies the Retention of the Breath, ſuch as happens when a Perſon ſtrains in order to procure a Stool; or a Retention of any Humour which ought to be evacuated. Another Signification is, the Interception of the Blood in the Veins by Bandage, as it happens in making a Ligature, before Bleeding. It is alſo a Term belonging to Bandages, and imports a laying hold, or fixing of the Bandage to ſome particular Part, that the reſt of the Bandage may be retained.

But Catalepſis ſignifies a Diſtemper, which *Cœlius Aurelianus* tranſlates *Apprehenſio*, and *Oppreſſio*, informing us, that *Hippocrates* and *Diocles* call'd it by the Name of *Aphonia*, and *Antigenes* by that of *Anaudia*.

Medicinal Writers are not agreed, whether the Catalepſis and Catoche are one and the ſame Diſorder, or different from each other. Some look upon the Catoche to be the ſame as the Coma Vigil; but moſt Authors, by Catoche and Catalepſis, underſtand the ſame Diſorder. But there is a manifeſt Difference betwixt the Catalepſis and a Tetanus; for in the latter all the Limbs are fix'd and immoveable, but in a Catalepſis they are indeed fix'd, but are eaſily flexible, and remain in whatever Poſition they are plac'd.

This Diſtemper occurs very ſeldom, and, as is ſaid, generally in Winters intenſely cold. The Fits ſeize the Patients at Intervals, and laſt for ſome Hours; tho' *Foreſtus* gives an Inſtance of one in a young Man, which continued for three Days.

It is ſeldom preceded by any Signs ſignificant of its Approach. *Henricus ab Heer*, however, tells us of a Monk, who, before the Attack of this Diſeaſe, was ſeiz'd with a Stiffneſs of his Neck; and *Foreſtus* relates the Caſe of a Prieſt, who previouſly perceiv'd a dull Pain in the poſterior Part of his Head.

Observation I.

In diſſecting Subjects who have died of a Catalepſis, we have found the larger Veins running ſtrait from the poſterior Part of the Head to the Sinciput, full of a coagulated thick Blood, and a ſerous Matter lodg'd in the poſterior Part of the Brain. And, indeed, the antient Phyſicians were of Opinion, that in this Diſorder the poſterior Parts of that important Organ were more particularly affected. *Galen*, in his Commentaries on the Prorrhetics of *Hippocrates*, makes Mention of a School-fellow, who ſurviv'd the Attack of this Diſorder; for Diſeaſes of every kind are ſometimes more, and ſometimes leſs violent. *Jacotius, Comm. ad Aphor.* 7. *Lib.* 2. *Coacarum.*

Observation II.

Secretary Vaſco, in the Decline of a Fever accompanied with a Flux, when a Diſcharge of well concocted Urine promiſed a certain Recovery, was ſeiz'd with a Catalepſis, of which he died in one Day's time.

Upon laying open his Body, his Lungs and Liver were found corrupted; a reddiſh kind of Serum was found in the poſterior Part of his Brain, and a coagulated Blood in the large Vein which runs along the Middle of the Head. *Scoliagraphus ad Caput* 9. *Lib.* 1. *Hollerii de Morbis intern.*

Observation III.

A certain Youth was firſt ſeiz'd with a gentle Fever, and afterwards with a Phrenitis and Catalepſis, upon which his Eyes became fix'd and rigid.

Upon opening his Head the Veins appeared varicoſe, and turgid with Sanies and black Blood. The medullary Subſtance of the Brain, which, in its natural State, is ſoft and friable, was become dry; and the Meninges were found exceſſively dry.

Observation IV.

A Merchant of *Liege* was put in Priſon by a Creditor; but, obtaining Bail, was ſet at Liberty, returned home, and indulg'd himſelf in an Exceſs of Melancholy. A few Days after, he was ſeiz'd with an acute Fever, which, however, was not accompany'd with a Delirium. When the Fever left him, being ſeized with a ſlight Madneſs, which at laſt degenerated into one of the raging Kind, there was a Neceſſity for binding him. He ſhook with ſuch Violence the Shackles in which his Hands were confin'd, that it was thought he would have broken them to Pieces. Having ſeiz'd his Wife's Necklace in his Teeth, he not only tore it, but, in a manner, reduced it to Powder. Having long uſed melanagogue Medicines at ſtated Times, and ſlept for many Nights, he ſeemed to reſume the Exerciſe of his Reaſon ſo far, that he was thought to be perfectly recovered. Twenty Months, however, after his Impriſonment, he became fooliſh, like a Child, tho' he was then forty-one Years of Age; and the three laſt Fingers of his Left Hand were ſo crook'd inwards, that no Art could extend them. By purging his Head, and applying heating and moiſtening Oils to the Region of the Medulla Spinalis, he recover'd the Uſe of his Fingers; but, ſoon after, all the Fingers of the ſame Hand were incurvated, became ſtiff, and, as in a cataleptic Patient, could not be extended by any means. Soon after, he loſt the Uſe of his Right Arm, and both his Legs; was deprived of his Speech, and lay immoveable. However, by means of various Ointments, Fomentations, and Gargariſms, he recover'd the Uſe of his Tongue; but for two Years after, till he died, he could not form an articulate Sound, but made an indiſtinct Noiſe, like a Child half a Year old, and had his Victuals given him by the Hand of another. His Body, in the mean time, was ſufficiently ſoluble, his Reſpiration very free, and his Pulſe exceedingly good; till at laſt, about the End of the fourth Year, he dy'd.

Being call'd to the Diſſection, I deſir'd that the Brain ſhould be firſt inſpected, which, upon laying open the Cranium, was obſerv'd to be very dry, hard, and, on the Surface, friable, when touch'd with the Fingers. It was alſo every-where ting'd of a yellowiſh Lemon-colour, about the Depth of a Finger's Breadth. About the Ventricles and Baſe it was ſofter, and more moiſt, but the Colour was ſomewhat vitiated. The Rete Mirabile was depreſs'd; the Origins of the Nerves were dry, and more ſlender than in their natural State. Nothing uncommon was obſerv'd in the Thorax and lower Belly. *Henr. ab Heer. Obſerv. Medic.* 3.

The Signs of an approaching Catalepſis are ſome of them common to it with a Lethargy, as a lazy Indiſpoſition, and Slowneſs of Motion; the Patient makes no Complaint of being at all affected with any Diſorder, is ſlow in anſwering what is ſaid to him, and inſenſibly falls into a too long and profound Sleep. But the proper Signs which diſtinguiſh the Approach of this Diſeaſe are, an intenſe Redneſs of the Cheeks, a continual Fever, a Flux of the Spittle, a high and full Pulſe, with a Conſtipation of the Belly, or, on the contrary, an immoderate Looſeneſs. When the Diſeaſe is formed, and the Patient actually labouring under it, he lies perpetually on his Back, his Neck diſtended, his Cheeks red; he is in a Fever, ſpeechleſs, oppreſs'd with a Torpor or Dulneſs of the Senſes, and he lies with his Eyelids open, and his Eyes fix'd, as in thoſe who earneſtly behold an Object, or in an Ox who has receiv'd the felling Blow; Tears alſo fall from his Eyes, as tho' he were ſenſible, and in Pain; a Subſultus, or Palpitation, affects his maxillary Muſcles, his Lips, Eyebrows, Fingers, and Hands; he is frequently moleſted with frequent and violent Hiccoughs; his Pulſe is high, humid, and full; he is very much afflicted with Coſtiveneſs; and is neither able to ſtretch forth his Limbs when drawn together, nor draw them in when extended. In ſome there is an Inflation of the Belly, as it were, from Wind, which increaſes gradually towards the Stomach; ſometimes it ſeems to proceed from Humour, or from Food, and is attended with a Rumbling of the Inteſtines: The Teeth are vehemently ſet, and ſometimes there is a Stridor, or Gnaſhing; and, in the Height of the Fit, the Teeth part aſunder, and leave ſome Diſtance between them: The Patient lies with his Mouth open and relaxed, the Spittle running out at the Corners, and ſometimes down his Throat with a Noiſe. Whatever Liquid is taken into the Mouth, or involuntarily receiv'd, floats about there; and the Patient very frequently draws up and contracts

his Lips, and fetches a Sigh, as if he were profoundly ſorrowful: If any one moves his Fingers before his Eyes, the Patient twinkles, and follows the Motion of the Hand with his Sight; and, if he begins to grow better, he turns his full Sight with Attention to the Object; and, being call'd, looks about, and falls into Tears, ſaying nothing, but ſeeming, by his Countenance, willing to ſpeak: He is delighted with pleaſant Smells, and the continual breathing of ſweet Odours; but can by no means endure any thing which ſmells rank or ſtrong, but ſhews his Averſion to it as far as he is able: He is ſenſible of ſweet and bitter Things when touched with his Tongue, and feels when he is prick'd: If his Arm be extended by any one, he draws it in again; and, if teaz'd, trembles, and grows red in the Face: Towards the End of the Fit, and Approach of Health, he often falls into a copious and hot Sweat, and relapſes: If the Diſeaſe increaſes, there is an extraordinary Heat of the Superficies of the Body, the Reſpiration is more profound, the Eyes are diſtorted, the Chin drawn down, and fix'd, the Hands contracted, and the maxillary Muſcles, by a ſpaſmodic Affection, reduc'd to a laughing Poſture; there is an extremely hot Sweat, and ſometimes Eruptions of various Colours, and like thoſe round Pimples which the *Greeks* call *Ionthi*, (ἰονθοι) on the Breaſt and Face, with a ſudden Loſs of Strength from the Violence of the Diſorder; a Stertor, which the *Greeks* call (βόγχος), a cold Numbneſs, a pale Countenance, and at laſt Suffocation, and Danger of Death. *Cœlius Aurelianus*, *Acut. Lib.* 2. *Cap.* 10.

This Deſcription, in ſome Things, agrees with the more modern Accounts of a Catalepſis; but, as it diſagrees in ſome reſpects, I ſhall give its Characteriſtics from *Hoffman*.

The Paroxyſm of a Catalepſis generally attacks the Patient ſuddenly in this Manner: He remains fix'd in whatever Poſture he happens to be in when ſeiz'd, whether ſtanding, ſitting, or lying: If his Eyes are ſhut, they generally remain ſo; but as the Diſtemper generally comes on in the Day-time, the Eyes are moſt frequently open, and immoveably fix'd, as it were, upon one Object, and cannot be made to wink, though touch'd or rub'd with an Handkerchief. Mean time the Limbs are capable of being mov'd and bended, but remain in whatever Situation they are put in: All manner of Senſation is aboliſh'd; for the Patient neither ſees, hears, nor feels, even though pinch'd hard, or prick'd: The involuntary Actions are, notwithſtanding, carry'd on regularly; thus the Pulſe is natural, and Reſpiration eaſy; and, as *Forreſtus* obſerves, whatever is put into the Mouth is ſwallowed down: Sometimes the Abdomen and inferior Ribs are convuls'd, according to the Reports of *Foreſtus*, *Sylvius*, *Platerus*, and *Dolæus*: At the ſame time the Anus is ſo contracted, that it will not admit of the ſlendereſt Pipe, as *Henricus ab Heers* remarks. Mean time, as *N. Piſo* reports, the Face continues florid: At laſt they begin to ſigh deeply, and then come to their Senſes; and then give ſurpriſing Accounts of what they have heard and ſeen, as if they were reviv'd from a Trance. When out of the Paroxyſm, they eat very little, or perhaps nothing at all.

In the *Hiſtoire de l' Academie Royale* for 1738. we have a remarkable Inſtance of a Catalepſis, which will give a better Idea of the Diſtemper than any general Deſcription, and which I ſhall therefore inſert.

In the Year 1737. during *Lent*, a certain Lady, of about forty-five Years of Age, came from *Veſoul* to *Beſanſon*, to ſolicit a Law-ſuit of ſuch Importance, that the Loſs of it would have completed her Misfortunes, which had already made too deep an Impreſſion on her. Agitated with the moſt uneaſy Thoughts, ſhe was never abſent, either from thoſe who had the Management of her Buſineſs, or from the Churches, where, by her Devotion, ſhe endeavoured to intereſt Heaven to her Cauſe. In theſe religious Edifices ſhe was ſeen proſtrating herſelf before all the Altars, one after another, with ſuch an Air of Sanctity, as to become remarkable in the Eyes of every one preſent. She ſlept little, and eat ſcarce any thing at all, either becauſe ſhe had loſt her Appetite, or becauſe ſhe piouſly denied herſelf the common Neceſſaries of Life, in order to give the more liberal Alms; a Circumſtance on which, ſhe imagined, the Succeſs of her Cauſe depended.

During this State of Things ſhe was informed, that the Inclinations of the Court were not very favourable to her Intereſt; and about Five o'Clock on that Evening immediately preceding the Day fixed for paſſing the Sentence, ſhe fell into a Diſorder which was taken for an Apoplexy. Accordingly Mr. *Attalin*, Profeſſor of Medicine at *Beſanſon*, and Mr. *Vacher*, Surgeon to the Hoſpitals of that City, were brought to her Relief with all Expedition.

Theſe two Gentlemen found the Lady ſeated in an Arm-chair, incapable of Motion, with her Eyes lifted upwards, fixed, and ſparkling; her Eye-lids open, and without Motion; her Arms elevated, and her Hands joined, as if ſhe had been in a Trance: Her Countenance, which was before pale and ghaſtly, was now become more florid, gay, and beautiful: Her Reſpiration was free and equal, and the Muſcles of her lower Belly played with Eaſe: Her Pulſe was ſoft, ſlow, and ſufficiently full, almoſt reſembling that of Perſons in a ſound Sleep: Her Members were pliant, moveable, and capable of being bended any way, without making the leaſt Reſiſtance; but this unhappy Circumſtance was the diſtinguiſhing Characteriſtic of her Diſorder: Her Members were too obedient, but forgot to move out of the Situation in which they were plac'd.

Upon drawing down her Chin her Mouth became open, and remained in that State: Firſt one, and then the other of her Arms was raiſed up, but they did not fall down again: They were turned backwards, and then elevated ſo high, that the ſtrongeſt Man would not have been able to hold his Arm long in that unnatural Poſture, which, however, hers retained as long as the By-ſtanders pleaſed. They raiſed her on her Feet, in order to make the ſame Experiments on her Legs they had done on her Arms, and with a View to put both, at one and the ſame time, in Poſtures the moſt difficult to be retained. We may readily ſuppoſe, that an ardent Deſire to diſcover the Cauſe of the Diſorder, and a Principle of Curioſity, natural on ſuch Occaſions, muſt have laid a Foundation for various and whimſical Conjectures in the Spectators. The Patient was always like yielding Wax, which ſucceſſively aſſumes any Figure at Pleaſure, and always retains the laſt. Mr. *Attalin* ſays he believes ſhe would have ſtood on her Head, with her Feet upwards. But what is ſtill more ſurpriſing is, that however her Body was inclin'd, it always preſerved a perfect Equilibrium. In a Word, ſhe appeared like a Statue of Wax, whoſe Feet are fix'd to its Pedeſtal, in order to prevent its falling.

She appeared inſenſible; ſhe was ſhak'd, pinch'd, and tormented; ſhe had a Chafing-diſh with Coals put under her Feet; and the By-ſtanders bawl'd into her Ears, That ſhe would gain her Cauſe; but no Signs of Life appear'd, for her Diſorder was a confirm'd Catalepſis.

Mr. *Attalin* order'd Mr. *Charles*, his Fellow-profeſſor of Medicine, to be call'd, and the Lady was blooded in the Foot by Mr. *Vacher*; after which they went to Supper, and came very ſoon back to their Patient. Upon their Return they found her recovered from her Diſorder, which had laſted three or four Hours; and ſhe greatly ſurpris'd them, by making a pretty long, well-pronounc'd, and coherent Speech, in which ſhe gave a pathetic Hiſtory of her Misfortunes, related the whole State of her Cauſe, and ſum'd up all, with moral Reflections ariſing naturally from the Subject; and with Prayers to God, not previouſly compoſed, but poured forth in an extemporaneous Manner.

At the Expence of Truth they began to encourage her as much as poſſible, with reſpect to the fatal Cauſe which had been the woful Source of her Misfortune. Then they examin'd her carefully with reſpect to every thing ſhe perceived to happen during her Paroxyſm.

She ſaw nothing, but ſhe ſometimes heard, and that ſo diſtinctly, that ſhe knew ſome Perſons by their Voices. She was ſo far from remembering her being blooded, that ſhe even doubted of the Fact when ſhe ſaw the Bandage apply'd to her Foot. The Chafing-diſh with Fire, which, in all Appearance, ought to have made a much more ſenſible Impreſſion on her than a human Voice, did not, in the leaſt, affect her. In a Word, tho' ſhe had been violently tormented, ſhe had not the ſmalleſt Remains either of Pain or Wearineſs.

Whilſt they were thus entertaining themſelves with their Patient, they perceived, that her Diſcourſe was now-and-then interrupted by ſmall Sighs, and that, in theſe Moments, her Eyes became fixed and immoveable. Nothing, in the mean time, was neglected, in order to prevent the Paroxyſm with which ſhe was threatened. She immediately recovered, and continu'd to ſpeak, but without reſuming her Diſcourſe where ſhe left off. She began another, tho' ſhe was put in mind on what Subject ſhe had been talking, and what particular Circumſtance ſhe had inſiſted on. This Accident happen'd every time this ſmall Prelude of a Paroxyſm interrupted her Diſcourſe. The Idea of what ſhe was to have ſaid was entirely baniſhed from her Mind, and another preſented itſelf in ſo forcible a manner, that ſhe could not reſiſt its Impreſſions.

At an Hour's End, however, her Paroxyſm return'd in all its Violence; and the Symptoms of a Catalepſis were the ſame, or, perhaps, of a more diſtinct and characterizing Nature than before. When this ſecond Paroxyſm was at an End, the Patient, ſeated in an Arm-chair, began to ſpeak for an Hour and an Half, in the ſame Tone and Strain ſhe had done after her firſt Paroxyſm; but, at laſt, her natural and pertinent Diſcourſe was ſucceeded by extravagant Jargon, accompany'd with hideous Shrieks and Howlings; and ſhe was attack'd by a violent Phrenſy, of which the Catalepſis was only the unlucky Prelude.

All the Remedies, employ'd by the ſkilful Phyſicians who had the Charge of her, prov'd ineffectual for the three or four Days ſhe remain'd at *Beſanſon*, for which Reaſon ſhe was ſent home to *Veſoul*; and, what is no leſs ſurpriſing than her Diſeaſe itſelf, ſhe there remains in a State of perfect Health, and has never ſince had a Relapſe. But we are not as yet ſufficiently

acquainted

acquainted with the animal Œconomy, and its myſterious Laws, to account for ſo ſurpriſing Phenomena as theſe. *Hiſtoire de l'Academie Royale des Sciences, Anno* 1738.

Borelli, in *Cap.* 2. *Hiſt.* 54. and *Martus Marci*, in *Philoſ. Reſt.* affirm that this Diſorder is more incident to Women than to Men, eſpecially that Species of it which is accompany'd with a ſort of *Trance* or Enthuſiaſm; for Women have more ſoft, tender, and ſenſible Nerves than Men; for which Reaſon they are not only highly ſuſceptible of immoderate Commotions of the nervous Syſtem, but alſo a favourable Foundation is laid for cheriſhing all the violent Impreſſions and Paſſions of the Mind, together with the Diſorders ariſing from an ungovern'd and diſorderly Fancy. In Caſes where there is a melancholic Habit, and where an unbounded Force of Imagination prevails, this Diſeaſe moſt generally appears; eſpecially if, according to *Nicolaus Piſo*, and according to Experience, whoſe Sanction is ſtill more ſacred and venerable, a cold Regimen, an unfavourable Seaſon of the Year, and a cold Climate, concur.

That the Cauſe of a Catalepſis is lodged in the poſterior Part of the Head, is not only obvious from the Diſſections of deceaſed Patients, and the Pains of the poſterior Part of the Head, and Nape of the Neck, which ſometimes precede the Paroxyſm, but alſo from the unanimous Voice and Conſent of Phyſicians. But, in accounting more particularly for the Cauſe of the Symptoms, they have run into various obſcure and perplex'd Hypotheſes. Some affirm, that the animal Spirits are ſo fix'd and concentrated, that they are retarded and hinder'd in their Motion; but this can by no means be conceived to be true, with reſpect to theſe highly ſubtile and penetrating Bodies. Others have advanced Hypotheſes ſtill more abſurd and ridiculous; but, without ſpending Time to recount them, I rather think, that the immediate Cauſe of a Catalepſis conſiſts in a Hindrance of the Influx of the thin and fine nervous Fluid into the Nerves ſubſervient to Senſation and voluntary Motion; whereas this Influx is carried on in its natural, and, in ſome meaſure, a more impetuous manner in the Nerves ſubſervient to the vital and mechanic Actions. But, how this Influx into the former Claſs of Nerves is intercepted, we are now to inquire: If, therefore, we conſider, that, in cataleptic Patients, all the Powers of Senſation, and all the animal Functions, entirely ceaſe, 'tis highly probable, that the Influx of the nervous Fluid muſt be principally intercepted in that Part, from which all the nervous Fibres in the Body draw their Origin. This Place is call'd the *Senſorium Commune*, in which we muſt alſo fix the primary Seat of the Soul; for tho' this intelligent thinking Principle cannot, in conſequence of its immaterial Nature, be, ſtrictly ſpeaking, included in Space; yet, ſince it is abſolutely certain, that it maintains the ſtricteſt Union and Correſpondence with the Body, and has a great Influence upon the Senſes and animal Functions, it is neceſſary, that, with reſpect to the Operations, which it performs, by means of the nervous Fluid, in a manner unknown to us, we ſhould aſcribe a certain Space to it, in which it may perceive all the Changes of the Fibres, and commodiouſly perform all the Actions ſubjected to the Determination of the Will.

But the *Senſorium Commune* is neither, according to *Des Cartes*, in the Pineal Gland, nor, according to *Lanciſi*, in his *Diſſert. de Sede Animæ cogitantis*, the Corpus Calloſum of the Brain. But, with later and more accurate Anatomiſts, we place it in the Medulla Oblongata, and that which conſtitutes the Baſis of the Brain; for the nervous Ducts, ariſing thence, borrow their external Coat from the *Pia Mater*, which is interwove with a large Number of Veſſels, and ſurrounds the Medullary Portions of the Brain, and are thus diſtributed thro' all the Parts of the Body ſubſervient to Senſation, and voluntary Motion. Into theſe nervous Ducts the ſubtile Fluid is originally carried along with the Blood to the Head, thro' the Carotid and Vertebral Arteries, then ſecreted in the Cortical Subſtance of the Brain, after the cruder Parts are abſorb'd by the Veins, and is at laſt impell'd with a certain Force thro' the Medullary Region; ſo that, by its Aſſiſtance, certain determinate and ſpontaneous Motions follow certain particular Thoughts; and, on the contrary, certain Ideas ſucceed certain particular Motions of the Body.

As, therefore, when the Influx of this fine Fluid is duly, and in a proper Quantity, carried on, all the Senſes entire, and the animal Functions duly perform'd, we are in Health, and awake; ſo when this Influx is leſs, we are ſaid to be aſleep; and when it is entirely intercepted, we are deſtitute of all Senſation, and voluntary Motion. Now every Interception of this Influx is produced either by a Palſy, or a ſpaſmodic Conſtriction of the ſmall nervous Fibres; for an Obſtruction of the Nerves is by no means the Cauſe, ſince, in a Catalepſis, a Palſy of the ſmall nervous Fibres cannot ſtop the Influx of the fine Fluid into the Nerves, becauſe the Paroxyſms return at Intervals, and under them the Face is red; but 'tis otherwiſe in lethargic Diſorders, ariſing from a paralytic Cauſe. In a Catalepſis, therefore, the Cauſe, preventing the Influx of the animal Spirits into the Nerves, is a ſpaſmodic Conſtriction of the ſmall nervous Fibres at their Origin, before they penetrate the Pia Mater; and hence alſo ariſe all the other Symptoms.

For this Reaſon, therefore, all the Senſations, and all the animal Functions, ceaſe: But, as there are no Spaſms in the Parts ſubſervient to theſe, the Reaſon is obvious, why the Members of them, incapable of Motion, may be bended at Pleaſure, and remain immoveable in the Situation in which they are put; but, at the ſame time, all the Motions we call mechanical remain entire. For 'tis certain, from anatomical Diſcoveries, that as the Nerves, ſubſervient to Senſation, and voluntary Motion, draw their Origin from the Medullary Subſtance of the Brain; ſo, on the contrary, the vital Functions, which are by no means ſubjected to the Determination of the Will, are perform'd by the Nerves ariſing from the medullary and inferior Part of the Cerebellum, according to an Experiment related by the celebrated *Vieuſſens*, in his *Neurograph. Lib.* 1. *Cap.* 20. We have already obſerved, that, in a Catalepſis, thoſe ſmall Fibres, which, ariſing from the Brain, furniſh the Nerves ſubſervient to ſpontaneous Motion, are conſtricted; but thoſe diſtributed from the Cerebellum, for the Preſervation of Life, remain ſound, and in their natural State: Hence the Palpitation of the Heart, and the Pulſation of the Arteries, continue, the Face becomes red, and the Reſpiration is natural. In the mean time, ſince the Influx of the nervous Fluid into the Organs ſubſervient to Senſation, and voluntary Motion, is hinder'd, it eaſily happens, that this nervous Fluid is impel'd from the Cerebellum in a larger Quantity, and with a greater Impetus, into the Parts which perform the vital Actions: Hence it is we are to account for the obſtinate Coſtiveneſs, and the convulſive Motions of the Breaſt and Abdomen.

It now remains, that we account for the Trances or Viſions which cataleptic Patients frequently fancy themſelves to have been in; for generally, when the Paroxyſm is over, they talk of wonderful Joys, or tragical Apparitions, heavenly Viſions, and the Company of Angels. They alſo attempt to predict future Events, and pretend to have acquired the Spirit of Prophecy. Various memorable Inſtances of this Kind are to be met with in the Works of Phyſicians. Nor, in theſe Caſes, muſt we aſcribe any Influence to the Devil; or ſuppoſe, that the Soul is removed from the Body to any other Place, or even to Heaven itſelf. There is no Neceſſity, on theſe Occaſions, for having recourſe to preternatural Cauſes; nor have we any thing to do with the devout Trances of St. *Paul*, and other holy Men; for we only talk of thoſe Trances which happen in diſorder'd Conſtitutions. If, therefore, we conſider, that cataleptic Patients are generally of a melancholic Habit, have lively Imaginations, and their Thoughts generally employ'd upon ſacred Objects, ſuch as God, Angels, and eternal Life. If, alſo, as we are taught by Experience, and the Example of Dreams, we ſuppoſe, that the more the Soul is abſtracted from the Perception of external Objects, and the Exerciſe of the vital Motions, the more intenſely it indulges the Workings of Fancy; it naturally follows, that the ecſtatic Viſions of cataleptic Patients are only the Effects of an intenſe Fancy, whilſt the Mind, being free from a Commerce with external Objects, recals paſt Ideas, from a Compariſon of which ſhe may alſo happen to predict Futurities. But let us return to conſider the remote and ſecondary Cauſes, which contribute to the Production of a Catalepſis.

Among theſe, the moſt conſiderable is a Peccancy of the thick and viſcid Humours, which the Antients diſtinguiſh'd by the Epithet *Melancholic*; and which, moving with Difficulty in the Head and Brain, and ſtagnating principally in the Baſis of the Brain and Pia Mater, prove an effectual Cauſe of the Conſtriction of the ſmall nervous Fibres: Hence hyſteric Women, and hypochondriac or melancholic Men, are not only more ſubject to a Catalepſis than others; but alſo the Diſſection of thoſe who die of this Diſorder informs us, that the Veſſels in the poſterior Part of the Brain have been fill'd with a thick coagulated Blood, and that a ſerous Colluvies has been found extravaſated in the Brain itſelf. Hence 'tis alſo obvious, why a Catalepſis ſometimes enſues a Suppreſſion of ordinary and ſtated Evacuations of Blood. Nor is the Reaſon leſs plain, why that Boy, mention'd by *Aetius* in *Tetrabibl.* 2. *Serm.* 2. *Cap.* 4. who lay ſtiff and congeal'd for three Days, was at laſt immediately recover'd by a plentiful Effuſion of Blood from his Noſtrils. Thick Humours will ſtill more effectually contribute to the Production of a Catalepſis, if a violent Expanſion and Exeſtuation of them concur; ſince, by this means, the Veſſels of the Brain and Pia Mater are more diſtended. Hence it may be conceived, why this Diſorder is produced by intermittent Fevers prepoſterouſly ſuppreſs'd, or treated with Volatiles, according to *Dedonæus*, *Obſ. Med.* 44. by indulging too liberally the Uſe of generous Wine, according to *Platerus*, *Lib.* 1. and by Drunkenneſs, or an Exceſs of Paſſion, according to *Delæus*, in *Encyclop. Medic.* Nor ought we to forget, that as Worms of the Inteſtines produce the moſt violent Diſorders, ſo they ſometimes lay a Foundation for a Catalepſis, according to *Marcellus Donatus*, *Lib.* 2. *Cap.* 7.

Beſides,

Beſides, a great Regard is to be had to the Violence of the Paſſions, by which, as Authors inform us, a Conſtriction of the nervous Fibres in the Brain, with a ſubſequent Catalepſis, is produced, the Diſorder bearing a Proportion to the Violence of the Paſſion. *Tulpius*, in *Lib.* 1. *Obſ. Cap.* 21. gives us an Account of a young Man, who became cataleptic upon a Woman he loved refuſing to marry him, but recover'd upon obtaining her Promiſe. *Rondeletius*, *Lib.* 1. gives us an Account of a Girl, who, being forced to marry a Man ſhe did not love, was afflicted with ſuch Grief, that ſhe became cataleptic; and was ſeiz'd with a Paroxyſm when ſhe ſaw her Huſband, heard of him, or even thought upon him. *Henricus ab Heer. Obſerv.* 3. gives us an Account of a Man of a melancholic Habit, who, by indulging himſelf in an Exceſs of Grief, became cataleptic. *See Obſerv.* 4. *above.* It is alſo confirm'd, by the Accounts of ſkilful Phyſicians, that this Diſorder is ſometimes produced by too intenſe Application of Mind, and profound Meditation, eſpecially if a cold Habit, and other accidental Cauſes, concur. Inſtances of this Kind are to be met with in *Galen*, *Comment. in Hippocr. Zacutus Luſitanus*, *Lib.* 1. *Hiſtor.* 42. and *Fernelius in Pathol. Lib.* 5. *Cap.* 2. Profound ſacred Meditations, eſpecially when accompanied with ſpiritual Contrition for paſt Sins, highly contribute to the Production of this Diſorder, complicated with a Trance. See *Sennertus in Praxi. Horſelt. Tr. Philoſoph. Hominis. Auguſtinus de Civitate Dei*, *Lib.* 14. *C.* 24.

Among cataleptic Patients we may alſo reckon thoſe who are, as it were, congeal'd and ſtruck with an intenſe Cold. The Reaſon of this is, that the Cold has a Power of violently bracing up the Surface of the Body, which it immediately ſurrounds. Upon this Conſtriction the Humours are carried in a larger Quantity to the internal Parts, and are principally accumulated in the Head, ſtagnate in the Veſſels of the Brain, and diſtend them: Hence they produce a Stricture of the nervous Fibres ariſing from the Brain, which is the Origin of a Catalepſis, attended with an Abolition of all the Senſes. The intenſe Cold continuing, and by that means its Effects, already mention'd, remaining in the Body, there at laſt happens an Extravaſation of Blood or Serum in the Head, by which the Cerebellum is often compreſs'd in ſuch a manner, that the nervous Fluid cannot enter the vital Organs; and hence Death enſues. As fatal Caſes of this Kind almoſt daily occur, ſo, in *Foreſtus*, *Lib.* 10. *Obſ.* 41. we have a great Number of them, where we are told, that, during the intenſe Cold of the Winter, many Soldiers, ſtanding on their Watch, were found dead. Others, ſitting on their Horſes, with the Reins ſtill in their Hands, were taken off congeal'd; and at laſt the Horſes themſelves became incapable of Motion, and died *(This Diſorder, however, ſeems very different from a Catalepſis)*.

If we conſider the accidental Cauſes which generally bring on the Paroxyſms of a Catalepſis, the moſt conſiderable of them are violent Commotions of Mind, Grief, Terror, Joy, Fear, and Sadneſs; as alſo the ſeeing hideous and diſagreeable Objects. Authors inform us, that ſome have been congeal'd by the Recital of certain Words, or the ſinging Pſalms; and I myſelf, ſays *Hoffman*, ſaw a Woman, who, upon hearing ſome Words, expreſſive of an ardent Love to her Redeemer, was ſeiz'd with a Catalepſy; and a certain Clergyman, according to St. *Auſtin*, upon hearing the Cries of the Diſtreſs'd, was ſeiz'd with his Paroxyſm. According to *Nicolaus Piſo*, *L.* 1. *C.* 13. a cold Air, living in high mountainous and cold Places, the Winter-ſeaſon, and coarſe Aliments, contribute very much to the Generation of this Diſorder.

As to the Prognoſtics of a Catalepſis, if it is produced by the Paſſions of the Mind, or profound Meditations, it does not threaten a very great and mortal Danger: But, on the contrary, when it proceeds from a thick, viſcid, and impure Blood, or from a Suppreſſion of accuſtom'd Evacuations of Blood, it is highly dangerous; for it either terminates in Melancholy, or is chang'd into an Epilepſy, as *Marcellus Donatus*, *Cap.* 8. informs us from *Benivenius*; or, laſtly, it terminates in a violent Apoplexy, and kills the Patient. Nor is the Congelation, brought on by Cold, of leſs Danger; ſince, if ſeaſonable Relief is not afforded, ſudden Death enſues.

In the Cure of this terrible Diſorder, two curative Intentions are principally to be regarded. The firſt is to relax the ſpaſmodic Stricture of the ſmall nervous Fibres in the Brain. The ſecond is cautiouſly to remove the material or ſecondary Cauſes which contribute to the Production of this Conſtriction. As the former Intention is principally to be anſwer'd during the Paroxyſm, ſo the latter is rather to be purſued when the Patient is out of it.

During the Paroxyſm itſelf, eſpecially when violent, little Advantage is to be reap'd from Medicines. But we are, notwithſtanding, to uſe all poſſible Means to alleviate the ſpaſmodic Strictures, and rouſe the Patients, who ſeem to be awake whilſt they are aſleep; for this Purpoſe we ought to apply to the Noſtrils either volatile urinous Spirits, or highly penetrating Acids, ſuch as Wine-vinegar, or ſtrong Vinegar of Rue, or Spirit of the Cryſtals of Copper, which is only a concentrated Spirit of diſtil'd Vinegar (ſee ACETUM); for theſe Acids are of a far more penetrating and efficacious Quality than any volatile Salt. Nor will it be improper to apply nervous and antiſpaſmodic Oils, prepar'd by boiling, to the Nape of the Neck, and poſterior Part of the Head, after the Hairs are ſhaved off. This Species of Remedy is commended by *Foreſtus*, *Lib.* 10. *Obſ.* 42. Strong Clyſters may alſo be injected, if the Anus is not ſo ſhut up as to admit nothing. And, laſtly, eſpecially when the Diſorder proceeds from too large a Quantity of Blood, and too violent a Conveyance of it to the Head, and when the Veins of the Face are turgid with Blood, under the Paroxyſm, a Scarification of the Noſtrils, or the introducing a notch'd Probe, and vellicating the Parts with it, till an Effuſion of Blood happens, promiſe conſiderable Relief.

It is not ſafe to make farther Attempts during the Paroxyſms; but the Intervals between them are the proper Time for endeavouring, as far as may be, the Removal of the material and mediate Cauſes. If this Diſorder, which is ſo rare and uncommon, has its Original from Melancholy, and ſuch as is of the hypochondriac or hyſteric Kind, as is moſt frequently the Caſe, where groſs and viſcid Humours ſtagnate, or move with Difficulty in the Veſſels of the Brain, we are to have recourſe to proper Remedies for ſubduing this Diſeaſe, which correct the Thickneſs of the Blood, and reſtore a free Circulation. Among theſe Remedies, beſides Clyſters and gentle Laxatives, are to be reckon'd Phlebotomy, repeated at proper Seaſons, with Motion and Exerciſe of the Body, and the right Uſe of the Non-naturals. Waſhings of the Feet, and Bathing, are principal Remedies, as well as drinking of mineral Waters; or, inſtead of them, Whey impregnated with the Salt of the *Sedlitz* Waters.

If the Diſeaſe be maintain'd by a Plethora, or a Redundance of Blood and Humours, occaſion'd by a Suppreſſion of the natural Evacuations of the Hæmorrhoids, or Menſes, or an Omiſſion of thoſe artificial Diſcharges by Bleeding or Scarification, which were habitual, we are to lay hold of the Opportunity, during the Intervals of the Paroxyſms, for recalling or reſtoring theſe Evacuations, or at leaſt to diminiſh the exceſſive Quantity of Blood by opening a Vein. For this Purpoſe, Veneſection in the Feet is juſtly preſcrib'd; after which, if the Quantity of Blood is ſo large as to lay a Foundation for ſuſpecting an Apoplexy in the very Paroxyſm, the Veins of the Noſtrils are to be open'd, by thruſting a Probe up them. If the Patient's Body is lax and ſpongious, Scarifications may be ſubſtituted; or if a Propenſity to a hæmorrhoidal Diſcharge is perceived, which is indicated by Pains about the Os Sacrum, and the Inteſtinum Rectum, or if a Suppreſſion of this Diſcharge contributes to this Diſorder, it is again to be promoted, as *Nicolaus Piſo* juſtly adviſes, in *Lib.* 1. *Cap.* 13. For this Purpoſe, after having ſufficiently fomented the Anus, the Application of Leeches is proper.

If there is a Suſpicion of Worms, Anthelminthics are to be preſcrib'd: But of theſe ſuch as are acrid, and vellicate the already irritated Inteſtines, the more acrid Purgatives, for Inſtance, Preparations of Vitriol, Acids, Mercurials, Preparations of Aloes, and much more Preparations of Copper, are to be avoided like Poiſon. It is far more proper to exhibit Pills which are compoſed of leſs acrid and corroding Ingredients, ſuch as the Extract of Tanſey, Worm-ſeed, Rhubarb, Myrrh, Aſa-fœtida, and the Panchymagogus Crollii, mix'd up in equal Quantities. Theſe Pills are of ſingular Efficacy.

When the Cauſe of a Catalepſis reſides principally in the Mind, either rack'd with violent Paſſions, deeply fix'd on certain Ideas and Meditations, or agitated with the Workings of Conſcience, Medicines are, in theſe Caſes, of little or no Service. The Phyſician is only to endeavour, by proper Means, to remove the material Cauſes, if any ſuch concur to the Production of the Diſorder. We are alſo to endeavour to baniſh from the Mind ſad and melancholy Ideas, which, to it, are like Scourges and Tortures to the Body, by the facetious and agreeable Converſation of Friends; nor are Idleneſs and Eaſe, thoſe great Encouragers of profound Meditation, to be too much indulged. A Change of Air is, in theſe Caſes, a valuable Remedy; ſince, by it alone, I have ſeen this obſtinate Diſorder removed. By this laſt Remedy the Caſe related above, from the Memoirs of the Royal Academy, was cured.

Thoſe who are congeal'd with Cold, and have as yet ſome Signs of Life remaining, are to be removed to warmer Places: But they muſt not be too warm, leſt the Blood, driven to the internal Parts, ſhould of a ſudden exeſtuate, and be extravaſated. It is alſo proper, in ſuch Caſes, to cheriſh the Body with gentle Frictions, that the external Parts, which are conſtricted, may be relax'd, and the Humours again invited to them. Then, rouſing the Patients, their Feet are to be put in very warm Pediluvia, which are of ſingular Service, partly by relaxing the Skin, and partly by reſtoring the equable Circulation of the Juices. The Strength of the Patient is alſo to be recruited by Cordials, and a Draught of generous Wine.

Practical

Practical Cautions and Admonitions.

It ought carefully to be obſerved, that, during the Paroxyſm, volatile oleous Salts, the ſtronger apoplectic Balſams, and the hoter Liquids, are carefully to be abſtain'd from, if the Catalepſis ariſes from an Orgaſm, Expanſion, or Stagnation of the Humours; for, in this Caſe, the Blood is put into a more violent Commotion, and it is to be dreaded, leſt an Extravaſation and Apoplexy ſhould enſue. It is more adviſeable, in theſe Caſes, to uſe the ſtronger Acids, and to anoint externally with nervous, anodyne, and antiſpaſmodic Oils and Balſams. But if the ſpaſmodic Conſtriction of the ſmall Fibres of the Brain is brought on by the Paſſions of the Mind, Fear, Grief, or intenſe Meditation, then volatile oleous Salts are of Service, both internally and externally.

As in all violent Diſorders of the Head, ariſing from too large a Quantity of Blood, thrown into ſtrong Commotions, and too plentifully convey'd to the Head, ſuch as Head-achs, Deliriums, Convulſions, and Epilepſies; ſo alſo, in a Catalepſis, when ariſing from the like Cauſe, a Detraction of Blood is of ſingular Service, by thruſting a Probe into the Noſtrils. Nor was this Operation unknown to the Antients; and the Words of *Aretæus*, in his ſeventh Book, are very remarkable: "In theſe Caſes, ſays he, 'tis neceſſary, that Blood be extracted from the internal Parts of the Noſe; for a pretty long Inſtrument is to be thruſt up, which they call *Cateiadion*, or that which is call'd *Storyne*; or, if the Surgeon has none of theſe at hand, he muſt take a Gooſe's Quill, cut off the thick Part, and notch its nervous Part in the Form of a Saw, and introduce it as far as the *Oſſa Ethmoidea*, ſo call'd from their Reſemblance to a Sieve, and then twiſt it with both Hands, that the Parts may be lacerated and torn by its Teeth, by which means the Blood flows eaſily and plentifully; for ſmall Veins terminate in the Noſtrils, whoſe Subſtance is ſoft, and eaſily cut."

When a Catalepſis is produced by the Workings of the Imagination, it eludes and baffles the Force and Efficacy of Medicines. But Travelling, and Change of Air, afford the moſt certain Relief; for 'tis ſcarce credible, how great Virtue and Efficacy, for the Cure of Diſorders of the nervous Syſtem and Spirits, there is in Travelling, eſpecially into Places where the Air is wholſome, and, as *Celſus* adviſes, contrary to that which produced the Diſeaſe; for the Air is that important and fine Element, which, by its elaſtic ethereal Portion, mixing with the Blood and lymphatic Juice, not only ſupplies the moving ſolid Parts with Senſation and Motion, but, according to *Galen*, has ſomething divine in it in the Cure of Diſeaſes. Beſides, Travelling is attended with this Advantage, that the Ideas which uſed to diſturb the Mind are by its means baniſh'd, and ſucceeded by others of a more pleaſant Kind, to which it gradually habituates itſelf. It has alſo frequently been obſerv'd, that this Diſorder has been carried off ſpontaneouſly, by Length of Time; for, as we advance in Age, the nervous Fibres become ſtronger, and the Mind more firm.

As for Preſervation, it may be obtain'd by carefully avoiding the accidental Cauſes which contribute to the Production of this Diſorder. And ſince Cold is ſingularly hurtful in this reſpect, it is not only carefully to be guarded againſt, but, if our Situation will allow us, we muſt remove from cold and mountainous Places, to thoſe where the Air is more mild. Let the Regimen be proper, and every thing that is acid, or can communicate a Coldneſs to the Stomach, be avoided in Food. Let Solitude be ſhun'd, and a Choice made of agreeable Company, in order to baniſh Care, Grief, and Thoughtfulneſs, from the Mind. It ought to be carefully obſerv'd, about the Winter-ſeaſon, that material Cauſes are not left in the Body, which may bring on the Diſorder. For this Purpoſe the Primæ Viæ are to be kept free from Sordes, and the Quantity of the Blood is to be diminiſh'd by proper Veneſection, and frequent Exerciſe.

CATALOTICA, in *Caſtellus* and *Rieger*, is by Miſtake for CATULOTICA, which ſee.

CATALYSIS, κατάλυσις, from κατὰ λύω, to diſſolve, or deſtroy. It implies a Reſolution of the Limbs, that is, a Palſy; or a univerſal Reſolution or Decay, ſuch a one as happens frequently before the Death of the Patient. Or it imports what we expreſs by Diſſolution, that is, Death.

CATAMENIA, κατάμηνια, from κατὰ, and μὴν, a Month; the ſame as MENSES, which ſee.

CATAMOSAS, κατάμωσας, is expounded by *Galen*, in his *Exegeſis*, καθὼς ἔνεκα τοῦ ζητῆσαι, "Who has let down ſome-"thing, for the ſake of making a Search;" and he ſays, "The "Word is made ἀφὰ τὸ μαίεύειν, which is, to inquire or inveſtigate; as is alſo the Word *Catamatumenos*, κατὰμαίόμενος." This laſt Word ſeems to be taken from *Hippocrates*, *Lib. de intern. Morb.* tho' we find not there κατὰμαίόμενος, but κατὰμαπτυόμενος, and κατὰμαπτόμενος, for which, perhaps, ſome Copies might with *Galen* read κατὰμώσας. *Foeſius.*

CATANANCE. *Candy-lion's-foot.*

The Characters are;

The Cup of the Flower is ſquamous, and of a Silver Colour; the Florets, which are round the Margin, are much larger than thoſe in the Middle of the Flower; the Seeds are wrapt up in a leafy or downy Subſtance, with the Cup or outer Covering.

1. *Catanance*; *quorumdam.* Lugd. 1190. *Catanance Dalechampii*, *flore Cyani*, *folio Coronopi.* J. B. 3. 26. *Chondrilla cærulea*, *Cyani capitulis.* C. B. P. 130. *Chondrilla Seſamoides dicta*, *flore completo.* H. Eyſt. Æſt. o. 5. F. 4. Fig. 2. *Cicherium cæruleum*, *coronopi foliis anguſtis*, *caliculis ſquammatis*, *argenteis.* M. H. 3. 55. BASTARD-SUCCORY, or LION'S-FOOT, with BUCK'S-HORN LEAVES.

There are two Species of Seſamoides mention'd and deſcrib'd by *Dioſcorides*; but his Deſcriptions are ſo ſhort and obſcure, that, as to the greater Seſamoides, it remains a Doubt to this very Day what Plant he means by it; ſome taking it for Hellebore, others for Reſeda, and others for Thymelæa. There are various Opinions alſo about the leſſer Seſamoides; but the Plant agrees beſt with the Deſcription of *Dioſcorides*. *Dale.*

The leſſer Seſamoides has a Stalk a Span long, with Leaves like thoſe of the Coronopus, only leſſer, and more hairy. On the Tops of the Stalks ſtand little Heads of purpliſh Flowers, which are white in the Middle. The Seed is like that of Seſamum, bitter and yellow. The Root is but ſlender.

An Ounce of the Seed, taken in Hydromel, purges Bile and Phlegm by Stool; apply'd, by way of Cataplaſm, with Water, it diſcuſſes Tubercles, and œdematous Swellings. It grows in rough Places. *Dioſcorides*, *Lib.* 4. *Cap.* 153.

CATANGELIE, κατάγγελίη. See CACANGELIA.

CATANTIA, κατάντίη, in *Hippoc.* κατ' ἰσχίον, is explain'd in *Galen's Comment.* to be the Declivity of the Members, as of the Arms and Legs when they hang down. *Foeſius.*

CATANTLEMA, κατάντλημα, from ἀντλέω, to draw or pour Water. A kind of Lotion, by Infuſion of Water. *Moſchion de Morbis Mulierum.*

CATANTLESIS, κατάντλησις, a Lotion with hot Water expreſs'd out of Sponges, recommended by *Marcellus Empiricus*, *Cap.* 1. for hot running Ulcers of the Head.

CATAPASMA, or CATAPASTUM; alſo DIAPASMA, EMPASMA, and SYMPASMA, Words of the ſame Import, from πάσσω, to ſprinkle. With the antient *Greek* Phyſicians they ſignify'd any dry Medicine reduced to Powder, in order to be uſed by way of Inſperſion on the whole Body, or any Part of it. Their various Uſes are mention'd by *Paulus*, *Lib.* 7. *Cap.* 13. where he ſays, that ſome of them are appropriated to Ulcers, others to the Skin: Of the firſt Sort, ſome fill up Cavities with Fleſh, others repreſs Excreſcences; ſome cicatrize, others are cauſtic and corroſive, and others ſtop Hæmorrhages: Of thoſe which are apply'd to the Skin, ſome are deterſive and mundificative, others attenuate and diſcuſs. Catapaſms, therefore, may conſiſt of Medicines of different Kinds, according to the Intention of the Phyſician; as, for Inſtance, of Dryers, Aſtringents, Abſtergents, Acrids, Corroſives, and others. *Pliny*, *Lib.* 21. *Cap.* 19. tells us, that Diapaſms, made of Roſes, were uſed to reſtrain Sweat, and to dry the Body after bathing: And *Dioſcorides*, *Lib.* 1. *Cap.* 21. ſays that a Diapaſm was made of the Wood of Agallochum, with which they ſprinkled the Body, in order to prevent Sweating; Powders which they put in their Drinks were alſo called Diapaſms. But this Name *Diapaſm*, according to *Pliny*, *Lib.* 13. *Cap.* 2. was particularly given to ſuch Powders as were in Requeſt on account of their grateful Smell. And *Oribaſius* ſhews, from *Antyllus*, that *Empaſmata*, ἐμπάσματα, were uſed in order to reſtrain Sweat, or any other Evacuation by the Pores, or for ſcarifying the outer Skin, or to provoke an Itching. Catapaſms were ſprinkled on Ulcers, but Diapaſms were prepared for the ſake of Smelling, and were apply'd to the Armpits, and the Inſide of the Thighs, to remove their rank Scent. *Cœlius Aurelianus*, *Morb. Acut. Lib.* 2. *Cap.* 38. informs us, that *Sympaſmata*, συμπάσματα, was a Name for ſuch Powders as, being endu'd with an acrimonious Quality, were ſprinkled on the Body, in order to procure Heat: And, *Tard. Paſſ. Lib.* 3. *Cap.* 5. he ſays it was a Name given to thoſe Aſperſions or Sprinklings which were invented on account of Itchings.

CATAPASMUS, κατάπασμός. A Term uſed by *Cœlius Aurelianus*, probably by a Miſtake for ſome other Word. It implies, according to him, a Rubbing of the poſterior Part of the Shoulders and Neck downwards (*devexo Curſu*).

CATAPHORA, κατάφορά. The ſame as COMA. See LETHARGUS. It is deriv'd from κατάφέρω, which, among other Significations, implies to render ſleepy.

CATASTUS *Lapis.* The ACHATES, which ſee.

CATAPHRACTA, κατάφράκτα. The Name of a Bandage deſcribed by *Galen.* It comes under the Armpits, round the

Neck, and croſſes upon the Breaſt and Shoulders; and is deſign'd to fix Dreſſings upon thoſe Parts.

CATAPLASMA, καταπλασμα. A Cataplaſm. It is an external, topical, ſoft kind of Medicine, of the Conſiſtence of pretty thick Panada, and prepared of Ingredients of different Virtues, according to the Intention of the Phyſician. Hence there are different Sorts of Cataplaſms, with reſpect to the Matter of which they conſiſt, as emollient, reſolvent, diſcutient, ſuppurative, corroborating, anodyne, and antiſeptic Cataplaſms. And, becauſe Cataplaſms are very frequently uſed in Caſes where Emollients are requir'd, hence *Malagma*, from μαλάσσω, to ſoften, and *Cataplaſma*, were ſynonymous Terms, even tho' the former were not compoſed of Emollients, but of Aſtringents, or any other Sorts. *Le Clerc* ſays, that Cataplaſms were a ſort of Medicine in Uſe among the Antients, of a thinner Conſiſtence than their Cerates, and compoſed of Powders or Herbs, macerated or boil'd in Water, or ſome other Liquor, with an Addition ſometimes of Oil. *Hippocrates*, for a Quinſey, directs a Cataplaſm made of Barley-meal, boil'd in Wine and Oil. Cataplaſms were apply'd with an Intention of mollifying and reſolving a Tumor, or of maturating an Abſceſs, almoſt after the ſame manner as Cerates. There were alſo cooling Cataplaſms, prepared of the Leaves of the Pear-tree, Olive-tree, Fig-tree, or Oak, boil'd in Water. The ſame Author informs us, that the Cataplaſm of the Antients was a ſoft Compoſition, made after different manners, ſometimes with Oil and Honey, and ſome Powders, as of Linſeed, Seed of Fenugreek, and ſuch others; ſometimes with Herbs boil'd in Water, or ſome other Liquor; and ſometimes they were prepar'd ſimply of Water, Oils, and Flour: They were alſo made of Bread boil'd in Water, of Bran, of Figs, or of Leaven and Oil. Beſides thoſe uſed in mollifying, maturating, or reſolving an Abſceſs, there were alſo aſtringent, cooling, and aperitive, beſides other ſorts of Cataplaſms.

The ſtrongeſt of all theſe Cataplaſms were thoſe made with Muſtard pounded, or other Subſtances yet more acrimonious, as Cantharides, mix'd with Crums of Bread, or dry'd Figs macerated in Water, and reduc'd to a Pulp. Theſe Cataplaſms excited a Redneſs in the Part, and ſometimes Bliſters, and took off the Skin. This ſort of Cataplaſm they call'd *Sinapiſmus*; and it was of Service in long and cold Diſtempers, and in Stupefaction of the Senſes. Thus far *Le Clerc*. In *Italy* the Followers of *Pythagoras* and *Eraſiſtratus* made more Uſe of Cataplaſms in the Cure of Diſeaſes, than did other Phyſicians, as *Schulzius* obſerves in his *Hiſt. Med.*

Cataplaſms are commonly applied hot or lukewarm, roll'd up in Linen Cloths, which, by means of the Oils which are added, preſerve Heat for a conſiderable time; for which End alſo ſome, upon theſe, apply a Swine's or Ox's Bladder, and ſometimes on the Top of all apply an earthen Tile. As for other Cataplaſms, which take their Names from the Part to which they are apply'd, or from their Effects, or ſome other Circumſtance, conſult the proper Articles, as, for Inſtance, ANACOLLEMA, FRONTALE, EPICARPIUM, EPISPASTICUM, and VESICATORIUM. But, as we are here ſpeaking of Cataplaſms in general, we are to obſerve, that ſome are prepared by boiling over a Fire, others not; whence they are diſtinguiſh'd into crude and boil'd: Of the former are green Plants bruiſed, and reduced to a Pulp, or dry'd, and reduced to Powder, and mix'd with a ſufficient Quantity of ſome crude or prepar'd Oil, or other convenient Liquor. Cataplaſms are prepar'd by means of Fire and Boiling, when the bruiſed or pounded Plants are boil'd in a ſufficient Quantity of ſome Liquid to a Softneſs, and then paſſed thro' a Strainer, which is not always neceſſary, if the Plants be well bruis'd and boil'd. When this is done, they add a ſufficient Quantity of Mucilage, Meal and Fat, Oil, Butter, Ointment, Leaven, Bread, Honey, and boil it over again to the Thickneſs of Pap. It may be boil'd in any Liquid, whether it be Water, Oil, Milk, Whey, Wine, Beer, Vinegar, or any other, according to the Diſcretion of the Phyſician. But it would be abſurd to prepare Cataplaſms by Decoction of Species whoſe Virtue conſiſts in their volatile Parts, becauſe they evaporate in Boiling; whereas, on the other hand, nothing can be more proper than to prepare them by Decoction of mucilaginous Subſtances, ſuch as are in the Claſs of Emollients, becauſe they are ſoon ſoften'd and reduc'd to a Pulp; for which Reaſon alſo green Vegetables are prefer'd to what are dry'd. It would be convenient alſo, when Cataplaſms are to be prepared of Milk, with an Intention of mollifying, to obſerve the Advice of *Foreſtus*, which is, in the firſt Place, not to boil them too much, but, rather than commit ſuch an Error, make them without Boiling, becauſe Milk is inſpiſſated by Decoction, and the thin Parts of it are diſſipated; ſecondly, that you chuſe the neweſt and richeſt Milk that can be had. When the Pulp is prepared, it may frequently be neceſſary to mix it firſt with dry Ingredients, as Powders; ſecondly, with liquid and ſoft Subſtances, as Fat of Animals, Butter, expreſs'd or prepar'd Oils of Vegetables, Ointments, the Yolk or White of an Egg, and other like Things; thirdly, with diſtil'd Oils, Eſſences, Tinctures, Elixirs, or Spirits: All theſe are to be mix'd in ſuch a Proportion as not to deſtroy the pulpous Conſiſtence of the Cataplaſm. The common Rate of Allowance is, for one Pound of Pulp, three Ounces at moſt of dry Ingredients, or Powders, and Liquids under the ſecond Head before-mention'd, and three Drams at moſt of ſpirituous Subſtances mention'd under the third. The Phyſician, who preſcribes the Cataplaſm, determines the Weight or Quantity of the Ingredients for preparing the Pulp according to the Intention he has in View: He next declares whether he would have them reduc'd to a Pulp by Decoction, or only by pounding them; and, laſtly, appoints the Quantities of the other Things which are to be mix'd with the Pulp, if he judges them neceſſary. If he thinks fit to add ſome hard Things, as reſinous or gummy Subſtances, he orders them to be diſſolv'd or macerated in ſome Menſtruum, that they may the more conveniently be mix'd; and the ſame Method is to be taken with Balſamics, as Turpentine, for Inſtance. When Dungs of Animals are to be taken, their Conſiſtence, with reſpect to Dryneſs, Humidity, or Softneſs, ſhews whether they are to be mix'd with dry or liquid Subſtances, in order to receive the due Form of a Cataplaſm. For it is to be obſerv'd, as *Joubert* would have us take notice, that a Cataplaſm is of a thicker Conſiſtence than an Ointment, and is nearly a Medium between an Ointment and a Plaiſter. Sometimes Electuaries, Extracts of Vegetables, Leaven of Bread, and the like ſoft Bodies, Pulps of Fruits, inſpiſſated Juices, Balſams, and the like, are us'd inſtead of Cataplaſms, either in their crude State, and unmix'd, or elſe alter'd by an Addition of other liquid, ſoft, or dry Subſtances, in ſuch a Quantity as to render the Whole of a due Conſiſtence. If the Phyſician happens to be at an Uncertainty whether, by Addition of this Variety of Ingredients, which are call'd *Acceſſories*, the Medicine will acquire a juſt Conſiſtence, to prevent his being laugh'd at by the Apothecary ſtrictly obſerving his Directions, or giving him Occaſion to add Things of his own Head, which would not agree with the Intention, it is a receiv'd Cuſtom, at the End of the Formula or Preſcription, to name ſome Liquid or Species, which is not dangerous in its Application, by exceeding a little in Quantity, and order it to be taken without determining the Proportion, but with a *Quantum ſufficit*, or ſo much as is neceſſary to give a due Conſiſtence to the Medicine. Sometimes, after the Cataplaſm, we find a Liquor preſcrib'd, which is to be brought to the Patient in a ſeparate Veſſel, and the Cataplaſm to be ſprinkled with it before Application, either for the ſake of its grateful Smell, or to exalt the Virtue of the Remedy, or to ſupply it with Moiſture, or for any other End which the Phyſician may have in View. The Quantity of the Cataplaſm is generally determin'd by the Part or Place to which it is to be apply'd, tho' ſeldom leſs than half a Pound is preſcrib'd, when prepar'd by Decoction.

CATAPLEXIS, καταπληξις, from πλήσσω, to ſtrike. It ſeems to imply any ſudden Stupefaction, or Deprivation of Senſation, in any of the Members or Organs.

CATAPOSIS, κατάποσις, from καταπίνω, to ſwallow down. Deglutition; or, according to *Aretæus*, the Inſtruments of Deglutition. Hence alſo

CATAPOTIUM, καταπότιον, or κατάποτον. A Pill. See PILULA.

CATAPSYXIS, κατάψυξις, from ψύχω, to refrigerate. A Refrigeration without Shivering, either univerſal, or of ſome particular Part.

CATAPTOSIS, κατάπτωσις, from καταπίπτω, to fall down. It implies ſuch a Falling down as happens with reſpect to apoplectic or epileptic Patients; or the ſpontaneous Falling down of a paralytic Limb; or it ſometimes imports a degenerating from a healthy to a morbid State.

CATAPUTIA *Major*. See RICINUS.

CATAPUTIA *Minor*. See LATHYRIS.

CATARACTA. A Cataract, a Diſeaſe of the Eye. The Words by which the Antients expreſs'd what we call a Cataract, were ὑπόχυμα, or ὑπόχυσις, and γλαύκωσις, or γλαύκωμα.

The ὑπόχυμα, or ὑπόχυσις, is defin'd by ſome, as the Author of the *Medicus* tells us, a Flux of Humour about the Pupil, which concretes, and either wholly intercepts the Sight, or renders it dim and obſcure. In the *Definitiones Medicæ* alſo, which Treatiſe, as well as the *Medicus* before-mention'd, is aſcrib'd to *Galen*, a ὑπόχυμα is defin'd a Concretion of an aqueous Humour, which is more or leſs an Impediment to the Sight: And *Paulus*, *Lib.* 6. *Cap.* 21. makes an ὑπόχυμα to be a Concretion of a dull Humour within the Cornea, near the Pupil of the Eye, which intercepts or obſcures the Sight. *Celſus* alſo, *Lib.* 6. *Cap.* 6. ſays that a *Suffuſion*, which the *Greeks* call ὑπόχυσις, ſometimes ſeats itſelf oppoſite to the Pupil of the Eye.

Γλαυκώσεις, and γλαυκώματα, (*Glaucedines*) in *Hipp. Aph.* 31. *Lib.* 13. are ſaid to be familiar to old Men, and are cauſed, as *Galen* ſays on the Place, by the Dryneſs of the Organs.

A γλαύκωσις, in *Ætius*, *Tetrab.* 2. *Lib.* 3. *Cap.* 50. is ſaid to be a Change of the cryſtalline Humour to a glaucous or

ſky

ſky Colour, with a Dryneſs and Concretion. And there is another kind of γλαύκωσις, or *Glaucedo*, conſequent upon a Suffuſion, when the Humour near the Pupil is very firmly congealed and dry'd; and this is what is generally meant by the Word, when uſed by the Antients; and this Diſeaſe they thought incurable. *Galen*, *Lib.* 10. *de Uſu Part.* defines a γλαύκωσις to be a Dryneſs and Concretion of the cryſtalline Humour.

Mr. *de Saint Yves*, a celebrated *French* Oculiſt, has given the ſubſequent Account of a Cataract.

Of a Cataract in general.

Authors do not agree about the Nature of Cataracts. Some think the cryſtalline Humour is affected; others will have it to be a Membrane formed by the Thickening of the aqueous Humour, which adheres to the Edge of the Pupil, and intercepts the Rays of Light.

This Diverſity of Opinions muſt not be imputed to the Obſtinacy of their Authors; it may, with greater Preſumption, be aſcribed to the few Occaſions they have had of undeceiving themſelves; for, if this Matter be carefully examined, we ſhall find both cryſtalline and membranous Cataracts; we may even eſtabliſh as many Species of Cataracts of the cryſtalline Humour, as there are Alterations of which that Humour is ſuſceptible.

As to membranous Cataracts, I remark two Sorts: The firſt proceeds from an Opacity of the Membrane, which covers the Socket of the vitreous Humour which lies behind the Cryſtalline. The ſecond Sort is ſubſequent to Inflammations of the Choroides. In theſe Inflammations a Matter like Pus is extravaſated into the aqueous Humour; this Matter grows dry, and forms a ſort of membranous Body. A third Sort of Cataract may be added, which is cauſed by an Opacity of the Membrane which covers the fore Part of the Cryſtalline, provided this Membrane can be thus affected, whilſt the cryſtalline Humour remains uninjured, of which Experience has not hitherto convinced me; neither am I ſatisfied, as to that Sort which is ſaid to be cauſed by a Congeſtion or Inſpiſſation of the aqueous Humour. I have, it is true, often ſeen an Opacity, in a ſmall Portion of the Membrane, which covers the fore Part of the Cryſtalline, without the Loſs of Sight, becauſe the cryſtalline Humour itſelf, and the reſt of that Membrane, remained ſound.

Thoſe who have never ſeen any but membranous Cataracts, have been as much miſtaken as thoſe who knew none but cryſtalline Cataracts. In order to give a more clear Idea of the different Species of a Cataract, I ſhall divide them into true, doubtful, and falſe Cataracts.

Of a true Cataract.

Moſt Moderns define a true Cataract to be the cryſtalline Humour affected, and not a Membrane formed in the aqueous Humour, as the Antients deſcribed it. I adhere to the Moderns; numberleſs Experiments have evidently ſhewn the Error of the latter. We ſtill ſee many perſiſt in the Opinions of thoſe learned Men, who were not infallible: They poſtpone a Conviction from ocular Demonſtration, and manifeſt Experiments, to the Reaſons advanced by thoſe Authors in Behalf of their Opinion.

I was a long time of their Opinion, that a Cataract, curable by the Operation, was a Membrane formed in the aqueous Humour. But two Reflections have entirely undeceived me. The firſt is on the Manner in which a Cataract is formed, from its Beginning to its full Maturity. My ſecond Reflection is on the Reſult of the Operation which this Diſeaſe requires. When a Cataract begins, it lies in ſo deep, that it can ſcarcely be diſtinguiſhed; thence I conclude, if it was a Membrane, or Inſpiſſation of the aqueous Humour, and it was ſituate in the poſterior Chamber of the Eye, behind the Iris, it might be eaſily perceived, neither would it appear to lie ſo far within. Three or four Months after, more or leſs, the Patients complain of a Diminution of their Sight. When we examine their Eyes, we perceive a Whiteneſs very deep on the Inſide, without any apparent Dimneſs or Inſpiſſation of the aqueous Humour; this ſeems to ſhew, that it is the cryſtalline Humour which begins to grow opake. By obſerving the Patient's Eyes, from time to time, we ſenſibly perceive the Cryſtalline advance towards the Hole of the Pupil; and the Sight leſſens gradually, till the Cataract comes near the Pupil, which it cloſes, as a ſort of Curtain drawn before a Window, which leaves room for ſome Light to enter the Chamber, though Objects cannot be diſtinguiſhed thro' it.

This Reflection ſeems of Force ſufficient to evince, that a Cataract is not a Membrane produced in the aqueous Humour, nor an Inſpiſſation of that Humour; were it ſo, it would remain in the ſame Place where it had its Origin, neither would it change its Situation, as I have ſhewn it does in its Beginning, in its Progreſs, and in its Maturity.

My ſecond Reflection is taken from the Operation of the Cataract: For when the Eye is pierced, and the Needle thruſt in, it happens ſometimes, that it enters into the Middle of the Body which forms the Diſeaſe, tho', at the ſame time, it was directed in ſuch a manner, that it could not penetrate to the Place where the Cryſtalline is naturally ſituated; yet, when the Cataract is depreſs'd, and the Needle is raiſed, there appears, thro' the Hole of the Pupil, an opake Body, in the Form of the cryſtalline Humour, adhering to the End of the Needle. Were this Body a Membrane, it would be flat or plaited, and not of a convex Figure: From theſe Circumſtances, we may conclude it is the Cryſtalline which is depreſſed in this Operation, together with the Membrane which retained it in the vitreous Humour, before it was affected; for, if it could any way get looſe from that Membrane, it would fall of its own Accord to the Bottom of the Eye; but, as it cannot, it muſt neceſſarily remain always attach'd to the Membrane which covers it.

That a Cataract is ſeated in the cryſtalline Humour, I ſhall give another convincing Proof, deduced from an Experiment made on the Eye of a Man, who died at the Hoſpital of the Name of *Jeſus*: He had undergone the Operation for the Cataract, in the Hands of Mr. *Woolhouſe*. I deſired M. *Mery*, of the Royal Academy of Sciences, to come thither, and examine the Eye: He drew the Eye, on which the Operation had been performed, out of the Orbit, opened it, and found the cryſtalline Humour placed in the Bottom of the Globe of the Eye, at the poſterior and inferior Part of the Pupil, to which Place the Operator had depreſſed it. This proves ſufficiently, the Seat of a Cataract is in the cryſtalline Humour. In the Sequel of this Treatiſe, all things will appear to corroborate theſe Proofs. Whoſoever deſires to be further informed, let him conſult the Works of *Briſſeau* and *Heiſter* on this Subject, who have detected the Error into which the Antients were led, for want of fully examining this Matter.

Theſe new Opinions engaged the Members of the Royal Academy of Sciences to make ſeveral Experiments, in Search of the Truth; and, ſince that time, ſeveral of them have abandoned the Error of the Antients, as may be ſeen in their Memoirs.

A true Cataract is, then, an Alteration of the cryſtalline Humour, which loſes its natural Tranſparence, becomes opaque, and at length hinders the Rays of Light reflected from luminous Bodies to paſs to the Bottom of the Eye, there to make their Impreſſion; by which means there is no Sight, till the Cataract is either depreſſed by the Operation, or falls ſpontaneouſly by its Weight, as I obſerved in the two following Caſes.

The firſt happened to one M. *Barthelemy*, Dean of the Account-office; he was about threeſcore and ten Years old, and lived in *Rue de la Ceriſaye* in *Paris*; his Cataract fell of its own Accord, and was lodged in the Place where it is uſually depreſs'd to by the Needle, ſo that he could ſee as well as People do, after the Operation for the Cataract has been well performed.

The ſecond Inſtance happened, in *Rue de Richelieu*, to an old blind Bitch, belonging to the Counteſs of *Chamillart*. They were ſurpriſed one Day, that this Bitch, contrary to Cuſtom, could ſee enough to guide herſelf: As I went frequently to that Houſe, to viſit the Abbot *de Guide*, for whom I had couched a Cataract, they ſhewed me the Bitch; in one of her Eyes I perceived a Cataract half depreſſed, ſo that a ſufficient Quantity of Light paſſed to the Bottom of her Eye, and enabled her to ſee.

After having, as it were, demonſtrated the Cryſtalline to be the Seat of true Cataracts, we muſt now ſhew, that the different Alterations of that Humour conſtitute the different Sorts of true Cataracts.

I admit three Sorts of Alterations of the cryſtalline Humour in true Cataracts. In the firſt, the Cryſtalline becomes ſoft, and, as it were, mucilaginous. In the ſecond, the Cryſtalline grows hard and dry. In the third, the inner Part of the Subſtance of this Humour becomes purulent, whilſt the outward Strata, and the Membrane which covers it, ſerve as a Purſe or Cyſtis for this Matter.

The Situation of true Cataracts is various: Sometimes they advance towards the Pupil, till they are full ripe; then they lie on the inner Circumference of the Iris. At other times, tho' the Cryſtalline is looſed from the Socket of the vitreous Humour, ſtill it advances very little towards the Pupil, but remains in the Middle of the poſterior Chamber, where the Cataract ripens. Perſons attacked with this laſt Species do not entirely loſe their Sight; and, tho' their Cataracts be full ripe, they can perceive Objects but in a very confuſed Manner, becauſe ſome Rays of Light paſs to the Bottom of the Eye, about the Circumference of the Cataract.

Authors have eſtabliſhed two particular Sorts of true Cataracts by the Names of the Milky and the Cheeſy, but, in this, they were miſtaken; for theſe pretended Species of Cataracts are only the different Degrees of Alteration, which the Cryſtalline muſt undergo, before it arrives to a full Ripeneſs; for which Reaſon they are ſeldom found, but when the Cataract is couched too ſoon.

Cataracts from the Birth require a long Time to ripen. Beſides, as Children have not Reſolution enough to bear the Needle

Needle to their Eye, they often cauſe their Eyes to be damaged, and their Sight deſtroyed. I have ſeen a like Accident happen to a Merchant's Daughter in *Rue de Thevenot*: At the Age of ſeven Years ſhe had a Cataract couched by M. *Gerrard* the elder; for which Reaſon I let Children alone, till they are ten or twelve Years old, leſt I ſhould meet with the ſame Misfortune.

Sometimes the Centre of a Cataract from the Birth is petrified; there is ſomething in the Middle of the Body of the Cataract, about the Bigneſs of a Pin's Head, hard and concreted like a Stone. A Noiſe is even heard, when the Needle, in the Couching, touches that Place, as if it rubbed againſt a ſmall Pebble-ſtone. This does not hinder the Patient from recovering his Sight, after the Cataract has been couched.

Of doubtful Cataracts.

I call that Cataract a doubtful Cataract, in which the Succeſs of the Operation is as uncertain, as the Uſe of topical Remedies. I admit four Sorts: The firſt is a kind of Membrane, which appears, and is formed, after a purulent Matter has been extravaſated into the aqueous Humour. In the Sequel of this Treatiſe, I ſhall diſtinguiſh this Sort by the Name of a Membranous Cataract. The ſecond Species is called Filamentous, from the great Number of Filaments which compoſe it. The third is a diſplacing of the Cryſtalline from a Stroke received in the Eye. The fourth is an Alteration of the Membrane which covers the Bottom of the Socket in the vitreous Humour.

Of a Membranous Cataract.

I have already obſerved a membranous Cataract to be the Conſequence of an Ophthalmy of the Choroides and Uvea; their obſtructed Veſſels emit a whitiſh Pus into the aqueous Humour; this Pus, by its Viſcidity, adheres to the Circumference of the Pupil, and there appears like a fine Cloth. When this Matter is not very copious, it does not entirely cloſe the Pupil; in this Caſe, if the Fluxion ceaſes, before it has damaged the Bottom of the Eye, it leaves a ſufficient Paſſage for the Light to make its Impreſſion, ſo that the Patients ſee a little, but their Sight is weak; but if the Fluxion reaches to the Bottom of the Eye, and deſtroys the Action of the Fibres of the Retina, the Sight periſhes. I had an Inſtance of this in the Perſon of M. *Vilvandé*, who had been attacked by a violent Defluxion on both his Eyes; one of them periſhed by an Abſceſs, and the other was ſeized with a membranous Cataract, which had deſtroy'd his Sight. M. *Woolhouſe* promiſed to reſtore it, by couching the Cataract. This Patient came afterwards to conſult me; but, as I found the Cataract complicated with a Gutta Serena, I aſſured him the Operation would be of no Service to him. Still he perſiſted to engage me to undertake it, and, as I was ſatisfied it would not ſucceed, I would not perform it, but in Preſence of another Oculiſt. M. *Bailly* the elder was called; he, in Complaiſance to the Patient, told him, if the Operation did not reſtore his Sight, it would not injure his Eye.

I performed the Operation, in Preſence of this dextrous Oculiſt; the Cataract was well depreſſed, Objects were preſented to him, but he could not ſee any of them, tho' the Pupil ſeemed very clear. When the Bottom of the Eye is not damaged, there remain certain Openings in this Cataract, thro' which the Patients can ſee. I ſhall relate two Inſtances. A Woolen-draper, of the City of *Beauvais*, came to *Paris* to be cured of an inveterate Defluxion on both his Eyes, which hindered him from diſtinguiſhing Objects, becauſe there was a whitiſh Humour placed in the Pupils; a Fortnight after, the Fluxion went off, and his Sight began to return by degrees; for the Matter in the Hole of the Pupil ſpent itſelf, and the Patient, by degrees, could ſee again to read. His Sight, however, continued weak, becauſe the Iris had been contracted by a Part of that whitiſh Matter, and left but a ſmall Space for the Entrance of the Rays of Light into the Eye.

There is alſo another kind of Effuſion of whitiſh Matter into the aqueous Humour, which places itſelf behind the Hole of the Pupil, and there remains till the Defluxion ceaſes. I have ſeen this Caſe, in one M. *Lomery*; I attended him, in the Year 1713. when he had a violent Defluxion, neither could he ſee at all with the diſtempered Eye. There appeared, behind the Hole of the *Pupil*, a ſort of purulent Cataract, which, as ſoon as it attain'd a certain Conſiſtence, fell to the Bottom of the Eye, with which he could ſee very well afterwards.

Theſe Examples ſhew a membranous Cataract has three different Places of Situation: 1. When it cloſes the entire Pupil, and adheres to its Circumference. 2. When the Cataract, tho' adherent, ſtops only Part of the Hole of the Pupil. 3. When the Matter, which forms the Cataract, floats in the aqueous Humour, behind the Iris, without ſticking to it; and, when the Defluxion goes off, it falls commonly to the Bottom of the Eye; for if it adheres to the back Part of the Pupil, it forms a membranous Cataract.

From what I have now ſaid it is plain, that I admit of membranous Cataracts, which proceed from Abſceſſes of the Choroides or Uvea, which diſcharge their Matter into the aqueous Humour. The more liquid Part of this extravaſated Matter mixes with the aqueous Humour, whilſt the more ſolid Part gathers together, and ſettles in the ſeveral Places I have mentioned. If this Matter remains behind the Iris, it will form a Cataract like a Membrane, without engaging the Cryſtalline; and this I call a membranous Cataract. The Succeſs of the Operation, in this kind of Cataract, is not to be doubted, provided the Defluxion, which cauſed the Abſceſs, has not deſtroyed the eſſential Parts of Viſion, which yet happens but very ſeldom. This Species of Cataracts is very rare; for which Reaſon I aſſert, that almoſt all Cataracts, in which the Operation ſucceeds, conſiſt in an Alteration of the Cryſtalline.

Thoſe who aſſert, that none but membranous Cataracts are reliev'd by the Operation, have not hitherto given any convincing Proof of their Opinion. Had they opened an Eye, and found the Cryſtalline entire, after the Death of a Perſon on whom a Cataract of this Sort had been couched, and who had ſeen, after the Operation, his Cryſtalline remaining without any Alteration, they would have ſome Foundation to defend their Aſſertion; and they might juſtly claim our Aſſent, could they produce ſeveral Experiments of this Sort well atteſted. They have only given us a Diſſection of ſome Eyes, on which the Operation had never been performed; whereas the contrary Opinion, which maintains, that almoſt all Cataracts proceed from an Alteration of the Cryſtalline, is confirmed by an infinite Number of well atteſted Experiments, made on the Eyes of Perſons who had undergone the Operation, and ſaw, from that time, to their Death; when their Eyes were opened, the Cryſtalline was found depreſs'd, together with the Membrane which covers it.

We have alſo ſeveral Experiments made on Perſons who lived many Years after the Couching of their Cataracts, where the Body, which had been depreſſed, having paſſed thro' the Hole of the Pupil into the anterior Chamber of the Eye, was taken out, by an Inciſion made in the Cornea Tranſparent; and, upon Examination, it appeared to be the Cryſtalline which had paſſed thro' the Pupil, the Patients having afterwards ſeen perfectly to read with Cataract Spectacles.

Of a Filamentous Cataract.

I reckon this Species amongſt the doubtful Cataracts, altho' it ſeems to be a true Cataract. It is very properly called filamentous; for, in the Couching of it, the Needle ſeems to draw off numberleſs ſmall Filaments. This Cataract cannot be cured by the Operation; for theſe Filaments cannot be broke. I think this Remark neceſſary, in order to precaution any one who may meet with a Caſe of this Nature, which is very rare, not to be ſurpriſed at it.

Of Cataracts proceeding from Strokes.

Some Oculiſts are of Opinion, that Cataracts, from Strokes received on the Eye, or the adjacent Parts, are incurable; but I have ſeveral Experiments of the contrary. I ſhall here mention one, in the Perſon of a Man, named *Conſtantine*, living in *Paris Rue du Verbois aux Carnaux*: He had been ſhot, ſixteen Years before, in both his Eyes. The ſmall Shot, which had penetrated between the Membranes, came out, from time to time, ſpontaneouſly, for the Space of three or four Years which intervened, from the time he received the Shot, to the time of the Operation. By the Violence of the Stroke, the Globe of the Eye was ſunk. The Cryſtalline, together with its Membrane, was looſed, and advanced towards the Pupil, to which it ſeemed to adhere on the Side of the little Angle, where one of the ſmall Shot had penetrated the Iris at its Union with the Cornea Tranſparent; the Pupil itſelf became oblong on that Side. The Iris had no Movement, either of Dilatation or Contraction; yet this Man could perceive, on that ſame Side, the Shade of a Hand placed between his Eye and the Light. This determined me to perform the Operation, about twelve Years ago; ſince which time, he has ſeen with that Eye, as well as if the Cataract had proceeded from an inward Cauſe. What is more ſurpriſing, after he had been ſhot in this manner, he loſt the Sight of his other Eye, tho' nothing appeared in the Humours, that could darken it; and, a Year after the ſaid Operation, the Sight of it was reſtored, without any Application.

When the Eye receives a violent Stroke, the Cryſtalline is looſed immediately, and, in two or three Days, it becomes opaque, ſo that the Patients can only juſt perceive the Light.

Theſe Cataracts have three different Situations: 1. When the Cryſtalline, already looſed by the Stroke on the Eye, advances towards the Pupil. In this Caſe, if it grows dry before it touches the Iris, it falls of its own Accord, and the Patients can ſee again, without any Operation; but, when placed behind the Iris, if then it adheres to the Iris, the Operation is neceſſary. This is the ſecond Place of Situation for theſe Cataracts, when the Cryſtalline advances, and adheres to the Pupil. The third Place is, when the Cataract paſſes altogether into the anterior Chamber, and is placed between the Cornea

Tranſparent

Tranſparent and the Iris; from whence it muſt be taken out, in the manner that ſhall be deſcribed in the Sequel of this Treatiſe.

Of a Cataract, cauſed by a Defect in the Membrane, which covers the Socket of the Vitreous Humour.

I reckon, amongſt doubtful Cataracts, thoſe cauſed by a Defect in the Membrane, which covers the Bottom of the Socket in the vitreous Humour. In this Sort, the Sight is not altogether loſt, it is only weakened: In this Caſe there appears, thro' the Hole of the Pupil, a Whiteneſs which is thin and flat, and ſeems to be the Membrane, which covers the Bottom of the Socket of the vitreous Humour, degenerated. It often aſſumes the Form of a Star, leaves ſome Intervals without Opacity, and ſome opaque; ſo that this Opacity, which affects only the concave Part of the Socket, propagated from the Centre to the Circumference, appears like a Star. In this Diſeaſe, the Cryſtalline is not looſed, and the Sight, tho' weak, ſubſiſts.

Of falſe Cataracts.

Thoſe Cataracts are called falſe, in which Remedies afford no Relief, and in which the Operation is intended only to remove the Deformity, or Pains, which attend them. I reduce them to two Sorts, the Glaucoma, and the ſhaking Cataract.

Of a Glaucoma.

That Diſeaſe is called Glaucoma, in which the Cryſtalline is of the Colour of Sea-water. I am convinced, by my own Practice, that it is only of that Colour in its Beginning; for, afterwards, it becomes whitiſh, or greyiſh. There are various Opinions concerning this Diſeaſe, both as to its Origin and Situation. Some have judged it to be ſimply a Depravation of the Cryſtalline; and others, of the vitreous Humour. I have found, by an Inſpection of Eyes afflicted with this Diſeaſe, a ſort of Depravation in the Cryſtalline, which was conſequent to a Palſy of the viſual Nerves, which firſt appears by a Dilatation of the Pupil.

The Signs of a Glaucoma, in its Beginning, are a Smoak and Miſts, which ſeem to paſs before the Patient's Eyes, and confuſe their Sight. They ſtill can ſee Objects, but imperfectly, and only at the Corner of their Eye, becauſe ſome Fibres remain not totally obſtructed. The Sight decays by degrees, and the Patients can only juſt diſtinguiſh the Light; then the Cryſtalline begins to degenerate, loſes its Tranſparence, and, at firſt, aſſumes the Colour of Sea-water. As it grows more ſolid, it changes its firſt Colour, appearing like a Cataract, ſometimes of one Colour, and ſometimes of another, as I have already obſerved. This is what I call a Glaucoma, which differs from a true Cataract, by its Complication with a Gutta Serena. A Glaucoma begins ſometimes after the Criſis of a Fever, in which the morbific Matter is remov'd to the Eye, and cauſes an Inflammation in all the Membranes, except the Conjunctiva, which is but ſlightly affected; the Patients feel an acute Pain in the Bottom of the Eye, and in the Temples; a Gutta Serena follows this Fluxion, and a Glaucoma enſues.

Sometimes the ſolar Rays, falling ſuddenly and violently upon the Eye, produce this Diſeaſe; as I ſaw, in the Year 1717, happen to a Commander of the Order of *Malta*: He had ſuffered for a long time, from ſuch an Accident, violent Pains in his Head and Eye, which were followed by a Glaucoma.

This Diſeaſe is ſometimes produced by a viſcid Humour, which creates Obſtructions in the Bottom of the Eye, and in the Cryſtalline, by which a Gutta Serena, and a Cataract without Pain, are formed, to which a Glaucoma ſucceeds.

Old People are deemed ſubject to this Diſeaſe, becauſe their Cryſtalline appears dry, which hinders them from ſeeing Objects perfectly, tho' they can diſtinguiſh them. I ſaw two Perſons, who had their Cryſtalline ſo opaque, that they ſeemed to have true Cataracts, and in Appearance they could not ſee; theſe Perſons, however, were able to read.

I do not take this Dryneſs of the Cryſtalline to be a Glaucoma, becauſe the eſſential Parts of the Sight remain ſound, whilſt the Cryſtalline grows dry: In this State, the Light penetrates to the Bottom of the Eye, finding a Paſſage round the Cryſtalline; ſo that the Patients, notwithſtanding this Opacity of their Cryſtalline, can ſee and diſtinguiſh Objects ſufficiently to read Writing. This Diſeaſe reſembles a Cataract, more than a Glaucoma. If theſe Perſons be attacked with a Gutta Serena, which may come very ſuddenly, the Pupil will be dilated; and a Glaucoma, according to my Definition, will be formed.

The Prognoſtic of this Diſeaſe is very fatal; for, when it is once formed, Remedies are of no Service; and, when one Eye is afflicted with it, the other is in great Danger.

When this Diſeaſe proceeds only from the Dryneſs of the Cryſtalline, as in old Men, the Sight continues often all their Lives. 'Tis to theſe old Men, Eye-bright Wine, and other Preparations of that Herb, ſo much recommended by the Antients, are very ſerviceable.

Of a Shaking Cataract.

I ſhall ſay very little of the ſhaking Cataract; for this Diſeaſe is incurable, and the Operation ſerves only to remove the Deformity of the Eye, and to abate the Pains. The Cryſtalline becomes like Plaiſter, and reſembles that of a fried Whiting. It rolls from one Side to the other, according to the different Movements of the Eye; for this Body adheres to ſome Ciliar Fibres, which keep it ſuſpended in the Middle of the poſterior Chamber. In Proceſs of Time, theſe Fibres break; then the Cryſtalline, having no Support, paſſes, upon the leaſt Motion, into the anterior Chamber; from whence it muſt be drawn out, in the manner which ſhall be taught, in treating of the Operation for Cataracts.

Of the Cauſes of Cataracts.

Cataracts proceed from internal or external Cauſes. Thoſe, who have hitherto wrote of this Diſeaſe, have not explained, in a ſatisfactory manner, how it is formed. My Opinion is as follows:

The firſt Thing, which happens in the Formation of a Cataract from an internal Cauſe, is the Thickening and Viſcoſity of the nutritious Juices, which flow into the Veſſels of the Membrane that fixes the Cryſtalline in the vitreous Humour, and into the Veſſels of the Cryſtalline. Theſe Juices, by their Viſcidity, ſtop the Chanels through which they paſs; then the Nouriſhment, neceſſary to preſerve the Tone and Spring of theſe Veſſels, cannot be duly ſupplied, the Veſſels, which ſhould convey it, being obſtructed; for which Reaſon, the Fluids, which arrive at laſt, not finding free Paſſage and Room to circulate, they ſtagnate, and grow acrid; thence enſues a total Diſſolution of all the Subſtance of the Cryſtalline. Hence Abſceſſes, and purulent Cataracts. If there be not a total Diſſolution of the Cryſtalline, this Humour loſes Part of its Fluidity, and is looſed, together with the Membrane which incloſes it, from the vitreous Humour. Afterwards it acquires a hard Conſiſtence; as it grows more ſolid, it advances towards the Hole of the Pupil, and is puſhed forward by a Seroſity collected behind it, whether it be the aqueous Humour which glides into that Place, or whether the vitreous Humour furniſhes it, as the anterior Cells of the vitreous Humour appear principally filled with it. That a Seroſity is gathered between the affected Cryſtalline and the vitreous Humour, ſeems to be proved by this, that in couching a Cataract, if any Portion is looſed, it is puſhed with Violence into the anterior Chamber of the Eye, as if it was violently forced by ſome Humour flowing from the Back to the Fore-part.

Wherefore I think, in the Beginning of Cataracts from an internal Cauſe, there is a Diſſolution of the Cryſtalline, by which it grows ſoft, and becomes more or leſs fluid; for, when we attempt to couch a Cataract, before it is full ripe, the Needle paſſes thro' it, as thro' a thick Cream, and can never depreſs it; whereas, in the ſound, natural State of the Cryſtalline, the Needle meets with a Reſiſtance. We muſt then conclude, from this Difference, that the Cryſtalline, at firſt, becomes ſoft; and that there is a Diſſolution of it in the Beginning of a Cataract.

It muſt not, however, be ſuppoſed, that all Cataracts are occaſioned by a Diſſolution of the Cryſtalline; for, in ſome, it grows hard and dry. This laſt Sort of Cataract may be couched in a ſhort time after it is formed.

It is very difficult to explain, how the Cryſtalline acquires this Conſiſtence, in ſo ſhort a time; yet it is not ſurpriſing, ſince it becomes like Plaiſter in the ſhaking Cataract.

The Colour of the Cryſtalline, in this Species of Cataract, approaches the Brightneſs of Quickſilver, ſomewhat inclining to the Colour of Window-glaſs. I cannot compare it, on account of its Conſiſtence, to any thing better than to Talc; for, in couching, when it is preſſed by the Needle, it breaks off in Scales, as that Subſtance does; this does not hinder the Succeſs of the Operation.

The external producive Cauſes of Cataracts are Strokes received on the Eyes, and the adjacent Parts; as alſo Falls, which give a great Shock to the Head; Strokes received about the Orbit, which cauſe a great Concuſſion in the Eye; Strokes in the Middle of the Globe, which make the Cornea bend inwards, and which divide the poſterior and lateral Parts of thoſe Membranes, which incloſe the Humours of the Eye; ſo that the Membrane, which joins the Cryſtalline to the vitreous Humour, is lacerated, and, by its Rupture, occaſions the Looſing of the Cryſtalline.

Theſe Accidents come either by ſmall Shot, as in the abovementioned Caſe of the Man called *Conſtantius*; or they happen by an infinite Number of other Means too tedious to deſcribe. I ſhall relate ſome Caſes: One of them happened ſix Years ſince, at the *Hôtel of Aſturias Rue de Sepulchre* in *Paris*, to a young Nobleman.

One of his Friends had ſtruck him undeſignedly, in the Middle of his Eye, with the End of a ſmall Switch. I was not called, till the Day after the Accident; I found the Cryſtalline looſed and floating in the aqueous Humour; it was already become opaque, though neither Scratch or Wound appeared on the Outſide of the Eye. He could only juſt diſcern the Light, with that Eye. Boys, who throws Squibs in the Streets, often cauſe Cataracts in Peoples Eyes, as they go along: There is ſomething, about the Bigneſs of a Pea, in the Squibs to ram them; when this Part ſtrikes the Eye, it produces a Cataract by looſing the Cryſtalline, in the beforementioned manner. About four Years ago, a like Accident happened, in the *Rue de la Mortellerie* in *Paris*, to a Corn-merchant's Son, about twelve Years old. The Cryſtalline was inſtantly looſed, appeared opaque and whitiſh, the next Day after the Stroke.

The Stab of the Point of Sciſſars may inſtantly looſe the Cryſtalline; a few Days ſince, a like Accident befel a young Girl, twelve Years old.

The Point of her Sciſſars had ſtruck and penetrated the Cornea Tranſparent; the next Day, when I examined her Eye, I found the Cryſtalline looſed and opaque.

A Pin, or any thing which can prick the Globe of the Eye, may produce a Cataract, as happened, laſt Winter, in the Community of the Nuns of St. *Genevieve quay de la Tournelle:* As one of them was ſhaking her Apron, a Pin run into her Eye, at the Place the Puncture is made in couching a Cataract. It entered very deep, and had pricked the Cryſtalline; violent Pains enſued, and, when they were alleviated, I diſcovered a Cataract to be formed.

I ſaw another Inſtance of a Cataract, proceeding from the Blow of an edged Weapon on the Middle of the Pupil. The Cryſtalline was looſed from the vitreous Humour, and placed in the poſterior Chamber of the Eye, at the Place where true Cataracts lie; the Point of the Weapon paſt through the Cornea, penetrated to the Cryſtalline, and wounded it, ſo that the Cataract was join'd to the Wound of the Cornea, by the Intervention of a whitiſh Matter, which flowed from the Cryſtalline. Three Years after the Stroke, the Patient applied to me: I examined his Eye, found the Parts in the Bottom to be ſound, and that he would ſee, if his Cataract was couched; for which Reaſon, I paſſed the Needle to it: The upper Part of the Cataract gave way, and was depreſſed; but, as I obſerved it firmly adhered to the Cornea Tranſparent, and that it drew the Cornea with it, I could not break it with my Needle, and ſo could not depreſs it below the Adherence. At that Time, I made uſe of the round Needle: Had I then, as I now have, a Needle edged and flat, I could have cut the Adherence with its Edge, and perfectly ſucceeded. It may, perhaps, be objected, that theſe Sorts of Cataracts which come by Strokes, and looſen the Cryſtalline, are only a whitiſh Juice extravaſated into the aqueous Humour, by the Rupture of ſome Veſſels of the Globe, and placed behind the *Iris*; ſo that I am miſtaken in ſuppoſing this whitiſh Juice to be the Cryſtalline.

To this I anſwer: The Diſtinction is eaſily made, provided the Blow has not tore ſome of the Blood-veſſels; for, if the Eye be inſpected, a few Days after the Blow, the Cataract may be ſeen, through the Hole of the Pupil, of a round convex Form as the Cryſtalline is; it has even ſome Conſiſtence, which it would not have, if it was only a whitiſh Juice extravaſated.

Beſides, this whitiſh Juice cannot be diſcharged into the aqueous Humour, but by the Rupture of ſome Veſſels, ſo that it ought to be mixed with Blood; but, in order to prove this Cataract is not occaſioned by a whitiſh Juice poured into the aqueous Humour, it is never mix'd with Blood. Indeed, when the Veſſels, or Membranes, are torn by a Blow which has looſed the Cryſtalline, ſome Blood appears in the aqueous Humour, but never any is ſeen in the Cryſtalline, as there ſhould be, if what I take to be the Cryſtalline is only a whitiſh Juice; for, when this Blood is diſperſed by proper Remedies, the Cataract is ſeen floating in the aqueous Humour, without any Tincture of Blood. We muſt therefore conclude, that this Sort of Cataract is not occaſioned by that pretended Juice, and that it is certainly the Cryſtalline looſed from its Socket; for it often falls ſpontaneouſly to the Bottom of the Eye, in the ſame Place to which the Operation reduces it; and then the Patients cannot ſee to read, but with Cataract-Spectacles; which is a manifeſt Proof, that it is the Cryſtalline which is looſed, ſince theſe Spectacles are deſigned to ſupply its Place.

This Account of a Cataract, from an external Cauſe, appears to be very rational. When the Cryſtalline Humour is detach'd from its Place, and the Veſſels, which ſupply it with Nouriſhment, conſequently broke, it is manifeſt, that it muſt very ſoon become opaque.

Of the Signs of Cataracts.

When a Cataract begins, and the Chanels of the Cryſtalline Humour are obſtructed, the Light, which enters the Eye, falling on the obſtructed Veſſels, makes a Shadow in that Part of the Eye, on which the Rays of Light ſhould fall; hence thoſe Flies and Cobwebs in the Air before the Patient's Eyes floating here and there, according to the Motions of the Eye; theſe Shadows aſſume different Figures, according to the Number of the obſtructed Veſſels of the Cryſtalline, and according to their different Diſpoſitions, as the Appearance of Hairs, Duſt, Cobwebs, and Flies.

It is difficult to know a Cataract in its Beginning; for the preceding Signs are almoſt the ſame with thoſe of other Diſeaſes of the Eyes; for theſe Flies, or Shadows, may be formed by the Relaxation of the Veſſels of the Retina: As they are, in ſome Places, ſeparated from the Choroides, the Light cannot make its Impreſſion on thoſe Parts, ſo that a Sort of Shadow is form'd on the Choroides.

There is likewiſe a falſe Suffuſion, attended with the Appearance of an infinite Number of Atoms in the Air; but the Sight is not ſhortened, in either of theſe Diſeaſes.

Theſe are the certain Signs of a beginning Cataract: The Patients perceive, in a ſhort time, the Sight of their diſeaſed Eye to grow much ſhorter; they cannot ſee as diſtinctly at a Diſtance, as they could before their Eye was attacked; they find their Sight ſenſibly diminiſh every eight Days.

But, as ſoon as the before-mentioned Diſſolution of the Cryſtalline ſupervenes, the Whiteneſs and Opacity may be perceived to ſink into the poſterior Chamber of the Eye, where the Cryſtalline is lodg'd; then the Inſpection of the Eye clearly ſhews the Cataract, which could not be known before, but from the Account the Patient gave of the Diminution and Weakneſs of his Sight.

Having now related the Signs by which a Cataract may be known, we muſt propound thoſe which diſtinguiſh the different Degrees of its Maturity. Theſe Signs are three in Number: Firſt, When the Cataract appears, in every Part, of an equal Opacity; for, when the Opacity is not equal, looking thro' the Hole of the Pupil, ſome Places appear more ſolid and opaque than others.

The ſecond Sign is: The Patient being placed with his Back to the Light, and an Object preſented to him, if he can diſtinguiſh it, his Cataract is not full ripe, unleſs it be one of thoſe Cataracts, in which the Cryſtalline remains in the Middle of the poſterior Chamber of the Eye.

The third and moſt certain Sign is: Let the Operator examine the diſeaſed Eye expoſed to the Light; if he finds the Cryſtalline of an equal Opacity, let him cloſe the Patient's Eyes with his Thumbs, then rub the upper Lid of that Eye which has the Cataract, and, keeping the other Eye ſhut, let him open the Lids; if he finds the Light, which falls on the Pupil, makes the Iris contract, and, tho' expoſed to the ſame Light, it dilates to the Half, or the Quarter, of that Degree to which it was contracted, he may be aſſured the Cataract is ripe. I do not know any Author who has deſcribed the Signs, by which a membranous Cataract may be diſtinguiſhed from that Sort produced by the Depravation of the Cryſtalline Humour; yet this Diſtinction is very neceſſary, to prevent the miſtaking one for the other in the Operation. The Diſtinction may be thus made: If it be a membranous Cataract, it will appear flat, and a Hollow may be ſometimes perceived in the Middle of it; whereas, in that produced by the Cryſtalline, if you look through the Hole of the Pupil, you may diſtinguiſh a lenticular Form, more elevated in its Middle, than in its Circumference.

It is not ſufficient to have deſcribed the Signs which ſhew the Maturity of a Cataract; it is likewiſe neceſſary to ſpeak of thoſe, by which we may be aſſured the Patients will ſee, after the Cataract is couched. Theſe Signs are taken from the Diſpoſition of the Eye, and the Nature of the Cataract. The firſt Point is to examine, whether the Organs of Viſion are ſound and well diſpoſed: This may be known by the Facility the Iris has of contracting and dilating, as we have already obſerved; for, if there be no Motion in the Iris, it is a certain Sign the Patient will not ſee, tho' the Cataract be couched, except it was occaſioned by a Blow which wounded the Iris; for then, if the Hand be placed between the Eye and the Light, the Patient ſees the Shadow of the Hand; and, when the Hand is withdrawn, if he perceives a certain Glaring of the Light, it is a Proof, that the Bottom of the Eye is ſound.

As to the prognoſtic Signs deduced from the Eye: In caſe the affected Eye be either bigger, or leſs, than the ſound Eye, it is a bad Sign; for the exceſſive Size of the Globe clearly ſhews, that whatever is extravaſated in the Eye, and has reduced it to that preternatural State, has likewiſe done Violence to the eſſential Parts of Viſion; and that the Eye is attacked with a Gutta Serena, through the Lengthening of its Nerves.

On the contrary, if the Globe be emaciated, it is alſo a bad Sign; for the Diminution of the Globe proves, that the nervous Parts have been moiſtened by a ſharp, ſaline Juice, which has decayed them, and intercepted the Courſe of the Spirits to the Eye. As to the prognoſtic Signs drawn from the Cataract, they are two-fold; ſome regard its Age, and ſome its different Colours.

With

With reſpect to the Age, we muſt obſerve, as the membranous Cataracts grow old, they become adherent, either to all the poſterior Parts of the Iris, or only to ſome Points of its Circumference. On this Difference depend the Changes which then happen to the Pupil; ſuch are certain preternatural Colours, or Wrinkles, which may be ſeen in it.

The Difficulty, or rather Impoſſibility, of deſtroying theſe Adherences, engaged ſeveral Oculiſts to lay the Operation entirely aſide, though it is very practicable, by cutting theſe Adherences with an edged Needle.

Let the Cataract of the Cryſtalline be ever ſo old, it never adheres to the Iris: Indeed, it comes ſo very near it, that it deſtroys almoſt all its Movement. Of whatever Age a Cataract be, the Operator may ſafely undertake to couch it, (tho' ſeveral Authors have aſſerted the Impoſſibility of Succeſs) provided he has Dexterity enough to cut the Fibres which oppoſe its Depreſſion, without damaging the Parts to which they adhere.

It does not ſeem improper to ſay ſomewhat of Barr'd Cataracts. We call that Sort a Barr'd Cataract, which has its Forepart croſs'd by one or more Fibres: Theſe Fibres are variouſly placed. As theſe Cataracts ſeldom attain to a Conſiſtence, which will admit of their being ſurely couch'd, there is often found in the Body of them a whitiſh, and ſometimes a yellowiſh Matter; which runs out inſtantly in the Operation, and, mixing with the aqueous Humour, renders it turbid. This Matter commonly acquires a certain Conſiſtence, and, remaining in the aqueous Humour, it obſtructs the Paſſage of the Rays of Light, as much as it did before it was couch'd: Then, if it does not fall ſpontaneouſly to the Bottom of the poſterior Chamber, a ſecond Operation, ſix Weeks after the firſt, is neceſſary, in order to depreſs this new Sort of Cataract, which then will have a Conſiſtence ſufficient to bear the ſecond Application of the Needle.

As to the Colours of Cataracts, I am convinced, from Experience, of whatever Colour they are, that the Operation always ſucceeds, provided they have the Signs of Maturity, and there is a good Diſpoſition of the Eye. It may, however, be obſerved, that, of all Colours, the Blue-grey ſucceeds beſt; thoſe of a Sky-colour'd White, thoſe of a ſhining Silver Colour, ſomewhat inclining to that of Window-glaſs, and the White, approaching that of Sea-water, are to be preferr'd, in the next Place. The Aſh-colour'd, thoſe of a leaden Colour, the Rediſh, or Cheſnut-colour'd, or thoſe of a ſnowy White, are difficult, and dubious in their Succeſs; as are likewiſe thoſe which have their Fore-part cover'd with Blood-veſſels.

The falſe Cataracts, in which the Operation ſerves only to remove the Deformity, are thoſe which are white, and like Plaiſter, or which reſemble white poliſh'd Ivory, or a Hail-ſtone.

Mr. *Sharp* differs, in ſome reſpects, from *St. Yves*, in his Sentiments relative to a Cataract. As this is a Subject of ſome Importance, it may be of ſome Service to the Reader to know wherein they diſagree, and wherein they are of the ſame Opinion.

The Mathematicians having obſerved, in thoſe who have been couch'd, that the Defect of Sight, remaining after the Operation, anſwers nearly to what, in Optics, the removing the cryſtalline Humour would occaſion, have endeavour'd to prove, that the Operation muſt, in conſequence, be the depreſſing that Humour, and leaving the Eye to perform its Function afterwards with the aqueous and vitreous Humours only; which, wanting the Denſity of that Humour, will not refract the Rays ſufficiently to re-unite them on the Retina; whence Patients, after their Cure, are obliged to uſe convex Glaſſes, as Subſtitutes for the depreſs'd cryſtalline Humour.

Petit, a moſt accurate Anatomiſt of *Paris*, has, from a critical Examination of the Figure of the Eye, argued againſt the Poſſibility of a Film's Exiſtence in the poſterior Chamber, by reaſon of the Smallneſs of that Chamber, or Proximity of the cryſtalline Humour to the Back of the Iris; and, again, from the Impracticability of diſlodging ſuch a Film, without offending the ſound cryſtalline Humour.

Laſtly, and what is more certain, Anatomiſts have frequently diſſected the Eyes of Perſons under this Diſorder, after their Death; and have found it to be always an Opacity of the cryſtalline Humour, agreeable to the Definition of a Glaucoma; ſo that, by conſequence, we muſt underſtand the Words *Cataract* and *Glaucoma* as ſynonymous Terms, ſince they are, in Fact, but one and the ſame Diſeaſe.

In deſcribing the Nature of a Cataract, it has been hitherto a poſitive Maxim, laid down by Oculiſts of every Nation, that there is one certain Stage of the Diſtemper, in which only the Operation is proper; and this State of the Diſeaſe is ſaid to be the Maturity of the Cataract. They have compared it to the Ripeneſs of Fruit, and have ſuppoſed a regular Change in the Conſiſtence of the cryſtalline Humour, from the Moment it is affected. They ſay the Diſeaſe, upon its firſt Invaſion, gradually liquefies the Humour; and that, after its Arrival to the utmoſt Period of Liquefaction, it then begins to acquire various Degrees of Tenacity, till at laſt it becomes perfectly hard, or, as they ſtyle it, horny: That the Skill of the Surgeon diſcovers itſelf by fixing on that Time for the Operation, in which the Fluidity of the Cataract is no Obſtacle to the Depreſſion of it, from its Want of Reſiſtance to the Needle, nor its Hardneſs, from the Elaſticity of its connecting Fibres, which, not being thoroughly broke, immediately return it to its former Poſition.

This, in a few Words, is the general Doctrine; but I think, the regular Alteration of the Denſity of the cryſtalline Humour is very much to be doubted; and, for my Part, I cannot help poſitively excepting to the Rule here laid down, having not only ſeen Cataracts, of twenty or thirty Years Growth, often, upon the Touch of the Needle, prove ſoft and milky, but alſo many Inſtances, in which a due Degree of Conſiſtence occurr'd after four or five Months, I may venture to ſay Days, when the Cataract was the Conſequence of a Blow or Puncture; both which Caſes ſo little correſpond with this ſuppoſed Change, that they ſeem not only to overthrow it, but to imply, that the Cataract, after it has acquir'd its total Degree of Opacity, may frequently, if not generally, continue in the ſame State of Tenacity to the Life's End. And tho' I will not take upon me to affirm, that Cataracts come always very early to their greateſt Conſiſtence, yet this we may ſafely deduce from theſe Obſervations, that, whenever they become entirely opaque, we may properly undertake the Operation; which has been my Method of Practice hitherto, nor do I find any Reaſon to lay it aſide.

Since, then, the Glaucoma is no other Diſeaſe than the Cataract, we muſt, at once, diſcard the Diſtinction of theſe two Diſtempers as merely imaginary; and, from what has been ſaid with regard to the Conſiſtence of a Cataract, that, whatever it be, the Removal of the Humour is the ſole End of the Operation, the Diſtinction of a true and falſe Cataract will appear equally frivolous, and conſequently moſt of the Subdiviſions compriſed under this laſt, ſuch as the Bag, the Milky, the Purulent, the Doubtful, the Membranous, the Fibrous, the Shaking, and many more in the Books on this Diſeaſe; the greateſt Part of which are Names that puzzle the Memory, without informing the Underſtanding, and, indeed, have not a ſufficient Foundation in Nature; but owe their Diverſity of Character more to the Imagination of Writers, than any real Variety in the Diſeaſe.

The general Criterion of the Fitneſs of Cataracts for the Operation is taken from their Colour: The Pearl-colour'd, and thoſe of the Colour of burniſh'd Iron, are eſteem'd proper to endure the Needle. The White are ſuppoſed milky, the Green and Yellow horny and incurable. The black Cataract is deſcrib'd by moſt Authors; but, I dare ſay, it has been miſtaken for a Gutta Serena, where, no Diſeaſe appearing, the Pupil ſeems black, as in a natural State of the Eye: And, as to the green one, I have not, as I remember, in a great Number of Cataracts, met with a ſingle Inſtance of it; but poſſibly it may be in Nature; and one would, indeed, imagine the Deſcribers of it could not be miſtaken, in what muſt have been ſo evident.

The Depreſſion of a Cataract, of any Colour, would be the Cure, if that alone was the Diſtemper of the Eye; but it generally happens, that the yellow ones adhere to the Iris ſo firmly as to become immoveable: Beſides, when they follow in conſequence of a Blow, which is often the Caſe, either the Cells of the vitreous Humours are ſo much diſturb'd and broken, or the Retina affected, that a great deal of Blindneſs will remain, though the Cataract be depreſs'd, and that one Cauſe removed.

To judge whether the Cataract adheres to the Iris, if you cannot at once diſtinguiſh it by your Sight, ſhut the Patient's Eye, and rub the Lids a little; then, ſuddenly opening it, you will perceive the Pupil contract, if the cryſtalline Humour does not prevent the Action by its Adheſion: And when this is the Caſe, in any Kind of Cataract, the Operation can hardly be adviſed; tho' I once did it, with Succeſs, on a Perſon who had been blind thirty Years. It is the only Trial I ever made on a Cataract I ever knew to be adherent; and I ſhould not have been tempted then, but that it look'd very firm, and I thought the Adheſion ſlight, as in Fact it proved.

Another Conſideration of the greateſt Moment, before undertaking the Cure, is to be aſſured of the right State of the Tunica Retina, which is very readily learnt, where there is no Adheſion of the Cataract, from the Light falling between the Iris and cryſtalline Humour; which, if the Eye is not ſenſible of it, is a certain Indication of another Malady, and abſolutely forbids the Operation. Generally this Cataract takes its Riſe from Head-achs, Convulſions, and nervous Diſorders.

The Operation of the milky Cataract has been, by ſome Writers, falſly ſaid never to ſucceed. Of this there are two Sorts, ſome which are almoſt uniformly ſoft, and admit the Needle thro' them as thro' Water, conſequently are immoveable; and others where the Humour is liquefied, and contain'd in its own Membrane, now pretty much thicken'd by the Diſeaſe, which laſt frequently does well; for, upon breaking the Membrane, the Fluid burſts out, and precipitates; and the

Membrane

Membrane itſelf, if it is not depreſs'd, in Proceſs of Time, ſhrinks into a ſmall Compaſs, or waſtes quite away.

Whether the whole Cataract, after its ſubſiding, continues to lie at the Bottom of the Eye, or is quite waſted by being ſeparated from its Veſſels, I have never had an Opportunity of knowing poſitively, by diſſecting one that has been couch'd; but, by what we ſee of thoſe, that have not been totally depreſs'd below the Pupil, and continue in that State for ever after, we may ſuppoſe, that they only waſte a little. I know one Inſtance of a Woman, whoſe Cataract, after couching, became quite looſe in the Eye, and, in an erect Poſture, ſunk to the Bottom; but, by ſtooping the Head forward, ſhe could bring it quite over the Pupil. *Sharp.*

Of what is to be done before the Operation of the Cataract.

As I have deſcrib'd the Nature of a Cataract, its different Cauſes, the Signs of its Maturity, and thoſe which foretel the Succeſs of the Operation, it now remains to examine, whether the Patient be in a Condition to undergo the Operation; for, if he has a Head-ach, Fever, or any other Diſorder, they muſt be remedied before it. Above all, you muſt avoid undertaking it too ſoon; for ſome Cataracts are four Years, others five, before they are full ripe. The Misfortune is, Perſons afflicted with this Diſeaſe are deſirous to ſee, and have not Patience to wait ſo long a Time. There are likewiſe Operators, who, for the ſordid Love of Money, couch them as they find them, ripe or not ripe. They flatter the poor Patients with the Hopes of reſtoring their Sight ſpeedily: Theſe are eaſily ſeduced by the pleaſing Bait; and the Deſire of Gain prevails with the Operator, who prefers his preſent Intereſt to his future Reputation, and hazards a doubtful Operation, leſt he ſhould loſe his preſent Practice.

A Cataract is like a Fruit which muſt be ſuffer'd to ripen on the Tree: If it be gather'd, before it is ripe, the Stalk muſt be broke; but, when it is full ripe, it is eaſily pluck'd from the Tree, and ſometimes falls of its own Accord. If the Operation be anticipated, or perform'd before the Cataract is full ripe, the Needle either paſſes without Succeſs through the Body, which is to be depreſs'd, by reaſon of its Softneſs, or the Ciliar Fibres are not dry enough to be broke with Eaſe by the Needle, ſo that they are forcibly tore: This violent Motion is communicated to the reſt of the Eye, and brings on a terrible Inflammation, which often deſtroys the Sight. Tho' this Accident ſhould not happen, we are ſtill oblig'd to a ſecond Operation, in order to depreſs what remain'd after the firſt. The Operation for the Cataract is of ſome Importance, and may have fatal Conſequences. Its Succeſs requires a great Dexterity in the Operator, and an entire State of Mind and Body in the Patient: He muſt be prepared, before the Operation, by Bleeding, Bathing, cooling Broths, and gentle Purges.

The moſt temperate Weather muſt be choſe, as the Spring and Autumn Seaſons; but the Spring is preferable, becauſe a fine Seaſon follows, which is otherwiſe with reſpect to Autumn. I know this Operation may be perform'd at any Time of the Year; but the Time I propoſe is always the moſt convenient for the Patients.

A fine ſerene Day muſt be choſen; for moiſt Weather is bad for the Patients, the Glandula Lacrymalis then furniſhing a great Diſcharge of Seroſity, which draws very obſtinate Defluxions to the Eye.

Thunder is likewiſe very prejudicial, in the firſt Days of the Operation, on account of the violent Emotion it excites in the Humours of the Eye.

Of the Manner of performing the Operation for the Cataract.

All the before-mention'd Precautions being obſerved, the well Eye muſt be cover'd with a Compreſs, kept on by a ſimple Bandage: Let the Patient be placed fronting the Light; the Operator muſt be ſeated directly before him, and ſomewhat higher. They muſt be both ſo placed, that the Head of the Operator may not ſhade the Eye which has the Cataract: Let him put the Patient's Legs between his own, in order to be very near him; let an Aſſiſtant, placed behind the Patient, lay his Left Hand on his Head, and his Right under his Chin (ſuppoſing the Operation is to be perform'd on the Left Eye); then, leaning the Patient's Head on his Breaſt, let him hold it firm, that the Patient may not give it any Motion. Let the Operator raiſe the upper Eye-lid with the Fore-finger of his Left Hand, and let him keep the lower Lid down with his Thumb; then let him take his Cataract-needle, which muſt be flat and edged, for Reaſons to be given hereafter; let him hold it in his Right Hand, almoſt in the ſame manner a Writing-pen is held, ſo that his middle Finger may bear on that Part which is diſtant, about a Finger's Breadth from the End of the Handle. Afterwards let him lay his Ring Finger and his little Finger on the Temple of that Side he is to operate on, deſiring the Patient to turn that Eye towards his Noſe; then let him make his Puncture in the White of that Eye, about half, or, at moſt, a Line's Diſtance from the Cornea Tranſparent, avoiding the Blood-veſſels on the Conjunctiva, and turning the Point of the Needle from the Iris, to hinder its being injured. As ſoon as the Point of the Needle, which ought to enter horizontally, on account of its double Edge, has pierced the Membranes, let him direct it ſtrait towards the back Part of the Cataract, without turning his Needle round. He muſt then puſh it forwards, till the Point arrives beyond the Middle of the Pupil, which may be known by preſſing the back Part of the Body of the Cataract with the Point of the Needle: And, to avoid damaging the Membrane of the vitreous Humour, he muſt likewiſe direct the Point of his Needle towards the Body of the Cataract. Afterwards let him raiſe the Point of his Needle to the upper Part of the Cataract, which he muſt gently depreſs below the Pupil, as near as he can to the back Part of the Iris. He muſt then raiſe his Needle, without drawing it out; and, to be aſſured, that all the Inſertions of the Cataract are deſtroy'd, let the Patient cough, and, if the Cataract ſprings up again, it muſt be inſtantly depreſs'd; if it does not riſe again, let him turn the Point of his Needle down, and preſs once more on the Body of the Cataract, avoiding pricking the Membrane of the vitreous Humour; for, if this Humour ſhould be looſed, the Loſs of Sight may enſue. Let him cloſe the Eye-lids, and draw out his Needle gently.

If the Operation is to be perform'd on the Right Side, the Left Hand muſt be uſed. The Aſſiſtant muſt likewiſe place his Hands in a Manner contrary to that we have deſcrib'd.

When the Operation is finiſh'd, let a Compreſs be wetted in a Mixture of common Water, juſt warm'd, ten Parts, Spirit of Wine, one Part; let the Compreſs be ſqueez'd, that ſome of this Mixture may drop on the Puncture: Let the Compreſs, and another over it, be laid to the Eye. The ſound Eye muſt be dreſs'd in the ſame manner. Theſe Compreſſes muſt be kept on by a ſimple Bandage, which muſt lie only on the upper Part of the Compreſs which is on the Eye-brows. Let the two Ends of the Rollers be pinn'd to the Patient's Night-cap.

The Patient muſt be put to Bed, with two or three Pillows at his Back, to keep him raiſed, and, as it were, ſitting up. The Bed-curtains, Window-curtains, and Window-ſhutters, muſt be ſhut, to hinder the leaſt Light from coming into the Room: He muſt be left quiet, neither muſt he ſpeak to any one. The Compreſſes muſt be ſprinkled, every Hour, with the ſame Mixture warm'd; and, at this Time, the Light muſt be placed behind the Patient, ſo that it may not affect his Eyes. Three Hours after the Operation, let him take Broth; and, three Hours after the Broth, let him loſe ſome Blood. For three Days he muſt live after this manner, taking Broth every three Hours. About the fourth Day he may eat a ſtronger Soop, and continue it to the ſeventh or eighth Day, when he may be allow'd to return to Meat.

The Compreſſes muſt be taken off the Eye Morning and Evening; and ſome of the Mixture of Water and Spirit of Wine, warm'd, muſt be put into the Eye. About the fifth Day, the Dreſſing may be removed from the Eye which was not couch'd, provided no Accident has happen'd to the other: If the Patient can ſee with that Eye, let a dry Compreſs be laid to it for five Days; but, if he cannot ſee with it, let it be expoſed to the Air, without applying any thing to it.

Nine Days after the Operation, the Eye, which was couch'd, may be cover'd with a dry Compreſs, pinn'd to the Cap. That the Eye may be accuſtom'd to receive the Light under the Compreſs, a ſmall Light muſt be admitted into the Patient's Chamber, ſuch as may ſuffice for People to ſee each other; and the Eye muſt be habituated gradually to the Light.

Some Perſons cannot remain lying on their Backs: In this Caſe, I have them placed, with their Feet raiſed on a Stool, in an eaſy Chair, ſurrounded with Curtains, and there they remain four or five Days: Then I order them to lie down, when they can keep in Bed, letting them ſit up, or lie down, as they find themſelves wearied by the ſame Situation. Some are ſo heated by lying on their Backs, that, were they kept long ſo, they would have a Fever, which might draw fatal Defluxions to the Eye; for which Reaſon, I deſire them to riſe in four-and-twenty Hours, and order them to be placed in an eaſy Chair by their Bed-ſide, with the Bed-curtains drawn round them. Care muſt be had, in lifting them up and down, that they always keep their Head raiſed, and that they make no Efforts in theſe Removals.

The Needles, for the Operation of the Cataract, are different; they are either flat or round. The flat ones enter better, and with more Eaſe, into the Eye. Some would have them edged, like thoſe which Surgeons uſe. I have invented a very convenient Sort; their Point is like that of a Lancet; their Edge is not above the Length of a Line, from whence it ceaſes to be flat, and becomes round. The Point muſt make the Aperture as wide as is neceſſary, for the Needle to be puſh'd forwards, or drawn back, in the Orifice, without any Impediment from the Membranes, as we are ſometimes oblig'd to do, in order to depreſs ſome Parts of the Cataract, which lie more or leſs remote in the Eye.

Of the Manner of Operating, when the Cataract lies in the Chamber of the aqueous Humour.

When a Cataract has paſs'd into the anterior Chamber of the aqueous Humour, a particular Operation muſt be perform'd; but, before I explain the Method of doing it, I ſhall ſhew by what means a Cataract may paſs thro' the Hole of the Pupil, and be lodged between the Iris and the Cornea Tranſparent.

Three Sorts of Cataracts paſs thro' the Hole of the Pupil: In the firſt, the Conſiſtence of the Cryſtalline is ſoft; in the ſecond, it is hard and concreted, like a Stone; in the third, it is partly ſoft, and partly petrified. When it is ſoft, the aqueous Humour, which lies behind this Body, thruſts it forwards, and fixes it in the Pupil, after the Manner I have deſcrib'd, when I treated of Cataracts in general: But, when this Body is hard, as in the ſhaking Cataract, it paſſes at once thro' the Hole of the Pupil, upon the leaſt Effort made in bending the Head, for Inſtance, in blowing a Fire, *&c.* This laſt Caſe may happen in a Cataract which has been couch'd three or four Years.

When you deſign to perform this Operation, to draw out the Cryſtalline which has paſs'd in the foregoing manner, the Patient muſt be ſeated in a Chair, with his Eye fronting the Light: Open both his Eyelids, with your Thumb and Fore-finger; then, with a ſharp-edged Lancet, divide the Cornea Tranſparent, a little below the Middle of the Pupil. You muſt continue your Inciſion tranſverſly, from one Side of the Cornea to the other, in ſuch a manner, that you do not leave, of each Side, above half a Line's Breadth of the Cornea Tranſparent undivided. Then introduce a fine ſmall Scoop thro' the Orifice, convey it behind the Cryſtalline, and, with it, draw out that Humour thro' the Inciſion made in the Cornea. Lay a Compreſs, moiſten'd with ſome proper Defenſative, to the Patient's Eye, and dreſs the Eye, as in a true Cataract: Afterwards let the Patient be carried to his Bed, and laid on his Back. His Head muſt be raiſed a little. The next Day you will find the Wound cicatrize, and form a Scar no broader than a Hair. Altho' I have perform'd many of theſe Operations, I ſhall, however, confine myſelf to three Examples, one of each Sort of Cataract which is lodged in the anterior Chamber of the Eye.

The firſt was in the Year 1707. in the Preſence of M. *Mery*, a Member of the Royal Academy of Sciences: I perform'd it on a Merchant of *Sedan*; he came to *Paris*, on account of a ſhaking Cataract, which had paſſed, thro' the Hole of the Pupil, into the anterior Chamber of the aqueous Humour. The Cataract, by preſſing very much the Iris, occaſion'd violent Pains in his Head, attended with want of Sleep, for three Months before. At that Time I never had heard of the like Operation; but, reflecting that I often open'd the Cornea, to diſcharge the Matter of an Abſceſs lodg'd behind it, I concluded I might ſafely do the ſame, on account of a ſolid Body; and I operated in the ſame Manner. The Body which I drew out of the Eye altogether reſembled Plaiſter: I order'd the Patient to lie on his Back: The next Day I return'd thither, along with M. *Mery*; and we were inform'd, that the Patient ſlept very well, which he had not done for a long time before. The Wound was cicatrized, and the aqueous Humour, which had run out in the Operation, was entirely repair'd.

The ſecond Caſe was in the Year 1708. M. *Petit*, a famous Surgeon, and now a Member of the Royal Academy of Sciences, perform'd the Operation on a Prieſt. His Cryſtalline, upon ſome Effort he had made, ſome Years after the Couching of a Cataract, had paſs'd thro' the Hole of the Pupil, and was lodg'd between the Iris and the Cornea Tranſparent. M. *Petit*, who had this Prieſt under his Care, deſir'd me to be preſent at the Operation; at which M. *Mery* aſſiſted likewiſe. M. *Petit* made a Puncture in the Cornea with his Needle, then ſlit it with his Lancet, and took out the Body thro' the Aperture. It was found to be the Cryſtalline. The Prieſt was, ſoon after, perfectly cur'd. I met him in *Paris* a Year after the Operation, and have ſeen him read very well with Cataract-ſpectacles. This Fact, tho' related to the Academy of Sciences, was, however, conteſted by M. *Woolhouſe*, who pretended, in one of his Writings, that the Prieſt abſconded, leſt he ſhould be ſeen and examin'd by him. I hope he will excuſe my citing his Name; for I think myſelf oblig'd to juſtify the Truth, as being one of the ocular Witneſſes of this Operation. M. *Mery* had this, and the preceding Caſe, inſerted in the Memoirs of the Royal Academy of Sciences for thoſe Years.

My third Experiment was in the Year 1716. on a poor Man living in the Suburbs of *St. Germain Rue Caſſette*: He had receiv'd a Hurt in his Eye, the Cryſtalline was loos'd, and had paſs'd thro' the Hole of the Pupil, between the Iris and the Cornea Tranſparent. I made an Aperture in the Cornea, thro' which I drew out this Body, which was partly like the White of an Egg, and partly concreted, like a Stone; it adher'd to the Cornea; I cut the Adherency, and took out the Cryſtalline, which held by one of the longer ciliary Fibres, which I cut with my Sciſſars as low as poſſible. The Operation ſucceeded perfectly, and the Patient was ſoon cur'd.

How to prevent the Accidents which attend the Operation of the CATARACT.

It muſt not be ſuppos'd, that this Operation is always perform'd without any bad Accidents, whether they ariſe from the Difficulty of depreſſing the Cataract, or from ſome Motion the Patient gives his Eyes, in the time of the Operation. There are, it is true, ſome Operations, in which a ſlight Preſſure, with the Flat of the Needle, on the Body of the Cataract, ſeparates the ſame, and it falls almoſt of its own accord, as a Nut full ripe, which is eaſily ſeparated from its Huſk. There are likewiſe ſome Operations liable to very great Difficulties. The firſt Caution is, to prevent the Extravaſation of Blood; for, as the Needle is introduc'd, ſome of the Veſſels ſpread on the Conjunctiva may eaſily be open'd. This Blood ſlides into the anterior Chamber, mixes with the aqueous Humour, and renders it turbid: This makes the Operation more difficult to the Operator.

When this Accident happens, you muſt endeavour, with all Speed, to depreſs the Cataract, before the Blood has fill'd all the Chamber: In which Caſe you muſt withdraw your Needle, and leave off working at that time, leſt you ſhould damage the Patient's Eye, by operating when you cannot ſee into it.

The ſecond Difficulty is, when the Cataract is of that Species call'd a milky or cheeſy Cataract; for the Needle paſſes eaſily thro' it, and divides the Body of the Cataract into ſeveral Parts of a different Conſiſtence: If theſe Parts are ſolid enough, they may be depreſs'd by moving the Needle, and preſſing them down gently; but if theſe Parts are too ſoft, you muſt lay aſide the Operation, leſt, by over-fatiguing the Eye, you bring on other bad Symptoms. This ſecond Inconvenience always occurs, when the Cataracts are not full ripe. I have couch'd, with Succeſs, Cartaracts of five-and-twenty Years ſtanding. This proves the Miſtake of ſome Oculiſts, who tell their Patients, in order to engage them to undergo the Operation before they are full ripe, that, if they wait any longer, their Cataract will become adherent, and then it cannot be couch'd: A bad Precaution, which has render'd the Operation uſeleſs to many Patients!

The third Difficulty is, when, in couching the Cataract, nothing is found, but a Cyſtis fill'd with Matter; as ſoon as the Needle preſſes this Cyſtis, it opens, and diſcharges into the aqueous Humour a whitiſh Pus, which dims it, and hinders the Operator from ſeeing the Membrane which inclos'd this Matter, ſo that he cannot finiſh the Operation. He muſt, notwithſtanding, move his Needle in the ſame manner as if he had a Cataract to couch; and he muſt endeavour to place the Cyſtis below the Pupil. Tho' the Patient cannot ſee clearly, let him draw out his Needle. The more ſolid Part of the Matter falls to the lower Part of the Eye; the more fluid Part reproduces a ſort of Membrane, which adheres to the poſterior Circumference of the Iris, about the Place where the Iris joins the Choroides. Six Weeks, or two Months after, a ſecond Operation is to be perform'd, in order to depreſs it; then the Patients can ſee again.

I perform'd two ſuch Operations on both the Eyes of Father *Saunnier*, a Canon Regular of *St. Genevieve*. The firſt was in the Year 1713. ſome Days after *Eaſter*; in that Eye I depreſs'd the Cyſtis, which contain'd a purulent Matter. A great Quantity of whitiſh Matter was diſcharg'd into the aqueous Humour, and obſcur'd it: This, however, did not hinder me from depreſſing the ſolid Body which inclos'd the Matter. This purulent Matter became more ſolid, and form'd a ſort of fine Membrane. Six Weeks after I couch'd his Eye a ſecond time, and the Patient ſaw very well after this ſecond Operation. I perform'd my ſecond Operation in the Year 1715. for, as I met with this Accident in the former, I was in hopes, that, by delaying the Operation for two Years, the Cataract would acquire more Solidity: The ſame thing, however, happen'd in the Operation; and I was oblig'd to perform a ſecond Operation, which had likewiſe very good Succeſs.

We may infer, from what has now been obſerv'd, that, in deferring the Operation in this Species of Cataract, we muſt not wait till they come to a full Ripeneſs. After the firſt Operation the fluid Part, which was extravaſated in the aqueous Humour, forms a ſort of Membrane, which we are oblig'd to depreſs ſix Weeks after.

The fourth Difficulty is, when, in depreſſing a Cataract, it enters into the anterior Chamber of the Eye, paſſing through the Hole of the Pupil. This happen'd to me, in an Operation I perform'd on a Woman in the *Rue St. Honore*: Mr. *Petit* aſſiſted. As ſoon as I preſſed the Cataract with my Needle, a glutinous Matter empty'd itſelf into the aqueous Humour, and was carry'd, with great Violence, into the anterior Chamber of the Eye, between the Iris and the Cornea Tranſparent. I continu'd to operate as long as I could; but not being able to bring back the glutinous Matter which had flow'd into the anterior Chamber, I was forc'd to draw out my Needle. Some Months after, all that Matter, which had ſubſided between the Iris and the Cornea Tranſparent, repaſs'd thro' the Hole of the Pupil into the poſterior Chamber; and, in ſome time after, all that fluid

Part was ſunk below the back Part of the Iris; then the Patient could ſee clear, tho' ſhe had not immediately after the Operation.

Whatever paſſes, during the Operation, thro' the Hole of the Pupil, if it be of ſufficient Solidity, the Point of the Needle, which is already in the Eye, muſt be puſh'd thro' the Hole of the Pupil, without touching the Iris; then pierce that Body of the Cataract with the Point of your Needle, bring it back to the poſterior Chamber, and lay it where it is uſually plac'd.

A fifth Difficulty occurs, when the Cataract adheres to certain Filaments, and ſprings up again, after it is depreſs'd, as ſoon as the Needle is raiſed, and returns to its firſt Place. When this happens, you muſt raiſe your Needle a little, pierce the Body of the Cataract with it, and puſh it to the Side oppoſite to the Puncture. By this Method, the Filaments, on that Side the Needle enters, are broke, and the Cataract is depreſs'd: Neither can it riſe again; for the few remaining Filaments, which adhere on the oppoſite Side to the Body of the Cataract, have not Strength ſufficient to raiſe it, nor to reſiſt the Weight of the Cataract, which draws them down.

The Caſe, now related, happens often in the Operation; for, when the Needle preſſes the Cataract, the Filaments, to which its upper Part adheres, break eaſily, whilſt thoſe on both Sides only give way; ſo that, as ſoon as the Needle ceaſes to preſs down the Cataract, it riſes by means of theſe lateral Filaments, which at firſt had only given way: Wherefore, as I have already obſerved, when you pierce the Body of the Cataract, puſh it as far as you can to the oppoſite Side, afterwards preſs it down, then bring it towards the Puncture, not drawing back your Needle, but raiſe the Handle of it, ſo that the Point, which is in the Body of the Cataract, may reduce it below the Pupil, where it ſhould be plac'd.

It happens ſometimes, when the Needle is raiſed, that the Body of the Cataract ſticks to its Point: In this Caſe turn the Point down, and raiſe a little your two Fingers, which reſt upon the Temple, and give a light dextrous Blow with them on the Temple: As this cauſes a Shaking in the Needle, it makes the Body, which hangs to it, fall off its Point.

It muſt be obſerv'd, that all theſe Adherences of the Cataract, which render it ſo difficult to be couch'd, are ſome ciliary Fibres adhering to the Iris, and to the Membrane which covers the Cryſtalline; they are call'd, by M. *Antoine*, the *Concomitants of a Cataract*.

As to the manner of breaking to Pieces, and, as it were, mincing a Cataract with the Needle, this is a very pernicious Method, and never to be practis'd, but when you are miſtaken in the Maturity of the Cataract.

The foregoing Diſcourſe ſhews this Operation is not eaſy to be perform'd; it requires a ſteady light Hand; the Operator muſt be prudent, and cautiouſly reſolute; beſides knowing how to depreſs the Cataract, he muſt likewiſe have Skill to handle his Needle, according to the various Accidents which may occur; for, of twenty Cataracts which one may couch, two ſhall ſcarce be found entirely alike.

When the Needle is in the Eye, Care muſt be had not to draw it with Violence forwards; for that Motion damages the Parts of the Bottom of the Eye, and cauſes very great Defluxions. The Operator muſt be very attentive to the different Motions the Patients ſometimes give their Eyes, in order to guide his Needle according to theſe Motions; otherwiſe he may pierce the Iris, cut the Fibres of its Circumference, and, in a Word, deſtroy the Patient's Eye.

Thoſe Gentlemen who admit only of membranous Cataracts, ſay it is of great Conſequence to know the exact Seat of the Cataract: They aſſert likewiſe, that thoſe who are of a contrary Opinion, damage the ſound Cryſtalline, when they introduce the Needle to perform the Operation, and that the Patient's Sight is in great Danger of being loſt. To this I anſwer, firſt, That we very ſeldom meet with membranous Cataracts; and, of a hundred one may couch, there ſhall hardly be found one or two without an Alteration of the Cryſtalline. In the ſecond Place, if the Method I propos'd, to introduce the Needle into the Eye, be follow'd, it is impoſſible to prick the Cryſtalline, unleſs it be alter'd, or to damage the vitreous Humour, and of conſequence, to do any Injury to the Eye; for the Needle is introduc'd upon the Aponeuroſes of the Muſcles, at a ſmall Diſtance from the Cornea Tranſparent; and, as ſoon as it has pierc'd the Membranes, the Handle of the Needle is turn'd towards the little Angle: By this Method the Point of the Needle bears directly behind the Cataract, without coming near the Cryſtalline, unleſs it be diſtemper'd. Hence I conclude, whether the Cataract be membranous, or not, it does not concern the Operator, whilſt he directs his Needle in the Manner I have already deſcrib'd; for the Eye is in no Danger, as thoſe Gentlemen pretend, who allow only of membranous Cataracts.

Having explain'd all the Accidents which happen during the Operation for the Cataract, I muſt ſubjoin a Word or two concerning thoſe Cataracts which are ſubject to become membranous: I find three Sorts of them, the *milky*, the *cheeſy*, and the *purulent*.

The milky Cataract contains a Body partly ſolid, partly fluid. The firſt is eaſily depreſs'd by the Operation, but the Needle paſſes thro' the fluid Part, which often forms a new Pellicle, which muſt be depreſs'd by a ſecond Operation, when it has acquir'd ſufficient Solidity. As the Parts of the cheeſy Cataract are more ſolid, the Operation is more ſucceſsful than in the preceding; but they are both unripe Fruits. If there remains any fluid Part, which does not yield to the Needle, it will generate a Membrane, as the foregoing.

The third Species is a purulent Cataract; for, as I have already obſerv'd, when the Needle preſſes it, in order to couch it, a great Quantity of purulent Matter diſcharges itſelf into the aqueous Humour: This Matter is of a whitiſh or yellowiſh Colour; neither is the Cryſtalline to be found in its proper Coat. This Sort of Cataract never comes to full Maturity.

Of the Means to remedy the Accidents ſubſequent to the Operation for the CATARACT.

The firſt Accident which follows the Operation for the Cataract is, the Extravaſation of Blood; for, as the Needle is introduc'd, ſome Blood-veſſels are prick'd: This Blood flows into the anterior Chamber, there ſtagnates, and dims the aqueous Humour. In order to diſperſe it ſpeedily, bleed a Pigeon under the Wing, and drop ſome of the Blood into the Eye upon which the Operation is perform'd: This muſt be continu'd three Days, Morning and Evening: You muſt likewiſe take care to bathe the Eye with Water and Spirit of Wine, applying Compreſſes, wetted in the ſame, to the Eye. I prefer this Mixture of Water and Spirit of Wine to a Collyrium made of Plantain and Roſe-waters, with the White of an Egg and Alum; for Compreſſes, wetted in this Collyrium, grow hard and uneaſy to the Eye, whereas they are always ſoftiſh, when moiſten'd in the firſt.

The ſecond Accident is the Weeping, or Flux of Seroſity, furniſh'd to the Eye, after the Operation, by the Glandula Lachrymalis. This Accident is more or leſs dangerous, according to the Nature of this Seroſity; for, if it be ſharp, it brings on a Defluxion, ſometimes very violent, with ſevere Pains in the Head, on the Side on which the Operation was perform'd: Theſe Pains ſeem to be fixed in the Dura Mater, by the Place which the Patient complains of, which is, all along the inner Part of the Os Parietale, beginning towards the Sutura Coronalis.

I have a long time ſearch'd after the Cauſe of ſo acute a Pain in this Place; the moſt probable which occur'd to me is, the Continuity of the Nerves of the Eye to the before-mention'd Parts, by which the Inflammation is communicated to this Membrane. To prove my Aſſertion, I ſay the ſame Accidents happen in violent Ophthalmies; hence I infer it is no Fault of the Operation, as ſome pretend, who ſuppoſe theſe Pains proceed from ſome Nerves being prick'd by the Needle. Were it ſo, this Accident would not happen in other Defluxions of the Eyes, which are not caus'd by any Operation or Puncture.

When this Accident is attended with a Pulſation in the Ear, ſuch as the Pulſation of an Artery, it is a certain Sign, that the Wound cauſed by the Puncture ſuppurates inwardly, inſtead of ſuppurating in the outward Parts of the Eye. In this Caſe the Conjunctiva and the common Membrane, together with the Eyelids, are tumefy'd, and advance between the Eyelids, ſometimes to the Thickneſs of one's little Finger. If this Eminence be pale, it is cauſed by a Seroſity, and may eaſily be diſperſed by ſcarifying it with a Lancet. If the Tumor be red, it proceeds from an Infarction in the Blood-veſſels, which ſuppurates in the Interſtices of the Membranes of the Globe, and afterwards fixes between the Iris and the Cornea Tranſparent.

As ſoon as the Flux appears, the Patient muſt be let Blood in the Arm, in the Neck, or Foot, if requiſite; Leeches muſt be applied about the Eye, and to the Temples; a Bliſtering-plaiſter muſt be laid to the Nape of the Neck: All this muſt be done with the greateſt Diſpatch, in order to prevent the Suppuration and entire Loſs of the Eye.

The third Accident after the Operation is, when there is an inveterate Defluxion, and the Hairs of the lower Eyelids are revers'd; for, as the Operation requires the Patient's Eye ſhould be kept cover'd a long time, the Skin of the Eyelid is relax'd, by which means the Cartilage is turn'd inwards: Then the Diſeaſe call'd Trichiaſis enſues, which is the Inverſion of the Cartilage of the Eyelids, ſo that the Points of the Eyelaſhes bear upon the Conjunctiva and the Cornea Tranſparent; the continual Friction of the Eyelaſhes brings on Defluxions, and produces obſtinate Ulcers in theſe Membranes, if not prevented by the following Remedies. I ſhall relate one Example:

M. *de St. Leon*, Major of *Bauchain*, came to me in the Month of *July* 1718. and had undergone the Couching of a Cataract in the Month of *October* 1717. He had a violent Defluxion with Ulcers on his Eye, and acute Pains in the upper Part of his Head, above the Eye, and in his Temple, on the Side where the Operation had been perform'd.

I began by bleeding him; afterwards I apply'd, to the Nape of his Neck, the potential Cautery pulveriz'd, and in a ſufficient

Quantity,

Quantity, to make an Eſchar the Breadth of a Crown-piece. I kept this Ulcer open two Months; and, as he was of an hot Conſtitution, I ordered him to drink the Mineral Waters of *Paſſy* for eighteen Days. I performed the Operation of the Trichiaſis. After the Operation, the Eye-laſhes ceaſed to fret the Eye, the Fluxion and Pains in the Head went off; in ſhort, he was ſo well cured, in two Months time, that he could ſee again with his Eye, which he had not done for ten Months before.

The fourth Accident is, when, after the Cataract has been couched, it ſprings up again, either whole, or only a Part of it. In the firſt Caſe, provided the Cataract, when couched, was full ripe, it falls down ſpontaneouſly; but, if only a Part of the Cataract was fluid, it adheres to the back Part of the Iris, and will not ſubſide, without a ſecond Operation.

Sometimes no Part of the Cataract riſes up; but very often the Patients can ſee, at firſt, after the Operation; their Sight continues the ſame to the twelfth or fifteenth Day; afterwards it decreaſes, and the Patients complain they ſee Filaments, or Threads, paſs before their Eyes. The Reaſon of this is, that in depreſſing the Cataract, it was ſeparated either at the Middle, or at the Extremity, of the ciliary Fibres, on the Side they are joined to the Membrane of the Cryſtalline. As theſe Fibres are inſerted in the great Circumference of the Iris, whence they have their Origin, and, uniting together behind the Hole of the Pupil, they preſent theſe Threads to the Patient's Sight, which is partly diminiſhed by them; neither can he ſee, as well as he ſhould, after the Couching; the Operator, not perceiving this, at firſt, thinks his Operation well performed, as it really is, with regard to him. In all theſe Caſes, where any Part of the Cataract remains behind the Pupil, if the Sight be much weakened by it, a ſecond Operation is neceſſary, in order to depreſs that Part. This ſecond Operation is more dangerous and painful than the firſt; becauſe the Pellicle, formed by the remaining Part of the Cataract, adheres to the back Part of the Iris, ſometimes by two or three Filaments, which muſt be cut. This requires the greateſt Dexterity; for theſe Inſertions commonly bend, and give way to the Needle; ſo that as ſoon as the Needle is raiſed, the Pellicle ſprings up, and returns to its firſt Place. We are often obliged to puſh this Pellicle with the Needle, thro' the Hole of the Pupil, into the anterior Chamber, there to pierce it, and from thence bring it back into the poſterior, ſtill puſhing it towards the great Angle. In ſhort, the ſame Movements of the Needle muſt be obſerved, which were deſcribed, when we treated of that Species of Cataract which riſes upon being depreſs'd.

The fifth Accident, which follows the Operation of the Cataract, is incurable, becauſe the Sight is loſt. It proceeds from a Defluxion which falls on the Optic Nerve and the inner Membranes of the Eye; then the Parts grow dry and decay, as appears evidently from the Contraction of the Pupil, and from the Patient's not ſeeing the Light. *Saint-Yves.*

Sometimes a Cataract, which the *Greeks* call *Hypochyſis*, ὑπόχυσις, forms itſelf before the Pupil of the Eye, the Part by which it diſcerns Objects; which Diſorder, when grown mature and inveterate, muſt be removed by manual Operation. Sometimes a Cataract, in its Beginning, as is evident from certain Obſervations, is diſcuſs'd by medicinal Remedies, as by Bleeding in the Forehead or Noſtrils, cauterizing the Veins in the Temples, Apophlegmatiſms, Suffumigations, and anointing the Eyes with acrid Medicines. The moſt proper Diet for the Patient is ſuch as attenuates Phlegm. *Celſus, Lib.* 6. *Cap.* 6.

I look upon this Advice of *Celſus* to be the more worthy of Notice, as few among the Moderns, except *Heiſter*, have paid ſo much Regard to it as it ſeems to deſerve. It is not eaſy to conceive how the Humours of the Eye ſhould be able to preſerve their Tranſparency for many Years, as we find they do, unleſs they were, like other Parts of the Body, perpetually ſupply'd with proper Juices from Veſſels deſtin'd to their Service; and if this is the Caſe, the adventitious Opacity of the Cryſtalline, or any other Humour, muſt ariſe from ſome Defect in thoſe Juices, or perhaps from the Veſſels which ſhould ſupply them being render'd impervious, or being turgid, and too much diſtended with Juices improper for affording the requiſite Supply. In a recent Cataract, therefore, or where there is only a Tendency to one, whatever is capable of attenuating the Juices, of unloading the diſtended Veſſels, and of deriving a Portion of their Juices to diſtant Parts of the Body, appears to be capable of doing conſiderable Service, however little they are to be depended on in a confirm'd Cataract. Reaſoning, in Phyſic, is of ſome Importance, when ſupported by Experience, however little it is to be regarded without this Touchſtone of Truth. The Experience of *Celſus* is greatly in favour of what I have ſaid; and I think I can affirm from my own, that I have known Cataracts at leaſt prevented, by Treatment not much unlike that which *Celſus* recommends.

A Diſeaſe, or a Blow, ſometimes occaſions a Concretion of the Humour under the two Coats of the Eye, at the Place where there is a Vacuity, which hardening by degrees, darkens, by its Oppoſition, the interior Part by which Viſion is exerciſed. There are ſeveral Kinds of this Diſorder, ſome of which are curable; others incurable. If the Cataract be ſmall, immoveable, of the Colour of Sea-water, or bright Iron, and admits of ſome Senſe of Light by its Sides, there are Hopes of a Cure. If it be great, if the Black of the Eye have alter'd its natural Figure, if the Colour of the Cataract be azure, or like that of Gold, if it ſlides, and is moveable from Side to Side, it is ſcarce ever known to be removed. It is generally of a bad Kind, when it proceeds from a ſevere Diſtemper, a great Pain of the Head, or a violent Blow. Aged Perſons, who are naturally dim-ſighted, without the Acceſſion of a Diſeaſe, are improper Subjects for an Oculiſt, and ſo are Children; but the Time of Life between Childhood and old Age is a proper Seaſon for undertaking the Operation. A ſmall Eye too, or a hollow one, do not favour the Performance of this Work. Some Maturity alſo is requir'd in the Cataract itſelf; for which Reaſon we muſt wait till it ſeems to be paſt its State of Fluidity, and grown to a ſort of hard Concretion.

For three Days before the Operation, the Patient is to live on ſlender Diet, and to drink Water, and the Day before it abſolutely to faſt. After this, he is to be ſeated in a lightſome Room, againſt the Light, in a Chair oppoſite to the Surgeon, who muſt ſit a little higher. Behind muſt ſtand an Aſſiſtant, to hold the Head of the Patient, and keep it immoveable, for a ſlight Motion might occaſion a perpetual Loſs of Sight; and to render the diſeaſed Eye alſo the more immoveable, the other is to be ſecur'd from Motion, by binding Wool upon it. The Operation on the Left Eye is to be performed with the Right Hand; on the Right Eye with the Left Hand. Then the Needle, which ought to be ſharp, and not too ſlender, muſt be introduced, and directed, in a ſtrait Line, thro' the two outer Coats, in the middle Diſtance between the Black of the Eye and the Corner next the Temple, oppoſite to the Middle of the Cataract, in ſuch a manner as not to hurt a Vein. And the Surgeon has no Cauſe to introduce his Inſtrument in a timorous manner, becauſe it is receiv'd in a void Space, to which it is eaſy for him, however unexperienced, to know when he has penetrated, by his meeting with no farther Reſiſtance. Having penetrated thus far, the Needle is to be inclined to the Cataract, and there gently to be turned, ſo as by degrees to depreſs it below the Region of the Pupil, where it muſt be compreſſed with ſome Force, that it may ſettle in theſe lower Parts; and if it there reſts, the Cure is completed. If it returns once and again, it muſt be cut more with the Needle, and ſeparated into more Parts, which are depreſſed ſingle with more Eaſe, and are leſs incommodious by their Breadth. This done, the Needle is to be drawn out in a ſtrait Line; and the White of an Egg in ſoft Wool is to be apply'd to the Place, with a Bandage, to check the Inflammation.

The Patient now requires Reſt, Abſtinence, Unctions with gentle Medicines, and Food, which laſt may be deferred till the next Day; and ought, at firſt, to be liquid, that the Jaws may not be exerciſed; but afterwards, when the Inflammation is at an End, ſuch as is proper in the Cure of Wounds, with this neceſſary Caution, that the Patient is to drink nothing but Water for a conſiderable time. *Celſus, Lib.* 7. *Cap.* 7. *Tit.* 14.

As this uſeful Operation requires a very great Dexterity, and much Knowledge, it may not be amiſs to give a farther Deſcription of it from *Heiſter*.

As to the Cure of a Suffuſion or Cataract, it may be attempted either by Medicines, or the Needle. Some, I know, reject the Treatment of a Cataract by Medicines, as vain and inſignificant; and yet I cannot but recommend it to a young Phyſician, as a ſafe and effectual way, at leaſt in ſome Caſes: For we are well aſſured, that there have been Inſtances, not only in later Times, but near two thouſand Years ago, of Perſons afflicted with a Cataract, who either by the Benefit of Nature, or the Aſſiſtance of Medicines, have, contrary to all Expectation, been freed from that Diſorder (ſee the Quotation above from *Celſus*). But by what Methods theſe Medicines are to be accommodated to the different Cauſes of the Diſeaſe, and the Age or Habit of the Patient, we leave to the Judgment of Phyſicians; our preſent Deſign, in this Work of Surgery, being to direct the Surgeon in the Cure of this Diſtemper by manual Operation with the Needle, and other Inſtruments.

But before we ſet about this Work, we cannot forbear ſeriouſly recommending to all Cultivators of the Art of Surgery the Study of that noble and incomparable Art of curing a Cataract by the Operation of the Hand, and perſuading them to reſcue it out of the Hands of Mountebanks and Strollers, who talk on all Occaſions of the ſtrange and almoſt inſuperable Difficulties and Niceties attending this Operation, tho' we ſee it frequently perform'd with Succeſs by ſkilful Surgeons, and ſometimes even by the Strollers themſelves. And, to ſpeak the Truth, that noble Operation for the Cure of a Cataract is uſually perform'd with far more Safety than opening a Vein, which yet is a thing practiſed by the very Barbers Apprentices: For in couching a Cataract there is very little Fear of pricking a Nerve, Tendon, or

or any dangerous Artery, as it ſometimes happens in Veneſection; beſides, in attempting Phlebotomy, oftentimes no Vein appears, eſpecially in fat and corpulent Perſons, where it is often very difficult to find a Vein, and make a right Inciſion therein; whereas, in the Operation for a Cataract, the Place where the Inſtrument is to be introduced, is always ſufficiently manifeſt. However, leſt any ſhould think us of Opinion, that this Operation may be ſafely perform'd by the Hands of aukward and unexperienced Surgeons, Apprentices, and Mountebanks, it will not be amiſs briefly here to enumerate the Qualifications which are requir'd in a Surgeon to make him a good Oculiſt. Firſt of all, he muſt have a thorough Knowledge of the Structure of the Eye, from the Study of Anatomy, that he may not commit any Blunder, nor hurt any thing thro' Ignorance. Secondly, he muſt know exactly what ought to be done, and after what Method every thing belonging to the Operation may moſt fitly be performed; for which End nothing can be more adviſable, than to be often preſent, as a curious Spectator, at the Performance of this Operation by ſkilful Surgeons. A third Qualification for an Oculiſt is an intrepid Mind joined with a ready, able, and ſteady Hand, which never tremble, and a clear and ſharp Sight. Fourthly, he muſt be able to uſe his Left Hand as well as his Right, that he may be equally dexterous at couching the Right Eye with his Left Hand, as the Left Eye with the Right. And, laſtly, he muſt have exercis'd himſelf in repeated Performances of this Nature on the Eyes of Animals and dead Men, before he ventures to practiſe upon living Perſons.

For the more ſucceſsful Performance of this Operation there are two Things principally to be regarded antecedent thereto. The firſt is to chuſe the fitteſt Seaſon, and not attempt it till after a due Preparation of the Patient. The moſt convenient time for the Operation is in temperate and moderately warm Weather, as it uſually is in Spring and Autumn. In the ſecond Place the Surgeon muſt be mindful to fix upon a remarkably clear and ſerene Day for the Performance. As to the Time of the Day, the Forenoon is uſually choſen; not but that the Afternoon may be proper enough, and even ſometimes preferable; as, for Inſtance, with reſpect to Patients of a puſillanimous Temper, who are not ſo ſubject to faint after a moderate Dinner, as when faſting; and we cannot be too careful in preventing an Accident which is moſt likely to be the Ruin and Diſappointment of the Operation. The more lightſome the Room is, the more convenient it is for the Purpoſe, provided too great a Splendor of the Sun's Rays be avoided. For too ſtrong a Light ſtriking upon the Eye immediately cauſes the Pupil to contract, which prevents the Surgeon from accurately diſcerning the Needle, or whatever elſe may occur within the Eye. With reſpect to the Preparation of the Patient, he is not only to obſerve a careful Regimen in his Diet and Way of Living for ſome Days before the Operation, but ought, at the ſame time, to have his Body evacuated of noxious Humours by proper Cathartics, and to have the Redundance of his Blood diminiſh'd, by opening a Vein, leſt a violent Inflammation, tormenting Pains, or perhaps the Suppuration and Deſtruction of the whole Eye, which has ſometimes happen'd, ſhould be the Conſequences of the Operation. At the Approach of the Day appointed for the Performance, the Belly is to be evacuated by a Clyſter, unleſs it be already in a ſoluble State, as it ought to be. And, laſtly, to prevent fainting under the Operation, which may throw an inſuperable Difficulty in the Way of the Surgeon, and be an Impediment of the moſt pernicious Conſequence to the Work, it ſeems adviſable, if the Time appointed be in the Forenoon, to let the Patient take ſome Food, or at leaſt ſup ſome ſtrengthening Liquor, or Broth, before the Operation. But nothing is more effectual, either for preventing or removing any bad Symptoms after the Performance, than procuring to the Patient ſound and agreeable Sleep by ſome anodyne Emulſion, which reſtores both Strength to the Body, and Tranquillity to the Mind; and prevents the depreſſed Cataract from eaſily riſing again.

The Surgeon is never to undertake the Operation by himſelf, but is to uſe the Help of at leaſt two Aſſiſtants, one of whom is to hold the Patient's Head, during the Operation, as is repreſented *Tab.* 38. *Fig.* 1. A. and the other is to ſtand in Readineſs to reach the Needle, or whatever elſe is neceſſary for the right Performance of the Work. For this Purpoſe, and to come off with Succeſs in the Undertaking, there is firſt and principally requir'd a good convenient Needle, which ſome uſe with the Help of what they call a *Speculum Oculi* (ſee *Tab.* 38. *Fig.* 15. and 16.).

There are great Varieties of thoſe Inſtruments for the Eye, which they call couching Needles, which are accommodated for couching a Cataract. The Figures of thoſe which are moſt in Uſe are repreſented *Tab.* 38. *Fig.* 2, 3, 4, 5, 6, 7, 8, 9, 10, and 11. the beſt of which, in my Opinion, are thoſe repreſented at 5, 6, and 10. which have all a Point ſomewhat broad and ſharp, and not unlike a Tongue, or a Grain of Barley; and particularly that at 6. has its Point fulcated, and conſequently is much better accommodated for couching the Cataract than the others, which are furniſh'd with thinner or narrower Points, or large, but blunt ones; for when they are too ſlender and ſharp, as thoſe are at *Fig.* 2. and 4. A. they eaſily tear the Cataract; and when they are too blunt, as is that at *Fig.* 8. they will not perforate the Eye without much Difficulty. It is no Wonder, therefore, that ſome Surgeons have adviſed the Uſe of two Needles in the ſame Operation, one ſharp-pointed, (*Fig.* 7. and 9.) for perforating the Eye; and another with a broad blunt Point, (*Fig.* 8.) for depreſſing the Cataract after Perforation. But it is eaſier to write of the Uſes of two Needles, than to accommodate them to Practice, without injuring the Eye. However this be, all poſſible Care is to be taken, that the Inſtruments be extremely well poliſh'd, by rubing them upon a Piece of woolen Cloth or Leather, before they are apply'd to the Eye, leſt, through ſome Ruſt or Roughneſs, they ſhould not without Difficulty penetrate the Eye, or greatly hurt and lacerate it. M. *Freytage* very much recommends the Uſe of hooked Needles, by which membranaceous Cataracts may be extracted out of the Eye; but if they are really inſtrumental to this Purpoſe, it is Pity he has not given us the Delineation of theſe Needles.

That no unneceſſary Obſtacle may retard the Surgeon in his Proceedings after the Operation, all things which may be of any Service towards the Dreſſing are very carefully to be provided beforehand. There muſt be in Readineſs (1.) ſome refrigerating Collyrium, which may conveniently be prepared of the Water of Plantain, or Blue-bottle well beaten with the White of an Egg, to which ſome add a ſmall Quantity of Alum, or prepared Tutty, or Saffron, or Camphire. Others uſe common Spirit of Wine for a Collyrium. M. *St. Yves* recommends before all a Liquor compoſed of ten Parts of lukewarm Water, and one of Spirit of Wine. (2.) There muſt be ready at hand a ſoft Compreſs of folded Linen, large enough for covering the whole Eye. And (3.) a Fillet, about three Yards long, and two Inches wide; or a Handkerchief, folded up in the Form of a Triangle, to bind up the Eyes of the Patient after the Operation. (5.) And, laſtly, you muſt be provided with *Hungary* Water, Vinegar, or ſome other ſtrengthening Medicine, to be apply'd to the Patient's Noſtrils, if he ſhould, as it ſometimes happens, faint under, or ſoon after the Operation.

There now remains no more to do, before the Surgeon enters on his Work, but to fix and ſecure the Patient in the moſt convenient Poſture. He muſt be placed, therefore, almoſt againſt the Light, in a Chair lower than ordinary, as is repreſented *Tab.* 38. *Fig.* 1. E. and oppoſite to the Surgeon C. who muſt ſit in a Chair a little higher than the other D. If one of the Eyes be ſound, or at leaſt not quite blind, it muſt be cover'd and bound up with a Handkerchief, or broad Fillet, and render'd immoveable, leſt the Patient, in moving it, ſhould, at the ſame time, as it naturally happens, move the diſeaſed Eye, and ſo expoſe it to be wounded by the Needle. For the ſame Reaſon you muſt be very careful to admoniſh the Patient, that, if he ſhould recover his Sight on a ſudden, in the very Operation, as it ſometimes happens, he muſt make no Exclamation or Exultation of Joy; as Perſons in ſuch a Circumſtance are ſubject to do, but to ſit quiet and immoveable, as much as may be, becauſe the leaſt Motion may endanger the Loſs of his Sight for ever. For the more commodious Performance of the Operation, the Patient is to be ſituated in his Chair, after ſuch a manner as to fix his Hands upon the Knees, and his Legs between the Legs of the Operator; and ſometimes the Legs of the Patient are elevated and firmly held by the Aſſiſtants, that he may not be able to riſe before he is permitted. Behind his Back, as we obſerved, muſt ſtand an Aſſiſtant, who is to hold the Head of the Patient with the greateſt Care and Addreſs, his Left Hand placed on the Sinciput, or Top of the Head; and his Right Hand on the Chin, in order to fix it upon his own Breaſt, and render it quite immoveable; for the leaſt Motion of the Head is attended with the Danger of perpetual Blindneſs, as we are aſſured by woful Experience.

All things being thus diſpoſed in their proper Situation, the Patient muſt be order'd to open his Eyelids as wide as poſſible, and to turn his Eye inwards towards his Noſe, that a pretty large Portion of the White of the Eye may appear at the leſſer Canthus, or Corner of the Eye next the Temple. Then the Surgeon, with the fore Finger and Thumb of his Left Hand, ſuppoſing it to be the Left Eye, which is the Subject of his Operation, dexterouſly opens wide the Eyelids, (ſee *Fig.* 1. and 14.) and by that means renders the Eye at the ſame time fixed, and in a manner immoveable. Some recommend the Speculum Oculi, (*Fig.* 15. or 16.) or ſomething like it, for this Purpoſe; but this Expedient, in my Opinion, is more likely to hinder than forward the Operation; however, if any one be accuſtom'd to the Uſe of it, or promiſes himſelf great Aſſiſtance from it, I am not againſt his uſing it. Next the Surgeon takes the Inſtrument, or Needle, handed to him by an Aſſiſtant, in his Right Hand, holding it betwixt his Thumb and fore and middle Fingers, in the ſame manner as we uſually hold a Pen in writing (ſee *Tab.* 38. *Fig.* 1. and 14.). He then places the two hinder Fingers of the ſame Hand upon the Patient's

Cheek,

Cheek, by which means that Hand is ſecur'd from eaſily ſhaking, and render'd more firm and ſteady in its Work, than if it were free and unſupported. With this Precaution, the Operator now proceeds to enter the Needle into the White of the Eye, near the middle Diſtance between the Cornea Tunica, and the leſſer Canthus, (See Fig. 14. A.) cautiouſly directing it in a ſtrait Line, through the Coats directly oppoſite to the Middle of the Cataract, to avoid wounding the Blood-veſſels.

As ſoon as the Needle has penetrated through the Coats into the Eye, which is known by its finding no more Reſiſtance, it is immediately to be inclined towards the Cataract (ſee *Tab.* 38. *Fig.* 14. B.); and as ſoon as you have taken hold of the upper Part of the Cataract with the Needle, you muſt endeavour gently to depreſs it below the Region of the Pupil, whether it be a preternatural Membrane, or an Opacity of the cryſtalline Humour; for as yet we have no evident Marks, by which we can diſtinguiſh one Caſe from the other as to outward Appearance, except thoſe with which we are furniſh'd from the Obſervations of Mr. St. *Yves*. If the Cataract deſcends with the Needle, which it will ſometimes do, when it is mature and hard, at the firſt Stroke, it will be convenient to keep it down for a while, in order to its Settlement below the Pupil; and if, upon elevating the Needle, it ſtill reſts in that Situation, your Operation is well performed, and the Needle is to be drawn out of the Eye in a ſtrait Line as it enter'd. If the Cataract returns, or riſes again, as it very often happens, you muſt depreſs it with the Needle a little more ſtrongly, and keep it down a little longer till it ſettles below the Pupil. M. *Freitage* adviſes, in ſuch a Caſe, the introducing of a hooked Needle, by which the Cataract, which is, according to him, generally a Pellicle, may be laid hold of and extracted, as he has frequently ſeen it done, he ſays, by his Father. But as we have no clear Deſcription either of the Needle or Method of Extraction, and it is to be doubted, whether this Needle, in extracting the Pellicle, will not lacerate the Coats of the Eye, the Retina, Choroides, and Sclerotica, for I ſee not what ſhould hinder it, I cannot as yet agree to his Advice.

When the Cataract adheres pretty ſtrongly, it is often a difficult Taſk to diſengage and depreſs it entire. When this, therefore, happens, it is to be divided with the Needle, and each of the divided Parts afterwards is carefully to be depreſs'd with the ſame Inſtrument. The Method of Operation is the ſame, when, during our Attempts to depreſs a Cataract, it either ſpontaneouſly, or by ſome Cauſe, breaks, and is divided into Pieces; for that the Sight has ſometimes been reſtor'd by this means, has long ago been obſerv'd by thoſe ſkilful Authors *Celſus*, *Guillemeau*, *Paré*, *Barbet*, *Briſſeau*, and others; and I myſelf have twice had an Opportunity of obſerving the ſame Thing. If the Cataract adheres ſo firmly to the Tunica Uvea, as that it can hardly be ſeparated therefrom, it is proper to make a Perforation in the Middle of the Cataract; for thus the Rays may paſs thro' it to the Bottom of the Eye, and a certain Degree of Sight is, by this means, ſometimes reſtored to the Patient. In a Caſe of this Nature, the Succeſs is in all Probability greateſt, when the cryſtalline Humour is pretty thin; for ſome time ago I found it, in a certain Subject, ſo diminiſh'd in Thickneſs, as ſcarce to exceed that of one's Nail, and at the ſame time it adher'd ſtrongly to the Tunica Uvea. But in Caſes where the Cataract is as yet found too ſoft, *Briſſeau* thinks it more adviſeable to withdraw the Needle, and defer the Operation for ſome time, till the Cataract is become ſufficiently ripe, than, by performing upon an unripe Cataract, to fruſtrate the End of the Operation, and for ever deprive the Patient of his Sight. When the Right Eye is blind in conſequence of a Cataract, the Surgeon muſt follow the ſame Method of Operation, but in ſuch a manner, as to hold the Eye in his Right, and the Needle in his Left Hand; after which, he is to apply the Needle, and couch the Cataract in the manner already directed; for, in the great Canthus, the Needle cannot be commodiouſly apply'd to the Right Eye, with the Right Hand, by reaſon of the Contiguity of the Noſe. I had a Needle preſented me by a Friend, with which he pretends the Operation may be perform'd by the Right Hand on the Right Eye, in the large Canthus, when the Surgeon is not very dextrous with his Left Hand. This Needle, on account of its Novelty, I have exhibited in Plate 38. Fig. 17. in which A. repreſents the Needle itſelf, B. the Handle, and C. the particular Degree of Inflexion, neceſſary to accommodate it to the Noſe. When a ſufficiently ripe Cataract is found in both Eyes, after performing the Operation on the one, and applying proper Dreſſings, we may immediately proceed to treat the other in the ſame manner. But when the Operation on the one has been long protracted, we are not to make any Attempt on the other, till ſome time after, when the Symptoms excited by the former Operation are gone off, leſt the Patient ſhall be too violently tormented, or fall into a Deliquium.

Having already directed in what manner the Operation is to be performed, we ſhall now give a ſuccinct Account of what is to be done after it. It is cuſtomary with the common Oculiſts and Quacks, after withdrawing the Inſtrument from the Eye, to hold before the Patient two of their Fingers extended, or a Glaſs full of Water, red Wine, or Ale, aſking them what kind of Object they ſee, and what particular Colour it is of. When they give pertinent Anſwers to the Queſtions aſk'd, and are able quickly to diſtinguiſh one Object from another, it is concluded, that the Operation is ſucceſsfully and happily performed; tho' this Trial ſeems not only improper, but alſo prejudicial to ſkilful Surgeons, ſince by it the weak and diſorder'd Eye is too much exercis'd, by which means the Cataract, now depreſſed, is eaſily driven upwards again. It, therefore, ſeeems more adviſeable, immediately after the Operation, to apply a Compreſs, dipt in ſome of the Collyriums already directed, to the Eye on which the Operation has been perform'd, and to ſecure it with a proper Bandage or Fillet, leſt the Rays of the Light ſhould act too forcibly on the Retina. But in this Caſe both Eyes muſt be ſecur'd with the Bandage, tho' the Operation has only been performed on one of them, leſt, by the Motions of the ſound Eye, the other ſhould, at the ſame time, be agitated or incommoded: For when this happens, there is a Danger, leſt the Cataract ſhould either be elevated and return again, or that greater Inflammation, or ſome other unlucky Symptom, ſhould be brought on.

Having duly applied the Dreſſings, the next Thing to be done, is to lay the Patient upon a Bed, in the moſt proper and commodious Poſture. He muſt therefore be laid upon his Back, and have his Head ſupported and kept erect by Pillows: He muſt alſo remain in a State of profound Reſt for eight Days, and abſtain from Food of hard Digeſtion, from talking loud, from ſneezing, from violent coughing and laughing, till the Cataract is obſerv'd to be ſecurely lodg'd in the inferior Part of the Eye. For if the Patient ſhould indulge himſelf in any of theſe, 'tis to be dreaded, leſt, by the unſeaſonable Commotions of the Head, the Cataract ſhould again break forth, and be elevated. 'Tis alſo to be obſerv'd, that no Surgeon, however ſkilful and ſagacious, can certainly affirm, that a Cataract, when depreſs'd, will remain in that State; yet, ſtill the miſerable Patients have this Comfort, that if it ſhould aſcend, there are ſome Hopes left, that it may again be depreſs'd by another Operation, and that their Sight may by that means be reſtor'd. Thus the celebrated *Antony Maitre-Jean*, in his Book *de Morbis Oculorum*, *Cap. de Cataracta*, informs us of a Man, who having the Operation perform'd in the Autumn, his Cataract return'd, but was happily and effectually depreſs'd next Spring by a ſecond Operation. The ſame Author informs us, that there are Inſtances of Patients, in whom the Cataract has again been elevated after a previous Suppreſſion, but that they have ſoon after perceiv'd it to ſubſide and fall down of its own accord; and I myſelf remember to have once ſeen an Inſtance of this kind. But *Freitage*, if we may give Credit to him, in his *Diſſert. de Cataracta*, affirms, that his Father extracted them by means of a hooked Needle.

Some Hours after the Operation, Veneſection is highly proper, leſt a violent Inflammation ſhould ſeize the affected Eye. Upon this Occaſion, as much Blood muſt be taken away as the Strength and Conſtitution of the Patient will admit of. For this Reaſon, leſt the Patient ſhould ſuffer by a Diſcharge of too much Blood at one time, or by the Inflammation, 'tis neceſſary, as in other violent Inflammations, to repeat Veneſection at different times. The Collyriums above recommended, and the internal Medicines preſcribed in Caſes of this Nature, by ſkilful Phyſicians, are not in the mean time to be neglected. I have frequently obſerved a Vomiting to ſeize the Patient an Hour or two, and ſometimes next Night, after this Operation is performed. *Freitage* alſo, in his *Diſſertatio de Cataracta*, informs us, that he had an Opportunity of obſerving the ſame Symptom in a certain Patient. This Symptom is, in my Opinion, to be accounted for from a certain Irritation of the Nerves; but, for the moſt part, it ſoon ceaſes of its own Accord. 'Tis ſurpriſing, that this Phenomenon ſhould be adverted to by ſo few, ſince 'tis generally a bad Prognoſtic; for by the Efforts made in Vomiting, the depreſſed Cataract generally riſes again. Towards the Evening of that Day, on which the Operation is performed, 'tis cuſtomary to exhibit a narcotic Emulſion, that the Patient may have as ſound a Repoſe as poſſible; for when he is awake, it is greatly to be dreaded, leſt, as it generally happens, the Cataract ſhould again riſe, by the reſtleſs and uneaſy Toſſing of the Body from one Poſition to another. The Food and Regimen ought to be entirely the ſame, as are directed in other ſevere Wounds and Inflammations; for, in theſe Caſes, conſiderable Inflammations are generally accompanied with the higheſt Danger. If the Patient is coſtive, an emollient Clyſter is proper, in order to evacuate the excrementitious Matter which incommodes the Patient, without depreſſing the Spirits, or exciting violent and unnatural Efforts. Nor is the Patient to be ſuffered to get out of Bed, in order to eaſe Nature, for ſome Days after the Operation; but he is to have a Veſſel

adapted to this Purpoſe; for the leſs the Head is allowed to remain in a State of Reſt, the greater is the Danger, leſt the Cataract ſhould riſe and ſpring up again.

As to the Method of Dreſſing, the following Directions are to be obſerv'd. Towards the Evening of the Day, on which the Operation is perform'd, the Bandage is to be looſed as gently as is poſſible, and a freſh Compreſs, dipt in the above-mentioned Collyrium, to be laid on and ſecur'd with a Bandage, apply'd in the manner already directed. On the ſubſequent Days, the Dreſſings ought to be renew'd twice a Day at leaſt, that is, at Morning and Evening. The Dreſſings may alſo be chang'd three or four times a Day, when the Heat is very intenſe, becauſe in that Caſe the Compreſſes generally become ſoon dry. Upon every Removal of the Dreſſings, two Things are principally neceſſary to be obſerv'd. The Surgeon muſt not only carefully examine whether any remarkable Inflammation appears, but he muſt alſo take care, that too ſtrong a Light is not ſuffer'd to ſtrike on the affected Eye, leſt, by that means, it ſhould be conſiderably injur'd. If the Eye is in a good State, or if only a ſlight Inflammation appears, the ſame Method of Dreſſing is to be continued for eight Days; for, in theſe Caſes, an Inflammation does not generally happen after the eighth Day, at which Time 'tis proper to remove the Bandage, and allow the Patient a faint Degree of Light, provided the Curtains of the Bed are drawn, and the Eye defended by a Piece of black or green Silk hanging before it. If every Thing is in a right State, the Patient may, after the tenth Day, ſafely venture gradually to get out of Bed, and walk up and down in his Chamber, provided the above-mentioned Piece of Silk be kept before the Eye, and the Window-curtains are drawn. If, after this, Things proceed happily, the Cure will be ſoon completed, and the Patient may be gradually accuſtomed to his former Method of Life: But if any other troubleſome Symptoms occur, the Patient is to be kept in a State of Reſt till they are remov'd.

But that the Surgeon may, with the greater Skill and Judgment, remove the Accidents ſometimes ſubſequent to this Operation, we ſhall here particularly conſider thoſe which moſt generally occur. Firſt, then, when during the Operation any Quantity of Blood is diſcharged in the Eye, and renders the aqueous Humour turbid and cloudy, the Operation is to be perform'd with all poſſible Expedition, leſt there ſhould be a greater Diſcharge; and the above-mentioned Collyrium is carefully to be apply'd, ſince, by this, expert Surgeons have obſerv'd ſlight Perturbations of the aqueous Humour to be digeſted and remov'd. But the Danger is far greater, when a large Quantity of the diſcharged Blood is mix'd with the aqueous Humour; ſince, in this Caſe, 'tis ſcarce poſſible, but that a Hypopium [which is a Collection of Pus under the Tunica Cornea] or ſome other Diſorder, muſt induce a perpetual Blindneſs. In this deplorable Caſe, however, 'tis proper, that a large Quantity of Blood ſhould be taken from the Patient, and Bags prepared of Sage, Roſemary, Hyſſop, and Fennel, boil'd in Wine, frequently apply'd warm to the affected Eye; for theſe are of ſingular Service, except in Caſes where the Diſorder is entirely deſperate. Secondly, when, during the Operation, the aqueous Tumor itſelf is diſcharg'd, in conſequence of which, the Tunica Cornea collapſes, we have no great Occaſion to be in Pain with reſpect to the Recovery of the Eye, ſince, in a few Days, the Humour is generally reſtor'd, and the Eye returns to its natural Form. Thirdly, when, after the Operation, any Inflammation appears, nothing is to be omitted which can contribute to remove it. If it ſhould happen to be only ſlight and gentle, the Medicines above recommended will prove ſufficient for ſuppreſſing it: But if it ſhould happen to be pretty violent, beſides theſe Medicines, 'tis neceſſary the Patient ſhould drink Water, and, at proper Intervals, have Blood taken either from his Arm, Foot, or Neck. His Temples muſt alſo be very frequently anointed with camphorated Spirit of Wine; Clyſters alſo, and Veſicatories, together with the internal Medicines preſcrib'd againſt Inflammations, are to be carefully and judiciouſly exhibited.

From what has been ſaid I think it ſufficiently obvious, that my Doctrine, which fixes the moſt general Seat of the Cataract in the Cryſtalline Humour, is of the moſt extenſive Uſe, not only with reſpect to the Diagnoſtics, Prognoſtics, and Cure, but alſo with reſpect to the proper Conſtruction and Application of the Inſtruments adapted to couch the Cataract; for as ſoon as it was obſerved, that a Cataract was almoſt always owing to an Opacity of the cryſtalline Humour, and very rarely to the Formation of a preternatural Tunic, *Briſſeau* accurately judg'd, that thoſe Needles were by far the moſt proper for depreſſing them, whoſe Points are ſomewhat broad and corner'd, like that repreſented in *Tab.* 38. by *Fig.* 6. *Letter* C. For by uſing the ſmall Needles of the antient Surgeons, whether made of Gold, Silver, Steel, or Iron, it is ſcarce poſſible, but that the deprav'd cryſtalline Humour, or any other noxious Matter, muſt, during our Attempts to depreſs them, be lacerated or cut. *Briſſeau*'s lately invented Needle, *Fig.* 6. is not only broad and corner'd, but alſo ſharp and acuminated, that it may the more readily penetrate into the Eye. The Handle A. B. is an Octagon, one of whoſe Sides, repreſented by E. E. is mark'd with Lines, or in ſome other manner, with a View to know the corner'd Part of the Needle from the other during the Operation; for by this means we may almoſt infallibly determine, whether the flat or ſharp Part of the Inſtruments, apply'd to the Eye, touches the Cataract. The Protuberance D. is added to this Inſtrument, principally to diſcover, with Eaſe and Accuracy, how far the Inſtrument has penetrated into the Eye.

Some Surgeons, thinking the principal Cauſe of a Cataract to be a certain preternatural Coat growing in the Eye, have chiefly us'd ſuch Inſtruments as they judg'd proper for the total Extraction of this membranous Cataract thro' the Wound made with the Needle, leſt, as it often happens, the Diſeaſe, when once cured, ſhould again return. The firſt kind of Inſtruments, therefore, they us'd, were ſmall Pipes, or perforated Needles, which they apply'd to the Eye, and by their means endeavour'd to ſuck out the preternatural and foreign Coat. To the ſecond kind belongs the particular Needle, ingeniouſly form'd like a ſlender kind of Forceps, and delineated in *Tab.* 2. *Fig.* 28. 29. 30. of which ſee the Explication, under the Article Acus. To the third kind belong the hooked Needles of *Freitage*, and the ſlender Hooks which they paſs'd thro' a ſmall Pipe, introduc'd into the Wound of the Eye, in order to ſeize and extract the preternatural Coat. But that Attempts of this kind are vain and uſeleſs, tho' the Inſtruments ſhould be never ſo artfully made, is confirm'd, not only by our having ſhewn the Falſhood of that Opinion, which places the ordinary Cauſe of a Cataract in the Production of a preternatural Coat in the Eye, but alſo by the concurring Teſtimonies of the moſt ſkilful Surgeons, who unanimouſly declare, that the Operations perform'd in theſe manners are never crown'd with Succeſs. Unleſs *Freitage* had more accurately deſcrib'd his Method, delineated his Needles, and ſhewn how the Laceration of the Eye was to be prevented, I cannot help thinking, that he wrote rather to indulge a wanton Genius, than to ſupport an important Truth.

It is here alſo to be obſerv'd, that when the Cataract, as it frequently happens, falls thro' the Pupil itſelf, it is proper cautiouſly to make an Inciſion in the inferior Part of the Tunica Cornea; and warily introducing a ſmall Hook, or proper Probe, to extract the Cataract, which is ready, as it were, to fall on the Cornea.

Taylor, in the eleventh Chapter of his Treatiſe of the Cataract and Glaucoma, has deſcrib'd a new Method of couching the Cataract by the Needle, which is as follows. He places the Patient in the uſual manner, ſecures the affected Eye with a *Speculum Oculi*, and afterwards with a Knife, Biſtory, or Lancet, makes a ſmall longitudinal Inciſion thro' the Membranes of the Eye to the vitreous Humour, about half a Line below the ordinary Place. Then he directly paſſes a ſlender plano-convex Needle into the Eye thro' the Inciſion, with the convex Part of it turn'd upwards to the inferior Part of the cryſtalline Humour. After this, he gently elevates the Point of the Needle a little, till he perceives a faint Reſiſtance from the cryſtalline Humour lying above it, and obſerves its Motion thro' the Pupil. When, from theſe Signs, he knows, that the Apex of the Needle is immediately under the Capſula of the cryſtalline Humour, he thruſts it downwards to the Bottom, in order to divide the vitreous Humour, and prepare a Space for the Reception of the cryſtalline Humour, which is afterwards to be depreſs'd: After this, he withdraws about two Lines of the Needle, and introduces it into the inferior Part of the Coat of the cryſtalline Humour, the Situation of which he carefully obſerves. This Part of the Coat, he ſays, he divides or opens with the Needle, without hurting the ciliary Ligament; that thro' this Aperture, or Diviſion of the Coat, the cryſtalline Humour may be afterwards depreſs'd. By this Motion or Action of the Needle, as he informs us, he endeavours, at the ſame time, to enlarge the Space intended for the Reception of the cryſtalline Humour: Then, in order to couch and ſuppreſs the opaque cryſtalline Humour itſelf, he withdraws about three Lines of the Needle, that the cryſtalline Humour, now diſengag'd from its Coat, may, as it were, ſpontaneouſly fall thro' the Aperture made below, into the Space before prepar'd for it. Then he elevates the Point of the Needle, and carefully directs it to the ſuperior Part of the cryſtalline Humour, which he cautiouſly lays hold of, and depreſſes to the Bottom or inferior Part of the Eye, where the Space for its Reception was before prepar'd: Then he withdraws the Needle as gently as he can. He affirms, that by this means the Tunica Uvea, and Ciliary Ligament, are not injur'd, but remain in their natural State. This is certainly a Circumſtance of great Importance, ſince, in the common Method of Operation, this Ligament is always lacerated. Tho' the Author's own Account of this Operation is more full and particular, yet I think I have ſelected the moſt material and important Circumſtances, which ought to be carefully adverted to, and cautiouſly imitated by every ſkilful Oculiſt: But

there are others ſo ſuperfluous and minute, as hardly to be underſtood by moſt; and they can never be accurately obſerved, in the Operation, even by the Author himſelf. To this it is, perhaps, owing, that the moſt terrible Symptoms, ſevere Pains, violent Inflammations, and Abſceſſes of the Eyes, without a Reſtitution of Sight, follow his Operations for the Cataract. But the Advantages and Diſadvantages of this Method muſt, like other Things of the ſame Nature, be determin'd by Time and Experience. *The younger* Heiſter *publiſh'd the Caſe of a Perſon of* Amſterdam, *who was couch'd by* Taylor, *with remarkably ill Succeſs. I have not the Book, ſo can give no farther Account of it.*

How to couch the ſhaking Cataract, or the cryſtalline Humour become opaque, and fluctuating behind the Pupil, which requires another Method of Operation, he informs us, in two diſtinct Chapters, the Sum of which is nearly as follows. He introduces his Needle into the Eye of the Patient, in the manner already deſcrib'd. Then he directs the Point to the anterior and ſuperior Part of the vitiated cryſtalline Humour, which, taking care, at the ſame time, not to hurt the Ciliary Ligament, he lays hold of with the plain Surface of the Needle, and depreſſes to the Bottom of the vitreous Humour.

In ſome Species of Cataracts, which he calls *falſe*, he maintains, that not only the cryſtalline Humour itſelf, but alſo its Coat, is become opaque and vitiated; and, after having depreſs'd the opaque cryſtalline Humour itſelf, he ſhews us, at great Length, in two Chapters, how he ſeparates its Coat from the Ciliary Ligament, and depreſſes it. In two other Chapters he gives us an Account of the Operation for the *Glaucoma*, to which Word he affixes a new and uncommon Idea, meaning by it ſuch an Opacity, and Increaſe of the cryſtalline Humour, as that it reaches, together with its vitiated Coat, near the Edges of the Pupil. In this Caſe, he informs us, that the Cure is to be attempted almoſt in the Manner now directed. But, ſince the Antients diſtinguiſh'd a Glaucoma from a Cataract by its deep Situation in the Eye, and its being pretty far removed from the Pupil, Mr. *Taylor*'s Signification of the Word is by no means to be embraced, ſince we cannot properly affix new Ideas to antient Words. I am rather inclin'd to think, that what he calls Glaucomas ought, on account of their Vicinity to the Pupil, to be claſs'd among the Species of Cataracts.

We muſt here alſo obſerve, that Cataracts, which have ſpontaneouſly paſs'd the Pupil, may ſometimes be extracted thro' an Inciſion made in the Tunica Cornea. But I am inform'd, by a Correſpondent in *England*, that *Taylor* there boaſted, that he could extract Cataracts, as yet lodged behind the *Tunica Uvea*, thro' an Inciſion made in the *Tunica Cornea*. But whether, in reality, he is capable of doing ſo, I have not, as yet, got certain Information. *Heiſter.*

I ſhall conclude the Accounts of this curious Operation, with what Mr. *Sharp* ſays upon the Subject.

Having placed your Patient in a convenient Light, and in a Chair ſuitable to the Height of that you yourſelf ſit on, let a Pillow or two be placed behind his Back, in ſuch a manner, that, the Body bending forward, the Head may approach near to you: Then, inclining the Head a little backward upon the Breaſt of your Aſſiſtant, and covering the other Eye, ſo as to prevent its Rolling, let the Aſſiſtant lift up the ſuperior Eyelid, and yourſelf depreſs a little the inferior one: This done, ſtrike the Needle thro' the Tunica Conjunctiva, ſomething leſs than one Tenth of an Inch from the Cornea, even with the Middle of the Pupil, into the poſterior Chamber, and gently endeavour to depreſs the Cataract with the flat Surface of it. If, after it is diſlodg'd, it riſes again, though not with much Elaſticity, it muſt, again and again, be puſh'd down: If it is membranous, after the Diſcharge of the Fluid, the Pellicule muſt be more broken and depreſs'd: If it is uniformly fluid, or exceedingly elaſtic, we muſt not continue to endanger a terrible Inflammation by a vain Attempt to ſucceed. If a Cataract of the Right Eye is to be couch'd, and the Surgeon cannot uſe his Left Hand ſo dexterouſly as his Right, he may place himſelf behind the Patient, and uſe his Right Hand.

I have not recommended the Speculum Oculi, (which we cannot however well do without, unleſs the Patient reſolutely determines to hold the Eye ſtill) becauſe, upon the Diſcharge of the aqueous Humour thro' the Puncture, the Eye, being ſomewhat empty'd, more readily admits of the Depreſſion of the cryſtalline Humour, than when preſs'd upon by the Inſtrument.

As to the Method of treating the ſucceeding Inflammation, (when it happens, for ſometimes there is none) I can adviſe nothing particular, but to refrain from thoſe Collyria that are charged with Powders; for the thinner Parts, flying off, leave a gritty Subſtance in the Eye, which muſt be pernicious. Bleeding, and other gentle Evacuations, are found abſolutely neceſſary. The Uſe of cool Applications, externally, is moſt eaſy to the Eye; but, after all, there will ſometimes enſue a troubleſome Ophthalmy, which, with the Uncertainty there always is of Succeſs, after the Operation, have deterr'd moſt Surgeons from undertaking it, and, till lately, from ſtudying the Nature of the Diſeaſe. But, I fancy, the Operation will come into greater Repute, when more generally practiſed by Men of good Character; for it is leſs the Difficulty, than the Abuſe of it by Pretenders, has brought it into Diſcredit. *Sharp.*

I muſt appriſe the Reader, that the Needles for the couching a Cataract, are, by Miſtake, repreſented twice; once in *Tab.* 2. and again in *Tab.* 38. See the Explication of theſe under the Article Acus.

CATARIA.

The Characters are;

It ſhoots up one ſingle Stalk, running into many Branches on both Sides. The Galea, or Creſt, of the Flower is erect, roundiſh, bifid; the Beard, or Lip, divided into three Segments, the middle one excavated, large, and elegantly crenated on the Edges; the other two Segments, like Wings, incloſing the wide Orifice of the Lips.

1. *Nepeta*, *Mentha Cataria*, Offic. *Nepeta major vulgaris*, COMMON GARDEN-NEP, Park. Theat. 38. Raii Synop. 3. 237. *Nepeta*, Riv. Irr. Mon. Dill. Cat. Giſſ. 126. Buxb. 233. Rupp. Flor. Jen. 191. *Mentha Cattaria*, J. B. 3. 225. THE GREATER OR MOST COMMON NEP, OR CATMINT, Raii Hiſt. 1. 548. *Mentha Cattaria ſive Nepeta*, Chab. 415. *Mentha Cattaria vulgaris & major*, C. B. Pin. 228. Hiſt. Oxon. 3. 414. *Mentha ſelina ſive Cattaria*, Ger. 554. NEP OF CATMINT, Emac. 682. Mer. Pin. 77. *Mentha ſelina*, *vel Cattaria*, Merc. Bot. 1. 50. Phyt. Brit. 74. *Cataria major vulgaris*, Tourn. Inſt. 202. Elem. Bot. 171. Boerh. Ind. A. 174. NEP. *Dale.*

Catmint has tall ſquare hoary Stalks, pretty much branch'd, having, at the Joints, two pretty large ſoftiſh Leaves, in Shape like thoſe of Dead-nettle, whitiſh and hoary underneath, and green above, ſet on long Foot-ſtalks. The Flowers grow on the Tops of the Branches, in long handſome whorl'd Spikes of white Flowers, galeated and labiated; the Galea is cut into two, and the Labella into three Sections; they are ſet in open five-corner'd Calyces, in which grow the Seed. The Root is white and woody, and ſpreads much. It grows in Lanes and Hedges, and flowers in the Summer Months. It has a ſtrong Scent, between Mint and Penyroyal. It is call'd *Catmint*, becauſe the Cats are very fond of it, eſpecially when a little flaccid and wither'd; for, then, they will roll themſelves on it, and chew it in their Mouths, with great Pleaſure. It conſiſts of warming and attenuating Parts, ſomewhat like Penyroyal, and, like that, is of great Service in opening Obſtructions of the Womb, and helping the Green-ſickneſs; as alſo Hyſteric Fits, and Vapours. It promotes the Birth and Lochia; and, by ſome Authors, is commended againſt Barrenneſs. *Miller's Bot. Off.*

Catmint is aromatic, acrid, bitter, and gives no Tincture of Red to blue Paper; which ſhews it to contain an aromatic oily volatile Salt, in which the urinous Part predominates, in the ſame manner as in the artificial oily volatile Salt. This Plant, taken as Tea, or infuſed in Wine, is very aperitive, emmenagogic, and cures the Vapours. *Tabernæmontanus* ſays, that, being boil'd in Wine and Honey, it cures the Jaundice, and a violent Cough. It is uſually employ'd in Waſhes for the Feet, for the Green-ſickneſs. *Martyn's Tournefort.*

CATARRHECTICUS, καταῤῥηκτικὸς, derived from ῥήγνυμι, to break, is an Epithet apply'd, by *Hippocrates*, to Subſtances of a penetrating and diſſolving Nature; as, for Inſtance, to Wine of fine Parts, becauſe it has a diuretic Quality; to Oxymel, and the Peplium. *Hippoc. de Ratione Victus in Acutis.*

CATARRHEUMA, καταῤῥεῦμα, derived from ῥέω, to flow, is the ſame as CATARRHUS, a Defluxion.

CATARRHEXIS, κατάῤῥηξις, from ῥήγνυμι, to break, is a violent and copious Eruption or Effuſion. Thus κοιλίης κατάῤῥηξις, *in Coac.* is a plentiful and urgent Evacuation, or Flux of the Belly, which, in *Epid. Lib.* 4. *Ægr.* 25. is call'd ſimply κατάῤῥηξις. The Verb κατάῤῥήγνυμι, is often uſed by *Hippocrates* in the ſame Senſe, when he ſpeaks of the Belly, and ſometimes to expreſs the Rupture and Effuſion of Tumors. The ſame Verb, when ſpoken of the more humid and lax Parts of the Body, as the Veins and Breaſts, ſignifies to ſink, ſubſide, or become flaccid; as, in *Lib.* περὶ φύσ. παιδίου, where he ſays,

ſays, ὅτι τὰ μαζὸι καὶ τ' ἄλλα μέλεα ὑγιέοντος καταῤῥέγνυται ἐν γυναιξὶν "The Breaſts of Women, with their other more "humid Parts, ſink and become flaccid," ſpoken of the State of Women after their Child-bed Purgations.

CATARRHOECUS, καταῤῥοικὸς, from ῥέω, to flow, in *Hippoc. Aph.* 24. *Lib.* 5. ſignifies *exciting Diſtillations*; and is there apply'd to cold Subſtances, as Ice and Snow. It is alſo uſed paſſively, and apply'd to Diſeaſes proceeding from Diſtillations.

CATARRHOPIA, καταῤῥοπὴ, from ῥοπὴ, an Inclination, of ῥέπω, to incline, to tend, ſignifies a Propenſity or Inclination downwards; as ANARRHOPIA, on the contrary, imports a Tendency upwards; and both theſe Words are uſed by *Hippocrates* in the Beginning of his Book of *Humours*.

Catarrhopa Phymata, καταῤῥοπα φύματα, *Epid. Lib.* 6. *Sect.* 1. *Aph.* 12. "Tubercles tending downwards," are explain'd by *Galen*, in his Comment on the Place, to be ὅσα κατὰ τὴν κάτω χώρην τὴν κορυφὴν ἑαυτῶν ἴσχει τῆς ἐμπυήσεως "Such as "have the Apex or Top of their Suppuration depreſs'd," in Oppoſition to τὰ ὀξέα καὶ κορυφώδη, "thoſe with a ſharp and "elevated Top," in the ſame Aphoriſm.

Catarrhopos Splen, καταῤῥοπὸς σπλὴν, according to *Galen*'s Explication, is a Spleen verging downwards, with a Declivity, *Epid. Lib.* 6. *Sect.* 2. *Aph.* 30. and its lower Part bloated, or which has a Propenſity downwards, or propels the Humours to the inferior Parts.

Καταῤῥοπὸς ἔσω, in *Lib.* περὶ χυμῶν, is a Remiſſion or Decline of a Diſeaſe, and oppoſed to παροξυσμὸς, the Paroxyſm or Fit.

CATARRHUS, καταῤῥοὸς, καταῤῥὺς, κάταῤῥος, from ῥέω, to flow, *in Aphoriſm.* 38. *Lib.* 7. implies a Diſtillation or Defluxion from the Head upon the Mouth and Aſpera Arteria, and thro' them upon the Lungs. So *Galen*, *Com.* 2. *in Prog.* ſays, that καταῤῥὺς is a Defluxion of a thin and crude Humour, from the Brain, upon the Mouth and Palate; and is comprehended by *Hippocrates* under a κόρυζα, *Coryza*. And, in his Comment on *Aph.* 12. *Lib.* 3. he ſays, that κατάῤῥοι was a common Name, among Phyſicians, for Diſtillations from the Head, thro' the Aſpera Arteria, upon the Lungs. Sometimes καταῤῥὺς ſignifies any Defluxion from the Head, by the Veins, upon the inferior Parts, as in the laſt-mention'd Aphoriſm. Defluxions of this Kind, after the fiftieth Year, and a ſudden Expoſing of the Head to the Sun's Rays, or taking a great Cold, produce an Apoplexy, or Palſy in ſome Part of the Body, according to *Hippocr. de Aere, Locis, & Aquis*; and theſe are the κατάῤῥοι συντόμως ἀπόλλυντες, "the Defluxions which ſoon kill "the Patient," mention'd in that Aphoriſm; or which, according to the Book before quoted, produce ſudden Death, or a Reſolution of the Right Side. *Celſus*, *Lib.* 2. *Cap.* 1. renders κατάῤῥοι *Diſtillationes*; and *Cælius Aurelianus*, *Tard. Paſſ. Lib.* 2. *Cap.* 7. calls καταῤῥοὸς *Influxio*. *Hippocrates* alſo, *in Coac.* ſpeaks of a καταῤῥὺς νωτιαῖος, "a Defluxion on the Spi-"nal Marrow;" and καταῤῥοοι ὀλίγματος ὀφθαλμοὶ, *Lib.* 2. *Epid.* are Eyes affected with pituitous Defluxions.

The frontal Sinuſes, the large Cavities in the ſuperior Jaw, call'd the Antra Highmoriana, all the Cells of the Os Sphenoides, and the Noſtrils, are lin'd with a thick ſoft Membrane, furniſh'd with an almoſt infinite Number of arterial Veſſels, round glandular Bodies, and excretory Veſſels, which are continually pouring out a thin Lymph. The Fauces and Mouth are full of Glands, and their excretory Ducts: The Aſpera Arteria alſo, and its various Ramifications, are lined with a Membrane containing Glands, whoſe excretory Ducts open into their Cavities. When too large a Quantity of ſerous Humours are diſcharg'd from all or any of theſe, the Diſorder hence ariſing is term'd a Catarrh, or, as it is more uſually call'd, a Cold. If 'tis attended with a Fever, as it almoſt always is in ſome Degree, it is call'd a catarrhous Fever.

The Antients, unacquainted with the glandulous Structure of the Parts ſubject to a Catarrh, apprehended, as is obſerved above, that the Humours flow'd from the Head upon theſe Parts. The Moderns have ſometimes preſerved the Term *Defluxion*, tho' they have diſcover'd the Error from whence it acquir'd this Appellation.

The Catarrhus ſuffocativus is a violent and ſuffocating Cough, either excited by an exceſſive Catarrh, by the Rupture of a Vomica in the Lungs, by a Polypus driven from the Heart into the Pulmonary Artery, and ſometimes a ſpaſmodic Conſtriction of the Nerves, as it happens in ſome Hyſteric Caſes.

Pertinent to this are the following Remarks of *Hoffman*.

Tho' a convulſive Aſthma, and a *Catarrhus ſuffocativus*, bear a near Reſemblance to each other in ſeveral reſpects, yet they are different in others; for this latter Diſorder is a Species of Palſy, affecting the Pairs of Nerves ſubſervient to Reſpiration, attacks the Patient unexpectedly, and is accompanied with a great Uneaſineſs, Stertor, and rattling Noiſe in Reſpiration; the Countenance is red and tumid, and the Patient is in Danger of being ſuffocated. But a convulſive Aſthma is more periodical, and of a chronical Nature; whereas the Catarrhus ſuffocativus is juſtly rank'd among acute Diſorders. In it there is alſo a perpetual Afflux of Matter perceived by the Patient, a Symptom which does not accompany the Aſthma. It is alſo accompanied with a greater Loſs of Strength than a convulſive Aſthma. But the Catarrhus ſuffocativus is principally incident to old Perſons, Patients of weak Conſtitutions, and ſometimes to Children; eſpecially when exanthematous Eruptions, Small-pox, Meaſles, ſcald Heads, Achors of the Face, Itches, and other Diſorders of this Kind, have been unſkilfully driven back to the internal Parts. *Hoffman.*

A Palſy of the Nerves, ſubſervient to Reſpiration, and which are diſtributed to the Bronchia, intercepts the Breath, and induces what we call a Catarrhus ſuffocativus. *Ibid.*

Polypous Concretions in the Pulmonary Veſſels often prove the Cauſes of a violent and fatal Spitting of Blood, of a Catarrhus ſuffocativus, of a convulſive Aſthma, and of a Dropſy of the Thorax. *Ibid.*

In Subjects who have died of an Aſthma, and *Catarrhus ſuffocativus*, polypous Concretions are generally found in the Veſſels more immediately communicating with the Heart and Lungs. This is confirm'd by the Obſervations of ſeveral Authors of Credit. Thus *Greiſelius*, in *Miſc. Nat. Curioſ. An.* 1720. *Obſ.* 74. tells us, that, in all the Patients he had diſſected, who died of a Catarrhus ſuffocativus, which often cuts the Patient ſuddenly off, he found callous glutinous and viſcid Bodies in the Heart. *Ibid.*

Of a Catarrhous Fever.

Among the lymphatic and ſerous Fevers, that generally diſtinguiſh'd by the Epithet *Catarrhous* is one, in which, by an increaſed Motion of the Solids and Fluids, the Serum, become ſuperfluous and impure in conſequence of an obſtructed Perſpiration, is evacuated, as it were, in a critical and ſalutary manner; eſpecially thro' the glandulous Organs of the Fauces, Noſtrils, and Bronchia.

This Diſorder generally ſeizes the Patient towards the Evening, and begins with a chilling Coldneſs of the Skin, a Refrigeration of the Extremities, eſpecially of the Feet and their Soles, a Coſtiveneſs, a Stimulus to diſcharge the Urine, which is nevertheleſs evacuated in a ſmall Quantity, a Weakneſs of the Head, a Languor of the whole Body, an increaſed, but, as it were, a falſe Appetite, a Thirſt, a Difficulty of Deglutition, a Stimulus in the Larynx, and a Heat of the Noſtrils and Fauces. Theſe Symptoms are ſucceeded by a Sneezing, a Heavineſs of the Breaſt, nocturnal Heats, a quick and increas'd Pulſe, a violent Cough, a Coryza, a Heat of the Fauces, diſturb'd Sleep; in the Morning, an Eruption of Sweat, a Heavineſs and Torpor of the whole Body, together with a Loſs of Appetite.

The immediate Cauſe of theſe Symptoms is an acrid or cauſtic Serum or Lymph, lodged in the glandular Coats, and producing an Inflammation in them, accompanied with Pain, Tumor, and Redneſs. This happens in the whole Region of the Noſtrils, Palate, and Fauces, the whole Aſpera Arteria, and the Bronchial Ramifications; as alſo in the Œſophagus itſelf, the Stomach, and Inteſtines; for that all theſe Parts are affected, at one and the ſame time, is ſufficiently confirm'd by the Hoarſeneſs, the Cough, the Spitting of a viſcid Matter, the Sneezing, the Heavineſs of the Breaſt, the Nauſea, which is ſometimes ſo violent as to produce a Vomiting, the Heat of the Præcordia, the Gripes of the Belly, and the ſubſequent ſalutary Flux.

This Serum is principally produced by an Obſtruction of Perſpiration; and hence it happens, that, during the vernal and autumnal Equinoxes, this Fever moſt generally begins to rage; for, at theſe Seaſons, the conſiderable Viciſſitudes and Changes of Weather, from hot to cold, from dry to moiſt, and *vice verſa*, affect the Surface of the Body in ſo different manners, that the Evacuations, neceſſary for the Preſervation of Health, are greatly diſturb'd.

For the ſame Reaſon, Catarrhs moſt generally ſeize thoſe who are forced to ſudden Changes of Air, and go from a hot to a cold, or from a cold to a moiſt Place; thoſe who incautiouſly expoſe themſelves to autumnal, nocturnal, cold, and moiſt Airs; thoſe who lay aſide their Winter Apparel too ſoon in the Spring, or begin to wear it too late in the Autumn; as alſo thoſe, who, during the Equinoxes, having been blooded, or ſeiz'd with any copious critical Hæmorrhage, imprudently expoſe themſelves to the free and cold Air.

This is alſo the Reaſon why Perſons of ſpongious, lax, phlegmatic, and ſanguine Habits, Infants, Children, and Women, are more frequently ſeiz'd with catarrhous Fevers, than Adults, Men, and Perſons of a more robuſt and bilious Habit of Body: As alſo, why thoſe are more generally ſubject to them, who indulge themſelves in Watching; who wantonly run into Surfeits or Exceſs; and who, having over-heated their Bodies with Wine or Brandy, afterwards expoſe themſelves to the cold and moiſt Air.

In thoſe Patients alſo, who, after the prepoſterous drying up of an Achor, Tinea, or Itch, or who, after an unſkilful and palliative Cure of a Coryza, or Cough, fall into catarrhous Fevers,

yers, no other Cauſe of the Diſorder can be ſuggeſted, than the Repulſion of the acrid and corroding Serum, which tends to bring on an Inflammation, from the Surface of the Body to the internal Parts.

But 'tis not to be doubted, that there is ſometimes in the Air ſuch a ſubtile cauſtic Matter, which, being received in Inſpiration, inſinuates itſelf into the glandulous Parts, thro' which it paſſes, excites Pain, Tumor, and Redneſs, and brings on a catarrhous Fever. This acrid Matter in the Air is certainly very ſoon generated in the Beginning of the Spring, when, in conſequence of the Thawing of the Snow and Ice, the Ground is overflow'd with an effete Water, which, ſtagnating and becoming putrid, diffuſes many noxious Effluvia into the Air. Hence it alſo happens, that, at this Time, Fevers of this Kind are for the moſt part epidemical.

But that Catarrhs, and catarrhous Fevers, are contagious, and affect thoſe who are near the Patients, or are diſpos'd for the Reception of the Diſorder, is owing principally to this, that they are produc'd by a Peccancy of the Lymph, juſt as in all other Diſeaſes of a contagious Nature, which are known to be produc'd by a Corruption, Vapidneſs, or Putrefaction of the Lymph.

When a benign catarrhous Fever ſeizes a Patient, the Phyſician, who is acquainted with theſe things, can eaſily diſtinguiſh it, by a Compariſon of the different Symptoms, from the other Species of Fevers which daily occur, ſuch as thoſe of the ſlow, hectic, quotidian, double tertian, and triple quartan Kind.

He will alſo eaſily perceive a Difference betwixt theſe Diſorders of the glandular Coats in the Fauces and Noſtrils, ariſing from a Lues Venerea and Scurvy, and thoſe produc'd by a Catarrh; for, in the former there is only a Corroſion and Ulceration, by the cauſtic lymphatico-ſerous Matter, without a Fever; whereas, in the latter, beſides the Corroſion, there is ſomething of an inflammatory Nature, ariſing from a Stagnation of the more ſubtile Part of the Blood, with a Fever.

The Difference will alſo be obvious betwixt a catarrhous Fever, and that which accompanies a Rheumatiſm; ſince, in the former, the internal glandular Coats are affected, and an Evacuation ſucceeds; whereas, in the latter, the external Coats of the Muſcles are only affected, and the Diſorder is not terminated by a critical Evacuation.

But 'tis ſomewhat more difficult to diſtinguiſh a benign catarrhous Fever from one of the malignant Kind, eſpecially at the Beginning, on account of the many Symptoms they have in common with each other: But the latter differs from the former in this, that it gives a more violent and ſudden Shock to the Strength, produces a perpetual Watching, which is ſucceeded by a diſorderly and uneaſy State of Mind; and that it is more contagious, and, for the moſt part, accompany'd with petechical Eruptions and Spots.

The larger the Quantity of the impure Blood and Serum is, the more violent are the Symptoms, and the longer the Diſorder is protracted; as is ſufficiently evident in ſcorbutic Patients, and in Caſes where the Matter of the Purple Fever remains pent up in the Body.

In hypochondriac Patients, beſides the Protraction of the Diſeaſe, in conſequence of the weaken'd Tone of the Stomach and Inteſtines, and the Propenſity to flatulent and ſpaſmodic Strictures, ſeveral violent Symptoms generally appear, eſpecially an Uneaſineſs at the Præcordia, a Difficulty of Breathing, and a Reſtleſneſs, accompany'd with an Inflation, and heavy kind of Pain in the Hypogaſtrium.

Thoſe who abound in Blood, who lead intemperate Lives, who drink liberally of the worſe Sorts of Wine, and are fond of acid and ſaline Aliments, feel a Heat towards the Evening, are afflicted with a dry, but ſevere, Cough, and their Sleep is diſturb'd and interrupted.

Women alſo, who from Frights, or any other Cauſe, labour under a Suppreſſion of the Menſes, are, during this Fever, afflicted with an Uneaſineſs of the Præcordia, accompany'd with frequent Faintings, a conſiderable Weakneſs of the whole Body, a Senſe of Heat and Cold, alternately ſucceeding each other, in the Skin; and theſe Symptoms are exaſperated principally in the Night-time.

But this Fever is of itſelf benign, free from Danger, if ſkilfully treated; and, for the moſt part, the Patient is cur'd, and all his Wearineſs remov'd, in ſeven, or, at moſt, fourteen Days. Beſides, other Diſorders of the Head, Cephalalgias eſpecially, and Hemicranias, are happily carry'd off by a ſucceeding Catarrh, and a Diſcharge from the Noſtrils.

In the Beginning, a catarrhous Fever is often immediately carry'd off by an Increaſe of Perſpiration: In others, after ſome Days, either by a plentiful Expectoration of a viſcid Matter, or by a liberal Diſcharge of a mucous Serum from the Noſtrils: In ſome alſo by frequent Stools; and in others, whoſe Urine was before thin, and diſcharg'd in a ſmall Quantity, by having that Fluid evacuated copiouſly, and ſo heavy as at leaſt to contain double the Quantity of ſolid Matter it did in its natural State.

The Methods of Prevention *and* Cure.

In order, therefore, to prevent the Attacks of Catarrhs, I adviſe all thoſe things to be avoided, by which I have already ſaid they might be brought on; and, in the Spring and Autumn, let the Patient be ſeaſonably blooded, let him eat moderately, let his Perſpiration be kept free and uninterrupted, and let him uſe proper Exerciſe: But, in thoſe who are young, and of a lax moiſt Conſtitution, and for that Reaſon, according to *Hippocrates*, *Sect.* 6. *Aph.* 2. frequently affected with catarrhous Defluxions, and rheumatic Pains, I have often, with Succeſs, order'd the Patient, for forty Days, to drink a Decoction prepar'd of China-root, Sarſaparilla, the Bark of Saſſafras, Raiſins, and a little Cinnamon, injoining him, at the ſame time, to uſe no Food beſides roaſted Fleſh, toaſted Almonds, and Biſcuit. He muſt alſo, in order to keep his Body ſoluble, frequently uſe Ptiſans prepar'd with Manna; and, when the Cure is finiſhed, he muſt daily take ſome Medicine capable of corroborating the Stomach, before Dinner, in Water or Wine.

In the Cure of catarrhous Fevers, theſe three Intentions are principally propos'd: Firſt, that the ſaline Acrimony of the acrid Lymph ſhould be obtunded and corrected; ſecondly, that the diſturb'd and interrupted Perſpiration, which is the primary Cauſe of the ſerous Congeſtion in the internal Parts, ſhould be reſtored, and reduc'd to Order; and, thirdly, that the Evacuation of the thick and viſcid Mucus ſhould be promoted, and its Generation for the future prevented.

The Acrimony of the Lymph is not only corrected by the abſorbent Bezoardic Powders, but alſo by all moiſtening and oleous Subſtances, ſuch as Oil of ſweet Almonds, Sperma Ceti, Cream, Emulſions of Almonds, or Pine-nuts with white Poppy-ſeeds, Water-gruel, Decoctions of Turneps and Barley, Broth of Capons and Hens, with the Yolks of Eggs. Among ſweet Subſtances, Liquorice, and Infuſions of it; *Spaniſh* Juice, and the Juice of Figs and Raiſins. If the Acrimony is too ſubtile and corroding, the gentler Anodynes are to be uſed; among which, the beſt are Preparations of Poppies, Saffron, the Pilulæ Wildeganſii, the Diacodium of *Montanus*, and the Pilulæ de Styrace, the Compoſition and Uſe of which are both antient and highly approv'd of, as appears from *Trallian. Lib.* 5.

As for promoting the Excretions, eſpecially that by the Skin, the moſt ſalutary of all the others, this Intention is anſwer'd by warm Infuſions of the Herbs, Paul's Betony, and Hyſſop, the Roots of Liquorice, Flowers of Elder, and the Seeds of Fennel and the wild Poppy: The more fix'd diaphoretic Powders are alſo advantageouſly exhibited, eſpecially with pectoral and antiſpaſmodic Waters: Nothing alſo contributes in a more ſalutary Manner to the Evacuation of the Serum thro' the Skin, than Motion and Exerciſe, which *Hippoc. Lib. de Inſomn. Sect.* 4. and *de Victu acut.* highly extols for promoting a Diaphoreſis in the Morning, after Friction. *In feveriſh Diſorders, however, it muſt always be uſed with Caution, being ſeldom or never proper.*

The viſcid Matter remaining in the Glands of the Fauces is to be evacuated by Pectorals, Figs and Raiſins reduc'd to a kind of Syrup, with Spirit of Wine burn'd upon them, and the pectoral Balſam of *Meibomius*; as alſo by the pectoral Elixir prepar'd of Gum Ammoniac, Myrrh, Liquorice-root, Elecampane, Saffron, Gum Benjamin, and Oil of Aniſe; the ſolvent Quality of which may be ſtill heighten'd by an Addition of the Tincture of Tartar, or of the vinous Spirit of Sal Ammoniac. But, for reſolving and attenuating the Phlegm ſtagnating in the Cavities of the Noſtrils, nothing is more effectual than the dry volatile Salt of Sal Ammoniac, impregnated with a few Drops of the pure, ſweet, and unadulterated Oil of Marjoram, and frequently apply'd to the Noſtrils.

Concerning the Application of theſe Remedies in general, we are to obſerve, that, in the Morning, it is expedient to promote Perſpiration, by drinking warm Infuſions of Herbs, Broths, and the Uſe of the correcting Bezoardic Powders; but, towards the Evening, Medicines of an anodyne and demulcent Nature are to be exhibited. But the particular Method of Cure conſiſts partly in an Alleviation of the Symptoms, and partly in a proper Exhibition of the Medicines, with reſpect to the Doſe and Order. The Exhibition is alſo to be accommodated to the particular State and Diſpoſition of the Patient. But of this we ſhall ſpeak more fully in the following Obſervations.

Cautions *and Clinical* Observations.

Catarrhous Diſorders, as well as all other feveriſh Indiſpoſitions, are to be treated in a very mild and gentle Manner; and the Patient is to be kept moderately warm, either in Bed, or by means of a Fire. He is, therefore, to abſtain from Medicines which are too hot, draſtic, and productive of Commotions, as alſo from a hot Regimen, becauſe, by theſe, the acrid Matter is put into Commotions, and a fervid Diſpoſition convey'd to the Parts: On the contrary, all refrigerating Subſtances, Acids, and whatever may diſturb or obſtruct Perſpiration, are carefully to be avoided; Opiates alſo, and Preparations of the *Theriaca*, are to be us'd with the greateſt

Caution, eſpecially when the Head is weak and heavy, or when the Patient is old or coſtive.

The Diet is to be ſpare, and the Drink tepid and wholſome. The moſt proper is a Decoction of excorticated Barley, with Shavings of Hartſhorn, Raiſins, and Liquorice-root; but Wine and Brandy, on account of their ſtimulating Acid, and the Spirit they contain, which increaſes the Heat, are of no Uſe in this Species of Fever. In the Decline of the Diſeaſe, however, when the Excretions are begun, it has been obſerv'd, that good Wine, pretty liberally drank, has prov'd beneficial, becauſe it promotes the Circulation of the Blood, and maintains an equable Perſpiration.

When the Efferveſcence is violent, and a Fervor of the internal Parts perceiv'd, a few Grains of Nitre may be advantageouſly mix'd with the Bezoardic Powders, and Emulſions muſt be plentifully drank.

When, during this Diſorder, the Fœces are indurated, and the Patient coſtive, beſides Water-gruel, Decoctions of Manna, Prunes, and Raiſins, nothing is more proper than emollient Clyſters. Ten or twelve Grains of the Pilulæ Aleophanginæ or Becherianæ, with four Grains of the Pilulæ de Styrace, taken at Bed-time, are of ſingular Service, becauſe they not only render the Body ſoluble, but moderate the violent dry Cough.

If, in the Decline of the Fever, the Cough is too moiſt and obſtinate, and the Matter producing it too copious, a Derivation and Evacuation of the pituitous Humours, by Stool, are excellently promoted by two or three Ounces of a Decoction of Manna in Water of Paul's Betony. The Pilulæ Balſamicæ Becheri, as alſo the Pilulæ Ruffi, prepar'd of equal Quantities of Aloes, Myrrh, and Saffron, are of conſiderable Service in Caſes of this Nature.

But, in the Beginning of a catarrhous Fever, purgative Medicines, eſpecially thoſe of the more acrid Kind, are highly improper, becauſe they invite the acrid ſerous Humours to the Inteſtines, excite Gripes and a Flux, and put the Patient in Danger of being ſeiz'd with a ſlow Fever: And, in a young Woman of a plethoric Habit, I knew an Inflammation of the Stomach brought on by an Exhibition of Mercurius Dulcis, with Reſin of Jalap.

When the Cough is violent and racking, it is to be allay'd with recent Oil of ſweet Almonds, mix'd with Syrup of Maidenhair, as alſo with the following Electuary:

Take of the Oil of ſweet Almonds, three Drams; of Sperma Ceti, one Dram; of white Sugar-candy, and Syrup of Violets, each an Ounce; of Saffron, one Scruple; of the Oils of Aniſe, Mace, and Saſſafras, each ſix Drops: Mix up into an Electuary, of which a ſmall Quantity is to be taken frequently.

When, in Women labouring under a Suppreſſion of the Menſes, the above-enumerated Symptoms appear, the Body is to be render'd ſoluble by Clyſters, and Diaphoretics muſt be exhibited, in order to promote the Circulation of the Blood towards the Surface of the Body. In this Caſe we may advantageouſly add one Grain of Saffron, or a few Grains of the Flowers of Sulphur, to the Bezoardic Powders; but the Patient muſt abſtain from all expectorating and ſweet Subſtances.

The Symptoms which happen to hypochondriac Patients, ariſing principally from a preternatural Inflation of the Stomach, are moſt commodiouſly remov'd by emollient and carminative Clyſters, as alſo by carminative Eſſences, in Conjunction with Pectorals.

When, after the Fever, the Lungs remain ſo relax'd as to produce too copious an Expectoration, we may, to the Bezoardic Powders, add a few Grains of the Bark of Caſcarilla, or a few Drops of my Balſam of Life may be exhibited towards Night.

Veneſection, ſeaſonably inſtituted, under a proper Regimen, is of ſingular Service for preventing the frequent Attacks of Catarrhs in plethoric Patients; but, during the catarrhous Fever, it is entirely to be abſtain'd from; for, in this Caſe, we are taught by Experience, it protracts the Diſorder.

In a violent and long-continu'd Cough, ſweet Pectorals, and incraſſating Medicines, exhibited in too large Quantities, diſpoſe the Patient to Cachexies, and phthiſical Diſorders, not only by impairing the Appetite, and digeſtive Faculty, but alſo by weakening the Tone of the Lungs.

Tho', according to *Hippocrates*, in the third Section of the ſixth Book of his *Epidemics*, thoſe who are afflicted with Head-achs, Heavineſs, and Hoarſeneſs, when ſeiz'd with a catarrhous Fever, are leſs ſubject to Relapſes, when the Diſeaſe terminates naturally with a Deſluxion; yet, leſt a Foundation ſhould be laid for ſome other Diſorder, I would, with the ſame *Hippocrates*, adviſe the recovering Patients to have a due Regard to their Food, and the State of their Stomach; and, in order to carry on a due Perſpiration, to continue for ſome time the Uſe of their Infuſions in the Morning. *Hoffman.*

CATARTISMUS, καταρτισμὸς, (from καταρτίζω, a Verb, uſed by *P. Ægineta* to ſignify the Reducing of a Luxation, and deriv'd from ἄρτιος, entire) is, as *Galen* ſays, a Tranſlation of Bones from a preternatural to their natural Situation.

CATASARCA, κατασάρκα. The ſame as ANASARCA, which ſee.

CATASCEUE, κατασκευὴ, in *Galen*, *Lib.* 3. *de San. tuend. Cap.* 2. a Term in Uſe among the Athletæ, or Wreſtlers, and ſignifies, as he ſays, that complete Courſe of Exerciſes perform'd by the Athletæ, their Bodies being prepar'd for them, which ſometimes laſted a whole Day. *Galen* alſo uſes the Term *Comment.* 2. in *Lib. de R. V. I. A.* to expreſs the organical Structure of the human Body.

CATASCHASMOS, καταχασμὸς, deriv'd of χάζω, ſignifying, among other various Senſes, to ſcarify, and to open a Vein. Scarification. *Caſtellus.*

CATASEISIS, κατάσεισις, from σείω, to ſhake, is properly a Concuſſion, but ſeems to mean a Diſtention or Extenſion, *Lib.* περὶ ἄρθρων, *Cap.* 24. So ἀνασείειν is expounded, in *Suidas*, by κατατείνειν, to extend, to ſhake off; and, in *Heſiod*, ἀσπίδ' ἀνασείσασα may be render'd, "She extended or ſhook "her Buckler." *Foeſius.*

CATASTAGMOS, κατάσταγμὸς, deriv'd from στάζω, to diſtil, was the Name which the *Greeks*, in the Time of *Celſus*, had for a *Diſtillation. Celſus*, *Lib.* 4. *Cap.* 4.

CATASTALAGMOS, κατάσταλαγμὸς, στάλαξις, from σταλάζω, to diſtil, means the ſame as the preceding. *Caſtellus.*

CATASTALTICUS, καταστολτικὸς, from καταστέλλω, to reſtrain, of στέλλω, to contract: An Adjective in frequent Uſe, and ſignifying *ſtyptic*, *aſtringent*, *repreſſing*. It is ſometimes, thro' Ignorance of the *Greek*, barbarouſly wrote *Caſtalticus*. The ſimple Word *Stalticus*, σταλτικὸς, bears the ſame Meaning.

CATASTASIS, κατάστασις, from καθίστημι, to conſtitute, of ἵστημι, to ſtand, ſignifies, in general, the Conſtitution, Habitude, State, or Condition, of any thing. The Word is frequently uſed by *Hippocrates*, to ſignify the Conſtitution of the Air or Seaſons, or the Nature of a Diſeaſe; and he means by it in general, as *Galen* explains him, the eſſential Nature, or Form, ἰδέαν, of Things. It is ſpoken alſo of the Colour and external Habit of the Body, *Prorrhet.* 2. and, in *Lib. de Fract.* it ſignifies the Reducing of a Luxation, where κατάστασις is expounded by *Galen* καθήλωσις, "A Reſtitution to, and "Poſition in, the proper Place."

CATASTEMA, κατάστημα, of the ſame Derivation and Signification generally as the former; but is more particularly uſed to expreſs the Clothing, Air, Motion, and external Habit, of the Body. In *Galen's Exegeſis* it is expounded a Leaning or Reſting upon, and quoted from the ſecond of the *Epidemics*; but no ſuch Word is found in that Book. The Verb καταστῆσαι is there alſo expounded by ἀποσκῆψαι, "to ſlip, or fall down;" but (*Lib.* 1. περὶ γυναικ.) καταστήσεως ſignifies to be moderated, check'd, repreſs'd, being us'd to expreſs the Effects of a cooling and aſtringent Medicine upon Bile.

CATASTOLE, κατάστολὴ, in *Lib.* περὶ εὐσχημ. ſignifies a plain and modeſt Dreſs, long Garments; κατάστολὴ is expounded by *Heſychius*, περιβολὴ, "Clothing, Veſture;" by *Suidas*, στολὴ, a Gown, or long Robe.

CATATASIS, κατάτασις, from κατατείνω, to extend, or to place. It has, in *Hippocrates*, two Significations, one of which is, the Extenſion of a fractur'd or diſlocated Limb, in order to replace it; the other is, the actual Replacing it in a proper Situation.

CATATRIPSIS, κατάτριψις, from τρίβω, to rub, ſignifies the Attrition or Friction of Machines. *Hippocrates* applies it to the Organs of the human Body.

CATAUDESIS, καταύδησις. Vociferation.

CATAXA, κάταξα. *Aetius* and *Actuarius* expreſs by this raw Silk, or Silk before it is dy'd.

CATE. A Name by which the Terra Japannica, or Catechu, is ſometimes call'd.

CATECHESIS, κατήχησις, from κατηχέω, to inſtruct by Word of Mouth. It implies Inſtruction, or Directing by Word of Mouth, in *Hippocrates*.

CATECHU. Japan Earth. See TERRA JAPANNICA.

CATEIADION, κατειάδιον, a very long Inſtrument, which was introduc'd into the Noſtrils, in order to provoke an Hæmorrhage, in the Cure of the Cephalalgia, or Head-ach. It is mention'd by *Aretæus*, *de Curat. Morb. diut. Lib.* 1. *Cap.* 2.

CATELLUS. A Puppy. Puppies were uſed by the Antients as a Part of Diet, and are by Authors directed to be laid upon various Parts of the Body when in Pain. See CANIS.

CATHÆRESIS, καθαίρεσις, from αἱρέω, to take away, implies any ſort of Detraction or Subtraction of a Part of the Body, by any kind of Evacuation whatever.

CATHÆRETICA, καθαιρετικὰ, of the ſame Derivation as the preceding. Catheretics, that is, Remedies which conſume ſuperfluous Fleſh. *Celſus* diſtinguiſhes theſe, which he calls *Rodentia*, from Cauſtics, which he calls *Cruſtam inducentia*. See CORRODENTIA.

CATHARMA, κάθαρμα, from καθαίρω, to purge, imports the Excrements purg'd off from any Part of the Body, as the Stomach,

Stomach, Inteſtines, or Bladder. It alſo ſignifies any thing ſacrificed by way of Expiation, with a View of averting a preſent or impending Judgment of Heaven.

CATHARMOS, καθαρμὸς, of the ſame Derivation, implies Purgation by Medicines; or an Expiation, that is, the Cure of a Diſorder by ſuperſtitious Ceremonies, or Sacrifices. The Cure of the King's Evil by the Royal Touch, if there was ſuch a thing, might be ſaid to be perform'd by a CATHARMOS.

CATHAROS, καθαρὸς, is uſed by *Hippocrates* to expreſs pure, or unmix'd; and, in this Senſe, is apply'd to the Excrements. Sometimes it imports clear, limpid, or not turbid, and is an Epithet to Urine. It alſo ſignifies Clearneſs of Viſion, or a Reſplendence of the Eye, when apply'd to that Organ.

CATHARSIS, κάθαρσις, Purgation, whether natural or artificial. It implies Evacuations of all Sorts of offending Humours, diſcharg'd by any Way whatever, as by the Mouth, Anus, Uterus, urinary Paſſage, Pores of the Skin, &c. Catharſis alſo ſignifies the menſtrual Purgation, and that of the Lochia.

CATHARTICA, καθαρτικὰ. Purging Medicines, as now generally underſtood; but it alſo implies Medicines which excite Vomiting, or Emetics.

Hippocrates was of Opinion, that particular Cathartics purg'd off, or attracted, as he expreſſes it, particular Humours: Thus, ſays he, a Medicine which purges the Bile, firſt attracts the Bile; but if it is too ſtrong, or if its Operation continues too long, finding no more Bile to act upon, it purges the Phlegm, after that the black Bile, and then the Blood. This is what I apprehend Phyſicians mean, when they ſay there are ſuch things as elective Purges, that is, Purges which act upon one Humour, and not upon another. Others deny the elective Faculty of Purges, becauſe they cannot give any Reaſons why a cathartic Ingredient ſhould act upon one Humour more than another, which, however, will determine nothing in this Diſpute. 'Tis certain, that amongſt Simples in general, ſome are inclin'd to act upon one Gland, Organ, and Part of the Body, whilſt others are diſpoſed by their Nature to act upon others. Thus the Operation of ſome is determin'd to the Kidneys, that of others to the Liver, Teſticles, or ſalival Glands. Theſe, therefore, may be ſaid to be elective, with reſpect to the Humours ſeparated in thoſe particular Glands. As to Cathartics, ſuppoſing they only acted upon the Stomach and Inteſtinal Tube, we may readily comprehend, that ſome Kinds may act upon the Glands ſituated in the Stomach, and deſtin'd to ſecrete a Juice uſeful in the Digeſtion of the Aliment, whilſt others operate principally on the Liver, Pancreas, or Inteſtinal Glands, which laſt may poſſibly be of various Kinds, and deſtin'd to ſeparate diſtinct Fluids. In this Senſe, then, Purges may, without any Impropriety, be ſaid to be elective.

The cathartic Simples known to *Hippocrates*, and by him employ'd in Medicine, were generally ſuch as operated both by Vomit and Stool, or at leaſt with much Violence downwards; ſuch were the white and black Hellebore, as Authors generally repreſent them: But with reſpect to the black I muſt remark, that the Plant which we make uſe of under that Name, is poſſeſs'd of but a very weak cathartic Virtue. Beſides theſe, he made uſe of the Grana Cnidia, ſuppos'd to be the Seeds of the Thymelæa; and by others, thoſe of the Mezereon; the Cneorum or Cneſtrum, which is the Thymelæa, or, perhaps, the Mezereon, or elſe the Thymelæa minor; the Peplium and Peplus, different Species of the Tithymalus; the Thapſia; the Juice of the Hippophaes; Elaterium; Colocynthis; Scammony; the Lapis Magneſius; the Cnicus, ſuppos'd to be what is uſually call'd the Carthamus. *Hippocrates* alſo takes notice of a white Poppy, different certainly from what is now call'd by that Name, and which ſome take for the Papaver Spumeum, others for the Peplus.

As theſe Purgatives were, for the moſt part, highly draſtic, our Author always uſed them with the utmoſt Precaution. He never, for Inſtance, exhibited them, during the Dog-days; neither did he purge pregnant Women, except in caſe of that Turgeſcence of the Humours, which we ſhall afterwards mention; and even then he tells us, that 'tis dangerous before the fourth and after the ſeventh Month of Geſtation. *Hippocrates* muſt, for the ſame Reaſons, have abſtain'd from purging Children and old Perſons, or at leaſt have done it very rarely.

The principal or moſt frequent Uſe he made of Purgatives was in chronical Diſorders; but in acute Diſeaſes, he was much more circumſpect in uſing them. Among all the feveriſh Patients, and others labouring under acute Diſorders, whoſe Caſes he gives us in his Epidemics, there are very few to whom he exhibited purgative Medicines; and he obſerves, that in certain acute Diſeaſes the Exhibition of Purgatives has produc'd very bad Effects.

Some may poſſibly conclude from this, that *Hippocrates* abſolutely rejected the Uſe of Purgatives in acute Diſorders; but 'tis obvious, from other Paſſages of his Works, that he was not of this Opinion; for he really exhibited purgative Medicines in acute as well as chronical Diſeaſes, tho' not ſo often. He thought, for Inſtance, that Purging was proper in Pleuriſies, when the Pain is under the Diaphragm; and, in this Caſe, he gave black Hellebore, or Peplium mix'd with Laſerpitium. In various Paſſages he affirms, that Purgatives may be exhibited in acute Diſorders, provided the following Precautions are uſed.

The principal Rule *Hippocrates* lays down, with reſpect to Purging, is, that *we ought only to evacuate the* concocted Humours, but not ſuch as are ſtill crude; and that we ought not to purge in the Beginning of the Diſeaſe, except when there is a violent Effervеſcence of the Humours, which rarely happens. By the Beginning of the Diſeaſe *Hippocrates* underſtood all the Time that intervened betwixt the firſt and the fourth Day. He was not the firſt who obſerv'd, that the Patient became worſe by carrying off the Humours, or Purging, before that Time; for the *Egyptian* Phyſicians had made the ſame Obſervation, and *Hippocrates* might have learn'd it from *Democritus*, who travel'd for a great while thro' *Egypt*; or from ſome *Egyptian*, ſuppoſing that his Predeceſſors the *Aſclepiadæ* had not made the ſame Obſervation; or his own Sagacity, and Attention to Caſes, might have ſuggeſted it to him.

This ſeems to be contradicted by the twenty-ninth Aphoriſm of the ſecond Section, where we are told, that in the Beginning of Diſeaſes we muſt move, that is, purge, what we think ought to be purg'd. This Aphoriſm has, in all ſucceeding Ages, employ'd the Wits of Phyſicians, to reconcile it with the former. *Galen* endeavours to vindicate *Hippocrates*, by making the Word *move* to ſignify the Exhibition of all the Remedies neceſſary for the Relief of the Patient, among which he reckons, in a particular manner, Veneſection and Purging; ſo that the Movement or Purging here ſpoken of, is rather produc'd, according to *Galen*, by the former than the latter of theſe Remedies; though the ſame Author acknowledges, that Purges may ſometimes, tho' more rarely, be exhibited in the Beginnings of acute Diſeaſes. This Explication of *Galen*'s might be admitted, if there was not a third Aphoriſm which explains this, and which appears contrary to the Senſe of *Galen*; for in the twenty-fourth Aphoriſm of the firſt Section, we are told, that we muſt rarely purge in acute Diſeaſes; and that it muſt be done in the Beginning, after having carefully examin'd the State of the Patient. *Galen* endeavours to reconcile the apparent Contradiction between this Aphoriſm and the other, by ſaying, that it is in chronical Diſeaſes we muſt always wait for the Concoction of the Humours before we purge; but that, in acute Diſorders, we may purge in the Beginning, when there is an Effervеſcence or Turgeſcence of Humours; and he adds, that the Rareneſs of this Caſe induces *Hippocrates* to adviſe Phyſicians carefully to examine the State of the Patient before exhibiting Purgatives.

It appears, that *Hippocrates* ſometimes exhibited Purgatives in the Beginning of acute Diſeaſes; and, beſides the Aphoriſm already quoted, he elſewhere expreſly affirms, *That we ought to purge in the Beginning of Fevers, when the Urine of the Patient is turbid; but that we ought to abſtain from it when it is clear.* It muſt, however, be confeſs'd, that he rarely put this Method in Practice, whatever the State of the Patient might be. The ſmall Number of Patients labouring under acute Diſtempers, to whom, as we learn from his Epidemics, he exhibited Purgatives, is a Proof of this.

In his Book *De Ratione Victus in Acutis*, he gives us this important Advice, which relates to the firſt quoted Aphoriſm. "Thoſe," ſays he, "who endeavour, by a purgative Medi-
"cine, to reſolve or diſſipate Inflammations formed in any
"Part, derive nothing from the particular Part where the In-
"flammation is, by reaſon of the Tenſion, and becauſe the
"Diſorder is as yet crude. On the contrary, they fuſe or cor-
"rupt what remains ſound and uncorrupted in the Part." But to return to the true or apparent Contradictions in the Aphoriſms already quoted: It would be no ſurpriſing thing, that there are Contradictions in them, if, as *Galen* ſuppoſes, it was true, that ſome of them were ſpurious; we might from thence infer, that ſome of theſe now mentioned are of the ſpurious Kind, tho' *Galen* does not own, that they are.

Beſides, *Hippocrates*, in the ninth Aphoriſm of his ſecond Section, adviſes the Phyſician, before Purging, to attenuate the Patient's Humours, and diſpoſe them for Evacuation, by diluting them ſufficiently, that they may paſs off with the greater Eaſe.

The preceding Criticiſm, relative to the imaginary Contradictions in the Aphoriſms above quoted, are Mr. *Le Clerc*'s, an Author of great Judgment, which, however, he does not ſeem to have ſhewn in theſe Remarks; for I can perceive no Shadow of a Contradiction in them. In the Aphoriſm firſt quoted, which is the twenty-ſecond of the firſt Section, the Precept laid down amounts to this: Purge off, ſays he, and move the concocted Humours, but not thoſe which are crude; in conſequence of this Maxim, Purging, in the Beginning of an acute Diſtemper, muſt be improper, becauſe at that time the Humours are generally crude: If, however, there is a great Effervеſcence or Turgeſcence of Humours, which does not often happen,

happen, Purging may be allow'd, in order to diminiſh their Quantity, and moderate the Symptoms thence ariſing.

This is, perhaps, one of the moſt important Doctrines in the Art of Healing, not only with reſpect to Purging, but to all other artificial Evacuations whatever, unleſs thoſe which are calculated to moderate the Symptoms, and clear the Primæ Viæ of Impurities. For if, with *Sydenham*, we conſider an acute Diſtemper, as the Inſtrument made uſe of by Nature, that is, the vital Powers, to remove ſomething which interferes with the regular Circulation of the Blood; and ſuppoſe this Obſtacle to be a Part of the vital Juices concreted, and ſtagnating in the Veſſels, it is evident, that, in ſuch a Caſe, the uſual Quantity of Humours muſt circulate in a ſmaller Space, than when the Veſſels were all pervious and unobſtructed; hence the Blood muſt return to the Heart more frequently than when the Veſſels are unobſtructed, the Heart muſt, for this Reaſon, contract more frequently, the Blood muſt move with more Velocity, the Attrition betwixt the Solids and Fluids, and conſequently the Heat, muſt be increas'd. The Maſs of Blood, therefore, acting upon the Matter concreted, and ſtagnating in the Veſſels, with a greater Velocity and Force, muſt contribute to its Reſolution, that is, to the rendering it fluid, and capable of circulating in the Veſſels, and being carry'd out of the Body. The increas'd Heat, alſo, carries on the ſame End; for, as is obſerv'd under the Article ALBUMEN, the Serum of the Blood, when concreted, will, in a particular Degree of Heat, reſolve ſpontaneouſly. Here, then, the vital Powers raiſe Motion and Heat, as the moſt effectual Means of reſolving the coagulated and obſtructing Humours.

From what has been ſaid, 'tis evident, that whilſt the offending Humours are in a State of Concretion and Stagnation, 'tis in vain to attempt their Diſcharge by Cathartics, which defer, ſays *Hippocrates*, till evident Signs appear of their Concoction, that is, till they are reſolv'd and attenuated, either ſpontaneouſly, or by Art, ſufficiently to be carried off by the Inteſtinal Glands, which cannot happen whilſt the Diſeaſe is in its Vigour.

In the ſecond quoted Aphoriſm, which is the twenty-ninth of the ſecond Section, the Word which Mr. *Le Clerc* interprets *purge*, is κίνει, move, and may ſignify any Attempt whatever to remove the Cauſe of the Diſeaſe, as well as Purging. It means, therefore, no more than this: When it appears neceſſary to attempt any thing for the Relief of the Patient, whether by Bleeding, clearing the Primæ Viæ of Impurities by gentle Laxatives, provoking the Stomach to diſcharge its Contents, by exhibiting large Quantities of mild Fluids, by Clyſters, Fomentations, Baths, *&c.* do it in the Beginning; but in the Vigour of the Diſeaſe it is prudent to reſt.

The third Aphoriſm is the twenty-fourth of the firſt Section, and by no means contradicts either of the former. For the Doctrine it conveys amounts to this: In acute Diſeaſes, eſpecially in the Beginning, ſeldom exhibit draſtic Purges, and never without due Conſideration. I have ſaid draſtic Purges, becauſe theſe are certainly what are meant by *Hippocrates*.

Thus we ſee Mr. *Le Clerc*, as well as many others, have been laviſh of their Criticiſms, without any apparent Neceſſity.

Hippocrates aſſerted that, with reſpect to the Choice of Purgatives, it was neceſſary to give Medicines which purge Bile to Perſons of bilious Habits, and ſuch as labour under bilious Diſorders; in pituitous Diſorders, ſuch as purge Phlegm; in melancholic Indiſpoſitions, ſuch as purge Melancholy, or black Bile; and in Dropſies, ſuch as purge Water. He added, that we knew whether a Purgative evacuates what it ought to have done, by the ſubſequent good or bad State of the Patient. If the Patient becomes well, 'tis a Sign, that the Medicine has effectually evacuated the peccant Humour. On the contrary, if he becomes worſe, *Hippocrates* is of Opinion, that whatever Quantity of Humours is diſcharg'd, yet ſtill the particular Humour, which occaſions the Diſorder, is retain'd; for he did not think, that the Advantage of a Purge bore a Proportion to the Quantity of Matter it evacuated, but to its Quality, and the Effects it produc'd.

But when he had an Intention to ſolicit the Humours from the moſt remote Receſſes of the Body, he uſed the moſt draſtic Medicines; and white Hellebore, which is claſs'd among the Purgatives, was principally employ'd by him on this Occaſion. But, in his firſt Book *De Diæta*, he orders it particularly for melancholic Patients, and ſuch as were mad. From the great Uſe made of this Medicine by all the antient Phyſicians, came the Proverb, *To ſtand in Need of Hellebore*, to imply that any one had loſt his Senſes. He alſo exhibited it in Defluxions, which, according to him, come from the Brain, and fall upon the Noſtrils and Ears, or which fill the Mouth with Saliva, or produce obſtinate Head-achs, a Wearineſs or preternatural Heavineſs, or a Weakneſs of the Knees, or any Swelling of the whole Body. He alſo preſcribed it for phthiſical Patients, in Conjunction with a Decoction of Lentils; for thoſe afflicted with that Species of Dropſy call'd Leucophlegmatia, and in other chronical Diſorders. But we do not find, that he uſed it in thoſe of the acute Kind, except in a *Cholera Morbus*, in which, as he tells us, in the fifth Book of his Epidemics, he exhibited Hellebore with Succeſs. In this Diſorder the Patient vomits too much; but the Vomiting is remov'd by an Emetic, as it ſometimes happens.

Some took this Medicine faſting, but moſt us'd it after Supper; and the Reaſon why *Hippocrates* preſcribed it after Meals was, probably, that it might mix itſelf with the Aliments, and by that means, loſing ſome of its Acrimony, act with leſs Violence on the Stomach. He alſo ſometimes gave Seſamoides, with an Intention to vomit; and ſometimes he exhibited it in Conjunction with Hellebore. We muſt alſo obſerve, that in ſome Caſes he uſed a Species of Hellebore, which he calls μαλθακὸς ἑλλέβορος, ſoft or ſweet Hellebore. This may poſſibly have been a particular Preparation of Hellebore corrected, in order to render its Action leſs violent.

When *Hippocrates* had only an Intention to keep the Belly open, or procure an Evacuation of the Excrements contained in the Inteſtines, without ſoliciting the Humours from other Parts, he principally employed ſome Simples, ſuch as the Herb Mercury, or Cabbage, the Juice and Decoction of which he ordered his Patients to drink. With the ſame Intention he preſcrib'd Whey, the Milk of Cows and Aſſes, with an Addition of a little Salt. This he ſometimes ordered to be boil'd. He alſo ſometimes exhibited a large Quantity of Aſſes Milk alone, in order to render the Body ſoluble. In one Paſſage of his Treatiſe *De Ratione Victus in Acutis*, he preſcribes ſixteen *Heminæ*, a Meaſure nearly equivalent to our Half-pint. In the ſeventh Book of his Epidemics, we find an Inſtance of a young Man to whom he exhibited nine Heminæ in two Days; a much ſmaller Quantity than the former. We may alſo affirm, that as the Time of taking the ſixteen Heminæ is not ſpecified in the former Paſſage, we may ſuppoſe, that this Quantity of Milk was deſign'd for more than one Day.

Hippocrates alſo ſometimes ſeems to make mention of certain Hypocatharſes, or Demipurgatives. But the Word he uſes is equivocal, and may equally ſignify an incomplete Purging, as ſome Commentators explain it, and a Purging by the Anus, or an ordinary Purging, in Oppoſition to a Vomiting, which is a Purging by the Mouth.

Hippocrates alſo uſed Suppoſitories and Clyſters, in order to render the Body ſoluble. The Suppoſitories were compos'd of Honey, the Juice of the Herb Mercury, Salt, Nitre, the Powder of Coloquintida, and other acrid Ingredients, in order to irritate the Anus, into which they were introduced either round as a Ball, or in an oblong round Form, almoſt like one's little Finger, and made longer or ſhorter, according to the Neceſſity of the Patient. The Clyſters preſcrib'd by *Hippocrates* were Milk, and unctuous Ingredients, mix'd with Decoctions of Chiches, or Sea or Salt-water. At other times he uſed a Decoction of Blites, or other Herbs of a like Nature, in which he diſſolv'd Honey, Oil, and Nitre, or other Ingredients, according as his Deſign was to attract, ſcour, irritate, or correct, and, in a Word, as the ſeveral Diſeaſes he treated requir'd. The Quantity of the Liquor amounted to four Heminæ, which ſeems to imply, that this Quantity ſerv'd for ſeveral Clyſters, repeated after each other.

Cicero de Natura Deorum, L. 3. ſays, that the third *Æſculapius*, Son of *Arſippus* and *Arſinoe*, invented Purging. But the firſt Inſtance in Hiſtory of the Exhibition of a Cathartic, is in the Daughters of *Prætus*, who were purg'd by *Melampus*, and by this means cur'd of Madneſs; ſee the Preface.

Eraſiſtratus was of Opinion, that thoſe Evacuations which are caus'd by Cathartics, proceed from the Blood, and the ſolid Parts of the Body, which are, as it were, fus'd; inſomuch that Cathartics make, inſtead of evacuating, Humours. Scammony, for Example, changes the Blood to Bile; the Flowers of Braſs convert it into Water; the Grana Cnidia, and Carthamus, change it into Phlegm.

Aſclepiades was of the ſame Opinion, and ſaid, that thoſe who found a Cure, immediately upon an Evacuation by Purging, did not recover, becauſe ſome particular Humour was taken away, but becauſe the Plenitude of the whole Habit in general was diminiſh'd. He thought alſo, that Plenitude was not the immediate, tho', perhaps, it might be the antecedent, Cauſe of Diſeaſes, or a Cauſa per Accidens. For this Reaſon he ſeldom made uſe of Purges; but thought Clyſters ſufficient, which he made uſe of in moſt Diſtempers; however not ſo frequently as other Phyſicians.

All the Methodics were utterly againſt Purging; and *Cœlius Aurelianus* is of their Party. However, he allows of it in a Dropſy. He preſcribes Euphorbium given with Mulſum, in the Quantity of two or three Cochlearia, or diluted with the Yolk of an Egg. He preſcribes alſo a Decoction of Squills.

N. B. Amongſt the Antients there were two Kinds of Cochlearia: The greater, which contain'd a Dram; and the leſſer, which contain'd a Scruple.

Plutarch was an Enemy to Purges.

We are obliged to the *Arabians* for the whole Tribe of milder Purges.

The

The *Arabians* not only found out milder Purges than the *Greeks* made uſe of, or were acquainted with, but, when they gave the old rough ones, it was in a ſmaller Quantity.

As Purging is of very great Importance, it will be proper to enter upon a full and thorough Examination and Inquiry into the Nature and Cauſes of inteſtinal Excretion. A Diſcourſe on this Head cannot be thought improper for this Place, becauſe many are too ſubject to deſpiſe this Kind of Evacuation, and others profeſs to ſet a much higher Value on Diſcharges by the urinary Paſſages, or by means of Clyſters.

Peyer, who firſt diſcover'd the inteſtinal Glands, aſcribes to them the Function of ſupplying a Humour for diluting and elaborating the Chyle; and ſuppoſes them to be the Source from whence ſuch vaſt Diſcharges follow, upon the Exhibition of a Cathartic. Some deny, that ſo great Plenty of Humours can be excreted from theſe Glands, either naturally, or by the Aſſiſtance of Art; and the Reaſon why they doubt how this can be effected by natural Excretion, ſeems to be their being at a Loſs to comprehend, how a Cathartic can derive ſo vaſt a Quantity of Excrements from little more than this one ſingle Source. But this Doubt may very eaſily be ſolved, by reducing the Matter to a Calculation.

By the ſtatic Laws of *Sanctorius*, Evacuations by Stool, compared with thoſe made through the Pores of the Skin, are as one to ten; wherefore, in the Space of four-and-twenty Hours, the Proportion will be as four Ounces, ſix Drams, one Scruple, four Grains, to forty-eight Ounces; or four Scruples, ſixteen Grains, to forty-eight Scruples in an Hour. In cold Countries, where Perſpiration is leſs, the Diſcharges by Stool may, perhaps, riſe a little higher. This laſt-mention'd Evacuation is, by thoſe who diſpute upon theſe Subjects, injudiciouſly confounded with that Excretion which is made by the Glands; but, to a Perſon who attentively conſiders both, they will appear vaſtly different. The Contexture of the Skin, and the Inteſtines, appears to be nearly the ſame, and both are interſperſed with Glands, which, tho' not very evident to the naked Eye, are eaſily diſcern'd by Help of the Microſcope. And Nature has wiſely provided for the more commodious Exerciſe of this Excretion by the Inteſtines, in furniſhing their Coats with vaſt Numbers of Blood-veſſels. The Skin, taken at a middle Rate, contains about two thouſand ſix hundred and forty ſquare Inches in Surface; and the Inteſtines, which are almoſt thirty Feet in Length, and, taken one with another, near four Inches in Compaſs, conſtitute a Cylinder, whoſe Surface amounts to one thouſand four hundred and forty ſquare Inches; ſo that the Superficies of the Inteſtines amounts to more than half that of the Skin; but, becauſe the Inteſtines are not ſo thick ſet with Glands as the Skin, let the Superficies, from whence any Humour is evacuated, be reckon'd as one to four. If, thro' the Skin, then, in the Space of an Hour, forty-eight Scruples perſpire, the Inteſtines will diſcharge twelve. Nor ſhall we be ſcrupulous in admitting ſo plentiful an Efflux of Lymph from the Inteſtines, if we conſider, how much wider the Orifices of the excretory Veſſels are in the Inteſtines than in the Skin, which is manifeſt from the Glands themſelves, which are much larger in the Inteſtines than in the Skin.

According to this Eſtimate, then, it appears, that theſe Glands are both ſufficient and accuſtom'd to ſupply far greater Quantities than what are diſcharged by Stool. But, ſince the Recrements of the Aliments make a great Part of the Stools, or rather the greateſt Part of them, becauſe they are ſolid, it would be eaſy to ſhew, that this Matter, which is thus derived from the Glands of the Inteſtines, is ſo far from being wholly evacuated this Way, that far the greater Part of it returns with the Chyle into the Lacteal Veſſels, and is reſtor'd to the Blood-veſſels, exactly in the ſame manner as Lymph uſes to return from the Parts of the lower Belly. It is certain, then, and confirm'd by Experiments, that, whenever Chyle is wanted to ſupply the Lacteal Veſſels, they are quite fill'd with this Lymph expreſs'd from the Glands.

The Want of due Attention to this Diſtinction has led *Pitcairn* into an Error, who, when he reaſons about the moſt commodious Way of Evacuation, makes the Proportion of cuticular Secretion to ventral, or by the Belly, greater than that of a hundred to one. For the Inteſtines, being vellicated by the continual Irritation of a Cathartic, diſcharge not only the Recrements of the Aliment, but whatever is excreted from the Glands; ſo that, from this one Cauſe only, the Belly diſcharges four times as much when excited by a Cathartic, as it does in its natural State.

Cathartics exert their Force principally two Ways, either by irritating the Coats of the Inteſtines with a kind of Stimulus, or communicating a ſwifter Motion to the Blood: The ſtronger Cathartics work both Ways. By their Stimulus Cathartics are enabled not only to expreſs a greater Plenty of Lymph from the Glands, but to invite the Humours in ſuch a manner towards them, as to render their Paſſage, thro' their excretory Ducts, more eaſy than thro' thoſe of any other Glands in the Body: Hence there is a greater Conflux of thoſe Humours to theſe Parts, or, which is the ſame Thing, the Celerity of the Blood is augmented in theſe Places, almoſt after the ſame manner, and with a like Effect, as the Skin, when corroded by a Veſicatory, diſcharges Serum. Cathartics which inſinuate themſelves into the Blood, cauſe it to circulate with greater Quickneſs; becauſe they not only increaſe the Stimulus, but attenuate and diſſolve the groſs and tenacious Humours. That this is Fact, appears from the Heat which is excited by Cathartics; and the Pulſe, which is ſtronger, fuller, and ſwifter, indicates the ſame Thing.

How great an Acceſſion is made by this Increaſe of Velocity in the Blood to the ventral Evacuations, will eaſily appear from the following Calculation. The Meſenteric Arteries, which ſupply the Inteſtines, are of a Size, in proportion to that of the Baſe of the Aorta, as one to ten. Since it is certain, then, from Experiments, that the Aorta receives an Influx of four thouſand Ounces of Blood every Hour, thoſe Arteries will, in the ſame time, convey four hundred Ounces to the Inteſtines; ſome alſo may be carry'd thither from a Branch or two of the Cœliac Artery. The natural Excretion made from thence amounts to no more than twelve Scruples. For the ſake of Calculation, let us ſuppoſe the Motion of the Blood to be increaſed to double its Velocity, as the Pulſe demonſtrates it really is, by a ſtrong Cathartic; the Meſenteric Arteries will every Hour ſupply the Inteſtines with eight hundred Ounces of Blood; and, in the ſame Space of Time, the Glands will excrete nearly twenty-four Scruples; for every Secretion, ſuppoſing an Equality in other Circumſtances, is to be eſtimated from the Velocity, as its only Standard. If the Velocity be increaſed to triple its former Degree, which, conſidering the Stimulus, is no abſurd Suppoſition, eſpecially at the Mouths of the Glands, there will be an Efflux of thirty-ſix Scruples; and if the Diameters of the excreting Veſſels be in like manner doubled, as no doubt they really are, when the Cathartic is a little ſtronger than ordinary, the glandular Excretion of the Inteſtines will amount to one hundred forty-four Scruples, which is twelve times the Quantity deſign'd by Nature; ſo that, by this way of reckoning, in the Space of eight Hours, while the Cathartic is operating, the Glands may be drain'd of forty-eight Ounces.

But, when we make an Eſtimate of the Diſcharges excited by purgative Medicines, the Bile is not to be neglected, but brought into the Account. If, therefore, in the Space of one Hour, there be an Influx of two Drams of Bile into the Inteſtines, by the Force of Nature alone, as is ſhewn by Dr. *James Keil*, a Man much experienced in theſe Matters, a Cathartic will exhauſt the Liver of ſix Ounces, ſuppoſing, as before, a triple Velocity in the Motion of the Blood, without the leaſt Enlargement of the Diameters of the Veſſels: Hence it is, that, in Evacuations of this Kind, prepared by Art, the Stools are generally bilious. And here it is to be obſerved, with reſpect to Bile, that the more haſtily and plentifully it flows, the more diluted it appears. We find, then, by thus reckoning, that, without including the Recrements of the Aliment, or the pancreatic Juice, the Quantity of Matter, which may be diſcharged by a Cathartic, amounts to four Pounds and a half; but, if the Veſſels be at the ſame time enlarged, the Efflux of Humours will be much more copious, as being in a duplicate Ratio of the Diameters. This being the Truth of the Caſe, it appears how vain it is to expect the ſame Effects from Clyſters, which may be convenient enough to cleanſe and waſh the Belly from Fœces, but are incapable of evacuating Bile, or, in any manner, affecting thoſe Glands which are principally ſeated in the Ileum.

And thus, when the Inteſtines are deeply affected with ſome Diſtemper, when the Purging is too violent, the Motion of the Blood too ſwift, or the Mouths of the Veſſels too much dilated, this Excretion by the Glands is augmented to a much higher Degree: For Example, in the Cholera Morbus, where an incredible Quantity of Humours is attracted, and diſcharged by means of that Stimulus, with which the Inteſtines are continually irritated from Summer-fruits, or ſome other Crudities. That the Mouths of the Glands may be diſtended to much larger Dimenſions than what are allotted them by Nature, is evident enough, not only from what they call the *ſymptomatical* Flux of the Belly, but alſo from the *critical* one, which often carries off the Matter, which, by means of a Cold, was thrown upon the Lungs and Fauces, in ſuch a manner as to prove of equal Benefit with Perſpiration; for, in this Caſe, that Redundance of Humours, which ought to have been eliminated thro' the Skin, ſeeks a Paſſage thro' theſe Glands; and, where it is obtain'd, ſuch Evacuation muſt doubtleſs be ten times as great as that of the natural Lymph.

This Excretion by the Inteſtines proceeds by ſo conſtant a Law of Nature, and is found to be ſo neceſſary for the due Elaboration of the Chyle, that if theſe Glands ſhould happen to be obſtructed, or grow callous, there will ſucceed either an incurable Coſtiveneſs, or the Cœliac Paſſion, which latter is more eſpecially the Conſequence of ſuch a Diſorder, as appears

from Diſſections. But when this Obſtruction of the Glands endures but for a ſhort time, or ſome Portion of them happens to be cloſed up with glutinous Humours, ſo that the Lymph, which is ſo neceſſary for the Comminution and Elaboration of the Aliment, cannot be obtain'd in a ſufficient Quantity, there ariſes that Species of the Cœliac Paſſion which admits of a Cure, and is diſtinguiſh'd from the chylous Flux, which, properly ſpeaking, derives its Original from an Obſtruction of the Lacteal Veſſels.

If we carefully examine into the Uſe of the Glands, and the Lymph which they ſecrete, we ſhall fully diſcover the Cauſe of this Diſeaſe; nor do I think it can be more clearly ſhewn, from any Argument, how much the Study of Anatomy conduces not only to the right underſtanding of the Theory, but to the ſucceſsful Practice of Medicine, than the Knowledge of *Pyerus's* Glands. If we conſult the Writings of the antient Phyſicians, we ſhall eaſily find, how erroneouſly, not to ſay abſurdly, they imputed the Cauſe of the Cœliac Paſſion either to a cold and moiſt Diſtemperature, or to a Weakneſs of the retentive Faculty. But Anatomy has ſcatter'd theſe Miſts, and, by diſtinctly explaining the Fabric of the Inteſtines, clearly ſhewn, that this Diſeaſe owes its Original to an Interception, at leaſt in Part, of the Humour which uſed to be diſcharged from the Glands. Thoſe Remedies, therefore, which gently irritate the Belly, and deterge the Mouths of the Glands, are found to have the greateſt Efficacy in this Diſeaſe; and thus a more perfect Inſight into the Nature of the Diſtemper leads us the neareſt and readieſt Way to the Cure. And as the Antients were defective in their Knowledge of the Diſeaſe, ſo they proceeded by wrong Methods in the Cure, which they carry'd on wholly by Aſtringents; for any one may ſee, that they embraced this Method, becauſe it was agreeable and correſpondent to that Opinion which made the Cauſe of the Diſeaſe to conſiſt in a Sort of Atony, ἀτονία, or Imbecillity of the Inteſtines. But if we ſhould carry on the Cure by ſuch Means, and make uſe of none but aſtringent Medicines, as was the Practice of the Methodics, inſtead of deterging, we ſhould more and more obſtruct the Glands, and take the ready Way not to relieve the Patient, but to confirm the Diſeaſe.

But, to put an End to this Diſquiſition, we have now ſufficiently explain'd by what Contrivance, and Laws of Nature, and for what Ends and Purpoſes, this glandular Secretion is perform'd. Theſe Things, being well underſtood, will enable us to comprehend the Reaſon of what Lord *Bacon* very judiciouſly obſerved concerning Cathartics. "We confi-"dently aſſert, he ſays, that frequent and repeated Purgations "are of much greater Efficacy, towards lengthening out the "human Life, than Exerciſe and Sweating. For it is very "certain, that not only Humours, and excrementitious Va-"pours, but, together with them, good Juices and Spirits, "which are not eaſily repair'd, are exhaled and diſſipated by "Sweat and Perſpiration; whereas in Purges, unleſs they be "immoderate, the Caſe is otherwiſe; for they operate princi-"pally upon the Humours." Thus he ſpeaks, according to his Manner, as a Philoſopher; but one, who accommodates the Ratiocinations of Anatomy to the Subject, will eaſily perceive, that the Uſe of Cathartics does not only open and cleanſe the Mouths of the Lacteals, but free the Glands from groſs Humours, with which they are frequently obſtructed; ſo that they are preſerved in a State of affording a conſtant and perpetual Supply of Lymph for the Preparation of the Chyle, on which all Nutrition, and Life itſelf, depend. By this means, therefore, Care is taken, during Health, not to conſume what ſhould be our Reſource and Support under Sickneſs. *Freind Comment. in Hippocrat. Epidem.*

Hoffman thus gives his Sentiments, as to Cathartic Medicines.

As, among the ſeveral Claſſes of Medicines, none more effectually contribute to the Preſervation of Health, and the Cure of Diſeaſes, than what we commonly call Evacuants; ſo, among the ſeveral Species of Evacuants, none are of greater Importance than thoſe which eliminate and diſcharge the recrementitious and peccant Matter, contain'd in the Body, by Stool. The Medicines of this Kind are either mild and gentle, or ſtrong and draſtic. Thoſe which ſafely, mildly, and, without doing any Injury to the Stomach and nervous Syſtem, render the Body ſoluble, are call'd *Lenitive* or *Laxative Medicines*, which the *Greeks* call'd *Eccoprotics*. Thoſe, on the contrary, which evacuate the Contents of the Inteſtines in a more efficacious and forcible manner, come under the Denomination of *Purgatives*. Of the former Kind, the principal are, among vegetable Subſtances, Manna, Rhubarb, Caſſia, Agaric, Tamarinds, Sena-leaves, Aloes, Buckthorn-berries, Raiſins, Polypody, Peach-flowers, thoſe of the *Egyptian* Thorn; as alſo the Flowers and Seeds of Violets. Among Salts, common Salt, Borax, and Nitre; as alſo thoſe obtain'd from medicinal Springs, ſuch as thoſe of *Epſom*, *Egra*, and *Sedlitz*, and the *Caroline* Springs. Among Subſtances ſupplied by the Animal Kingdom, Milk, eſpecially that of Aſſes, Whey, and the Saccharum Lactis. Among chymical Preparations, the Terra foliata Tartari, vitriolated Tartar, Cream of Tartar, Salt prepar'd of Alum and Salt of Tartar, the eſſential Salt of Wood-ſorrel, the Magneſia, Sal Polychreſtum, Aurum Fulminans, Mercurius Dulcis, Flowers of Benjamin; as alſo ſome compound Medicines, ſuch as the Pilulæ de Succino Cratonis, the Pilulæ Aleophanginæ, the Pilulæ Marocoſtinæ, and the Pilulæ Tartareæ Schrœderi, the Eſſence, the Extract, and the Syrup of Rhubarb, the ſolutive Syrup of Roſes, the laxative Water of *Vienna*, and *Thomſon's* purging Elixir, beſides many others.

Theſe gentle Laxatives, without greatly diſturbing or weakening the periſtaltic Motion of the Stomach and Inteſtines, not only evacuate the Fœces, but, when exhibited in pretty large Doſes, copiouſly diſcharge the Serum from the Glands of the Inteſtines. Nor, like the more draſtic Purgatives, do they operate by an acrid ſubtile and cauſtic Salt, which proves noxious to the nervous Parts; but by an innocent and harmleſs Kind of Subſtance, which, however, is of a fine ſaline and ſtimulating Nature, and which, like that of Emetics and Purgatives, evaporates, and is loſt, by long boiling, as is obvious from Manna, Rhubarb, Aloes, and Sena-leaves, which, for this very Reaſon, are more properly infuſed than prepared by Decoction. But theſe Laxatives act either by a certain ſaline, ſtimulating, but mild Principle, ſuch as Manna, Caſſia, Raiſins, and Polypody, or by a certain ſubtile, ſulphureous, bitteriſh, and earthy Salt, ſuch as Aloes and Rhubarb, or by an acid Salt, which vellicates the Fibres, ſuch as Tamarinds, Cream of Tartar, and Salt of Wood-ſorrel; or they act by means of a neutral Salt, ſuch as Nitre, Borax, Sal Gemmæ, the Digeſtivum Sylvii, the Arcanum Duplicatum, vitriolated Tartar, Salts obtain'd from medicinal Waters, and the eſſential Salts of Herbs; or they operate by means of a certain calcarious and bitteriſh Salt, ſuch as the Salts of *Sedlitz*, *Epſom*, and *Egra*; or, laſtly, they act by means of a calcarious Earth, ſuch as the Magneſia, which, being diſſolved by the Acid of the Primæ Viæ, is converted into a neutral acrid and ſtimulating Salt.

Practical Corollaries.

Theſe highly ſafe laxative Medicines, which are of ſingular and uncommon Uſe in the Cure of many Diſorders, and, for that Reaſon, by ſome diſtinguiſh'd by the Epithet *Benedicta*, (bleſſed) were little known to the Antients, in whoſe Works we find not the leaſt Mention of Aloes, Rhubarb, Tamarinds, Sena-leaves, and Agaric, but only of Caſſia and Polypody, among the gentler Purgatives. *Dioſcorides* was the firſt who wrote any thing concerning Rhubarb and Aloes; and, from him, *Pliny* and *Galen* took what they have deliver'd concerning theſe Medicines: But Manna, Tamarinds, and Sena-leaves, were firſt known to the *Arabian* and *Egyptian* Phyſicians. But tho' all Laxatives agree in this, that they render the Body ſoluble, without Danger, Violence, or Commotion; yet, in Practice, they ought neceſſarily to be diſtinguiſh'd according to the Differences of Diſeaſes, and the various Conſtitutions of Patients. Manna, for Inſtance, Caſſia, Raiſins, and Polypody, are exhibited with ſingular Advantage in Diſorders of the Breaſt, ſuch as a Cough, a Spitting of Blood, a Pleuriſy, and a Phthiſis; as alſo in thoſe Diſeaſes which ariſe from a ſaline, acrid, and ſcorbutic Serum, ſuch as Gouts, Rheumatiſms, Itches, and Purple Eruptions. In theſe Caſes the above-mention'd Medicines are preferable to others, becauſe they not only diſcharge the inteſtinal Fœces, but, at the ſame time, allay and correct the ſaline Acrimony of the Fluids. Gentle Acids, ſuch as Tamarinds, Cream of Tartar, Salt of Wood-ſorrel, as alſo the eſſential Salts obtain'd from nitrous Herbs, Sal Polychreſtum, and antimoniated Nitre, are highly proper in hot Climates, and in the Summer-time, for Patients of choleric Habits; as alſo in Diſorders ariſing from too large a Quantity of Bile, and thoſe attended with a preternatural Heat; in continued, double, and Summer Tertians; as alſo in a *Cauſus*, attended with an inſatiable Thirſt. In theſe Caſes the Medicines now-mention'd are preferable to others, not only on account of their evacuating Quality, but alſo becauſe they check the inteſtine Motion of the ſulphureous Parts of the Blood, and correct the exorbitant Acrimony of the Bile. In Diſorders ariſing from a Defect of Bile, and the Want of a balſamic Sulphur in the Blood, ſuch as Cachexies, and almoſt all chronical Diſorders, which are attended with an Inſpiſſation of the Juices, and an Infarction of the Viſcera, bitter Laxatives, ſuch as Preparations of Rhubarb, and of Aloes, duly corrected, are juſtly preferable to all other Medicines. But in Diſorders ariſing from tough and viſcid Humours lodged in the *Primæ Viæ*, and producing Want of Appetite, Diſtentions of the Hypochondria, Eructations, and Flatulencies, all neutral Salts, whether chymically prepar'd, or the native Salts of medicinal Springs, exhibited in a pretty large Doſe, and with a ſufficient Quantity of ſome proper Liquor, effectually render the Body ſoluble, and diſcharge the thick and viſcid Recrements. When an Acid, as it generally happens in hypochondriac and melancholic Patients, as alſo thoſe labouring under quartan Fevers, abounds in the Habit, and eludes the Force of the moſt acrid Purgatives, in this Caſe, beſides Preparations of Manna, the Magneſia is ſingularly beneficial, which, as it is entirely diſſolv'd by Spirit of Vitriol,

and

and paſſes into a neutral Salt of a bitteriſh Taſte, and purgative Quality; ſo it aſſumes the ſame Virtue and Nature when it meets with an Acid in the Stomach. But, on the contrary, when a diſſolvent Liquor is wanting in the Body, it operates little or none, and proves more hurtful than beneficial.

Aurum Fulminans and Mercurius Dulcis are, indeed, generally claſs'd among the Laxatives, but their Uſe is not altogether ſafe; for when Aurum Fulminans is thoroughly edulcorated, its Operation is either very languid, or abſolutely none at all. On the contrary, when it is richly impregnated with ſalino-nitrous Spiculæ, it indeed renders the Body ſoluble, becauſe, in conſequence of its Gravity, it ſtrongly adheres to the Coats of the Stomach and Inteſtines; but, in delicate Patients, it excites violent Gripes, Flatulencies, and other troubleſome Symptoms. Beſides, it proves highly prejudicial, where there is a large Quantity of acido-corroſive Humours, or cauſtic Bile, lodg'd in the Stomach or Duodenum. *Mercurius Dulcis*, which alone, and without the Aſſiſtance of Purgatives, does not generally operate as a Purge, aſſumes, upon an Acceſſion of corroſive Bile into the Duodenum, its original deleterious Quality, and proves prejudicial to the nervous Syſtem. And tho' this Medicine is almoſt univerſally recommended for expelling Worms, yet, as mercurial Preparations are highly hurtful to Children, and as I have obſerv'd violent Symptoms, and a conſiderable Weakneſs, produc'd by them, I would not, even with this Intention, have them exhibited, except with the utmoſt Caution, and in Conjunction with a proper Method and Regimen. Many, in order to heighten the purgative Quality of Aurum Fulminans, mix neutral Salts with it, ſuch as the Arcanum Duplicatum, or vitriolated Tartar. Nor is it to be denied, that half a Dram of either of theſe Salts, triturated with two Grains of Aurum Fulminans, acquires a metalline Taſte, and, by ſtimulating the Inteſtines, eliminates their Contents; but this Effect is rarely produc'd by it without Gripes. But we are, above all Things, to take care, that the Mercurius Dulcis be not triturated along with Salts, eſpecially thoſe of an alcaline Nature, or Sal-ammoniac, ſince by this Method of Preparation its corroſive Quality is again rous'd, by which it acts upon the glandular and nervous Syſtems, and often excites a troubleſome Salivation.

All the Salts above enumerated, eſpecially thoſe of the neutral and bitteriſh Kind, when half an Ounce or an Ounce of them is exhibited for a Doſe, in a ſufficient Quantity of ſome proper Liquor, are poſſeſs'd of a ſingular Virtue in rendering the Body ſoluble, without any Commotion of the Blood, or Loſs of the Appetite and Strength. And they may be at once more ſafely and efficaciouſly us'd than the draſtic Purgatives obtain'd from the vegetable Kingdom; eſpecially in Diſeaſes and Conſtitutions where a large Quantity of thick and viſcid Humours is lodg'd in the *primæ Viæ*, or in the Veſſels. Hot and cold Medicinal Springs, generally call'd *Acidulæ*, and which are ſingularly efficacious, both for the Prevention and Cure of chronical and obſtinate Diſorders, derive their aperient, deterſive, and purgative Qualities, from the aqueous, but much more from the ſaline Principle they contain.

Among Flowers of a laxative Quality, the moſt conſiderable are thoſe of the *Egyptian* Thorn, Peaches, Violets, and Roſes; but they ought to be recent, and to be only infus'd, but not prepar'd by way of Decoction. Theſe are moſt advantageouſly exhibited with ſweet Whey, or Aſſes Milk, eſpecially in the Spring; and the Patient, eſpecially when delicate and tender, ought every Morning, for ſome Weeks, to drink about half a Pint of ſuch a medicated Draught, in order to purify his Blood; for both Whey and Aſſes Milk are poſſeſſed of a certain laxative Quality, as *Celſus*, *Lib.* 2. *Cap.* 12. informs us in the following Words: "There are, ſays he, certain Diſeaſes, in "which purging by Milk is highly proper." And a little after he ſubjoins, "The Antients, after adding a little Salt to "the Milk of Aſſes, Cows, or Goats, boil'd it, and, removing "the coagulated Parts, ordered their Patients, in certain "Caſes, to drink the remaining Whey."

Laxative Preparations of Aloes, whether of the hepatic or ſuccotrine Kind, are Medicines of uncommon Efficacy, if the Aloes is, by a proper Method, previouſly freed from its prejudicial ſulphureous and volatile Principle, and from its Reſin, which firmly adheres to the Coats of the Inteſtines. But even after theſe Precautions, the Doſe muſt be ſmall, and mix'd up with bitter Extracts, and mild balſamic Ingredients. For this Reaſon, the Pills perhaps accidentally invented by *Becher*, and upon his Model ſince prepar'd of more proper Powders, may be advantageouſly preſcrib'd, not only with an Intention to render the Body gently ſoluble, but alſo in order to reſtore and corroborate the Tone of the Inteſtines, which, being weakened in many Diſeaſes, is ſtill more impair'd by the Uſe of draſtic Purgatives. And tho' theſe Pills produce but faint and almoſt inſenſible Effects in Patients of robuſt Conſtitutions, and ſuch as abound with Blood, yet their Operation is more ſpeedy and conſiderable in Perſons naturally delicate, or ſuch as are weakened by the Shock of a Diſtemper; as alſo in Childbed Women, or thoſe whoſe monthly Evacuations are irregular or obſtructed. For Patients whoſe Digeſtion is weak, when recovering from any Diſorder, they are alſo highly proper, for correcting and evacuating the crude Juices; as alſo for hypochondriac Perſons, whoſe Stomachs continually throw up acid Crudities. On the contrary, Preparations of Aloes exhibited in large Doſes, and without proper Correctors, throw the Blood into violent Commotions; for which Reaſon plethoric Patients, thoſe of delicate Conſtitutions, and ſuch as are ſubject to Evacuations of Blood, ought entirely to abſtain from them, becauſe, when prepoſterouſly exhibited, they are attended with this particular Diſadvantage, that they excite very painful blind Hæmorrhoids, and drive the Blood to the Region of the Loins, and the Parts contained in the Pelvis. But among the ſeveral Pills in which Aloes is an Ingredient, in Conjunction with other proper Ingredients, beſides thoſe of *Becher*, the Pilulæ Tartareæ Schrœderi, the Pilulæ Aleophanginæ, the Pilulæ Marocoſtinæ, the Pilulæ de Succino Cratonis, and the Pilulæ Solenandri, are not to be robb'd of the Encomiums due to their Efficacies and Virtues.

But the Contents of the Inteſtines are evacuated in a far more efficacious and powerful manner, by what we call ſtrong *Purgatives*. Of this Claſs, the moſt conſiderable are the Roots of black and white Mechoacan, of Jalap, black and white Hellebore, common Flower-de-luce, Bryony, and Eſula. The Herbs, Soldanella, Gratiola, Purging-flax, Coloquintida, Purging Nuts, the Seeds of the Cataputia, Turbith, the middle Bark of Elder, Gamboge, wild Cucumber, and Scammony, together with the Shop-preparations of theſe; ſuch as the Trochiſci Alhandal, the Extracts of Coloquintida, and Eſula, the Panchymagogum Crollii, ſulphurated Diagrydium, the Pulvis Cornachini, and the Counteſs of *Warwick*'s Powder.

The Principle by which theſe draſtic Medicines operate, is of a highly virulent Nature, and the fine cauſtic and inflammatory Salt, which in a very ſmall Doſe attacks the nervous Membranes, not only of the Stomach and Inteſtines, but alſo of the whole Body, in the ſame manner Poiſon does, acts with Violence on theſe Membranes, and generally excites ſpaſmodic Conſtrictions, an Uneaſineſs of the Præcordia, Cardialgias, and Gripes, accompanied with frequent Stools, Hiccups, Inflammations of the Stomach and Inteſtines, Coldneſs of the Extremities, and ſometimes Convulſions; for that the Salt contain'd in theſe Purgatives is highly ſubtile and active, and diffuſes its Virtue thro' the whole Maſs of Humours, is ſufficiently obvious from this, that a Child is purg'd by the Milk of the Nurſe who has taken ſuch a Purgative. And ſometimes, by the external Application only of Purgatives, violent and formidable Fluxes have been brought on. Thus *Heurnius*, in *Comment. in Aph. Hippocratis*, informs us, that the Antients purged themſelves by waſhing their Feet in a Decoction of Hellebore. *Walæus*, *de Meth. Medend.* informs us, that a Piece of Hellebore, us'd for cleanſing an Iſſue, excited a Vomiting, and prov'd purgative. Any Ointment, in which Coloquintida is an Ingredient, laid upon the Navel, purges not only Children, but alſo Adults. But the cauſtic and inflammatory Nature of ſtrong Cathartics is ſufficiently obvious from this, that, when externally apply'd, they burn the Skin, and excite Bliſters like a Veſicatory: The Juice of the Eſula conſumes Warts, and the Eſſence extracted from draſtic Purgatives, ſuch as Jalap, Mechoacan, and Scammony when ſwallow'd, burns and corrodes the Fauces and Œſophagus, and excites hot Puſtules and Aphthæ. And certainly the virulent and poiſonous Quality of draſtic Purgatives is ſufficiently evinc'd by the Experiments of *Wepfer*, who, in his *Tract. de Cicuta aquatica*, informs us, that he gave various Purgatives in a certain Quantity to Whelps, immediately after which, Vomitings, Convulſions, and at laſt Death, enſued. Upon diſſecting theſe Animals, the Stomach and ſmall Inteſtines were found inflam'd, and mark'd with red Spots, juſt as if they had taken Arſenic: And what deſerves our Attention is, that, according to the expreſs Words of the Author, the ſame Phenomena are exhibited, and the ſame Effects produc'd, by the Reſin of Jalap, ſo much us'd in our own Days.

Since, therefore, the Operation of the more acrid and draſtic Cathartics is ſo violent, dangerous, and ſometimes fatal, the prudent, rational, and cautious Phyſician ought ſcarce ever to preſcribe them. 'Tis ſufficiently confirmed by Experience, that in all Ages greater Havock, or more terrible Conſequences, have not been produced by any Medicine, than by draſtic Purgatives prepoſterouſly and unſkilfully exhibited; and I myſelf, ſays *Hoffman*, who have practis'd Medicine forty-five Years and upwards, have obſerv'd numberleſs Inſtances of Patients, who, by the Uſe of draſtic Purgatives alone, have either contracted incurable Diſorders, or died. None of the Shop-preparations ſo quickly and powerfully impair the Strength, change the Pulſe, injure the Stomach, or prejudice and diſturb the natural Strength thereof, and the Inteſtines, as acrid and draſtic Purgatives. I know ſeveral Patients, who, by a frequent and repeated Uſe of theſe, have brought on themſelves Dropſies, hypochondriac Diſorders, Inflammations of the Stomach, accompanied with Fevers which have prov'd mortal, Dyſenteries, a Cho-

a Cholera Morbus, and ſometimes a Palſy of the Right or Left Side. The Antients, indeed, to whom the mild Laxatives, and the Uſe of the Salts, were in a great meaſure unknown, frequently preſcrib'd theſe draſtic Purgatives; and *Hippocrates* himſelf purg'd his Patients principally with Elaterium and Hellebore: But if we carefully look into their Works, we find, that they did not exhibit theſe draſtic Purgatives, except in Caſes where the Danger of the Patient render'd them neceſſary; and, even then, they made their Patients drink Milk before and after the Exhibition of the Elaterium, to the Virtues of which they attributed a great deal; and they corrected the Hellebore with an Admixture of Mulſum, Oil, or Milk. Beſides, they did not promiſcuouſly uſe theſe Medicines, but accurately diſtinguiſh'd in what Diſeaſes they were proper, and in what not. And *Hippocrates*, eſpecially in *Lib. de Purgantibus*, expreſly diſcharges the Uſe of them in all Fevers and inflammatory Diſorders. Beſides, that the bad Conſequences produc'd by draſtic Purgatives, were not unknown to the moſt ſkilful of the antient Phyſicians, is ſufficiently obvious, from the Precepts and Maxims every-where occurring in their Works. This is aſſerted in expreſs Words, in the thirty-ſeventh Aphoriſm of the ſecond Section, where we are told, that "thoſe who are in a State of perfect Health, are ſpeedily "reduced to a deplorable Condition by being purg'd." And in the ſixteenth Aphoriſm of the fourth Section, *Hippocrates* confirms the ſame Truth. *Heurnius*, in his Attempt to demonſtrate the Truth of this Aphoriſm, adds, "I have ſeen ſound "and healthy Perſons, to whom a ſimple purgative Apozem "of Fumitory and Sena-leaves, raſhly exhibited, has proved "fatal." *Celſus* alſo, in *Lib.* 1. *Cap.* 3. informs us, that as Purgatives are ſometimes neceſſary, ſo, when frequently uſed, they prove dangerous. And, in the twelfth Chapter of his ſecond Book, he has theſe Words: "Purgatives generally hurt "the Stomach, weaken the Patient, and are never properly "preſcrib'd, except in Diſorders unaccompanied with a Fever." *Dioſcorides*, in *Lib.* 4. *Cap.* 178. declares himſelf of the ſame Sentiments, and affirms, that Purgatives are highly prejudicial and unfriendly to the Stomach. But *Campegus*, in a particular Book, has treated of the poiſonous and hurtful Quality of Purgatives in a more full and circumſtantiate manner, than any who went before him. *Helmont* alſo, and his Followers, as alſo *Bontekoe*, did not ſcruple to call Purgatives mortal Poiſons. *Montanus*, *Crato*, and *Solenander*, Men well acquainted with the healing Art, were much afraid of preſcribing them; but frequently us'd Pills prepar'd of bitter Extracts, Gums, and Aloes. But the draſtic Purgatives are in a particular manner hurtful and injurious to Patients of weak Conſtitutions, Children, and old Perſons; to thoſe who are recovering from a Diſeaſe, whoſe Stomachs are weak, or whoſe nervous Syſtems are ſubject to diſorderly Motions. Nor is there any Medicine more prejudicial to Men of choleric and delicate Conſtitutions, after the uneaſy Shocks of Grief and Sorrow, than draſtic Purgatives, by the Uſe of which I have known ſeveral Patients cut off in conſequence of an Inflammation of the Stomach, and a ſubſequent Cholera. They who are ſubject to hæmorrhoidal Colics, hypochondriac and hyſteric Spaſms, ought alſo carefully to abſtain from draſtic Purgatives, unleſs they are in Love with Pain, and fond of Miſery. This Species of Medicines is alſo highly prejudicial to Children, eſpecially when ſtruggling with the Pangs of a difficult Dentition.

But however terrible the Conſequences to be dreaded from the Uſe of Purgatives are, yet as Poiſon, carefully and circumſpectly exhibited, becomes a Medicine, as is obvious from Mercurials and antimonial Emetics, ſo there are alſo ſome, tho' very few, Caſes, where ſtrong and draſtic Cathartics are properly preſcrib'd: In that Species of Dropſy, for Inſtance, call'd Anaſarca, eſpecially when it does not ariſe from an Induration, or a ſcirrhous State of the Viſcera and Glands, but from a ſudden Stagnation of Water, in conſequence of a Suppreſſion of the menſtrual or hæmorrhoidal Diſcharges, or from too great Voracity in or after a Diſeaſe. I have ſeen a few Ounces of the Juice of common Flower-de-luce, as alſo Gamboge, Elaterium, and Extract of Eſula, ſucceſsfully exhibited with half a Pint of Milk. The Doſe may alſo be ſeveral times repeated, as the State of the Patient ſhall require; for, by this means, a ſurpriſing Quantity of Water is not only diſcharged by the Anus, but alſo, in Women, from the Uterus; and I remember two Inſtances, in which theſe draſtic Purgatives evacuated only a ſmall Quantity of Excrements, but excited a very copious and ſalutary Diſcharge of Urine; for hydropic Patients, in conſequence of the relax'd and torpid State of the inteſtinal Fibres, are the better able to bear theſe draſtic Purgatives; and theſe Fibres require a ſtrong and powerful Stimulus to excite and rouſe them to their proper excretory Motions. Theſe acrid and draſtic Purgatives may alſo be properly preſcrib'd in paralytic Reſolutions of the Limbs, lethargic Diſorders, and Caſes where the languid State of the Patient requires an efficacious Medicine, as alſo in Madneſs; agreeably to which, *Celſus*, in the twelfth Chapter of his ſecond Book, informs us, that "black Hellebore is properly exhibited to thoſe who abound "with black Bile, who are melancholy mad, or whoſe Nerves "are, in any Part of the Body, become paralytic." I have alſo found from Experience, that violent Pains of the Os Iſchium and Os Coccygis, which now-and-then affect the Thighs, have been reliev'd by draſtic Purgatives, which, by procuring ſeven or eight briſk Stools, have remov'd that Load of bilious and ill-concocted Juices, which was the Cauſe of the Diſorder.

Men of robuſt Conſtitutions, who live in the more Northerly Climates, and uſe Aliments which are coarſe, and of hard Digeſtion, may, if Neceſſity requires it, have the draſtic Purgatives exhibited to them; but the Doſe muſt be very ſmall, either in Powder, in Conjunction with Salts, ſuch as Cream of Tartar, or vitriolated Tartar, with an Addition of a few Grains of diaphoretic Antimony. Or let the Extract of black Hellebore, the Trochiſci Alhandal, Scammony, Reſin of Jalap, or other Subſtances of a like Nature, be reduc'd into the Form of Pills, together with ſuch Things as allay and correct their virulent Quality; ſuch as Cinnibar, Vitriol of Mars, Saffron, Caſtor, Salt of Amber, Amber, and Myrrh, with which, if we mix a proper Doſe of the Extractum Panchymagogum Crollii, which contains pretty acrid Purgatives, we have Pills which excellently anſwer the Intention, where a briſk and acrid Stimulus is requir'd. 'Tis, however, always to be remembered, that where a ſtrong Evacuation is requir'd, 'tis far more proper to excite it by an increaſed Doſe of the more gentle Purgatives, than to force it by thoſe which are highly acrid and virulent. *Hoffman.*

Our Countryman *Quincy*, in his Pharmaceutical Lectures, lays down the following Rules relative to Cathartics.

It may be convenient to obſerve, with relation to Cathartics, that the groſſer the Forms are, in which they are admitted into the Body, the ſtronger and quicker are their Operations; but the more they are divided and broke in their conſtituent Parts, by their reſpective Preparations, the further will they paſs into the Body in the Courſe of Circulation, and be longer before their Operations are diſcernible. Thus Emetics, eſpecially the ſaline ones, of which kind moſt in Practice now are, by a further Diviſion and Comminution in Preparation, ceaſe to be perceiv'd in the Stomach, or to operate by Vomit; but carry their Efficacies into the Inteſtines, and work by Stool: The ſame Procedure, ſtill further continued, will paſs them into the Blood, and intitle them to the Diſtinction of Diuretics; and a yet further Progreſs in the ſame Management will convey many of them, eſpecially thoſe of the ſulphureous Kind, into the minuteſt Veſſels of the whole Body before they are perceived.

There is another Way of changing the Seat, wherein the ſame Medicine ſhall operate, by Mixtures which reſtrain its Efficacies in one Part, and leave it in its full Force to operate in others.

Of the ſaline Cathartics, beſides thoſe produc'd by ſome Proceſſes of the Chymical Pharmacy, there are few, except Manna; and as there is nothing requir'd in the Management of that, but plain Solution in any aqueous Vehicle, we ſhall proceed to thoſe Materials which require more Labour; and of theſe common Salt moſt naturally comes in our Way firſt.

The ordinary Production of this is ſufficiently known: The Foundation of moſt of its Medicinal Preparations is a Spirit, which the Chymiſts make by various Ways; but the moſt material Circumſtance in them all is previouſly drying the Salt by the Fire or Sun, and mixing it with three or four times its Quantity of ſome brittle earthy Subſtance, as broken Tobacco-pipes, Brick-duſt, or the like; which facilitates the Separation of its Parts, and makes it riſe eaſier by the Fire, which ſuch heavy Materials are very unfit to do without theſe kind of Helps. But this being too corroſive, of itſelf, for a Medicine, it is dulcify'd with a Mixture of Spirit of Wine, which, at firſt, heats and ferments with it; whereby its Points are both broken ſmaller, and cover'd by thoſe of the Spirit, ſo that it becomes a ſafe Medicine, and ſo far from ſtimulating too much in the firſt Paſſages, that it paſſes them unfelt, and, operating in the next Stage of Circulation, proves a Diuretic. The ſame Management thus far holds good with Nitre, Vitriol, and all like ſaline Subſtances.

But we have a noted Cathartic in the Shops, of which this is the Baſis, under the Title of *Sal Glauberi*. *Lemery*, indeed, teaches to make it with Sal Ammoniac and Oil of Vitriol; but, as good Huſbandry is allow'd to take Place, where a Medicine doth not ſuffer by it, our Chymiſts make a Spirit of Salt, by adding to it Oil of Vitriol, and drawing them over together; the Reſiduum of which, diſſolv'd, filtred, and duly evaporated, cryſtallizes into that Form wherein we meet with it in the Shops.

For like Intentions, there hath lately been contriv'd a Salt, from the mineral purging Waters, made alſo by Evaporation, Filtration, and Cryſtallization. It was firſt intitled *Sal Mirabile*, or *Sal Catharticum amarum*; but it is now ſo ſcandalouſly counterfeited, that it is little elſe than common Salt diſſolv'd, and re-cryſtalliz'd.

Tartar

Tartar affords a good many Medicines of different Intentions, according to its different Management in Preparation. The moſt in Uſe is the Cremor Tartari, which is made by diſſolving it, as far as it is capable, in boiling Water; for, after Filtration, it will ſhoot into the Form we meet with in the Shops.

The Fitneſs of theſe for extemporaneous Forms is chiefly determin'd by the Quantities of them neceſſary for a Doſe. Manna, *Sal Glauberi*, and the *Sal Cathartícum amarum*, beſt ſuit a Diſſolution in large Quantities of Liquor, to be taken down at ſeveral Draughts, as when People purge with the common mineral Waters; for, being diſſolv'd in Liquor, little enough in Quantity to be taken at once, as in ordinary Draughts of about three Ounces, they will, when cool, ſhoot again into Cryſtals in the Phial: An Error frequently committed with Manna. Indeed, where only a Dram or two of theſe are added, in Conjunction with other Cathartics, in this manner, they will not only well enough admit of it, but are found alſo to quicken and facilitate the Operation of other things, eſpecially if they be of the gummy or reſinous Kind. Thus ſome obſerve the common Infuſions with Sena, Rhubarb, and the like Materials, not only to operate better for a ſmall Mixture of theſe Salts, but alſo that their Tinctures are, by their Aſſiſtance, much improv'd, in the ſame manner as from the fix'd Salt of Tartar.

In Boluſes, Electuaries, or any Form where they reſt long upon the Palate in paſſing down, they are very irkſome, beſides the inconvenient Bulk they occaſion, when given in Quantity ſufficient to anſwer any conſiderable End; tho', in ſome ſolutive Electuaries, they may be order'd, where a ſmall Doſe only at a time is requir'd; but the Cremor Tartari generally obtains in ſuch Preſcriptions.

But theſe Materials, likewiſe, are much better given in liquid Forms than in any other, and that too with large Quantities of Liquor, becauſe their Intentions are very often to break away Obſtructions which occaſion colic and nephritic Pains; which, in moſt Caſes, they more effectually do, by being plentifully diluted, eſpecially when their Operation is deſir'd in the remoter Paſſages, as by Urine; tho' very weak Stomachs are ſubject to throw all theſe Things up again, becauſe of the nauſeous Roughneſs they carry along with them.

In Glyſters, deſign'd for quick Operation, theſe are very ſuitably added, becauſe of the Stimulus they carry along with them; for which Reaſon Sugar, common Salt, or Sal Gemmæ, are ſometimes order'd.

Too frequent Repetitions of the Medicines under this Diſtinction have been obſerv'd, in many Inſtances, to do Harm, by fouling the Glands, occaſioning great Thirſt, and ſometimes Fevers of the worſt Kind, beginning with Rigors, and other Appearances of Intermittents, but terminating in the moſt aggravated Symptoms; and on this Account too do they require large Dilution, and that with Gruel and Broths rather than thinner Liquors.

Thoſe Cathartics come next in courſe, which are reſinous; by which Diſtinction is meant ſuch as yield their Medicinal Virtues only to ſpirituous Liquors, or, at leaſt, are manag'd with ſuch Liquors to the beſt Advantage.

That of moſt Note, which occurs under this Diſtinction, is Jalap, a due Attention to the Texture and Management of which will alſo inform us in what is neceſſary with others of ſimilar Properties, as the Turpeth, Hermodactyls, and the like.

The moſt black, brittle, heavy, and ſhining Jalap, moſt abounds with Reſin, and is therefore to be choſe for this Proceſs, which is order'd by infuſing one Pound of the Root in three Pounds of Spirit for a Day or two, in a cloſe Veſſel; and, pouring that off, more Spirit is to be put on, as long as it will receive any Tincture; then exhale the ſeveral Portions together till a fourth Part only remains, to which put ſome common Water, and the Reſin will fall to the Bottom.

The Conveniency of this Management conſiſts in leſſening the Bulk of a neceſſary Doſe, a few Grains this way anſwering in Efficacy to a much larger Quantity of the Root itſelf; and this gives an Opportunity for that empirical Form call'd purging Sugar-plums, with others of a like Kind, where ſo ſmall a Mixture of theſe Materials, as ſhall hardly alter Sugar, in Smell, Taſte, or Colour, will be ſufficient for a Purge to ſuch as they are generally adminiſter'd to, which are commonly young Children.

But all the Advantages of this Management with the reſinous Drugs of greateſt Value ſubject them to be moſt grievouſly adulterated by our Chymiſts and wholeſale Dealers. The moſt common Trick with the Reſin of Jalap is, mixing it with as much black Reſin as they dare venture upon, without hazarding a Diſcovery by its Effect in the Operation. I have been told, that they put frequently two Parts of the latter to one of the former: But where there is Reaſon to ſuſpect ſuch Dealing, the Fraud may be diſcover'd by infuſing it afreſh in rectify'd Spirit, becauſe that will again take up the genuine Reſin of Jalap, but leave the other untouch'd.

Other Ways I have been inform'd of, whereby this is counterfeited without any Aſſiſtance from Jalap, as with an high Extract of a Malt Decoction, mix'd with Gamboge; but ſuch a Mixture will ſoon diſcover itſelf in Water, by diſſolving therein, which the genuine Reſin will not do. There are, indeed, Reſins within this Reſtriction, capable of being diluted with Spirit of Wine only, with which this, and other cathartic Reſins may be adulterated, that cannot be detected by theſe Tryals, as the *Reſina Guaiaci*; but they generally come too dear to anſwer the Ends of Gain; and, if ſuch Mixture ſhould be ſuſpected, it may be pretty eaſily known by the Taſte; the *Reſina Guaiaci*, or any other of the like Kind, occaſioning a Heat upon the Palate, or giving ſome particular Reliſh of the Materials whence it is obtain'd, different from what is in the genuine Jalap. But our Medicine-merchants are not contented only with this Sophication of the Reſin, but alſo, when that is genuinely made, they dry the Reſiduum or Fæces of the Tincture, powder it, and, mixing it with a little freſh Root, ſell it in the Shops for true Powder of Jalap.

But the Conveniencies of this Proceſs with reſinous Subſtances, which are purging, hardly balance the Inconveniencies from thence ariſing; becauſe common Experience proves how much Cathartics of the like Texture do, by adhering to the Membranes and Fibres of the Stomach and Bowels, occaſion moſt grievous Nauſeouſneſs, Gripings, and ſometimes manifeſt Convulſions, which is the Reaſon, that, in extemporaneous Preſcription, their Tenacity and adheſive Properties are generally prevented by a Mixture of Sugar, Salt of Tartar, or any other like Subſtances of oppoſite Textures.

When the reſinous Parts, indeed, of Cathartics are taken up by ſpirituous Liquors, and given without Precipitation in Tincture, as in the *Elixir Salutis*, *Tinctura Sacra*, *Rhabarbari*, or the like, they are not ſo liable to theſe Inconveniencies, but are diluted, and ſeparated enough to paſs only with gentle Irritations; and this way, likewiſe, they have the Advantages which were before taken notice of in the repeated Comminutions of the ſaline Purgers, of being convey'd further into the Habit, and anſwering Purpoſes of Moment, which can be no ways effected by Operation only in the firſt Paſſages: So that by almoſt the ſame Contrivance as a ſaline Cathartic is chang'd into a Diuretic, is a reſinous Cathartic chang'd into a Sudorific; the former, by a further Comminution, being fitted, by its Weight, to paſs away by Urine, as the other, upon like Changes, is diſpos'd, from its Levity, to go off with the higher Secretions, and paſs, in a great meaſure, thro' the cutaneous Pores. The Intention, therefore, very much directs the manner of Preparation: Where the firſt Paſſages want cleanſing chiefly, and an End can be obtain'd by ſtirring up uncommon Commotions in them, the more groſs and undivided the reſinous Cathartics are adminiſter'd, the more certainly will they anſwer; but when the Seat of a Diſorder is more remote, and the Efficacy of a Medicine is there wanted, theſe will ſooner anſwer in ſpirituous Vehicles, and under ſuch Management as divides and dilutes their conſtituent Parts.

The moſt material Circumſtance in Practice with reſinous Cathartics in Tincture is, that they be given only to Perſons who can diſpenſe with the Strength of the Vehicle, which then need not be diluted with any thing aqueous, unleſs juſt at the time of Exhibition; becauſe the Parts wherein the chief Virtues conſiſt will precipitate, and be loſt by remaining at the Bottom, or come ſo undivided into the Stomach, as to give all the Diſturbances before-mention'd concerning the groſſer Reſins unprepared.

As to the ordinary Contrivance of giving reſinous Subſtances with Salt of Tartar, Sugar, or Things of a brittle Texture, to divide and ſeparate their Parts, it very naturally returns us to the Examination of theſe Drugs, before their Reſins are drawn out, and to conſider them in Mixture with thoſe other Principles with which they are naturally blended.

From the Experiments made upon Jalap by Monſ. *Bolduc*, it appears, that after its reſinous Parts are taken out by Spirit, it yields an Extract with Water, which proves purgative, but in a much lower Degree, and carries alſo its Efficacies far enough to operate by Urine. This demonſtrates, that in this Drug, beſides its Reſin, is contain'd an earthy Salt; and that qualifying and correcting its Reſin with Sugar, Tartar, or the like, is but bringing it back again, as far as poſſible, to the Condition in which Nature firſt afforded it; and the ſame Monſ. *Bolduc* tells us, that a large Experience had convinc'd him, that the natural Root is a better Purger than any of its Preparations. From the Whole, however, we may conclude with ſome Certainty, that the reſinous Parts operate with the moſt Strength and Roughneſs, and chiefly ſpend their Force in the firſt and larger Paſſages; and that the ſaline and more earthy Parts, which are diſſolvable only in aqueous Vehicles, carry into the Bowels only ſome gentle Irritations, and paſs further into the Habit, before their Efficacies diſappear. And this is ſufficient to direct us in the Management of this Drug, whether by Tincture with Spirit, by Infuſion with Water, in its Reſin, or in Subſtance, according as the Intention requires its rougher or gentler Operation, in the firſt or more remote Paſſages.

The ſame is a Rule to us with all other Cathartics of like Principles and Texture; but, in Rhubarb, this Difference is

remarkable in the Root itſelf without any Preparation: That which is bright, light of Texture, moſt fragrant, and ſound, contains leſs Sulphur, or Reſin, in proportion to its earthy and ſaline Parts, than that which is heavy, tenacious, and fetid; and, therefore, we find it milder in its Operation, more grateful to the Stomach, and better to anſwer the Intentions of an Aſtringent, a Diuretic, or an Alterant; and the other more to nauſeate the Stomach, and to operate more ſtrongly as a Purge in the firſt Paſſages: But this is more notorious in its Preparations by Tincture or Infuſion. The latter, which takes out principally its ſaline and earthy Parts, operates much gentler, and with much leſs Nauſeouſneſs and Gripings, than the former; as every one may experience with the common extemporaneous Infuſions of it, and its Tincture, which is made with a ſpirituous Liquor, and kept in the Shops.

But it being before obſerv'd of ſome Reſins, that the more ſpirituous the Liquors in which they are diſſolv'd, the better and gentler do they go through the firſt Paſſages, and carry their Operation into remote Parts, it may be neceſſary to take notice, that the Subſtances commonly paſſing under this Denomination are of different Degrees of Subtilty; ſo that, altho' all of them are diſſolvable in Spirit, yet ſome of them are ſo groſs in their own conſtituent Parts, or ſo intimately blended with ſomewhat viſcid and tenacious, that they will not admit of equal Degrees of Comminution and Diviſion by ſuch Solution. The moſt ſubtile, therefore, only, and the moſt pure, are capable of the firſt aſſign'd Effect, and the more groſs of the latter. And this Difference is both remarkable in the Things themſelves, and in their Tinctures: The firſt are from Subſtances hard and brittle, whence the Tinctures are bright and tranſparent; whereas the latter are from Materials that are yielding and glutinous, giving Tinctures that are more thick, turbid, and commonly fetid. The Textures of Jalap and Rhubarb, as well as their reſpective Tinctures, very remarkably juſtify this Diſtinction.

And this brings us to a Claſs of Simples which is not ſtrictly of the reſinous or ſaline Kind, but wherein thoſe two Principles ſeem to be ſo blended, that neither of them can conveniently be ſeparated pure by any Menſtruum, but require rather a Management whereby both are retain'd, and the groſs, droſſy, and uſeleſs Parts only are rejected; and theſe commonly come under the Denomination of Gums, or inſpiſſated Juices.

Amongſt the Catharties of this Texture the Gamboge is moſt remarkable; and with this the Author before-mention'd hath made ſeveral Experiments, tending chiefly to ſhew, that this Gum doth not, of itſelf, properly diſſolve in Water, but flows with it only into a kind of milky Subſtance; that its moſt reſinous Parts may be taken up by Spirit of Wine, which he found to operate more roughly than the Gamboge itſelf; and that the Reſiduum, after ſuch a Tincture, would give ſomething ſaline to Water, which, being exhaled to an Extract, was little, or not at all, purgative by Stool, but prov'd diuretic. The Intention, therefore, is principally to direct the manner of Preparation with this Drug; though, indeed, it is ſeldom given in any other manner than is preſcrib'd in the Compoſition of the Pills bearing its Name in the *New Diſpenſatory* of the College, or by itſelf, divided only with Salt of Tartar, and corrected with a ſmall Quantity of ſome of the aromatic or carminative eſſential Oils; but its grievous Roughneſs, and Violence of Operation, make it ſeldom preſcrib'd, but to robuſt Conſtitutions, and in obſtinate Caſes.

Scammony, in like manner, will flow conſiderably with Water into a milky Fluid; but the much greater Part of it is taken up by Spirit of Wine, which being again precipitated with Water, like the Reſin of Jalap, is intitled in the Shops *Reſin of Scammony*. It is ſubject to the like Adulterations with Reſin of Jalap, which are diſcoverable alſo by the ſame Means. What hath been obſerv'd, likewiſe, in regard to the Exhibition and Operation of that, is applicable to this; but there is ſomewhat ſo peculiarly adheſive in the Scammony itſelf, that it is not reducible to Powder without firſt rubbing the Mortar with a ſmall Portion of Oil, and continuing to do ſo as often as it begins to adhere to it. And to this ſame Property, without doubt, is owing its Roughneſs of Operation, as was before obſerv'd, of others of like Texture and Diſpoſition.

Aloes comes under the like Notice, both in Preparation and Uſe, from a Similitude in Properties. The coarſer Sort, commonly call'd Hepatic or *Barbadoes* Aloes, is moſt of the gummy Kind, and very fetid and adheſive, which makes it loathſome to the Stomach, and occaſions it to operate with great Roughneſs and Gripings; but the ſuccotrine Aloes, which is more brittle, fine, ſweet, and diſſolvable in Spirit, works with Gentleneſs in the firſt Paſſages, and may be extended in its Operations, by Means already-mention'd, to the moſt remote Stages of Circulation.

Thus much may be ſufficient to obſerve in general, with relation to the Simples of this Diviſion, as they are diſtinguiſh'd into ſaline and reſinous, and the particular Management due to them as ſuch, with the particular Advantages or Diſadvantages thence ariſing in their Operations. As to thoſe of a mix'd Kind, where their Principles are not eaſily ſeparated, or anſwer no Intention in Separation ſo well as in Conjunction, but yet require ſome Preparation, to clear them of any droſſy or uſeleſs Parts, the beſt Way ſeems to be to diſſolve and make Extracts from them, both with ſpirituous and aqueous Vehicles, and afterwards mixing thoſe Extracts together; for this not only preſerves the Medicinal Virtues of the Whole, but, as far as the ſaline Parts moderate the Operations of the reſinous, it alſo preſerves the beſt and moſt natural Correctors ſuch Materials can admit of.

In the Colocynth, which is a principal Ingredient in many of the officinal Cathartics, there ſeems, by Monſ. *Bolduc*'s Account, to be a pungent Salt, wrapt up in a few reſinous or gummy Parts; and, by the Experiments he made with the Extracts by ſpirituous and aqueous Liquors, it appears, that the ſaline Extracts operate with leſs Violence than the reſinous, as has been already obſerv'd of moſt purging Simples. But the ſaline Parts in this Drug ſeem to have a more than ordinary Subtilty, as well as Pungency, ſo that, when ſeparated, they have Efficacy enough to operate, as ſoon as ever they come into the Body, and will not, as was before obſerv'd of the ſaline Parts of other Cathartics, go thro' the firſt Paſſages unfelt, and carry their Operations into the next Stage of Circulation, and prove diuretic.

But notwithſtanding the Subtilty or Volatility of this Salt, and that which is extremely bitter in the Colocynth, yet nothing purgative or bitter will paſs from it over the Helm, ſo that there muſt have been ſome Error in thoſe Experiments, which Monſ. *Bolduc* produces to prove the contrary.

The Roughneſs and Gripings with which this Drug, by itſelf, operates, hath been the Occaſion of many Contrivances to mitigate its Efficacies; but the *Trochiſci Alhandal* is the only one that concerns our Practice; and, in this, it is loaded only with mucilaginous Gums, whereby its Irritations are made leſs ſenſible to the Coats of the Veſſels: But even this Preparation is ſo little in Eſteem, that it is hardly ever preſcrib'd in Practice; ſo that into moſt or all the officinal Compoſitions, where it is concern'd, it enters only as Nature hath produc'd it; and, in that manner, the Pulp only is directed, on a Suppoſition, that its purgative Faculties reſide only in that; tho' ſome are of Opinion, that the Seeds are alſo purgative, and that ſome greater Portion of Oil contain'd in them proves a Corrector to the ſaline Parts, and makes the Whole operate gentler. But, be this as it will, thoſe who ſtudy Profit in their Compoſitions, more than the Good intended to be done with them, make no Scruple of uſing Pulp and Seeds together, and even the latter for the former.

Agaric ſeems to be much of the ſame Texture with the Colocynth, and to contain ſome Portions of a ſtimulating Salt, in a ſpongy, gummous, or viſcid Subſtance, tho' in a much leſs Degree than the other, it being able to do little elſe, than to give a Loathing and Sickneſs to the Stomach: However, the officinal Diſpenſatories, and even that of our College, give a Form of Troches and Pills wherein it is the chief Ingredient, and from whence they have their Titles; but neither are in Eſteem enough ever to be made, or aſk'd for.

The Cataputia and Elaterium contain a very pungent cauſtic Salt, which makes their Operations extremely hazardous, inſomuch that they are ſeldom met with but in the Hands of Empirics, or in Caſes of great Danger and Obſtinacy. The Euphorbium alſo, which exceeds in the ſame Qualities, is now quite rejected in all internal Uſe.

The Myrobalans, which make a Part of this Diviſion, ſeem to owe their Medicinal Virtues to a ſmall Portion of the ſaline Principle; as do likewiſe the Tamarinds, Caſſia, and other Fruits of the like Kind; but they are too weak in their Efficacies to be depended on in Caſes of Moment, and are, therefore, only made uſe of as Auxiliaries to others of more vigorous Operations, except only where common Lenitives are requir'd.

The black Hellebore, by Monſ. *Bolduc*'s Experiments, yields a great deal of a ſaline Extract with Water, which proves only diuretic; and but very little to a ſpirituous Menſtruum, which is reſinous, and proves cathartic: All which ſufficiently demonſtrates, that the Intention of the Preſcriber ought to determine its particular Management; and that, as it is generally deſign'd for a Deobſtruent, and to operate much further than in the firſt Paſſages, it ought to be open'd by a Menſtruum that will not fail of taking up its ſaline Parts: A rectify'd Spirit, therefore, is too high for this Purpoſe, and one ought to be choſen of a middle Nature, as a ſtrong Wine, or a low Spirit, which will unite with both its reſinous and ſaline Parts. For an Extract, indeed, a double Proceſs, as before-mention'd, with Spirit and Water, and then mixing them together, is beſt; but as for Tincture, ſuch a Mixture would grow turbid, and precipitate; and, therefore, the Virtue is much better drawn out at once with a middle Menſtruum between theſe Extremes.

As for what concerns the extemporaneous Preſcription of theſe Materials, there is little or no Difficulty, becauſe moſt of them are in ſuch officinal Forms as ſerve to anſwer the general Intentions

tions of Cathartics, which require no other Care in Preſcription, but to adjuſt the Doſes neceſſary for every Exigence and Conſtitution.

All the ſtronger Cathartics are beſt ſuited to be given in Pills, not only on account of their Nauſeouſneſs, both to Smell and Taſte, in any other Forms, which is beſt concealed in this; but alſo becauſe thus they gradually unfold themſelves to the Stomach, and are not ſo ſubject to be thrown up again by Vomit. Some of them, indeed, ſucceed well enough in Tincture, as was before obſerved, concerning the Materials which compoſe the *Elixir Salutis*, *Elixir Proprietatis*, *Tinctura Sacra*, and the like; but all the Cathartics of a lax Texture, and whoſe Doſe in Subſtance exceeds the ordinary Bulk of a Bolus or Pills, as Flowers, Herbs, and ſome Roots, are moſt conveniently ordered by way of Infuſion, as in the common Infuſions of Sena, Rhubarb, *&c.* and of theſe Infuſions ſome may be made ſtrong enough to admit of boiling into a Syrup, with a proper Quantity of Sugar, without exceeding a convenient Meaſure for a Doſe, as the *Syrupus de Cichoreo cum Rhabarbaro*, *Syrupus de Rhabarbaro ſimplex*, and the like; but theſe are not much eſteemed, unleſs for Children, to whom their Sweetneſs is ſome Inducement to take them. Some cathartic Syrups are likewiſe made from the expreſſed Juices of ſome of this Claſs, as the *Syrupus de Spina Cervina*, and *Syrupus è Succo Roſarum Damaſcenarum*; but only theſe two, which are thus made, are of any Eſteem.

There are ſome officinal Electuaries, of which the Materials of this Diſtinction are the Baſis; but the extreme Bitterneſs or Nauſeouſneſs of moſt of them either renders them very unſuitable in this Form, or their Doſes cannot be duly adjuſted; ſo that they are ſeldom truſted to, in this manner, eſpecially thoſe of moſt Efficacy in Operation; altho', indeed, lenitive Compoſitions, where there is no great Exactneſs of a Doſe required, may be thus well enough ordered. Where, therefore, this Form is moſt eligible for taking, the Proportion for a Bolus of one Doſe only is much the ſafeſt to truſt to.

There are ſome officinal compound Powders from this Claſs, but few of them are of any great Eſteem, both on account of their being liable to decay in this Form, and their Inconveniency for taking; their ſufficient Doſes in Draughts being very unſightly and troubleſome, or in a Bolus of too large a Bulk, to get down at once, unleſs it be ſome of the ſtronger Sort, as the *Pulvis Cornachini*, or *Pulvis Comitiſſæ Warvicenſis*; but neither of theſe will ſuit with Draughts, becauſe their purgative Ingredients being reſinous, they are ſubject to run into Lumps, which are not eaſily ſeparable in an aqueous Vehicle, or by the Force of the Stomach itſelf.

Reſins, then, are to be extracted in the way of Tincture, with a high Menſtruum, and precipitated by Water; they are greatly capable of Sophiſtication. Reſinous purgative Subſtances, exhibited without a Diviſion of their Particles by ſome other Body, greatly adhere to the Inteſtines, and occaſion violent Gripings; and therefore the moſt pure and ſubtile ſucceed beſt in Tincture made with Spirit, where a Perſon can diſpenſe with the Strength of the Vehicle. Where the ſaline and reſinous Principles are united, their Virtues are beſt obtain'd in an Extract made both with a ſpirituous and aqueous Menſtruum. The ſtrong Cathartics are beſt given in Pills. *Quincy's Prælectiones Pharmac. Sect.* 3. and 4.

With reſpect to purging in acute Diſeaſes, it has been much controverted by Phyſicians, whether the Exhibition of Cathartics is ſalutary or otherwiſe. Thoſe who maintain the latter are terrified with chimerical Apprehenſions, leſt the Humours ſhould be drawn, as they expreſs it, from the Circumference of the Body to the Centre; and farther inſiſt upon it, that Purging decreaſes Perſpiration, which they imagine the only proper Evacuation by which the Diſtemper ought to be carried off. That Perſpiration is decreas'd by the Operation of a draſtic Purge, is confirm'd by ſome Paſſages in *Sanctorius*, which it is not my preſent Buſineſs to examine, as it ſeems of but very little Importance whether Perſpiration is decreas'd or not, or whether the Humours are in the Circumference or Centre, provided Purging contributes to the Cure of the Diſtemper more effectually than any other Evacuation. I have been more than once ſurpris'd with Reaſonings of this Kind, from People who have ſpoken well of *Sydenham*, and his Practice; and who had read his Works, to however little Purpoſe.

Whoever examines the Caſes which occur in Medicinal Writers, from the Time of *Hippocrates* to this Day, repreſenting the ſpontaneous Termination of acute Diſeaſes, will find more of theſe carry'd off by plentiful Stools, than any other Way, except by critical Sweats. And this may inſinuate, that when the vital Powers fail of relieving the Patient this way, an artificial Evacuation of the ſame Kind may frequently prove ſalutary.

Dr. *Freind*, in his ſeventh Commentary on the Epidemics of *Hippocrates*, tells us, that the Doctrine of Purging in Fevers is ſo abſtruſe, and beſet with ſo many Difficulties, that he declines laying down Rules relative thereto. I believe, however, that many Phyſicians of the moſt diſtinguiſh'd Character will agree with me in one Rule, which is, that Purging, either in a greater or a ſmaller Degree, can never be improper in thoſe Fevers which are uſually epidemic or intercurrent in our Climate, provided Stools are wanting, and Bleeding has preceded; for nothing is more ſtrongly inſiſted on by *Hippocrates* and *Sydenham*, than the Neceſſity of Bleeding previous to the Exhibition of a Cathartic or Emetic.

It muſt be confeſs'd, that with reſpect to Cathartics in Fevers, much muſt be depended upon the Judgment of the Phyſician; for a Medicine is like a Pencil, which, in the Hands of an Artiſt, almoſt rivals the Works of Nature; but when directed by the Unſkilful, does Miſchief by every Attempt to mend.

Purges in Fevers are exhibited either in full Doſes, in the Beginning, in order to put an End to the Diſorder at once, and carry it off by the Evacuations they cauſe; or they are given in minute Doſes, one Fourth perhaps of the uſual Quantity, with a View of cooling, and moderating the Symptoms, keeping the Primæ Viæ clean, relaxing the Solids, and even of promoting the cutaneous Diſcharges, which laſt Effect they will frequently produce. But in both Caſes the more lenient Cathartics only are to be uſed, becauſe the more draſtic are ſo far from anſwering the ſalutary End propos'd, that they do infinite Prejudice.

The Practice of *Sydenham*, which he recommends in his *Schedula Monitoria*, is an Evidence of the Efficacy of Cathartics exhibited in full Doſes, for the Cure of the Fever he there deſcribes; and he ſeems to regret his Neglect of them in other Fevers. That this may appear in its full Light, I ſhall tranſcribe his Deſcription of this Fever, and the Method of Cure, which with him was attended with Succeſs.

This Fever, from the juſteſt Obſervation I could make, was generally accompanied with theſe Symptoms. Intervals of Heat and Cold ſucceeding each other, and frequently a Pain in the Head and Limbs; a Pulſe not much unlike that of a healthy Perſon; the Blood taken away, commonly reſembling pleuritic Blood; a Cough generally, which, with the other Concomitants of a mild Peripneumony, goes off ſo much the ſooner, as the Diſeaſe comes on at the greater Diſtance from Winter; ſometimes a Pain in the Neck and Throat in the Beginning of the Illneſs, but not ſo violent a one as in the Quinſey; tho' the Fever be continual, yet it often increaſes towards Night, as if it were a double Tertian or Quotidian; lying always in Bed, tho' with few Clothes on, is dangerous; for the Fever being thereby tranſlated to the Brain, a Coma or Phrenitis ſoon ſucceeds. And, to ſpeak the Truth, there is ſo great a Tendency to a Phrenitis here, that it frequently comes on ſpontaneouſly on a ſudden, without any ſuch Occaſion, but riſes not to ſuch a Height as it does in the Small-pox, and other Fevers, the Patient being rather quietly than furiouſly delirious, and talking wildly between whiles. Petechiæ frequently appear, occaſioned by an unſeaſonable Uſe of Cordials, and a hot Regimen; and young Perſons, of a warm Conſtitution, are ſeiz'd with purple Spots, which are certain Signs of a conſiderable Inflammation, both in this, and all other Kinds of acute Diſeaſes; and ſometimes ſuch Spots as are term'd miliary Eruptions, come out all over the Surface of the Body, appearing much like the Meaſles, only they are redder; and, when they go off, do not leave branny Scales behind them, as in that Diſeaſe. Tho' theſe Eruptions ſometimes come out ſpontaneouſly, yet they are frequently driven out by the Warmth of the Bed, and by Cordials. The Tongue is either moiſt or dry, according to the Regimen which hath been uſed; when dry, it is brown in the Middle, and white round the Edges; but, when moiſt, it is white and foul. Sweat, likewiſe, depends upon the Regimen; for if that be over-heating, it is in a manner viſcous, eſpecially about the Head; and tho' it flows plentifully and univerſally, affords little Relief; whence it follows, that ſuch Sweats are only ſymptomatical, not critical. The raiſing a Sweat by Medicines in the Beginning of the Diſtemper, ordinarily tranſlates the morbific Matter, if not to the Head, at leaſt to the Limbs. But when the Fever has ſeized the Head, and the Phrenitis prevailed, the feveriſh Signs vaniſh; only the Pulſe beats ſometimes quick, and ſometimes ſlow; at length, however, when the Spirits are exceedingly hurried by wrong Management, the Pulſe becomes unequal, with Startings of the Tendons, and Death ſoon follows.

In order to the Cure, I firſt direct ten Ounces of Blood to be taken away from the Arm; and in Effect, tho' the Blood in this Fever generally reſembles pleuritic Blood, yet it does not well bear repeated Bleeding. But if a difficult Reſpiration, a violent Pain in the Head in Coughing, and other Symptoms of this Kind, ſhew the Tendency of this Diſeaſe to a baſtard Peripneumony, Bleeding and Purging are to be repeated, till the Symptoms entirely diſappear, as we have elſewhere hinted.

In the Evening I lay a Bliſter between the Shoulders, and next Morning exhibit this lenitive Cathartic.

Take of Tamarinds, half an Ounce; the Leaves of Sena, two Drams; Rhubarb, a Dram and an half: Boil them together in a ſufficient Quantity of Spring-water to three Ounces; in the ſtrained Liquor diſſolve Manna, and ſolu-

tive

tive Syrup of Roſes, each an Ounce: Mix all together for a Draught, to be taken early in the Morning.

I order this Draught to be given three times, interpoſing a Day between each Purgation; and the following, or a like Opiate, to be given at Bed-time, after the Operation.

Take of the diſtil'd Water of Cowſlips, two Ounces; Syrup of white Poppies, an Ounce; freſh Lemon-juice, two Spoonfuls: Mix the Whole for a Draught.

This I do to prevent a Coma's coming on, from the Diſturbance of the Spirits, which Purging often occaſions, by the Tumult it raiſes in the Blood and Juices of Perſons in Fevers; which Symptom yields to Opiates, tho' they ſeem to promote it. For this Reaſon, as I durſt not venture to give a Purge in the comatous Fever of 1673. I perſiſted in the Uſe of Clyſters, being fully convinc'd that Purgatives did then immediately cauſe a Coma, which might, perhaps, have been prevented, if I had thought of adminiſtring an Opiate after the Operation of a Cathartic.

But on the intermediate Days of Purging, an Opiate muſt not be given at Bed-time, for fear of checking, or entirely ſtopping, the Operation of the Purgative to be taken the next Day, which uſually happens, though it be given late. It is a Rule with me, in this or any other epidemic Fever, to forbear Purging in the Beginning or State of the Diſeaſe, unleſs Bleeding hath been previouſly uſed, a Neglect of which hath been of fatal Conſequence to abundance of Perſons, eſpecially to Children, as I have elſewhere obſerved by way of Caution.

It muſt, nevertheleſs, be remark'd, that tho' the abovementioned Evacuations ought in general to be uſed, in the Cure of this Fever; yet young Perſons, or eſpecially Children, frequently recover after being blooded and purged once; and require no more Purging, the Fever being conquer'd by the firſt Cathartic; whereas, on the contrary, it is ſometimes neceſſary to purge oftener than we have intimated above: For it happens, tho' not frequently, that the Patient relapſes in a few Days, after recovering by this Method, on account of a freſh Supply of febrile Matter; which, however, is ſoon carried off, by repeating the Purgative a fourth time. But a Return of this Fever, when it is treated by this Method, ſeldom happens, unleſs it be cauſed by Aphthæ, ſucceeding the former Fever, now come to their Height; which Fever is, in reality, only ſymptomatical, and often accompanied with Hiccups at Intervals, which continue alſo ſome Days after the Fever is gone off; and, at leaſt, ceaſes ſpontaneouſly, as the Patient recovers Strength; which is well worth Notice, inaſmuch as the Hiccup, happening at the Declenſion of this Fever, is no way dangerous, unleſs ſeveral Medicines be over-officiouſly, and without any Neceſſity, adminiſter'd; in which Caſe it proves fatal. But both the Aphthæ and Hiccup, or either of them, if they do not go off ſpontaneouſly, but prove obſtinate, readily yield to the Bark; an Ounce of it being made into an Electuary or Pills, with a ſufficient Quantity of the Syrup of red Poppies, and taken at proper Intervals, drinking a Draught of Whey after every Doſe. I have found this the ſureſt Medicine in this Caſe, provided it be not rendered ineffectual by the Patient's keeping his Bed, which too often happens.

On the intermediate Days of Purging, I ſometimes preſcribe the following, or the like Remedies.

Take of the Conſerve of Wood-ſorrel, and of Hips, each an Ounce; Conſerve of Barberries, half an Ounce; Cream of Tartar, a Dram; Syrup of Lemons, enough to make them into an Electuary: Of which the Quantity of a Nutmeg is to be taken thrice a Day, with ſix Spoonfuls of the following Julap after each Doſe.

Take of the diſtil'd Waters of Purſlain, Lettuce, and Cowſlips, each three Ounces; Syrup of Lemons, an Ounce and an half; Syrup of Violets, an Ounce: Mix the Whole together for a Julap: Or,

Take of Spring-water, a Pint; the diſtil'd Water of Roſes, Lemon-juice, and fine Sugar, each four Ounces: Let them be deſpumated over a gentle Fire. Let three Ounces of it be taken at Pleaſure.

I add no Spirit of Vitriol to any of theſe Medicines, tho' it is very cooling, by reaſon of its remarkable Stypticity; whence it is improper in all Diſeaſes requiring to be cured by Purgatives, to ſay nothing here of the mineral Nature of this Spirit.

It frequently happens, eſpecially in the Declenſion of this Fever, that the Patient, when treated in this manner, ſweats now-and-then ſpontaneouſly, in the Night, which greatly abates all the Symptoms; but notwithſtanding, as ſuch Sweats are not to be depended upon, the above-mentioned Method muſt by no means be diſcontinued, becauſe, if thoſe Sweats ſhould be promoted longer, the Fever, which had been in ſome meaſure check'd by the preceding Purgatives, will increaſe again. For, if the Sweat be prolonged beyond that Space of Time, wherein the febrile Matter, prepared by due Concoction, is entirely carried off, the following Sweats will do nothing but raiſe a freſh Inflammation. Hence, tho' theſe Sweats, which flowed ſpontaneouſly, might, perhaps, be critical, with reſpect to the Expulſion of the febrile Matter, fitted to be carried off, yet the ſubſequent Sweats may be only ſymptomatical, and ſo do more Miſchief than Good. In ſhort, the gentle Warmth of the Bed in the Night fortunately favours the Sweat which flows ſpontaneouſly at that time; and, for this Reaſon, the Patient ſhould have no more nor thicker Clothes laid on him, than he uſually had when in Health; he ſhould forbear all heating Medicines, lie later than ordinary the next Morning, and afterwards purſue the Methods of Cure above delivered.

The Diet, in this Caſe, ſhould be Water-gruel or Barley-water, and now-and-then a roaſted Apple upon Occaſion; and after the ſecond Purge, weak Chicken-broth. I order Small-beer to be drank cold for common Drink; and the White Decoction, made by boiling an Ounce of burnt Hartſhorn in three Pints of Spring-water, afterwards ſtraining off the Liquor, and ſweetening it with fine Sugar.

I have elſewhere obſerved, that when the Patient hath been twice purged, there is no Neceſſity to reſtrain him from eating Chickens, and the like Food of eaſy Digeſtion; this Indulgence being allowable on account of Purging, which otherwiſe could not be granted. Again, after the laſt Purge, provided the Fever be ſomewhat abated, and not yet entirely degenerated into an intermittent Fever, three or four Spoonfuls of Canary may be given every Morning, and after Dinner, and again in the Evening, for ſome Days; which may promote the Recovery of the Patient's Strength, and prevent the Fever Fits.

As this Kind of Fever is more ſubject to ſeize the Head than any I ever yet ſaw, and cannot be removed without great Difficulty and Danger, I adviſe my Patients to lie without their Clothes only in the Night; but if they are ſo much debilitated by the Diſeaſe, that they cannot ſit upright, I allow them to lie down upon the Bed, or a Couch, with their Clothes on, and the Head a little high; neither do I ſuffer a greater Fire to be kept in the Room, than they were uſed to whilſt in Health.

This Regimen is not only to be ſtrictly purſu'd from the Beginning, in all that have this Fever, except in Women ſeiz'd with it a few Days after Delivery, but muſt be indiſpenſably injoined, when the Patient is attacked with a Phrenitis, Petechiæ, purple Spots, or any other Sign of a violent Inflammation occaſioned by an over-heating Regimen. For, in this Caſe, neither Bleeding, nor covering the Patient thinly in Bed, nor the Uſe of any Kind of cooling Liquors, will remove the Fever, without ſitting up in the Day-time; inaſmuch as the Heat of the ſurrounding Air, included in the Bed by the Coverings, puts the Blood into an exceſſive Motion, and the ſupine Poſture of the Body hurries it violently to the Head. But in this Fever, when a Phrenitis comes on from ill Management, it cannot be removed immediately; neither is it ſafe to attempt the Cure by repeated Bleeding and Purging, beyond the Limits preſcribed; whereas it will at length go off at its own time, and ſpontaneouſly, by means of the above-mentioned Method. Nothing, however, promotes the Removal of this Symptom more than ſhaving the Head; and therefore I always order it, without applying a Plaiſter, but only a Cap thick enough to ſupply the Loſs of the Hair, or at leaſt to keep the Head warm. By this means the Brain is greatly cool'd and refreſh'd, ſo as by degrees to be able to overcome the Heat occaſioning the Phrenitis.

What hath been ſaid of the Phrenitis is alſo applicable to the Coma ſucceeding this Fever; in which the febrile Matter, as it happens in that Diſorder, is tranſlated to the Head, whence, except the Whiteneſs of the Tongue, no Signs of a Fever appear, ſo that the Patient ſeems perfectly free therefrom. In this Diſorder, therefore, as well as in the former, the Uſe of Purgatives, Sudorifics, Bliſters, and the like Remedies, inſtead of proving effectual, do much Hurt; for ſuch Evacuations oftener kill than cure here. Having, therefore, previouſly uſed the general Evacuations of Bleeding and Purging, the Cure of this Diſorder, tho' it may terrify the Attendants, is to be truſted to Nature and Time. For tho' the Patient ſhould be afflicted with a Stupor for ſome Days, he will, nevertheleſs, at length recover his Health, provided he be not conſtantly kept in Bed, but is ſuffered to riſe in the Day-time, and lie down on the Bed, or a Couch, with his Clothes on. In the mean time, however, it is proper to ſhave the Head; and, towards the Declenſion of the Diſtemper, to give three or four Spoonfuls of *Canary* twice a Day.

The Phyſician muſt not be diſcourag'd from making the above-ſpecified Evacuations, tho', upon feeling the Pulſe, he ſhould perceive a Starting, and a convulſive Motion of the Body, becauſe both Bleeding and repeating Purging are abſolutely required, and do Service in ſome nervous Diſeaſes.

It ſometimes happens in Women ſubject to hyſteric Complaints, when the Cure hath been attempted by the Evacuations above

above ſpecified, that the Fever continues even after Bleeding and repeated Purging. And in this Caſe its Continuance is manifeſtly owing to the Diſturbance of the Spirits, occaſioned by the Evacuations; and, conſequently, if there be no Signs of a Peripneumony or Inflammation about the vital Parts, the curative Indications are only to be level'd at quieting the tumultuary Motion of the Spirits; for which Purpoſe a ſufficiently powerful Opiate muſt be given every Night, and hyſteric Medicines taken twice or thrice a Day. Of this Kind are Pills made of Galbanum, Aſa fœtida, Caſtor, and ſimilar Ingredients, and Julaps of the ſame Nature. Furthermore, to recruit the Strength, and ſuppreſs the Vapours, it is neceſſary to allow ſuch Food, both of the ſolid and liquid Kind, as is moſt palateable.

We have already obſerved, that this Fever, in the preceding, but eſpecially in the current Year, increas'd every Day towards Night, when a Fit came on like that of an Intermittent. The Phyſicians, therefore, who had learnt from Experience, that all ſuch Fevers as did in the leaſt intermit, and thoſe frequently which did not, throughout the Courſe of Years, from 1677. to the Beginning of the Year 1685. certainly yielded to the Peruvian Bark, failed not to treat this Fever with the ſame Medicine. But however rational this Procedure was, it nevertheleſs did not ordinarily ſucceed ſo well as in the foregoing Years: For, having made the ſtricteſt Search I could into this Matter, I found, that tho' the Bark was given in great Plenty, yet it ſo ſeldom cured the Diſtemper, that I ſhould rather aſcribe the Patient's Recovery to ſome happy Termination of it, than to the Efficacy of the Medicine; ſo entirely it ſeem'd to have loſt the effectually curative Virtue it was poſſeſs'd of in the Years above ſpecify'd, at leaſt, with reſpect to the Fever under Conſideration, which reſembles a Quotidian.

If a Child be ſeized with this Fever, two Leeches muſt be applied behind each Ear, and a Bliſter between the Shoulders; and it muſt be purged with an Infuſion of Rhubarb in Beer. And if the Fever ſeems to intermit after Purging, give a Julap made with the Peruvian Bark.

It is further to be noted, that tho' Children are as ſubject to this Kind of Fever, as grown Perſons, and conſequently ought to be cured by the ſame Method; yet leſs Blood muſt be taken away according to their Age, to which Purging likewiſe ought to be adapted, and perhaps need not be ſo often uſed; the Diſtempers of Children and young Perſons frequently yielding to the firſt or ſecond Purge. Nevertheleſs, it ſhould be well conſider'd, whether the Fever which is treated in this manner does certainly belong to this Conſtitution, or is of a different Kind; which ought likewiſe to be attended to with the ſame Exactneſs in Fevers of all other Conſtitutions.

But to return to the Fever under Conſideration, which is that of the preſent Conſtitution: It muſt be carefully obſerved, in this Kind of Fever, in the ſame manner as in the Rheumatiſm, and ſeveral other Diſtempers, only curable by Evacuations, that if we obſtinately perſiſt in the Uſe of the abovemention'd Evacuations, till the Symptoms go quite off, the Diſeaſe will often prove fatal: For it is not uncommon to find ſome ſlight Symptoms remain a while, even after the Diſorder vaniſhes, which, notwithſtanding, do not endanger a Relapſe, inaſmuch as they go off by degrees ſpontaneouſly, as the Patient recovers. In Effect, theſe Symptoms are frequently nothing more than the genuine Product of the repeated Evacuations, order'd to cure the Diſeaſe, and partly occaſion'd by the Emptineſs, proceeding from the ſlender Diet uſed throughout the Courſe of the Cure; all which, when they affect ſuch Subjects as are much debilitated, and in a manner worn out with Diſtempers, give Riſe to Vapours, as in Women, and proceed from the Weakneſs and low State of the Animal Spirits. For this Reaſon, therefore, after uſing ſuch Evacuations as are ſufficient to remove the Diſeaſe, a judicious Phyſician ought to forbear the unreaſonable Uſe thereof, and wait a while to ſee what Time will contribute to this End, which frequently proves the beſt and moſt ſucceſsful Phyſician, in conquering theſe ſlight Symptoms; and I have, indeed, often known them go off in the Declenſion of ſuch a Diſeaſe, without any thing more than an Opiate, taken two or three Nights ſucceſſively.

The Method juſt recommended is the beſt, that I have ever try'd in curing this Fever; and, if it fails of effectually curing, it at leaſt brings it to intermit, and then it always yields to the Bark. But as Purging, as it is here directed, in order to cure this Fever, may perhaps ſeem detrimental to ſome Perſons, I aſſert, from Experience, that nothing cools ſo much, and ſo ſurely, as Purging after Bleeding, which ſhould be firſt uſed in all Caſes. For tho' a Purge, whilſt it operates, may, for the preſent, raiſe a greater Commotion in the Blood and Juices than there was before, and of courſe increaſe the Fever, yet that Miſchief will be much over-balanced by the immediately ſubſequent Benefit: For Experience ſhews, that Purging, after Bleeding, checks a Fever ſooner and better than any other Remedy whatſoever, inaſmuch as it carries off the foul Humours whence the Fever originally proceeded, which, ſuppoſing them not to have been vitiated before, are at length inflam'd and inſpiſſated by the Heat of the Fever, and ſo contribute to render it more laſting; and likewiſe, as it makes way for an Opiate, which operates with more Speed and Safety, than if the morbid Humours, which might otherwiſe leſſen its Virtue, had not been expel'd by Purging.

Whereas, on the contrary, that Method which conſiſts in carrying off the febrile Matter thro' the Pores of the Skin, is not only leſs certain, but more troubleſome and tedious, as prolonging the Diſeaſe ſeveral Weeks, and brings the Patient's Life into imminent Danger; and, though he is at length ſo happy as to eſcape Death, reduces him to the Mortification of taking a Multitude of Medicines, during the long Continuance of the Fever, to remove thoſe Symptoms which proceed from ill Management, by attempting to cure it by an extremely hot Regimen, and heating Medicines, which, of its own Nature, requires the cooleſt of both Kinds. And thus, while Men of unſound Judgment tie themſelves up to follow Rules of Art, as they are falſly term'd, deſpiſing the contradictory Teſtimony of their Senſes, and perplexing the Cure by their Hurry and Apprehenſions, they change a Diſeaſe, which, of itſelf, goes off in a little time, and eaſily yields, into a laſting and difficult Diſorder.

For theſe Reaſons, therefore, I hope I may, with due Confidence, aſſert, that the Method of Cure above deliver'd, which conſiſts in Bleeding and Purging, is the moſt effectual one to conquer moſt Kinds of Fevers. Sweating is, indeed, properly ſpeaking, Nature's Method of expelling the febrile Matter, and beſt adapted to the End, whenever Nature, unaſſiſted, firſt digeſts the morbid Matter, and, after it is ſufficiently concocted, carries it off gently thro' the Pores; which ſucceſsful Manner of curing Fevers by Nature having been often obſerved by practical Phyſicians, the *Theoriſts* thence took Occaſion to make this Rule, That all Fevers may and ought to be cured only by Sweating.

But, admitting this Concluſion, it is manifeſt, that Art, how nearly ſoever it may ſeem to imitate Nature, cannot always certainly cure Fevers by Sweat: For Art is unacquainted with the Manner of duly preparing the morbific Matter for Expulſion; and tho' this were no Secret, yet there are no certain Signs indicating its due Preparation; whence the fitteſt Time of raiſing a Sweat muſt neceſſarily likewiſe be unknown. And, ſure, none but an obſtinate Perſon will deny it highly dangerous to excite Sweat inconſiderately, before the due Concoction of the febrile Matter, as the tranſlating the unconcocted Matter to the Brain muſt increaſe the Diſtemper. Beſides, the judicious Aphoriſm of *Hippocrates*, *viz.* "That concocted, and "not crude Matters, are to be evacuated," ſeems to relate more to Sweating, procured by Art, than to Purging: For a Man muſt be but little converſant in the Practice of Phyſic, not to know, what Numbers of Perſons are injured every Day by old Women, and unſkilful Pretenders to Medicine, by this prepoſterous Uſe of Sudorifics; it being cuſtomary with them, when a Perſon complains of Chilneſs, and a Pain of the Head and Bones, which are the general Fore-runners of a Fever, to put him to Bed immediately, and uſe their utmoſt Endeavours to promote Sweat. But this ill-timed Attempt is ſo far from preventing the Fever, which might perhaps have gone off ſpontaneouſly, or upon taking away a little Blood, that, on the contrary, it is much increaſed thereby, and becomes a laſting and inveterate Diſeaſe.

It is further to be obſerved, that as thoſe Sweats, which appear ſpontaneouſly in the Beginning of the Fever, are entirely ſymptomatic, and not at all critical; ſo thoſe, likewiſe, which are forced out at this time by Sudorifics, generally forward the Cure no more than the former, which avail nothing to this Purpoſe. Again, as the proper Time of promoting Sweat is not known, ſo neither can we tell how long we ſhould perſiſt in this Way; for, if the Sweat be continued beyond the due Time, that is, longer than is requiſite to carry off all the morbific Matter, the Waſte of thoſe fluid Particles, which ſhould ſerve to dilute and allay the Heat of the Blood, will be a Means of prolonging and increaſing the Fever: Hence, therefore, the Precarioufneſs of this Method appears; whereas, on the contrary, the Phyſician hath it in his Power to regulate the other Method, which conſiſts in expelling the febrile Matter by Bleeding and Purging, as he ſhall judge moſt convenient. Furthermore, this Method deſerves the Preference, for this Reaſon, becauſe it will do no Miſchief, tho' it ſhould fail of curing; whereas Sudorifics are pernicious, unleſs they complete the Cure: For the Heat, ariſing from a conſtant Confinement to Bed, as well as the Cordials, always uſed in this unhappy Regimen, confound the Œconomy of Nature, excite convulſive Motions of the Limbs, and bring on other Symptoms of an entirely anomalous Nature. Theſe Symptoms cannot be deſcrib'd, becauſe they do not properly come under the Hiſtory of the Diſeaſe; but are produced by an additional Tumult and Confuſion, by which Nature is often oppreſs'd, when we attempt the Cure of a Diſorder in this manner. All theſe anomalous Symptoms are generally attributed to a certain Malig-

nity, the particular Nature of which is not as yet aſcertain'd.

The Invention of the Term, *Malignity*, has been far more deſtructive to Mankind than that of Gun-powder. For, as thoſe Fevers are principally intitled malignant which are found moſt inflammatory, hence it is, Phyſicians have recourſe to certain Cordials and Alexipharmics, in order to expel the imaginary Poiſon by the Pores; for ſo it muſt be call'd, unleſs they had rather triſle about Words, than propoſe, in earneſt, what may be underſtood; and, upon the ſame Foundation, they have adapted the warmeſt Regimen and Medicines to thoſe Diſeaſes which chiefly requir'd the reverſe. We have, indeed, an evident Proof of this in the Cure of the Small-pox, which is one of the moſt inflammatory Diſeaſes, as well as of other Fevers; Phyſicians having, perhaps, been led into this Miſtake by the Petechiæ, purple Spots, and the like Symptoms, which, in moſt Subjects, proceed originally from an additional Inflammation of the Blood, already over-heated by the Fever; becauſe they ſeldom come out ſpontaneouſly, except in the Beginning of the Plague, or that Sort of confluent Small-pox, attended with the higheſt Inflammation. In this Kind, indeed, the purple Spots ſhew themſelves in different Parts of the Body, intermix'd with the Eruptions, at their coming out; and are accompanied, at the ſame time, with a Flux of Blood from the Lungs, or urinary Paſſages, and a Cough, if the Fever be ſo high as to put the Blood into a very tumultuary Motion, and cauſe it to burſt the Veſſels, and empty itſelf into the Cavities of the Body. And tho' the purple Spots, in this Fever, proceed not from ſuch a conſiderable Heat of the Blood as that which occaſions ſuch Bleedings; yet they are produced by the ſame Inflammation, with this Difference only, that it is not ſo violent; and, when accompanied with ſuch a Flux of Blood, (the only Symptom in the Small-pox which hitherto baffles the Art of Medicine) eaſily yield to a cooling Regimen.

But if it be inferr'd, that there is ſome Malignity in the Caſe, not only from the purple Spots, but alſo from finding the Symptoms of the Fever milder ſometimes than ſhould ſeem agreeable to Nature, whilſt, notwithſtanding, the Patient is more debilitated than could be expected for the Time; I anſwer, that all theſe Symptoms proceed from Nature's being in a manner oppreſs'd, and overcome by the firſt Attack of the Diſeaſe, ſo as not to be able to raiſe regular Symptoms, adequate to the Violence of the Fever, all the Appearances being quite irregular: For the Animal Œconomy being diſorder'd, and in a manner deſtroy'd, the Fever is thereby depreſs'd, which, in the true natural Order, generally riſes high. I remember to have met with a remarkable Inſtance of this, ſeveral Years ago, in a young Man I then attended; for tho' he ſeem'd in a manner expiring, yet the outward Parts felt ſo cool, that I could not perſuade the Attendants he had a Fever, which could not diſengage and ſhew itſelf clearly, becauſe the Veſſels were ſo full as to obſtruct the Motion of the Blood. However, I ſaid, that they would ſoon find the Fever riſe high enough upon bleeding him. Accordingly, after taking away a large Quantity of Blood, as violent a Fever appear'd as I ever met with, and did not go off till Bleeding had been uſed three or four times. And this may ſuffice, with reſpect to theſe Particulars.

But if the Reaſons alleged be not ſufficient to prove the Validity of my Sentiments of this Matter, yet, if Experience teaches me, that this Fever does not readily yield to Sweating, it is enough for my Purpoſe, ſince it is not Reaſoning, but Experience, that ſhews what Sort of Fevers will yield to, and ought to be cured by Sweat, and what Kind by other Evacuations. And, indeed, no judicious Perſon, who is ſufficiently acquainted with the Nature of Men and Things, would haſtily embrace the Sentiments of another Perſon, tho' of the greateſt Authority, in Matters of mere Speculation, not demonſtrable by any certain Experiment. A Man of this Character ſhould reflect, that there is ſo much Difference and Subtilty in Arguments, that tho' a Theory may be propoſed by a Perſon, which ſhall appear to be founded upon ſuch ſolid Reaſonings as to command the Aſſent of all that are preſent; yet, ſoon after, another Perſon of great Abilities, perhaps, coming to conſider the Hypotheſis which ſeem'd ſo well eſtabliſh'd, ſhews its Inconſiſtencies, and clearly proves, by more cogent Arguments, that it is no more than an imaginary Notion, not the leaſt Trace of it being diſcoverable in Nature, and ſubſtitutes a new, and ſeemingly more probable, and artful Hypotheſis in the room of it; which, notwithſtanding, meets the ſame Fate as the former, as ſoon as ſome third Perſon, as much ſuperior in Parts to the ſecond, as he was to the firſt, ſtands up to oppoſe it. And there will be no End of the Diſpute, till we come at length to him who is arrived at the Height of human Knowledge; but the great Difficulty of finding this Perſon, and diſtinguiſhing him from the reſt of Mankind, will ſoon appear to any one, who is not ſo extravagantly vain as to lay Claim to the Character himſelf. For as it is no improbable Suppoſition, that there is an almoſt infinite Number of Beings in theſe vaſt Orbs placed above us, in different Parts of the Firmament, poſſeſs'd of much more Penetration than weak Men; ſo it is not certainly known, whether the Brain, which is the Repoſitory of Thought, may not be ſo form'd by Nature, that Mankind cannot ſo clearly diſcover what is abſolutely true, as what is beſt adapted to their Nature. But we ſhall ſay no more to thoſe Phyſicians, who regulate their Practice more by idle Speculations, than Experience derived from the ſolid Teſtimony of the Senſes.

But if it be objected here, that this Fever frequently yields to a quite oppoſite Method to that I have laid down, I anſwer, that the Cure of a Diſeaſe, by a Method which is attended with Succeſs only now-and-then, in a few Inſtances, differs extremely from that practical Method, the Efficacy whereof appears both from its recovering greater Numbers, and from all the practical Phenomena happening in the Cure. Thus, for Inſtance, abundance of Perſons have recover'd of the Small-pox, notwithſtanding their having been treated by a hot Regimen, and heating Medicines; and, on the contrary, ſeveral have recover'd by the oppoſite Method. Now, by what means is this Diſpute to be decided? And which of the two Methods is to be preferr'd? The ſureſt Way of judging, in this Caſe, I take to be this: If, in purſuing the former Method, I ſhould find, that the more I heat the Patient, the more I increaſe the Fever, Reſtleſſneſs, Delirium, and other Symptoms; and, on the contrary, if it ſhould appear, upon being moderately cool'd, that he is ſo much the calmer and freer from the Fever, and other Symptoms; and further, that, by keeping the fleſhy Parts in ſuch a Degree of Warmth as beſt ſuits with the Riſing and Suppuration of the Puſtules, they grow larger and fuller, than by keeping him over-hot; having, I ſay, thus ſtated both Caſes, I conceive it cannot be doubted which Method merits the Preference.

So likewiſe, if I find, in the Fever under Conſideration, that the more the Patient is heated, the more he is diſpoſed not only to a Phrenitis, purple Spots, Petechiæ, and the like Symptoms; but further, that the Fever, by this Procedure, is attended with all Sorts of irregular and violent Symptoms; and, on the other hand, if it appears, that another Patient, by treating him according to the Method here propoſed, is quite free from theſe Symptoms; Reaſon ſhews, that the latter Method of Practice is much the beſt, tho' both the Subjects recover by ſuch different Treatment. But if more Patients recover by this Method than the other, the Diſpute is ſo much the more eaſily determin'd; which, however, I ſhall decline affirming, for fear of ſeeming too partial to my own Opinions. *Sydenham.*

Thus we ſee, that the great *Sydenham*, an Author much more frequently praiſed than imitated, is fully of Opinion, that Fevers, at leaſt ſuch as he deſcribes, are moſt commodiouſly and effectually cur'd by Purging; and it is moſt certain, that Sweats, extorted by heating Cardiacs or Cordials, are always prejudicial, however beneficial a Diaphoreſis may be, when ſpontaneous, critical, and brought about by the vital Powers.

I have been the more prolix upon this Subject, becauſe I obſerve the pernicious Cuſtom of exhibiting warm Medicines, with a View of forcing Sweats, ſtill perſiſted in by many, tho' the Theory, which gave Riſe to it, is long ago exploded; whilſt the ſalutary Exhibition of Purges is in a great meaſure neglected. If my own Experience could add any Weight to the Opinion of *Sydenham*, I could, with great Truth, affirm, that, in moſt of the epidemical Fevers which are incident to our Climate, Bleeding and Purging, to a proper Degree, generally reduces them, and that in a few Days, either to a Termination or Intermiſſion; and, in the laſt Caſe, Purging is an excellent Preparative for the Bark. And I have ſeen great Numbers of Caſes, where, when the miſerable Patient had been heated, and, as it were, parch'd, by the continual Uſe of Cardiacs, without any ſubſequent Diaphoreſis, the Exhibition of a Purge has removed the moſt threatening Symptoms, and been follow'd by a ſpontaneous and critical Diaphoreſis.

As to the other Method, mention'd above, of adminiſtring Purges in minute Doſes, it is principally of Uſe when a Fever is too far advanced, and a Patient too much reduced to admit of one in a full Doſe. Thus I have known Rhubarb given in the Quantity of ſeven Grains or more, and repeated at proper Intervals, till a ſufficient Number of Stools were procur'd, and the Patient greatly relieved. Upon theſe Occaſions, it is very remarkable, that the Urine is generally tinged manifeſtly by the Rhubarb, a Sort of yellow Oil of Rhubarb floating on the Top of it. Now, as the Rhubarb is given in ſuch a Quantity as not to be carried, by reaſon of its Stimulus, immediately thro' the Inteſtines, it is highly reaſonable to believe, that it is carried into the Blood, where it exerts very ſalutary Effects, by reſolving Obſtructions, and ſtimulating more or leſs every Gland of the Body, to the great Relief of the Patient.

CATHEAUTONPERAS, κατ' ἐαυτὸν περας. The Name by which the *Macedonians* call'd the Month, in the Beginning of

of which the Winter Solſtice happened. *Galen, Com. 1. in Epid. 1. Tit. 1.*

CATHECTICE, καθεκτικὴ, from κατέχω, to retain. An Adjective commonly join'd with δύναμις, and ſignifying, with it, the *Retentive Faculty. Galen. de Fac. Nat. Lib. 3. Cap. 6.*

CATHEDRA, καθέδρη, in *Hippocrates*, ſignifies the Anus.

CATHEMERINOS, καθημερινὸς, from ἡμέρα, a Day. The ſame as AMPHEMERINOS, which ſee.

CATHESTECOS, καθεστηκὼς, from καθίστημι, to eſtabliſh, ſettle, ſignifies conſtant, ſettled, or ſtay'd; and is apply'd by *Hippocrates*, in his *Aphoriſms*, to the Age of Man, and Seaſon of the Year. A Thing is ſaid to be conſtant, when it preſerves its Nature unchanged, or when it is arrived at its Height, and is upon the Point of declining. *Cathefteces* is alſo an Epithet for a ſtrict and regular Diet, in *Plutarch's Precepts of Health.*

CATHETER, καθετὴρ, from καθίημι, to introduce.

A Catheter, according to *Galen, Lib. 5. Meth. Med. Cap. 5.* and according to *Paulus Ægineta, Lib. 6. Cap. 59.* is an oblong, hollow, crooked Inſtrument, or Tube, uſed by Surgeons in the Diſorders incident to the Bladder. It always retain'd the common Name of *Catheter* among the *Greeks*; but among the *Latins*, as we ſee in the twenty-ſixth Chapter of the ſeventh Book of *Celſus*, it was call'd *Fiſtula*, and had the Epithet *Aenea* beſtow'd on it, from the Matter of which it was form'd.

CATHETERISMUS. The Introduction of the Catheter into the Bladder.

Tho' the Introduction of the Catheter thro' the Urethra into the Bladder is often look'd upon as a thing attended with no Difficulty by unſkilful Surgeons, yet various Cauſes and Obſtacles concur to render the Operation generally ſo difficult, that it does not always ſucceed, even in the Hands of the moſt ſkilful and expert Surgeons, who have had long and frequent Practice in this Way. The Uſe of the *Catheter*, both in Men and Women, becomes neceſſary principally for two Reaſons. The firſt Reaſon then is, that, in Men who ſeem to be afflicted with the Stone in the Bladder, we may certainly diſcover whether that is really the Caſe, or not; for the other Signs of the Stone, ſuch as a Pain in the Bladder, a difficult Diſcharge of the Urine, a Strangury, or an Iſchury, are often found to prove fallacious, ſince they may ariſe from an Inflammation, an Abſceſs, or Ulcer of the Bladder, or from a Tumor ſituated about its Neck. The other Reaſon which renders the Uſe of the Catheter neceſſary is, that when Patients are, from any Fault of the Bladder, afflicted with a Difficulty of diſcharging their Urine, or a total Suppreſſion of it, which the *Greeks* call'd ἰσχουρία, the Urine contain'd in the Bladder, and exciting Pain, a preternatural Diſtention of the Bladder, and other troubleſome Symptoms, may, by means of this Inſtrument or Tube, be drawn away. *Hildanus*, in *Cent. 2. Obſ. 65.* informs us, that, at one Time, ſix Pounds, Apothecary's-weight, of Urine, were taken from the Bladder of a certain Patient; and that an old Man had his Bladder diſtended ſo much, that it reach'd very near his Navel, and his Abdomen was render'd tumid, like that of a pregnant Woman. *Panarolus*, in *Penteceſt. 1. Obſ. 27.* informs us, that, in a Bladder diſtended to the Navel, he ſaw about twenty Pints of Urine. Now, unleſs the Bladder be ſeaſonably freed from this Load, 'tis to be dreaded, that the Patients will be afflicted with the moſt acute and racking Pains, an Inflammation or Gangrene of the Bladder, and with Convulſions; or, if theſe ſhould frequently recur, that they ſhould fall Sacrifices to their Diſorder. Not that the Uſe of the Catheter is abſolutely neceſſary, or even proper for the Cure of every Iſchury, or Difficulty of making Water; for when, from any Fault or Obſtruction of the Kidneys and Ureters, the Urine is retain'd, the Uſe of a Catheter is entirely ſuperfluous, becauſe, in this Caſe, the Urine is not lodg'd in the Bladder. The Phyſician is, therefore, on ſuch an Occaſion, to attempt the Removal of the Diſorder by proper Medicines. When the Urine is ſuppreſs'd, and, at the ſame time, lodg'd in the Bladder, which is principally known from the Pain and Swelling about the Pubes, whether this Suppreſſion ariſes from Cold, or from too long a Suppreſſion of the Urine from a culpable Modeſty, or any other Cauſe, by which the muſcular Fibres of the Bladder are diſtended, and loſe their Power of Contraction, or from a ſpaſmodic Contraction of the Neck of the Bladder, we are not, in theſe Caſes, to have immediate recourſe to the Uſe of the Catheter, becauſe it cannot, for the moſt part, be introduc'd without exciting Horror, and even Pain, in the Patient. Proper Medicines, therefore, and ſuch as are contrary to the Cauſe of the Diſorder, are firſt to be tried; and, when theſe prove ineffectual, the Catheter is to be uſed. Accordingly, *Fabricius ab Aquapendente*, in his *Operat. Chirurg.* recommends Oil of Capers as a Specific, eſpecially in Children; others preſcribe Oil of Scorpions, apply'd warm, or before a Fire, to the Region of the Bladder; and I myſelf, ſays *Hiſter*, have obſerv'd happy Effects produc'd by roaſted Onions apply'd to the Pubes. Sometimes a gentle Preſſure of the Abdomen by the Hand, eſpecially when the Diſorder proceeds from a Relaxation of the Bladder, promotes a Diſcharge of the Urine. Sometimes alſo this Species of Diſorder is cur'd by Suction: In Children, for Inſtance, the Nurſe or Midwife, and, in Adults, the Surgeon, or any other Perſon, is to take the Penis of the Patient in his Mouth, and ſuck out the retain'd Urine. But when the Diſorder ariſes from a violent Inflammation in the Neck of the Bladder, Relief is ſo little to be expected from the Catheter, that it cannot be ſafely introduc'd into the Bladder, by reaſon of the Narrowneſs, Inflammation, and violent Pain of its Neck; for, if the Inſtrument ſhould be forcibly introduc'd whilſt the Inflammation is violent, it is to be dreaded, leſt ſome of the internal Parts ſhould be lacerated or broken, a violent Hæmorrhage excited, the Pain and Inflammation increaſed, and a Gangrene, or Death itſelf, brought on. On the contrary, when the Inflammation is leſſen'd by Veneſection, reſolvent Cataplaſms, and proper Clyſters, the Catheter is often ſucceſsfully introduc'd, and Relief afforded. The Inſtrument alſo, of which we now ſpeak, is very properly and ſucceſsfully us'd,

Firſt, When, by reaſon of any Stone lying internally on the Sphincter or Neck of the Bladder, the Urine cannot be diſcharg'd.

Secondly, When a preternatural Weakneſs of the Bladder hinders the Urine from being diſcharg'd in the ordinary manner, and when other Remedies prove ineffectual, as frequently happens in very old Perſons, and Women weaken'd by difficult Labours, and ſometimes in ſuch as have been expos'd to Cold.

Thirdly, When, by too long a Retention of the Urine, either from a Principle of Modeſty, or any other Cauſe, the Bladder is ſo diſtended, and conſequently weaken'd, as to become inſufficient for diſcharging its Contents. By a Diſorder of this Nature the celebrated Aſtronomer *Tycho Brahe* is ſaid to have loſt his Life.

Fourthly, The Catheter is properly us'd, when any Mucus, or coagulated Blood, or glutinous Pus, or Particles of corrupted Fleſh, ſuch as thoſe which generally ſtick in the Neck of the Bladder, in caſe of Ulcers or Wounds of the Kidneys, or after Diſcharges of bloody Urine, block up the Paſſage of the Urine.

Fifthly, and laſtly, The Uſe of a Brazen or Silver Catheter ſeems abſolutely neceſſary, when a Caruncle, a Tubercle, an Abſceſs, or a large and hard Cicatrix after an Abſceſs, ariſe in the Urethra, or about the Neck of the Bladder; and when the Proſtatæ are ſo inflam'd, or by a Scirrhus, an Abſceſs, or any other Cauſe, render'd ſo tumid, as to prevent the Diſcharge of the Urine. But, becauſe the Catheter cannot, for the moſt part, be introduc'd without Difficulty and Pain, it ought never to be us'd till milder Remedies have prov'd unſucceſsful. In the laſt Months of Pregnancy alſo, when the Child preſſes ſo upon the Urethra, as to prevent a Diſcharge of Urine, and ſometimes in a Prolapſus Uteri producing an Iſchury, the Introduction of the Catheter is abſolutely neceſſary.

The Catheter is generally introduc'd with far greater Eaſe into Women than into Men, becauſe the former have naturally not only a ſhorter, but alſo a larger and more direct Urethra, than the latter: It is, however, generally very difficult to introduce it even into Women, unleſs the Surgeon, from an anatomical Acquaintance with the Structure of the Parts, perfectly knows the external Mouth of the Urethra, together with its Poſition and Direction; for, in the Beginning of the Vagina, there are ſeveral Pits or Holes which may eaſily impoſe on the Surgeon. But, that he may readily find the Mouth of the Urethra, or the Paſſage of the Urine, it is abſolutely neceſſary he ſhould carefully examine that Part which is ſituated directly within the Lips of the Pudenda, and lies about a Finger's Breadth below the Clitoris (See *Tab. 50. Fig. 2. D.*); for here a ſmall kind of Cicatrix, as it were, or Hole, diſcovers the urinary Paſſage. But the Method of performing this Operation, which, by *Paulus Ægineta*, is elegantly ſtyl'd *Catheteriſmus*, is as follows: The Woman muſt be laid upon her Back, either on a Bed or a Table: Then, her Thighs being carefully ſeparated from each other, the Surgeon is, with one Hand, to diſtend the Lips of the Pudenda, or order another to do it; and, with the other Hand, he is, as cautiouſly as poſſible, at the Orifice above ſpecify'd, to introduce into the Bladder a Silver or Brazen Catheter, repreſented in *Tab. 48.* by *Fig. 1.* or 2. This Inſtrument ought to be ſeven, eight, or nine Inches long, as thick as a ſmall Gooſe's Quill, and about its Extremity, repreſented by B. it muſt be anointed with Oil before the Operation is attempted. When it is duly introduc'd, upon pulling out the Wire, A. from the Catheter, the retain'd Urine is diſcharg'd thro' the Holes, B. when the Inſtrument is us'd in order to give Relief in a difficult Diſcharge of the Urine: But if the Catheter is introduc'd into the Bladder with a View to diſcover a Stone, it is proper to turn it gently every Way, carefully obſerving, at the ſame time, whether any Noiſe is made, or whether the Inſtrument touches any hard Body in the Bladder; for, when any thing of this kind is perceiv'd, we may juſtly conjecture, that there is a Stone lodg'd in the Bladder: But, when a Hardneſs alone is perceiv'd, without any Noiſe, the Diſorder is ſometimes only a Tumor or Scirrhus. As to the Structure and Form of Catheters themſelves, we muſt obſerve, that,

that, for Women, they are generally us'd ſtrait; or, at leaſt, very little incurvated, like that repreſented in *Tab.* 48. by *Fig.* 1. But I do not think this Form at all neceſſary, ſince thoſe deſign'd for Men, variouſly incurvated, made of different Lengths for different Patients, and repreſented in *Tab.* 48. *Fig.* 2, 3, 4, and 5. may be equally commodiouſly uſed by Women. Upon a Diſcharge of the Urine procur'd by this means, the Diſorder is often, tho' not always, remov'd; but when, after it is once evacuated, a Difficulty of diſcharging it ſtill remains, the Operation muſt be repeated as often as the Neceſſity of the Patient calls for it; or the Catheter may be left introduc'd, till the Bladder is reſtor'd to its former Vigour, and becomes capable of diſcharging its Contents at Pleaſure. For this very Reaſon I would adviſe Women in Labour, as ſoon as they perceive any Difficulty in diſcharging their Urine, to procure an Evacuation of it with ſuch a Catheter, leſt, if the Labour ſhould be too long protracted, the Bladder ſhould be ſo diſtended, its Tone ſo weaken'd, and its Nerves ſo debilitated, as afterwards to admit of no Cure.

We have already obſerv'd, that it was a more difficult Taſk to introduce a Catheter into Men than into Women; for, in the former, the Urethra is generally ſo winding and long, that unleſs the Surgeon is previouſly acquainted, from an anatomical Knowledge of the Parts, with its Figure and Poſition, (for which ſee *Tab.* 50. *Fig.* 1. E. D.) is Maſter of certain Dexterities he has ſeen obſerv'd by other ſkilful Surgeons, and has himſelf frequently attempted the Operation on Subjects, he generally has no great Succeſs in introducing the Catheter. Tho' theſe particular Dexterities are better learn'd by having them exhibited to the Eye, than by having them deſcrib'd in Words; yet, for the ſake of Beginners, we ſhall ſuccinctly lay down the moſt important Directions, with reſpect to the Application of the Catheter. The Surgeon, then, for the Uſe of Men, muſt have ſeveral Catheters in Readineſs. *Celſus*, in the twenty-ſixth Chapter of his ſeventh Book, requires only three, which he orders to be neither too ſlender, nor too thick: But I would adviſe him to have ſeveral of theſe Inſtruments, four at the very leaſt, ſome long, ſome ſhort, ſome ſlender, and ſome thicker; but, at the ſame time, the Whole of them muſt be ſmooth, and well poliſh'd. See *Tab.* 48. *Fig.* 2, 3, 4, and 5. That repreſented by *Fig.* 2. may be us'd for a Boy, almoſt to the ſixth Year of his Age; that by *Fig.* 3. till the twelfth Year of his Age; that by *Fig.* 4. till the ſixteenth; and that by *Fig.* 5. is to be us'd for Patients farther advanc'd in Years. The longeſt of thoſe deſign'd for Men *Celſus* order'd to be fifteen Inches in Length, and the ſhorteſt nine, a Length ſufficient even for Men; whereas thoſe of the middle Kind were to be of various intermediate Lengths. Some would have their Catheters very ſlender, imagining that, in conſequence of their being ſo, they are the more eaſily introduc'd into the Bladder; but this is a falſe Piece of Practice, ſince theſe ſlender Catheters eaſily inſinuate themſelves into, and ſtop in the Corrugations and Foldings of the Urethra, which often occur in old Men, and which would be more commodiouſly paſs'd over by thicker Catheters. This *Hildanus* confirms by two Inſtances, in which neither he himſelf, nor the Lithotomiſt, could introduce a ſlender Catheter into the Bladder, but eaſily introduc'd one as large as a Swan's Quill. *Rauvius* has aſſerted the ſame, and Experience has convinc'd me of the Truth of it. The beſt Catheters are thoſe made of Silver, well poliſh'd, incurvated in a certain Degree, and, for the ſake of Strength, that they may not bend more than is neceſſary, containing within them the Silver Wires repreſented by the Letters A. A. A. *&c.* When the Operation is to be perform'd, the Patient is to be laid upon his Back, either on a Bed, or on a Table: Then the Surgeon, ſtanding on the Right Side, is to take the Patient's Penis in his Left Hand, and raiſe it upwards; and, with his Right Hand, he is to take hold of the Handle, C. of a Catheter juſtly proportion'd to the Size of the Patient, anointed with Oil at its other Extremity, and ſo gently to introduce it into the Urethra. This Catheter he is to introduce in ſuch a manner, that the convex Part of it ſhall be turn'd to the Abdomen, (See *Tab.* 50. *Fig.* 3.) and it is to be convey'd as far as the lower Part of the Os Pubis. After this the Handle of the Catheter is, by a certain gentle Dexterity, to be turned on the Left Hand, towards the Abdomen of the Patient, ſo that the concave Part of the Catheter may be turn'd to the Abdomen, as in *Fig.* 4. Then the Point of the Catheter, B. is to be firſt gently depreſs'd below the Os Pubis, and then cautiouſly preſs'd upwards into the Bladder; and, upon retracting the Wire, A. the retain'd Urine enters the Holes, B. B. and is diſcharged from the other Extremity at the Handle; and, when the Whole is evacuated, the Catheter is to be taken out. The Catheter may ſometimes alſo be commodiouſly introduc'd when the Patient is ſitting in a Poſture ſomewhat reclin'd, or ſtanding and leaning to a Wall; in which Caſes the Surgeon, ſtanding before, or on either Side of the Patient, introduces the Catheter in the manner already deſcrib'd. Beſides, this Operation is commodiouſly perform'd, tho' moſt of the modern Authors ſeem to make no mention of it, by placing the Patient on his Back, either on a Bed or a Table, whilſt the Surgeon, ſtanding on his Left Side, takes his Penis in his Left Hand, and reclines it a little towards the Navel: Then he is to introduce the Catheter, with its concave Part to the Abdomen, into the Urethra, as far as the Os Pubis; and by moving the Handle, ſo as to deſcribe an Arch, towards the Knees, without that Dexterity of turning it under the Arch of the Os Pubis, he gently forces it into the Bladder. This Method of applying the Catheter often ſucceeds more eaſily than the others, eſpecially with Surgeons little accuſtom'd to Operations of this Kind. But, in all theſe Methods, the Surgeon is to proceed cautiouſly, prudently, and gently, leſt, by the Application of too great Force, the Urethra ſhould be raſhly lacerated by the Catheter, and, by that means, violent Pains, ſevere Hæmorrhages, dangerous Gangrenes, and Death itſelf, be brought on; for I have known Diſorders of this Kind excited by unſkilful and raſh Surgeons. Sometimes, when the Urine is once evacuated, the entire Diſorder is remov'd, and the Patient reſtor'd to Health; and ſometimes the Operation is to be repeated at Intervals, if the Patient cannot ſpontaneouſly diſcharge his Urine; and I have known ſome Patients who ſoon learn'd to introduce the Catheter themſelves. For as by means of this Inſtrument the Cauſe of the Retention of Urine is not always remov'd, but only a dangerous Symptom; ſo the Cure of the former is to be attempted by itſelf, whether it be an Inflammation, too great a Relaxation of the Bladder, Caruncles, or the Proſtatæ become too tumid. By reaſon of the Inflammation of the Neck of the Bladder, the Catheter cannot often be introduc'd into it at the Beginning; whereas it finds a more eaſy Acceſs when the Inflammation is leſſen'd by Veneſection, and the Exhibition of proper Medicines. When, upon introducing the Catheter into the Bladder, the Urine is not quickly diſcharg'd, as it ſometimes happens, the Abdomen is to be gently preſs'd, or rub'd with the Hands, by which means the deſir'd Effect is generally produc'd, or the Urine may alſo be extracted by Suction. If the Catheter ſhould be ſtopt by that Caruncle of the Proſtatæ, which Anatomiſts call the *Caput Gallinaginis*, as it ſometimes happens, it is not to be forcibly thruſt forwards, for fear of hurting ſome of theſe Parts; but it is rather to be retracted a little, and then gently thruſt forwards, by which it often paſſes over this Caruncle, and enters the Bladder. If a venereal Caruncle in the Urethra prevents the Introduction of the Catheter, it is to be broke thro' by it.

When the Catheter is introduc'd into the Bladder in order to diſcover a Stone, it is proper diligently to move it up and down in all Directions; for, as ſoon as any hard Body makes a Reſiſtance to the Inſtrument, and a Noiſe and Crackling, as it were, are perceiv'd internally, we have no great Reaſon to doubt, that a Stone is lodg'd in the Bladder; but, if none of theſe Circumſtances are perceiv'd, we may probably conjecture, that there is no Stone, or, at leaſt, we may doubt of its Exiſtence. In like manner, when the hard and ſonorous Body, which, with great Difficulty, we could reach with the Catheter, vaniſhes, as it were, and is no more to be perceiv'd, this is a Sign, that the Stone is but ſmall, or has fallen into ſome Pit or Receptacle of the Bladder, ſuch as are now-and-then obſerv'd. See *Tab.* 53. *Fig.* 1. and 2. But 'tis a Sign, that a larger Stone is lodg'd in the Bladder, if, upon moving the Catheter, it immediately ſtrikes upon ſome hard and ſonorous Subſtance. Moreover, if the Catheter ſlips eaſily, and without Interruption, on the Surface of this Body, the Stone muſt neceſſarily be ſmooth: If the contrary happens, and if, at the ſame time, the Urine is bloody, we conclude, that the Surface of the Stone is rough, and beſet, as it were, with Spiculæ. If, on the contrary, this Matter is with Difficulty remov'd from its Place, or if a diſtinct Sound is perceiv'd, we conclude, that the Stone is large and hard: But, if the Matter eaſily yields to the Inſtrument, if the Sound is leſs acute, the Urine ſandy, and carrying along with it ſmall Scales, as it were, we, according to the Obſervation of *Celſus*, conclude, that the Stone is ſoft.

But leſt theſe Patients ſhould be rack'd with continual and additional Pains, in whom there is a Neceſſity for repeating this Operation again and again, either in conſequence of the Weakneſs of the Bladder, or a Stone internally blocking up its Neck; or in conſequence of the Urethra collapſing immediately as the Catheter is drawn out, as ſometimes happens; and ſince the Operation cannot, for the moſt part, be performed without Pain and Trouble; ſome modern Surgeons, among whom *Solingen* was, perhaps, the firſt, have, for relieving the Difficulty of Urine, adviſ'd the Uſe of a Silver flexible Catheter, made of ſmooth Silver-wire twiſted in a particular manner, ſee *Tab.* 48. *Fig.* 6. For this Inſtrument may, eſpecially when the Penis is ſmall, without any Trouble, be left in the Bladder for ſome Days, or till, being reſtor'd to its former Vigour, it no longer requires a Catheter for evacuating its Contents, provided the Inſtrument be ſecur'd with proper Ligatures about the Abdomen. But, as it is generally very difficult to introduce flexible Catheters into the Bladder, it is, for the moſt part, neceſſary previouſly to introduce into the Urethra an ordinary Catheter, and to leave it for ſome time there,

in

in order to enlarge the Paſſage, thro' which the flexible Catheter is afterwards to be convey'd into the Bladder. But leſt this Paſſage ſhould unfortunately collapſe, we are to take care, as ſoon as the inflexible Catheter is drawn out, dexterouſly to introduce the flexible one into the Bladder, and leave it in it till the Difficulty of diſcharging the Urine is either remov'd, or at leaſt creates the Patient a very ſmall Degree of Trouble. *Helmont*, in the third Chapter of his Book *De Lithiaſi*, entirely rejects Silver and Brazen Catheters of every Kind, as too ſevere and painful; and recommends a new flexible one of Leather, invented by himſelf, and ſewed up in the Form of a Pipe; and he flatters himſelf with the Thoughts, that this Contrivance, in conſequence of its Softneſs, creates no Pain. But by this very Thing he ſeems to convince the World, how little he has been converſant in chirurgical Operations; ſince, by ſoft Catheters of this Kind, the Intention muſt either be not at all, or at leaſt leſs commodiouſly anſwered. Thus alſo *Fabricius ab Aquapendente*, in his *Operat. Chirurg.* informs us, that he prepared and uſed a flexible Catheter of Horn; and others have prepar'd the like Inſtruments of other Subſtances. But thoſe made of Silver are found moſt commodious, and therefore univerſally uſed by the greateſt modern Surgeons, not only becauſe they have a due Degree of Strength, but alſo becauſe they are capable of being well poliſh'd, and ſuſceptible of receiving the particular Figure and Degree of Curvature neceſſary for their being eaſily and commodiouſly introduced into the Bladder.

Some, as *Nuck* and *Solingen*, order ſeveral Holes to be made in the crooked Part of the Catheter, that the Urine may be diſcharg'd with the greater Eaſe. But two at its Extremity are ſufficient, ſince by their means the Urine is, for the moſt part, conveniently diſcharg'd; for a larger Number of Holes, eſpecially when the *Corpus Spongioſum* of the Urethra, rendered too tumid by a Congeſtion of Blood, inſinuates itſelf into them, rather hinder the Introduction of the Catheter into the Bladder, eaſily lacerate the Corpus Spongioſum, and by that means excite various troubleſome Symptoms. For this Reaſon Mr. *Petit*, a celebrated Surgeon, recommends another Species of Catheter, with no Holes at all in its Sides; and for extracting the Urine, gives it the Preference to all others (ſee *Tab.* 48. *Fig.* 7.). This Catheter has a Perforation at its Extremity, A, ſtopt up with the oblong Globe, B. But when the Inſtrument is introduced into the Bladder, the Handle of the Wire, C. is preſs'd inwards; by which means the Globe, B. is forced out of the Catheter, in the manner repreſented by the Letter D. in the adjacent Figure; by which means the Urine is capable of paſſing thro' the Catheter. This Intention is, however, generally well enough anſwered by the common Catheters. Laſtly, Catheters are uſeful, when, in various Diſorders of the Bladder, we intend to inject ſome Subſtance into it; in which Caſe, by adapting a Syringe, or the Bladder of an Animal, to the other Extremity of the Catheter, any Liquor, proper for the Diſorder, may be injected into the Bladder, as *Paulus Ægineta*, in the fifty-ninth Chapter of his ſixth Book, obſerves. An Abſceſs of the Neck of the Bladder, preventing a Diſcharge of the Urine, is alſo ſometimes broken by the Catheter, and the Diſorder by that means remov'd. *Henricus Meibomius* has publiſh'd a Diſſertation on this Operation, intituled *De Catheteriſmo*. *Heiſter*.

CATHIDRYSIS, καθιδρυσις. The reducing of a Thing to its proper Place. The Verb καθιδρύω is uſed by *Hippocrates*, in the ſame Senſe, *Prorrhet.* 2.

CATHIMIA, in the ſpagirical Language, ſignifies, 1. a ſubterraneous mineral Vein, whence Gold and Silver are digged. 2. Concretions in the Furnaces of Gold and Silver. 3. Gold. 4. Spuma Argenti. 5. Soot that adheres to the Walls in burning of Braſs. *Rulandus*. It is the ſame as CADMIA, which ſee.

CATHMIA *affidia*. The *Cathimia* of Silver, which is of the Colour of Litharge, that is, burnt Lead. *Cathmia* is the Spuma Auri, Æris, et Argenti; and there is alſo the *Cathmia Ferri*. *Rulandus*. See CADMIA.

CATHOCHITES. The ſame as CATOCHITES, which ſee.

CATHODOS, κάθοδος, and in the *Ionic* Dialect κάτοδος, (from κατὰ, a Prepoſition frequently adding the Signification of *downwards*, to the Word with which it is compounded, and ὁδὸς, a Way) is a Deſcent; thus κάθοδος αἱματίων, *Hippoc.* περὶ παθ. is a Deſcent of the Blood, in order to the Formation of the CATAMENIA.

CATHOLCEUS, καθολκεὺς, an oblong Fillet, which came over the whole Bandage of the Head called *Periſcepaſtrum*, and held it firm. *Galen. de Faſciis*. See PERISCEPASTRUM.

CATHOLICUS, καθολικὸς, from κατὰ and ὅλος, the Whole, univerſal, a boaſting Epithet of ſome Medicines, preſtended to cure all Diſtempers, and moſt liberally beſtow'd by the Chymiſts on their Noſtrums.

CATHYGROS, κάθυγρος, from κατὰ and ὑγρὸς, humid, exceſſively humid, is an Epithet apply'd by *Hippocrates*, *Aph.* 62. *Sect.* 5. to the Uterus, who reckon'd ſuch a State of it among the Cauſes of Barrenneſs.

CATHYPNIA, from ὕπνος, Sleep, is a profound Sleep. *Blancard*.

CATIAS, κατιὰς, in *Paulus*, *Lib.* 6. *Cap.* 74. is an Inciſion-knife, uſed in extracting the dead Fœtus; and alſo in opening an Abſceſs of the Uterus. It ſeems to be derived from καθίημι, to introduce, for which *Paulus* uſes κατίημι, and κατίεναι for καθίεναι, according to the *Ionic* Dialect.

CATILLIA. The Weight of nine Ounces. *Johnſon*.

CATILLUS CINEREUS, or OBRUSÆ CATILLUS. See CAPELLA. *Blancard*.

CATIMIA. The ſame as CADMIA. *Rieger*.

CATINUM *Alumen*, is Pot-aſh.

CATINUS FUSORIUS. See CRUCIBULUM.

CATISCHON, κατίσχον, in *Lib.* 6. *Epid. Sect.* 8. *Aph.* 33. is one who is coſtive, or not eaſily purg'd, and is there oppoſed to ὁ βραχὺ καθαιρόμενος, "one who is ſoon purged."

CATMA. Filings of Gold. *Rulandus*. *Johnſon*.

CATOBLECTA *Animalia*. Animals furniſhed with Civet. *Caſtellus*.

CATOBLEPAS, or CATOBLEPON, κατωβλέπων. A wild Beaſt found in *Ethiopia*, which *Pliny* takes Notice of. It is fabled to kill, like the Baſiliſk, by its Look.

CATOCATHARTICA, from κάτω, downwards, and καθαίρω, to purge, Medicines which operate by Stool, by way of Diſtinction from *Anocathartica*, thoſe which purge upwards, that is, Emetics.

CATOCHE, κατοχὴ, κάτοχος. The ſame as CATALEPSIS, which ſee.

CATOCHEILON, κατώχειλον. The inferior Lip.

CATOCHITES, from κατέχω, to retain. A Stone found in *Corſica*, ſaid to attract and retain the Hand when laid upon it. *Pliny*, *Lib.* 37. *Cap.* 10.

CATODON, from κάτω, below, and ὀδὼς, a Tooth. A Name of the Sperma-ceti Whale, ſo call'd becauſe furniſh'd with Teeth only in the inferior Jaw.

CATOECIDIOS, κατοικίδιος. Domeſtic, familiar, eaſy to be made or procur'd. *Hippocrates* applies it to Extenſions neceſſary for replacing luxated Limbs, in his Book *de Articulis*.

CATOMISMOS, κατωμισμὸς, from κάτω, under, and ὦμος, the Shoulder, a putting under of the Shoulder. A Method of reducing a luxated Shoulder, which is thus deſcribed by *P. Ægineta*, *Lib.* 6. *Cap.* 114. A luſty young Man, taller than the Patient, or at leaſt higher, [by the Advantage of Place] is to ſtand at the affected Side, and to put his Shoulder under the Armpit of the Patient as he is ſtanding, and, lifting him up, is to ſtretch out his Arm, and draw it down to his own Belly, ſo that the Patient hangs with the reſt of his Body above the Ground, behind the Man who raiſed him; if the Patient be light, a ſlender Boy is to hang on him. And thus while the Patient hangs with his Arm and Body in equal Poiſe, the other Perſon's Shoulder, which bears their Streſs, forces the luxated Bone into its proper Place.

CATOPTER, κατοπτὴρ, from ὄπτομαι, to ſee. It ſignifies a *Speculum Ani*. See SPECULUM.

CATORCHITES, κατορχίτης. A ſort of Wine, whoſe Preparation and Virtues are deſcribed by *Dioſcorides*, *L.* 5. *C.* 41. as follows: *Catorchites*, which ſome call *Scytes*, is made in *Cyprus*, after the ſame manner as Palm-wine, [ſee PALMEUM VINUM] but with this Difference, that in making of *Catorchites*, ſome, inſtead of Water, put an equal Meaſure of a Dilution of Huſks of newly preſſed Grapes. For the Preparation of this Wine they make Choice of black Carice, or dry'd Figs, of the ſort which they call *Chelidonian*, or *Purple*; theſe they macerate; and after ten Days Maceration draw off the Liquor, and make a ſecond, and after that a third Affuſion of the Dilution of Grape-huſks. At due Diſtances of Time, they make a fourth and a fifth Affuſion, which, turning acid, ſerve for Vinegar.

This Wine is of fine Parts, flatulent, bad for the Stomach, and cauſes a Decay of Appetite; but is good for the Belly, provokes Urine and the Menſes, and procures Plenty of Milk. However, it generates bad Blood, and brings on an Elephantiaſis, as does alſo Zythus.

Some to fifty-four Gallons of Liquor put ten Pounds of Salt, others nine Gallons of Brine, with an Intention of rendering it leſs ſubject to corrupt, and more proper for the Belly. Some lay Thyme and Fennel in the Bottom, and upon them the Figs; then ſpread another Lay of the ſaid Herbs, and proceed thus alternately with a Lay of Fruit, and then of Herbs, till they have filled the Veſſel.

CATORETICA, κατωρητικὰ, from κάτω, downwards, and ῥέω, to flow. Purgative Medicines. *Catoterica* imports the ſame.

CATOXYS, κάτοξυς, very acute.

CATROBIL. Earth. *Rulandus*.

CATTU-SCHIRAGAM. The *Malabar* Name for the *Scabioſa Indica Arborea*.

This is a Shrub of a Man's Height, growing in ſundry Places; the Root is ſhort, ſtrait, and of a bitteriſh Taſte; the Trunk round, and an Inch thick, with a watry-green Bark,

and a reddiſh Wood; the Leaves oblong, narrow, ſharply mucronated, and of a very bitter Taſte; the Flowers are ſmall, cluſter'd, of a faint purple-red Colour, and without Smell. The Seeds, which are contain'd in great Numbers within foliaceous Heads, are of an oblong round Form, ſtriated lengthwiſe, and its lower Part cuſpidated, with the Cuſpis, or Point, inſerted into the Baſe of the foliaceous Head; each of them has its Top ſurrounded with a Tuft of pretty long, whitiſh, and yellowiſh Hairs, from the Middle of which proceeds a ſmall Flower, with a greeniſh Pedicle. The Shrub bears Flowers once a Year, in the rainy Seaſon.

Bruiſed, and boiled in Oil, it makes a good Fomentation for Puſtules. The Head, rubbed with the expreſſed Juice, relieves the Patient under a Fever proceeding from Choler. The Seeds powder'd are drank in warm Water for the Cough, and Flatulencies, and to kill Worms in Children. They alſo eaſe Pains in the Belly, provoke Urine, and, mixed with warm Water, are good to anoint Parts affected with the Arthritis, or Pains contracted by Cold. *Raii Hiſt. Plant.*

CATULOTICA, καλυλωτικὰ, from οὐλὴ, a Cicatrix; Remedies, which, by their eating Quality, wear away groſs Cicatrices, and render the Place ſmooth and clear. *Galen. de Dynamidiis.*

CATULUS. In Botany, a Catkin. See IULUS. In Zoology, a Puppy. See CANIS.

CATUS.

Felis, Catus, Offic. *Catus domeſticus & ſylveſtris*, Schrod. 5. 280. Schw. Quad. 79. *Felis*, Aldrov. de Quad. Digit. 564. Jonſ. de Quad. 126. Charlt. Exer. 20. *Felis, Catus*, Mer. Pin. 169. *Felis domeſtica ſeu Catus*, Raii Synop. A. 170. *Catus ſeu Felis*, Geſn. de Quad. Digit. 317. THE CAT. *Dale.*

The Fat, Blood, Head, Dung, Skin, and Secundines, are uſed in Medicine. The Fat of a wild Cat heats, mollifies, diſcuſſes, and is of great Service in Affections of the Joints. The Blood cures a Herpes. The Head of a black Cat incinerated is an excellent Medicine for Diſeaſes of the Eyes, as the Unguis, Nubecula, Albugo, and other Diſorders. The Dung cures an Alopecia, and helps the Gout. The Skin is worn to heat the Stomach, and contracted Joints. And the Secundine is hung about the Neck, to preſerve the Eyes from Diſorders. *Dale.*

CAVA *Vena*. The large Vein which receives the refluent Blood, and conveys it to the Heart. See VENA.

CAVALAM. A *Malabarian* Plant; call'd alſo *Arbor ſiliquoſa Malabarica pluribus ad ſingulos flores Lobis*. I find no medicinal Virtues attributed to it.

CAUCAFON. A Name for the *Moly Indicum*.

CAUCALIS. A Plant of which *Boerhaave* mentions twelve Sorts. The Characters are;

The Petals are unequal, and in the Shape of a Heart; the Seeds are oblong, and ſulcated longitudinally, with denticulated, and, as it were, aculeated Ridges.

1. *Caucalis*; *arvenſis*; *echinata*; *magno flore*. C. B. P. 125. M. H. 3. 308.

2. *Caucalis*; *major*; *daucoides*; *Tingitana*. M. U. 65. M. H. 3. 308. a.

3. *Caucalis*; *Monſpeliaca*; *echinata*; *magno fructu*. C. B. P. 153. M. U. 33. M. H. 3. 308.

4. *Caucalis*, Offic. καυκαλὶς. Dioſc. *Caucalis lato Apii folio*, Hiſt. Oxon. 3. 307. C. B. Pin. 152. *Caucalis arvenſis echinata latifolia ejuſd.* Raii Hiſt. 1. 466. Synop. 3. 219. Tourn. Boerhaave's Index alter Plantarum.

CAUCALOIDES, καυκαλοειδὲς. This is in *Moſchion, de Morbis Mulierum*, the Patella, ſo call'd from its ſuppoſed Similitude to the Flower of the Caucalis.

CAUCIUM, καύκιον. A certain Weight mentioned by *Nicolaus Myrepſus, Sect.* 10. *Cap.* 19. But his Commentators cannot tell what Weight it is.

CAUDA. A Tail. The Tails of Animals conſider'd as Aliment are, by *Galen*, repreſented as hard of Digeſtion, and crude. *Cauda*, alſo, ſignifies the Os Coccygis.

In *Rulandus*, *Cauda Vulpis rubicundi* is Red-lead.

In Botany, *Cauda Equina* is the EQUISETUM, which ſee.

The *Cauda Muris* is a Species of *Ranunculus*.

The *Cauda Porcina* is the PEUCEDANUM.

CAUDATIO, in *Blaſius*, is an Elongation of the Clitoris.

CAUDEX, *Stipes*, *Truncus*, κορμὸς, στέλεχος. Trunk, Stock, Stem, is that Part of a Tree, or Shrub, which is between the Root and Branches, and generally riſes up from the Root tapering, till it ſpreads itſelf into Branches. Through the Trunk is the Juice convey'd for the Nouriſhment of all the other Parts of the Plant. This Part in Herbs and Under-ſhrubs is called *Caulis*, or *Thyrſus*, καυλὸς, the Stalk, and ſometimes *Scapus*, and, in ſome Kinds, *Calamus*, *Calmus*, which may be ſeen in their proper Places. The Trunk conſiſts of all thoſe Veſſels and Parts which are in the Root, and is therefore by *Linnæus*, in his *Fundamenta Botanica*, called ſimply the *Root above Ground*. For this Reaſon Water and Air, which are contiguous to this Part of the Plant, and apply'd to its whole Surface, enter it by the bibulous Veſſels of the Bark, and penetrate into its interior Parts, and into the very Root itſelf. The Uſe then of the Trunk to the Plant is to diſtribute the Humour which it receives from the Root, or by Application to its Superficies, to the Parts produced from it, which are the great and ſmall Branches, Leaves, and the reſt.

CAVERNA. A Cavern. It is by ſome Authors applied to the Female Pudenda.

CAVIARIUM. The pickled Spawn of a Sturgeon. See STURIO.

CAVICULA or CAVILLA. The Ankle. *Schneider* ſays the Os Cuneiforme was called Cavilla, by *Haly-Abbas*.

CAULEDON, καυληδὸν κάταγμα. A Species of Fracture, when the Bone is broken tranſverſly, ſo as not in the leaſt to cohere in any degree, the fractur'd Parts receding from each other, and ſliping ſideways, ſo as not to lie directly againſt each other, in the manner of a Stalk, καυλὸς. *Galen.*

CAULIAS, καυλίας. An Epithet for that Juice of the Silphium which flows from the Stalk, by way of Diſtinction from that which flows from the Root, and is call'd ῥιζίας.

CAULIS. A Cabbage. See BRASSICA.

Caulis, alſo, ſignifies a Stalk. Hence ſuch Plants as have a true Stalk are call'd *Cauliferous*.

The Penis, alſo, and the Vagina, are ſometimes call'd by the Name of *Caulis*. See CAUDEX.

CAULOTON, καυλωτὸν. An Epithet of the *Beta*, Beet.

CAUMA, καῦμα, from καίω, to burn, ſignifies the Heat and Sultrineſs of the Atmoſphere, or of the Body in a Fever, or of an inflam'd Part, or any other violent Heat.

CAUNGA. A Name for the ARECA, which ſee.

CAUSA. A Cauſe. Whatever produces a Diſeaſe is call'd the Cauſe thereof. This operates either by inducing a new State of the Solids and Fluids; or by taking away ſomething which is abſolutely requiſite to the Exerciſe of ſome Function.

If a Cauſe pre-exiſted in ſome meaſure in the Body before the Effect produc'd, it is call'd an internal Cauſe; but if it exiſted out of the Body, and by its Application to it produc'd the Diſeaſe, it is call'd external.

Internal Cauſes generally injure, firſt, the Humours, and then the ſolid Parts; whereas the external Cauſes affect the Solids, and, in conſequence of that, the Humours; and this holds univerſally, unleſs, perhaps, in ſome few Diſeaſes produc'd by Poiſon, or Contagion.

The immediate or proximate Cauſe is that, which, taken all together, immediately conſtitutes the preſent Diſeaſe; this is always adequate and ſufficient to the Formation of the Diſeaſe; whether ſimple or complicated. The Preſence of this conſtitutes and continues the Diſeaſe; and the Abſence of it removes the Diſorder, being very little different from the Diſeaſe itſelf. The Inveſtigation, therefore, of this, is extremely uſeful, and very neceſſary.

The

The remote Cauſe is that which changes the Body in ſuch a manner, as to diſpoſe it for the Reception of a Diſeaſe, upon the Acceſſion of another Cauſe; but it is never adequate or ſufficient to produce a Diſeaſe alone; nor would the other Cauſe, the Acceſſion of which is neceſſary, be ſufficient for the Production of the Diſeaſe, by itſelf, but both muſt concur. The Buſineſs of Phyſic, therefore, is to eradicate both theſe together, which, in Conjunction, conſtitute the proximate or immediate Cauſe.

The remote Cauſe, inherent in the Body, is call'd Prediſponent, Antecedent, and by the *Greeks* προηγούμενον and conſiſts principally in Temperament, Plethora, and Cacochymy.

The Cauſe, whoſe Acceſſion to the remote Cauſe excites, and in Conjunction with it forms, the Diſeaſe, is call'd the Procatarctic Cauſe, or the πρόφασις, or Occaſion of the Diſeaſe. It is ſometimes internal, ſometimes external. Theſe *Boerhaave* reduces to four Claſſes.

Firſt, The *Ingeſta*, or Things entering the Body, ſuch as the Air, Aliments, Drink, Medicines, Poiſons; ſuch Things as enter by the Pores of the Skin and Noſtrils, by the ſeveral Paſſages of the Mouth, Lungs, Oeſophagus, Stomach, Inteſtines, and Pudenda of Women, whether in a viſible or inviſible manner; whether by Steam, Draught, Deglutition, Clyſter, or Injection.

Secondly, The *Geſta*, or Things acted, as Motion of the Whole, or any Part of the Body; Affections of the Mind; Reſt, both of Body and Mind; Sleeping and Watching.

Thirdly, Things retain'd, or excreted, whether ſalubrious, recrementitious, or morbid.

Fourthly, Things apply'd to the Body, as Air, Vapours, Fomentations, Clothes, Liniments, Ointments, Plaiſters, together with whatever wounds, contuſes, or corrodes.

This Diviſion of the Non-naturals, as they are call'd; is different from that of all other Writers of Inſtitutes, who divide them into ſix Claſſes. 1. Air. 2. Meat and Drink. 3. Motion and Reſt. 4. Affections of the Mind. 5. Things retain'd and excreted. 6. Sleep and Watching. See NON NATURALIA; and that Part of the Preface which gives an Account of *Galen*'s Syſtem.

CAUSIS, καῦσις, from καίω, to burn. A Burn. See AMBUSTA.

CAUSODES *Febris*, καυσώδης πυρετός, a burning Fever. The ſame as CAUSUS, which ſee. *Celſus*, *Lib.* 2. *Cap.* 8. renders καυσώδης in *Hippoc. Aph.* 58. *Lib.* 4. by *Febris ardens*.

CAUSOMA, καύσωμα, πύρωσις, in *Hippocrates*, is a burning Heat and Inflammation. *Gorræus*.

CAUSTICA. Cauſtics.

Cauſtic Medicines or Cauteries, derive their Name from the *Greek* Word καίω, to burn; becauſe, when for chirurgical Purpoſes they are apply'd to any live Part of the Body, they burn it to a hard Cruſt or Eſchar; for this Reaſon they are alſo call'd Eſcharotic Medicines. Of this Kind are all thoſe Subſtances which operate like Fire, by deſtroying the Veſſels of the Part to which they are apply'd, ſo that the Fluids are diſcharg'd under the dry'd and burnt Solids, ſo as to form a kind of Cruſt. To this Claſs of Medicines belong, firſt, what we commonly call Actual Cauteries, ſuch as Fire itſelf, any Metal, which, when ignited, is not fus'd, and in a Word, every burning or kindled Subſtance, ſuch as the Moxa, the woolly Subſtance which adheres to the Leaves of Mullein, Cotton, Hemp, and Wood, which are applied in that particular Form, which beſt ſuits the Place on which their Operation is intended. Theſe actual Cauſtics are, by ſome, peculiarly call'd Cauteries, and are generally us'd of Iron. Hence *Celſus*, when ſpeaking of the Cauteries of this Kind, calls them *Ferramenta candentia*, red-hot Irons, and theſe are ignited more or leſs, according as the Part is to be burned more or leſs deep. Other Subſtances are alſo claſs'd among the actual Cauteries, ſuch as the Nucleus of the Olive, boiling Oil or Water, and melted Sulphur or Lead; but theſe are ſcarce us'd in modern Practice. Theſe Medicines act upon the Part, which they burn into a Cruſt, firſt by heating the Humours, which, being rarefied by the great Heat, burſt the Veſſels which contain them, and, their fineſt and moſt aqueous Parts flying off, the Part is left dry and incruſtated. *Heiſter* gives the following Directions with reſpect to the Uſe of actual Cauteries. "We "are, ſays he, to chuſe an Inſtrument, which, in Bulk and "Figure, is accommodated to the Part affected; and whilſt "the Patient is preparing for the Operation, and putting himſelf in a proper Poſture, it is to be put into the Fire. We "are alſo carefully to defend the adjacent Parts againſt the "Effects of Aduſtion, leſt new and unneceſſary Pains ſhould "be produc'd. And this is the Reaſon, why, in carious "Bones, the Fleſh is carefully to be remov'd and preſs'd back "by the Fingers of an Aſſiſtant, before the Application of "the Cautery. When the Inſtrument is ſufficiently hot, it is "to be ſtrongly applied to the Part affected, till the Diſorder "appears to be entirely extirpated. But that this may be "done with the greater Succeſs, eſpecially in carious Bones, "Cancers, and Effuſions of Blood, 'tis neceſſary to have a "ſufficient Number of Cauteries in Readineſs, that what can"not be extirpated by one, may be eradicated by a ſecond or "third."

Secondly, Potential Cauſtics are the ſtrongeſt Corroſives, ſuch as Butter of Antimony, Lapis Infernalis, corroſive ſublimate Mercury, fix'd and volatile alcaline Salts, Quick-lime, Oil of Vitriol, Spirit of Sea-ſalt, and Aqua-fortis, all of which may be apply'd, either in the Form of a Poultice, of an Ointment, or with Lint. The Cauſtics of this Claſs act by virtue of the acrid Salts they contain, which, being pungent and inciding, deſtroy the Coheſion of the Membranes which conſtitute the Veſſels; as alſo in conſequence of the Rarefaction they excite in the Humours, by diſſipating their fine aqueous Particles, they produce an Eſchar, by drying up the Part. And becauſe it is of the Nature of Salts, not to act before Solution, it is requir'd, that potential Cauſtics ſhould be in a liquid Form; or, if they are ſolid and dry, it is neceſſary, that the Part, on which they are to act, ſhould be moiſt.

Petit, in the Hiſtory of the Royal Academy of Sciences, gives the enſuing Account of the Operation of Cauſtics and Aſtringents.

It may poſſibly be thought, that what we call Aſtringents are only Medicines of an emplaſtic Nature, or ſo many Plaiſters which ſhut up the Mouths of the open Veſſels; but Mr. *Petit*, the Phyſician, has, by a conſiderable Number of Experiments, convinc'd himſelf, that they are real Aſtringents; and that they conſtrict the ſeveral Orifices to which they are apply'd. They conſtrict theſe Orifices, by abſorbing the Fluid contain'd in them; which being done, the Sides of the emptied Veſſels, by their natural Spring, approach each other; which they can do ſo perfectly, as even to come into immediate Contact, and thereby ſtop up the Mouths of the weeping Veſſels.

This will appear to be an inconteſtable Truth, if Aſtringents, apply'd to Pieces of Fleſh, leſſen their Bulks; but 'tis certain, that they have leſſened their Bulk, if they have diminiſhed their Weight. This Mr. *Petit* found by all his Experiments, excepting a few trivial Circumſtances, which we ſhall not diſſemble, and which even confirm the general Reaſoning. He always took the ſame Quantity of Beef or Mutton, that is, ſixteen Drams, which he put into different Aſtringents, ſo as to cover the Whole of it. He always ſuffer'd it to remain in the Aſtringent for four Days in a pretty hot Summer. Every Evening he took it out a little in order to weigh it, but put it in again as ſoon as ever he had done, and by the Sum total of the four different Weighings, he found how much the ſixteen Drams had loſt.

Thoſe Aſtringents, which in equal Times diminiſh moſt of the Weight of equal Quantities of Fleſh, are inconteſtably the ſtrongeſt, becauſe they have abſorb'd more of its Moiſture, dry'd it more thoroughly, and render'd its Spring much ſtronger. Beſides, by conſidering what their Effects have been, whether greater or leſs, during every one of the four Days their Action laſted, we may be enabled to form a Judgment of the Quickneſs or Slowneſs of this Action.

There is ſtill a Circumſtance of Importance to be adverted to, and that is the Corruption or Non-corruption of the Fleſh, which is to be judg'd of by its Smell. The Corruption proceeds from a Diſunion of the Principles, which form'd the Particles, or minute conſtituent Parts of the Fleſh. Humidity favours this Diſunion; Drying and Conſtriction are oppoſite to it. Hence it plainly follows, that a good Aſtringent ought to leave the Fleſh, if poſſible, dry, and without a diſagreeable Smell.

There are Aſtringents of three Kinds; Earths, as the *Bolus*, *ſeal'd Earth*, *Plaiſter of Paris*, and *Lime*. Secondly, The Juices of Plants, or Gums and Reſins, as the Juice of *Aloes*, and of the *Egyptian Thorn*, *Storax*, *Benjamin*, and *Gum Arabic*. Thirdly, Salts, as *Sea-ſalt*, *Alum*, and *the Vitriols*. We may add to theſe a fourth Sort, with which the Animal Kingdom ſupplies us, as the Spider's Web, Crabs Eyes, and others of the like kind. Upon all theſe Sorts of Aſtringents Experiments were made by Mr. *Petit*, and their Effects compar'd in a large Detail, of which we ſhall only mention the general Reſult.

All Aſtringents commonly act more forcibly during the two firſt Days, than they do on the two following ones; and more on the very firſt, than on the ſecond Day. Their Action is generally diminiſhed, rather than increas'd, by Time.

The ſtrongeſt of the earthy Aſtringents took only five Drams from the ſixteen Drams of Fleſh.

They always leave it with ſome Degree of a diſagreeable Smell, which is ſtill leſſen'd in proportion to the Weight they have diminiſhed, or, which amounts to the ſame, the Quantity of Humidity they have abſorb'd.

Vegetable Aſtringents are generally more ſtrong than thoſe of the earthy kind. A Gall abſorb'd ſix Drams and nineteen Grains of the Humidity, without leaving any bad Smell about the

the Fleſh; a Caſe not very common with this Species of Aſtringents.

All Gums are great Aſtringents.

Saline Aſtringents have generally no more Force than the beſt of the Vegetable Kind; but yet ſurpaſs them in point of Goodneſs; that is, tho' they abſorb no more Humidity, yet they more effectually preſerve the Fleſh from Corruption, and ſcarce ever leave it ill-ſmel'd. Practice has alſo added her Sanction, and declar'd in Favour of Vitriol.

Theſe ſaline Aſtringents have a Property peculiar to themſelves, which ſeems oppoſite to the Properties of all other Aſtringents; for they often augment, rather than diminiſh, the Weight of Fleſh; but it is to be remember'd, that this only happens during the laſt Days, and that they always begin to act by diminiſhing the Weight. After they have abſorb'd a Part of the Moiſture of the Fleſh, this Moiſture, with which they are impregnated, diſſolves ſome of their Salts; and theſe Salts, being put into Motion, and ſupported by this Vehicle, enter the Fleſh, join with it, and augment its Weight. Every body knows that Salts prevent Corruption; thus theſe ſaline Aſtringents, not only dry the Fleſh like other Aſtringents, by drawing forth its Moiſture, but they likewiſe embalm it, as it were, with a foreign Matter; but they neceſſarily require a certain Time before they can furniſh that Matter, after which it is eaſy to ſee what will happen, according as they ſhall yield more or leſs Moiſture than they abſorb'd.

We may alſo perceive, that this Accident cannot happen, but when the Salts are not much entangled, but are diſpos'd to a free and eaſy Diſengagement of themſelves; for we have not here a Principle ſufficient for a ſtrong Action, ſince we have only the Moiſture of the Fleſh, and of a Fleſh too that is deſtitute of Life. The ſame Aſtringents would act much more forcibly upon the Parts of a living Animal, which are animated and actuated by their natural Degree of Heat.

Acid Spirits, ſuch as thoſe of Salt and Nitre, Oil of Vitriol, for Mr. *Petit*'s Curioſity led him to try every thing, would in a manner boil Fleſh, and reduce it to a Paſte, if they were us'd pure, and without Moiſture: They muſt, therefore, be lower'd and weaken'd by a great deal of Water, and then they are obſerv'd to augment the Weight of the Fleſh.

As to Cauſtics, when Fire is apply'd to the open Extremity of a Veſſel, its Sides, as ſoon as they feel it, retire, ſhrivel inwards, approach ſo near each other, as to come into Contact, and by that means ſtop up the Veſſel. The external Parts of theſe Sides, which ſuffer the Action of the Fire, feel its greateſt Force, becauſe they are moſt expos'd to it; by which means their Texture is totally alter'd, their Fibres deſtroy'd or confounded to ſuch a Degree, as that they are now no more than a kind of ſhapeleſs Callus, which has no Connection with the animal Life; a dead Fleſh, which, being independent of every other Part, very ſoon falls off of itſelf, and is call'd an *Eſchar*.

Hot Iron, melted Lead, and boiling Oil, may be employ'd; but, as they are very painful, other Subſtances have been found out, which produce the ſame Effect, but in a milder way; becauſe, without being actually made hot, they contain a latent Fire, which will in time diſplay itſelf. Theſe are call'd potential Cauteries, in Contradiſtinction to thoſe of the actual Kind. *Oil of Vitriol*, *Spirit of Nitre*, and *Aqua Regia*, are potential Cauſtics in a liquid, and the Lapis Infernalis is one in a ſolid Form.

The ſubtile or ethereal Matter, or, as other Naturaliſts call it, the Matter of the Fire, makes up all Cauſtics, as well actual as potential, but with this Difference, that in the potential ones, which are originally made by Fire, the Fire for the moſt part cuts out certain Paſſages and Roads for itſelf, which it again takes as ſoon as it is agitated, and put in Motion: Whereas, in Cauteries of the actual Kind, the Fire does not make itſelf Roads or Paſſages which remain; for which Reaſon, when they are cold, they retain no Traces of the former Action of the Fire, and can only produce their Effects when they are hot or burning.

The natural Heat of any living Part, to which a potential Cauſtic is apply'd, join'd to its Humidity or Moiſture, diſſolves and puts in Motion the active Salts of the Cauſtic. The ethereal Matter which had heretofore lain in a manner dormant, begins to circulate with all its Vigour, in the Roads which it had before ſtruck out for itſelf; and thus becomes equivalent to an actual Fire, without the ſame Exceſs of Impetuoſity.

It is a Confirmation of this Theory, that potential Cauſtics do not act forcibly enough upon dead Bodies to produce that Eſchar, which is their laſt Effect upon living Bodies. Carcaſes retain no longer that Degree of Heat which is neceſſary to produce a great Motion in Cauſtics. *Van Helmont* was the firſt who aſſerted this Fact, which Mr. *Petit* afterwards proved by Experiments, which ſet it in a fairer and more open Light.

He diſtinguiſhes potential Cauteries into three Sorts. The firſt act only on Fleſh when the Skin is taken off from it. The ſecond on both Skin and Fleſh. The third upon the Skin only. The two firſt are *Eſcharotics*, or induce an *Eſchar*; the third produces no ſuch Effect. *Hungarian* or Cyprus Vitriol, Arſenic, corroſive Sublimate, *&c.* are of the firſt Kind. Aqua Regia, Oil of Vitriol, Lapis Infernalis, *&c.* belong to the ſecond Claſs. Thoſe, in fine, of the third and laſt Sort, of which Cantharides are the moſt us'd, deſerve only the Name of *Veſicatories*, on account of the Bladders or Veſicles they raiſe on the Skin. They rarefy both the Lymph and Air contain'd in thoſe little Veſſels of the Skin, whoſe Orifices terminate at the Epidermis, or Scarf Skin, which covers them. This violent Rarefaction raiſes the Epidermis, under which a Cavity is form'd, which is forthwith fill'd with dilated Air, and the Lymph pour'd forth from thoſe little Veſſels which are now burſt aſunder. The Epidermis, or Scarf Skin, being ſeparated from the true Skin, ſoon becomes dry, and eaſily comes off, which is equivalent and analogous to Eſchars produc'd by other Cauſtics. *Hiſt. de l' Acad. Royale*, *A.* 1732.

Potential Cauſtics are diſtinguiſh'd from one another, not only by their Salts, which are more or leſs acute, and conſequently do more or leſs, more ſpeedily or ſlowly, penetrate and diſſolve the Texture of the Solids, but alſo with reſpect to the Nature of the Salt, which in Solution acts upon the Humours, either by condenſing or diſſolving them; to ſay nothing of the Quantity in which Cauſtics of this Kind are apply'd, tho' the greater their Quantity, the longer they continue their Action, and the more they extend it both in Breadth and Depth, till all the ſaline Subſtance be perfectly diſſolved, and ſufficiently diluted, by the Humours of the Veſſels, or become abſolutely inert; for it is to be obſerv'd, that ſolid Cauſtics act more ſlowly, but longer, than liquid. *Ettmuller*, *Tom.* 2. ſays, "That potential Cauteries are diſtinguiſh'd, with reſpect to the Nature of their "corroſive Salts, into alcaline and acid. To the firſt belong "all lixivial acrimonious Salts, and among theſe, in a more "particular manner, the coagulated Salt, obtain'd from the "Lixivium of Soap-boilers; as alſo thoſe Salts, which, beſides "other Subſtances, have quick Lime for an Ingredient. This "Species of Salt, preſerv'd in a warm and dry Place, that it "may not be diſſolv'd by the Moiſture of the Air, is highly "extol'd by *Ludovici*, who informs us, that no Cautery is "either more ſafe or efficacious. Theſe alcaline Cauteries, "however, are not ſo properly and commodiouſly us'd, be"cauſe, by their Diſſolution, they putrify the Part to which "they are applied, and ſoon after produce a black Spot, and "a fetid Cruſt, reſembling a beginning Gangrene. Acid "Salts, on the contrary, more or leſs concentrated, operate "more ſpeedily, ſince they only corrode, and by corroding "wound the Part more deadly: Hence they induce firſt a red, "and then a white Eſchar. But, among theſe Acids, the "moſt conſiderable is Silver diſſolv'd in Aqua-fortis, which, "by Inſpiſſation alone, yields a Powder of a whitiſh dark Co"lour, call'd *Lapis Infernalis*, of which the Bulk of a com"mon Pea is to be laid on the Part to be cauteris'd, apply"ing a Plaiſter over it. Thus this Powder, in conſequence "of the Aqua-fortis, concentrated in it, begins to operate "like the Biting of Fleas. This ſame Powder is to be uſed "for the fungous Excreſcencies of Ulcers, which it mortifies "and corrodes. The beſt Cautery, next to this, is Butter of "Antimony, incloſed in the Cavity of a Quill." *Elias Camerarius*, in *Eph. N. C. D.* 3. *a.* 5. *o.* 212. orders the Lapis Infernalis to be prepar'd in the ſame manner directed by *Ettmuller*. The *Emplaſtrum Cauſticum Andromachi* is the Lixivium of Soap-boilers, with the excorticated Grains of Rice and Wheat diſſolv'd in it. *Heurnius* beſtows uncommon Praiſes on his Cautery, made of a Lixivium of Soap alone, boil'd into a black Subſtance, and then calcin'd into a Stone. In order to make the Mineral Cauſtic of *Angelus Sala*.

Take of the ſtrongeſt Aqua-fortis four Ounces, and of the Oil of Vitriol one Ounce, place them in a Matraſs in Balneo Mariæ, and diſtil off the Phlegm; add of ſublimate Mercury, or Sal-ammoniac, two Drams. The Solution obtain'd is to be kept in a well-ſtopt Phial for Uſe.

This Preparation is ſaid to be a Specific againſt peſtilential Tumors, Cancers, callous Fiſtulas, Gangrenes, and all fungous Excreſcencies of the Fleſh. It is to be applied upon a Pledget, and where 'tis neceſſary, a defenſative Plaiſter muſt be laid round it. It is commended, becauſe it quickly, and without great Pain, produces a ſoft and eaſily ſeparable Eſchar. *Tenzelius* thinks the arſenical Magnet deſerves the ſame, if not greater Encomiums, becauſe it operates without producing an Inflammation or painful Corroſion; and that, for this Reaſon, it is highly proper for Patients of Diſtinction, or of a delicate Turn. But, according to *Bartholine*, the Cauteries prepar'd of ſublimate Mercury are highly dangerous, and produce Inflammations and Pains of the Parts, ſo that in the Hands of a great many Surgeons they produce terrible Effects, unleſs when corrected with Camphire. The ſame Author, in his *Hiſtoriæ Anatomicæ*, *Cent.* 5 *Hiſt.* 36. informs us, that the *Daniſh* Surgeons

geons think the Aſhes of the *Fraxinus*, or common Aſh-tree, a highly ſafe Ingredient in their Cauteries. Theſe Aſhes they prepare in the following manner:

Removing the external rough Bark, they take the middle Bark, which, when cut in Pieces, they dry and burn. The Aſhes, when paſs'd thro' a Sierce, they put into a ſmall Bag of worn Linen Cloth, which they immerſe in warm Water till it is thoroughly warm: After this the Bag is immediately applied to the deſtin'd Part, and cover'd with Plaiſters.

The Operation is ended in the Space of four or five Hours, and the Eſchar falls off in as many Days. No Pain, nor any other Symptoms, are produced. But this Cautery is attended with two Diſadvantages; the one is, that the Bark ought always to be recent; and the other is, that it diſſolves and ſpreads far. A Cautery, prepar'd of Aqua-fortis and Orpiment, is ſo efficacious and commodious, that I have been ſurpris'd, ſays *Bartholine*, at its Operation. Quick-lime alſo, when it can be had, operates as a Cauſtic, if it is mix'd with Soap, and included in a perforated Piece of Leather. They who deſire a Cauſtic in a dry Form, may commodiouſly uſe one prepared of a Piece of Silver, diſſolved in Aqua-fortis, and evaporated in a proper Veſſel over a Fire. Other Cauteries conſiſt of common Coal; but the Pain, attending the Uſe of theſe, is to be dreaded. *Bartholine*'s potential Cautery, which acts ſpeedily, and without any conſiderable Pain, is, in his *Ciſta Medica Hafnienſis*, order'd to be prepared in the following manner:

Take of white Tartar, calcin'd, one Part; of the Aſhes obtain'd from the Stalks, Trunk, and Knots of the Oak, each two Parts: Diſſolve them in a ſufficient Quantity of the Lixivium of black Soap, and make into a Stone, according to Art.

Barbette, in his *Surgery*, extols his Cautery, which operates without exciting any Pain, and which is prepared in the following manner:

Take of crude Sulphur, white Arſenic, and crude Antimony, each two Ounces: To the Sulphur, melted by itſelf over a gentle Fire, and ſtir'd with a Spatula, add the Antimony and Arſenic, reduced to a Powder. Let them be mix'd till they incorporate with the Sulphur, and become red. Then take of this Mixture, one Ounce; and of the Caput Mortuum of Vitriol, half an Ounce: Mix up into a Powder, to be ſix times waſh'd with Spirit of Wine, and dry'd for Uſe.

According to *Hoffman*, in his Annotations on *Poterius*, the beſt and ſafeſt potential Cautery is the Infernal Stone. Liquid Cauteries, ſuch as the Butter of Antimony, and concentrated Spirit of Vitriol, operate leſs ſucceſsfully, by reaſon of their diffuſing themſelves unequally. So various are the Materials of potential Cauteries, and the Methods of compoſing them ſo different, that it is no Wonder, if many, obſerving the happy Effects of their own Compoſitions, keep them as Secrets to themſelves; ſince human Nature has, in all Ages, been ſo mercenary, that Men keep the Arts, in which they excel others, as ſo many Myſteries. There are various Forms of potential Cauteries, exhibited under different Titles, in the ſeveral Diſpenſatories; but theſe we ſhall not here enumerate, becauſe any one may have recourſe to them at Pleaſure.

The celebrated *Heiſter*, in his Surgery, gives Directions for making an excellent cauſtic Stone, in the following manner:

Take of Pot-aſh, and the ſtrongeſt Quick-lime, equal Quantities, of each, for Inſtance, ſix Ounces; or, of Pot-aſh, one Pound, and of Quick-lime, ſix Ounces; which, when pounded ſeparately, are to be mix'd. Then, putting them in a large Glaſs or Pot, a large Quantity of Water is to be pour'd upon them; and they are to ſtand for an Hour or two, till they are ſufficiently incorporated with each other: Then what is colliquated is to be ſeparated from the ſubſiding Maſs, ſtrain'd thro' a Linen Cloth, and condenſed in an Iron Veſſel over a Fire. After which this conſiſtent Maſs, being put into a Crucible, is to be fuſed over a briſk Fire, till it aſſumes the Conſiſtence of Oil. Then it is to be pour'd into a Veſſel or Mortar; and, before it is entirely cold, it is either to be cut in Pieces, or broken, and kept for Uſe, in a cloſe ſtopt Glaſs, in a dry Place.

From this Glaſs we take what is ſufficient for opening an Abſceſs, and apply it either whole, or groſly pounded in a Mortar, ſecuring it on the Part affected. If any moiſt Subſtance is laid upon the Cauſtic, it generally operates, and corrodes the ſubjacent Parts ſooner, in the Space of an Hour or two, for Inſtance; but, when it becomes old, it generally loſes its corroſive Quality. *Albucaſis*, in the firſt Part of his Surgery, and the forty-third Chapter *de Methodo Cauterizandi in Sciatica*, orders a potential Cauſtic in a liquid Form, under the Name of a *Sharp Water*, to be prepared in the following manner:

Take of Alcali, or the fix'd Salts of Kali, and of unſlaked Lime, each equal Parts: Triturate both, and put them in a new Pot, whoſe inferior Part is perforated with a ſmall Hole; then place under the Bottom of the Pot another glaz'd Pot, and pour upon the Alcali and Lime as much freſh Water as may riſe a Digit above them: Then compreſs them well with your Hand, and leave the Pot till the *Sharp Water* be deſcended into the lower Part of the glaz'd Pot. After this, take and pour all the Water upon more Lime, and let it diſtil anew. By this means you will obtain a Water of a very ſtrong Sharpneſs, of Uſe in many Operations of Medicine, and in cauteriſing of Amputations.

The *Cauſticum Holoſericum*, in the *Pharmacopœia Bruxellenſis*, is prepared of

Aſhes of the Stalks and Pods of Beans, and Aſhes of the Wood of Oak, of each one Pound and a half; Pot-aſh, half a Pound; Quick-lime, two Pounds; and Roch-alum, two Ounces: Mix the Aſhes and Pot-aſh, and put them into a large glazed Veſſel, full of clear River Water, in which ſlake the Lime. Let them macerate for two Days, ſtirring them now-and-then with a Stick, that the Lixivium may be the more acrid; and then add the Roch-alum pulverized: This being diſſolved, ſtrain it thro' a Linen Cloth ſo often till it be ſufficiently clarify'd. Boil this Lixivium in a glaz'd earthen Pot, over a pretty large Fire of Coals, continually ſtirring it, till the Humidity of the Water be almoſt evaporated: Towards the End, let the Fire be ſuffer'd to decay, till the Lixivium concretes into a ſaline Paſte, which is to be made into little Balls, of the Bigneſs of a Lentil or Pea, to be uſed in cauteriſing: Let them be repoſited in a warm Place, in a Glaſs Veſſel, well ſtopp'd, that the Air may not melt them.

The Cauterium ὁλοσηρικὸν (*Holoſericum*) of St. *Ambroſe*, as it is call'd, in *Bauderon*'s *Pharmacopœia*, is made of Aſhes of the Stalks and Pods of Beans, and Aſhes of the Wood of Oak, each three Pounds; with four Pounds of Quick-lime. Theſe two laſt Cauteries take their Name (*Holoſericum*, purely ſilken) from the Gentleneſs of their Operation, which is ſaid to be almoſt without Pain; whence alſo they are call'd, in *French*, *Cauteres de Velours*, "Velvet Cauteries." One like theſe, according to *Cardan*, quoted by *Schottus* in his *Jocoſeria*, is made of a very ſtrong ſaponaceous Lixivium, Quick-lime, and Oak-aſhes, with an Addition of Vitriol. *See Cardan de Subtilitate*, *Lib.* 7. How to prepare one with leſs Trouble, call'd the *Indolent Cautery* of *Platerus*, of only a ſaponaceous Lixivium and Quick-lime, ſee under CALX. It is a great Queſtion, ſays *Wedelius*, in his *Medicamentorum Facultates*, whether there be an indolent Cautery; and, comparatively ſpeaking, it may be anſwer'd in the Affirmative; for Cauteries which are of an active Quality, and ſpeedily corrupt the Part, excite little or no Pain; ſuch is a Cautery of Cryſtals of Silver, prepared with Aqua-fortis. We experience the ſame thing in our Bodies, not only externally in a Gangrene and Sphacelus, where, on the Principles of Mechanics, we may very rationally ſuppoſe the Action of ſome ſuch cauſtic and corroſive Salt; but alſo internally, in the indolent Dyſentery, where there is a ſudden Acceſſion of Acrimony to ſo high a Degree, as to cauſe a total Deprivation of Senſe, in which Caſe nothing but abſolute Death can be expected.

The Lunar Cauſtic is in the *Edinburgh Diſpenſatory*, and, by *Boerhaave*, call'd *Lapis Infernalis*; for the Preparation of which ſee the Article ARGENTUM. But the *Lapis Infernalis*, or *Septicus* of the *London Diſpenſatory*, is a very different Thing, and order'd to be thus prepared:

Let the ſtrong Lixivium, which is uſed in making Soap, be boil'd in a Pan to the Hardneſs of a Stone; taking care, however, that all the Liquid does not exhale, and dry away: When it is cold, cut it in ſmall Pieces, and keep it in a Glaſs, cloſe ſtopt, for Uſe.

Another Way of making the *Lapis Infernalis* is this:

Take of Vitriol, calcined to Redneſs, two Ounces; of Sal Ammoniac, one Ounce; of Tartar, calcined to a Whiteneſs, and Quick-lime, each three Ounces: When they have been melted together, pour upon them the Lixivium of Fig-tree, Spurge, or Soap-lees, and paſs it thro' them till almoſt all the Matter is waſh'd away with it. Let the ſtrain'd

ſtrain'd Liquor be boil'd, in an earthen Veſſel, to a Conſumption of its Humidity; and what is left be put into a Glaſs, well ſtopp'd, to be kept for Uſe. *London Diſpenſatory.*

Boerhaave's Method of preparing the *Lapis Septicus*, or Potential Cautery, is ſomewhat more diſtinct.

Take Lime, made of burnt Stones, that is quite freſh, very dry, ſolid, not affected by any Moiſture, nor as yet cleft aſunder; of this put one Part into a clean Iron Pot, and lay upon it two Parts of the pureſt Pot-aſh, in ſuch a manner, that the Lime may be cover'd all over with this Alcali. Let theſe be then left together in the Pot, with a Cloth flung over them, till the Lime begins to crack, and ſplit aſunder. When you obſerve this, add four times their Weight of Water, and boil them for the Space of one or two Hours. When the Fœces are ſubſided, pour off the Liquor, and let it be ſtrain'd thro' *Hippocrates*'s Sleeve, made of thick Linen Cloth, till it at laſt paſſes thro' as limpid as pure Water. Put this Lixivium into a large Iron Ladle over the Fire, and, taking care that it don't boil over, evaporate it till it becomes perfectly dry. Then increaſe your Fire till the Ladle grows red-hot, and, as ſoon as ever the Salt has done ſmoking, it will melt. When it is in this State, pour it out upon a hot Braſs Plate; and, whilſt the Matter continues very ſoft, make it ſmooth, and cut it into ſuch Pieces as are fit for chirurgical Uſes. Let theſe be put into a very dry, hot, ſtrong Glaſs Bottle, by the Fire-ſide, and inſtantly ſtop it with a choice dry Cork: Let the Mouth of the Bottle be then dipt in melted Pitch, and be very accurately ſecured, that no Moiſture may poſſibly get thro' it, which is attracted by the Alcali, prepared in this Manner, with an incredible Power, even thro' Corks and Bladders: But, if you obſerve theſe Cautions, it may be kept pure for Years. When you want to take a Bit out for Uſe, it muſt be done in a dry hot Air, or near a good Fire, and then the Bottle muſt be immediately ſtopt again, as before.

REMARKS.

1. This Salt, from the truly igneous Virtue of the Lime attracted into the fix'd igneous Alcali, acquires a moſt acute and quick corroding Power, which was neither in the Alcali nor the Lime, when they were ſeparate. The Acrimony of it exceeds that of all other Salts hitherto known; for if you cut a round Hole in a ſticking Plaiſter, and apply this to the human Body, and then put a Bit of this Salt upon the Skin in the Vacuity, and cover it over with another Plaiſter, that it may not fall off, it will, in a very ſhort time, conſume the Skin, and the Membrana Adipoſa; and hence it is valued by the Surgeons, for what they call their Potential Cautery, above all others.
2. If almoſt any Parts of Animals are thrown into a freſh Lixivium of this Salt, whilſt it is boiling, they will, in a ſhort time, be converted into a liquid Matter; as will likewiſe moſt vegetable Subſtances, and the Sulphurs of Foſſils. A poor Man, unfortunately falling into a boiling Copper of ſuch a Lixivium, had his Clothes, and all the ſoft Parts of his Body, conſumed, ſo that there was found nothing of him left, but his Bones: Hence this Lixivium is of incomparable Service, where the Parts are gangrenous to a great Depth, and almoſt ſphacelated, as it diſpoſes them to a happy Separation; but it requires the prudent Application of a ſkilful Surgeon.
3. This Salt melts with a pretty moderate Fire, and then it runs like Wax. By this eaſy Fuſion, therefore, it is capable, without the Aſſiſtance of an intenſe Fire, of diſſolving a great many Bodies, which, otherwiſe, are not diſſolved without Difficulty, as Myrrh, Gum Sandarach, and others. The antient Chymiſts wrote a great deal about the Art of making Alcalis melt in the Fire like Wax; and hence they called the Operation *Inceration*. Might they not mean the Proceſs we have juſt now deſcrib'd? Certainly the Salt, produced by it, has this Property.
4. If Lime is firſt ſlaked, or extinguiſh'd, either in the Air, or with Water, as almoſt all old Lime is, or is converted into a fine Powder; then, if it is thus managed with a fix'd Alcali, it will not produce this acrid Kind of Salt. This Salt, when it is once melted in the Air, or is kept by a good while, not carefully ſtopt, loſes this ſingular Virtue; and then it depoſits a large Quantity of inactive ſtony Fœces, which did not appear before: Hence, therefore, we learn, that Fire communicates to inert Stone, and Shells of Fiſh, an Acrimony, that is not eaſily procurable in any other manner. When a native vegetable Salt, therefore, from a natural, ſoft, ſaponaceous one, is converted into a fix'd Alcali, does it not acquire this Acrimony from the Fire?
5. The Salt, thus prepared, obtains this ſingular Property, that it becomes vaſtly diſpoſed to a Union with the expreſs'd and diſtil'd Oils both of Vegetables and Animals, and thus to form a Soap. And this ſeems to ariſe from its being render'd ſo exceedingly penetrating, that it becomes capable of intimately dividing theſe Oils, and uniting with them, which, without the Aſſiſtance of this ſharp Lime, can ſcarcely be effected conveniently: Nor, without the Lime, would the Alcali run ſo eaſily in the Fire; for that melts with a great deal of Difficulty.

The Uſe of Cauteries, eſpecially actual ones, is of very great Antiquity, as we may learn from *Hippocrates*, who relates, that, among the *Scythian Nomades*, may be found many burnt in their Shoulders, Arms, Wriſts, Breaſts, Hips, and Loins; that, living in a flat Country, abounding with Meadows, in a humid Air, and drinking the Water of diſſolved Ice and Snow, and, beſides, uſing no bodily Exerciſe, they become unable to bend a Bow, or throw a Dart, by reaſon of the Weakneſs of their Shoulders, occaſion'd by an Exceſs of Moiſture; but after they are burnt, and the Joints by that means freed from their ſuperfluous Humidity, they grow more robuſt in Body, and ſtronger and more pliable in their Joints. We read, in the ſame Author, that it is cuſtomary for the Wives of the *Scythian Sarmatæ*, who live about the Lake *Mæotis*, to burn off the Right Breaſt of their Female Infants with a Copper Inſtrument, heated in the Fire; leſt it ſhould be a Hindrance to them, when adult, and engaging with the Enemy on Horſeback, in drawing the Bow, and throwing the Dart. *See* Hippocrates *of Air, Water, and Situations, under our Article* AER. What *Herodotus* relates of the *Libyans*, a Nation of *Africa*, is alſo worthy of Obſervation. The *Libyans*, he ſays, who live by feeding of Cattle, have a Cuſtom, whether obſerved by all or moſt of them I am not certain, which is to burn the Veins on the Crown of the Head of their Sons, when four Years old, with greaſy Wool: Some burn the Veins of the Temples. The Reaſon they give for this Practice is to prevent Defluxions of Phlegm from the Head; and they attribute their healthful and ſound Conſtitutions to the Obſervation of this Cuſtom; and, indeed, the *Libyans* are, of all People that are known to us, the ſoundeſt in their Bodies. If the Boys be ſeiz'd with Convulſions, under the Operation, they have found out a Remedy for them, which is, to ſprinkle on them the Urine of a Goat. *Herodotus, Lib.* 4. *Helmont*, therefore, ſeems to be in the right, when he ſays, that Catarrhs invented Cauteries; but he is miſtaken, when he ſubjoins, that Cauteries were an Invention of the Schools of Phyſicians, ſaying, "What God has "made entire, that it might be in its beſt and moſt perfect "State, Phyſicians have attempted to rectify by inflicting "Wounds, and keeping them open; ſo that to be often "wounded, and to preſerve a Diſſolution of the Continuity of "Parts, is a Precept for Health among the Schools. It is a "Wonder, that Phyſicians have not preſcrib'd Wounding as "one Means of Health, as well as Cauteries, which are con-"ſtant and durable Wounds." Among the *Turks* and *Arabians*, when they are affected with a Pain of the Head, or a Defluxion upon any Part of the Body, they cauteriſe with a hot Iron, Tinder, or burning a Linen Cloth, without conſulting a Phyſician, as we are inform'd by *Belon* in his Obſervations, and in *Thevenot*'s Travels. It was an uſual Practice in *Egypt*, among the *Egyptians*, and eſpecially the *Arabian* Horſemen, who lived in Tents, and others who inhabited the Deſerts, in the Time of *Proſper Alpinus*, as himſelf obſerves in his *Medicina Ægyptiorum*, to apply a Cautery for the Cure of various Diſeaſes. You may ſee Multitudes, he ſays, who ſhew, by their Eſchars, that they have been cauteriſed in many Places; as, for Inſtance, in ſeveral Parts of the Head, as the Sinciput, Occiput, and other Parts, on the Temples, behind the Ears, on the Neck, Breaſt, Sides, Hypochondria, under the Navel, on the Spine of the Back, and the Articulations of the Arms, Hands, Legs, and Feet. And he aſſures us, that all the Inhabitants of that Country regard Burning as a choice Secret in the Cure of many Diſeaſes, which reſiſt other Remedies. But they make no Uſe, he ſays, of Iron, Gold, or any other heated Metal, or Box-wood, for this Purpoſe, but Cotton, or Linen Cloth, ſet on Fire. Thus, when they intend to cauteriſe any Part of the Body, they take a Piece of Linen, a Cubit long, and three Fingers in Breadth, and a due Quantity of Cotton, which they roll up in the Linen, and tie with a ſilken Thread, in the Shape of a Pyramid, the broad End or Baſe of which they apply to the Place which is to be cauteriſed, taking care that it ſhall adhere well to the Skin: They then ſet Fire to the Head, or leſſer Extremity, and ſuffer it to burn till the Linen and Cotton be totally conſumed, continually touching the Fleſh round about with Iron, all the while the Skin is burning, in order to prevent an Inflammation from the Heat; obſerving alſo, in the making up of this pyramidal Maſs, to leave a Hole or Paſſage in the Middle, for the ſake of ventilating the Fire: After Burning, they apply Marrow of Bones to the Place till the Eſchar falls off. The Uſe of this

Remedy

Remedy is very common in this Country, for many Sorts of inveterate Pains in the Knees, and other Joints and Parts of the Body, which owed their Riſe to a Defluxion of cold Humours, or a ſimple cold Diſtemperature, or a flatulent Spirit, either generated in the Part itſelf, or tranſlated thither from elſewhere. This Way of Burning or Cauteriſing cures theſe inveterate Pains, corrects every Imbecillity of the Parts, diſſolves groſs Humours, diſcuſſes Flatulencies, heats the Joints, and, by potently drying, corroborates them. It is no Wonder, then, that they uſe this Remedy with good Succeſs, in all obſtinate Pains of the Joints, and eſpecially in the Sciatica; in which Caſe they cauteriſe often not only upon the Joint, but alſo upon the Thigh. It is of no leſs Service in the Gout in the Feet or Hands, before the Generation of Tophi; for they cauteriſe the Joints, and the incumbent Veins, when the Pain ſeizes the Joint of the great Toe; and cauteriſe the Joint between the Thumb and fore Finger, by which means the Paſſages are render'd too narrow for the Flux of the Humours to the infirm Joints, and conſequently the Patient is leſs ſubject to the Gout. Thus the *Egyptians*, by cauteriſing, correct the Laxneſs and Debility of the Joints, and procure Strength to them, by which they are enabled to reſiſt the Influx of the Humours: Cauteriſing, therefore, is a moſt approved Remedy to be applied to all Parts, which are affected with Defluxions of Humours. But it is the Cuſtom to cauteriſe not only the Parts moleſted with a Defluxion, but alſo the Parts from which the Humours are tranſmitted; for which Reaſon they uſe frequent Cauteriſings of the Head, in all Defluxions or Diſtillations, as they are call'd, from that Part upon the Breaſt or Lungs, cauteriſing the Sinciput, the Crown of the Head, the Occiput, and behind both Ears. They practiſe the ſame in long-continued Lippitudes, and other inveterate Diſtempers of the Eyes, in Epilepſies, Palſies, Apoplexies, Vertigos, Madneſs, Stuffings of the Head, Stupor, Decay of Reaſon, and immoderate Sleep. They cauteriſe the Temples under violent Pains of the Eyes, Ears, and Teeth, occaſion'd, as they ſuppoſe, by Diſtillations from the Head. They cure periodical Pains of the Teeth, with Laxneſs and Putrefaction of the Gums and Teeth, by Cauteries, applying them both to the Parts whence the Humours are tranſmitted, and to thoſe which, by their Weakneſs, are diſpos'd for their Reception. For this Reaſon they find cauteriſing the Breaſt to be of Service in an Aſthma proceeding from cold, groſs, and viſcous Humours moleſting and clogging the Lungs and Aſpera Arteria; and for ſuch Patients as are affected with malignant Diſtillations from the Head upon the Thorax, or Spitting of Blood, from an Eroſion of ſome Vein by the ſame Humours, they cauteriſe both the Head and Breaſt; for thoſe who labour under a Phthiſis and Suppuration, whence they are call'd *Empyi*, they only cauteriſe ſome Parts of the Breaſt. Many, labouring under a Suppuration, have been reſtor'd to Health by three or five Applications of the Cautery to the Breaſt and Back; for the Pus continually diſcharged itſelf by the Wounds till it was all evacuated; and this Method is none of the moſt dangerous, becauſe the Pus is diſcharged ſlowly and inſenſibly. *Dominicus a Rege*, aged forty Years, living in *Cairo*, was affected many Years with a troubleſome Aſthma, and had try'd a Multitude of Remedies to no Purpoſe; at length, being almoſt exhauſted, and coming into a Conſumption, he reſolv'd, as his laſt Refuge, to have recourſe to the *Egyptian* Remedy of cauteriſing the Breaſt with a triple Cautery: After the Operation, he kept the Ulcers open for a conſiderable time, and, by that means, recover'd his Health. They uſe the ſame Remedy for a cold and moiſt Stomach, which is moleſted with Flatulencies, and a Defluxion of Humours: They cauteriſe alſo very ſucceſsfully in caſe of an indurated and refrigerated Liver and Spleen. In a Dropſy they cauteriſe in many Parts, particularly in three Places under the Navel, keeping the Ulcers open, that the Water may diſcharge itſelf that Way; others apply a Cautery to the Stomach, Spleen, and Liver, as well as under the Navel. In moſt Caſes they uſe Cauteriſing as aforeſaid; tho' they often apply alſo Corroſives, or potential Cauteries, ſome uſing them under the Ankle-bones, others above the Knee, both on the Inſide and Outſide, keeping the Ulcers open for ſome time. Some cauteriſe or veſicate the Legs in the ſame manner, and from the Veſicles produce Ulcers, by which they gradually make a thorough Evacuation of the Water.

By this manifold Cauteriſing they cure the Aſcites, with the Hernia aquoſa and carnoſa. In hydropical Caſes it cannot ſeem ſtrange, that the Patient ſhould receive Benefit from Cauteries, both actually and potentially drying, becauſe the Water is, by ſuch means, conſum'd; but I have often ſeen the Hernia carnoſa cur'd by them, as well as all ſorts of cold œdematous and ſcirrhous Tumors; and I am aſſur'd, that even a Scirrhus, which is generated of groſs Phlegm, is remov'd by the ſame Remedy. In Pains of the Back, Loins, Neck, and of all the Joints, the common Remedy is a Cautery, apply'd to the Spine of the Back, Loins, Neck, or other Parts where the Pain is ſeated. For Swellings, proceeding from crude and pituitous Humours, a Cautery is their chief Remedy; which they aſſert alſo to be proper for the Poor, becauſe it is a ſpeedy Cure for many Diſeaſes. To conclude, Burning or Cauteriſing is the boaſted Remedy of theſe People, which they prefer, before many others, in the Cure of inveterate Diſeaſes. Thus far *Alpinus* of the practical Uſe of Cauteries in *Egypt*. Among the *Arabians*, the Uſe of actual Cauteries is very common for thoſe Parts of the Body in which they feel any Pain, as we are inform'd by the Chevalier *D'Arvieux*: And *Kæmpfer* writes, that the *Chineſe*, *Japoneſe*, and other *Aſiatic* People, make uſe of actual Cauteries in almoſt all Diſtempers. Theſe Cauteries are of various Kinds, according to the Difference of the Diſeaſe; but they reject the Uſe of hot Irons. The ſame Author ſhews us, that, among ſome of theſe Nations, Cauteriſing is of very antient Date, and was practis'd before the Invention of Medicine itſelf, or any other Part of Surgery. The Matter with which they cauteriſe is generally the *Moxa*. This they make up, with their fore Fingers, into the Shape of a Cone, about an Inch in Height, and ſomewhat leſs at the Baſe, which they apply to the Part affected, ſometimes wetting it with Spittle, to make it ſtick the better: Then, with a very ſlender burning Stick or Rod, they ſet Fire to the Top of the Cone, and ſuffer it to burn out; after which they apply another to the ſame Place, and repeat the Operation as often as the Intention of the Phyſician, or Operator, ſhall require. The illuſtrious Author acquaints us, that he has ſeen no Part of the Body more mark'd with theſe Combuſtions of Moxa than the Back, on both Sides of the Spine, down to the Loins, ſo that you would ſwear, that ſome of their Backs, eſpecially in *Japan*, had been under the Executioner's Laſh, ſo many Marks, and deep Eſchars of Ulcers, were there to be ſeen on both Sexes. *Kæmpfer*'s *Amœnitates Exoticæ*. Nor were the *Americans* ignorant of the Uſe of actual Cauteries for Pains in any Part of the Body; for they cauteris'd the Part affected with a burning Piece of Wood. In *Tuſcany*, and ſome other Countries of *Italy*, as *Mercurialis*, in his *Variæ Lectiones*, informs us, it is an antient Cuſtom to cauteriſe the Boys, while ſucking at the Breaſt, or, when a little bigger, with a hot Iron, in the Occiput, as a Preſervative againſt phlegmatic Diſeaſes, and eſpecially the Epilepſy. And *Linnæus* aſſures us, that the chief and laſt Remedy, and which ſeldom fails, among the Inhabitants of the *Swediſh Lapland*, who have no Phyſicians, for all Pains, which are not attended with any remarkable external Inflammation, as the Head-ach, Tooth-ach, Pleuriſy, Colic, and Pain of the Back, is an actual Cautery, made of the Wood of an old Birch-tree.

From the Premiſſes we are doubtleſs convinc'd, that the Method of curing many Diſeaſes by Cauteries has been approv'd by the Experience of many Nations, for a long Courſe of Time, from the remoteſt Ages. From Men the Uſe of the Cautery ſeems to be tranſplanted to brute Animals, and to make a Part of that Care and Medicine which they require, if we may reaſon from *Vegetius*, who, *Lib.* 1. *Cap.* 28. calls the Cautery *Noviſſima Cura*, the laſt Thing to be try'd upon a diſeaſed Animal, the Benefits of which Operation I ſhall here tranſcribe from that Author; and tho' they are ſpoken with regard to Quadrupeds, I doubt not but they will be agreeable enough to the Sentiments of thoſe who have dedicated their Time and Service to the Cure of thoſe Diſtempers which afflict the human Body. "Burning," ſays *Vegetius*, "conſtringes Luxations, "attenuates Inflations, dries up Humidities, diſſolves Coagu- "lations, extirpates Cancers, eaſes inveterate Pains, reſtores "thoſe Parts of the Body which are alienated from their natu- "ral State, let the Cauſe be what it will, to a due Order, "and puts an effectual Stop to the Growth of all Excreſcences: "For, when you have made a Breach in the Skin with the hot "Iron, every Corruption is concocted and maturated, and, "being diſſolv'd by the Benefit of the Fire, is diſcharg'd, with "the Humour, through the Paſſages which are made, by which "means the Diſeaſe is cured, and the Pain removed; and "when afterwards the Wound is cicatriz'd, the Place is ren- "der'd more tenſe and robuſt, and the Skin almoſt indiſſo- "luble."

If we conſult thoſe Authors who have ſpent their Time to very good Purpoſe in furniſhing themſelves with an Hiſtory of Medicine from the Writings of the Antients, we ſhall have little Room to doubt, that Cauteries were frequently uſed, in many Diſtempers, by the antient Phyſicians of all Sects, *Greeks*, *Latins*, and *Arabians*, from whom the Knowledge of Medicine was convey'd down to us. *Barchuſen*, in his *Collecta*, ſays, that of Phyſicians who uſed Burning in the Cure of Diſeaſes, the firſt ſeems to have been *Euriphon Cnidius*, whom *Cœlius Aurelianus* reckons among the moſt antient Inventors of Medicine; and it is ſuppos'd, that he was the Author of the *Cnidian Sentences*, mention'd by *Hippocrates*. This Perſon lived an Age before *Hippocrates*, or, at leaſt, was cotemporary with him, but older. Thus *Barchuſen*. And *Schulzius*, in his *Hiſtoria Medicinæ*, rightly obſerves, that *Hippocrates* was not much apprehenſive of Danger in the Uſe of Cauteries. *Le Clerc*, *Hiſtoire de la Medicine*, *p.* 472. ſeems to be of Opinion, that Cauteries were rejected by the Methodics, becauſe according to *Cœlius Aurelianus*, they were cruel and ſuperfluous; but that

Author

Author ſpeaks only of a certain Caſe, which is the Cephalæa, or an obſtinate Pain of the Head. But *Celſus* recommends the Uſe of Cauteries in many Caſes. *Albucaſis*, a very eminent *Arabian* Writer, in his Book of Cauteries, ſeems to be in a Rapture, when ſpeaking of the divine and ſecret Virtue of Fire. He gives an Account of fifty Diſtempers in which they may be of Service, and in which he actually experienc'd the Method himſelf: And it is certain, that by this Operation, however painful and terrible, great Cures have often been done. He lays down all the Directions for applying them; but he ſays, that thoſe only who have a good Inſight into Anatomy, and know exactly where the Nerves, the Tendons, the Veins, and Arteries lie, ſhould apply them; and, therefore, he adviſes great Caution in this reſpect, and relates the Hiſtory of one who was kill'd, in the Sciatica, for want of this Circumſpection, by cauteriſing the Inſtep, and hurting the Tendons there: And for this very Caſe he deſcribes a Cautery, terrible, he ſays himſelf, to behold, and, therefore, not often us'd by him, yet, however, of very great Efficacy; and, accordingly, he recommends it, in Caſes of Extremity, to his Diſciples. We ſee how much more familiar the Practice of the Cautery was with the *Arabians*, than even with the *Greeks*; and we may the leſs wonder at it, ſince the Way of Burning, by the potential Cautery, had been commonly us'd by that Nation, and had the Name of *Uſtio Arabica* given it many Ages before, as *Dioſcorides* informs us in the Hiſtory of Goats-dung, which was the Material they apply'd. Thus far Doctor *Freind*; from whoſe Words it appears alſo, that, in the Uſe of Cauſtics, there is need of Caution; for Illuſtration of which, give me Leave to quote *Albertus Bottonus*, a celebrated Profeſſor of Medicine in the Univerſity of *Padua*, in the ſixteenth Century, who, in his Book of Womens Diſeaſes, has theſe Words: Cauteries, ſays he, are the Materials of a Remedy, which ſenſibly evacuates, and is indicated by the Humour, which is daily and inſenſibly generated, and, not having its uſual Paſſage, is preternaturally detained within the Body, and, cauſing an Alteration in the ſame, the Symptoms are continually augmented, both in Number and Greatneſs, till the Phyſician, finding other Remedies ineffectual, has recourſe to Cauteriſing; by which means the offenſive Matter, which was gradually collected, may find a proper Vent by which it may be diſcharged. Cauteries are of ſuch general Uſe in our Times, that, in all groſs and ſtubborn Diſeaſes, recourſe is had thereto, as to the laſt and ſureſt Remedy; but as to the Succeſs of ſuch a Practice, let thoſe who have experienc'd it ſpeak for themſelves. For my own Part, I am aſſur'd, that many who have us'd this Method have been ſo far from obtaining the good Succeſs they expected from it, that they have been oblig'd to relinquiſh it. Beſides, this kind of Remedy cannot be adminiſter'd without Danger, ſince we know, by ſad Experience, that it has frequently occaſion'd a Gangrene, and prov'd more fatal to the Patient than the Diſeaſe itſelf could have been. There are various Reaſons to be given, why ſuch an extraordinary Method of Cure has been attempted; one of which may be, the Impatience of the Sick, which incapacitates them for attending on the ſlow and hidden Ways of Digeſtion by which Nature operates in ſubduing the Diſeaſe. A ſecond Reaſon, probably, is the Fault of the Phyſician, who, tho' he ought to regard himſelf as the Aſſiſtant of Nature, neglects to obſerve her Motions, which, if duly attended to, would preſerve him from Error in all his Operations, and direct him in the Way mark'd out for him, and point out the Paſſages by which Nature attempts to diſcharge herſelf of the offenſive Matter; and, if ſuch Paſſages are found to be convenient, ſhe is to be aſſiſted in her Efforts by the Phyſician: But, by the violent making of unſeaſonable Breaches and Drains, we often compel Nature not only to an Evacuation of crude Matter, but to diſcharge it by ſuch Ways as ſhe has neither Ability nor Inclination to attempt. In ſuch a Caſe we not only impede Nature in rightly carrying on her Operations, and provoke her to an Evacuation before a due Digeſtion be made, but direct her Courſe to inconvenient, and oftentimes oppoſite Places, and by violent Means; and if this be the Conſequence, we receive more Injury than Benefit from the Application of a Cautery. Beſides, it often happens, that the Phyſician, who, with all his Art, can do no better, in ſome Caſes, than conjecture, is ignorant of the Situation of the Matter which is to be evacuated; and, if this be unknown, he muſt, of neceſſity, be ignorant of a convenient Place by which it may be diſcharged. Thus, for Inſtance, if we would apply a Cautery with an Intent to make a Derivation, we ought to chuſe a Place near the affected Part; but, if we deſign a Revulſion, we are to find out a Place more remote, but ſituated in a ſtrait Direction with the Part affected. But if we have no perfect Knowledge of the Place where the offenſive Matter is generated, we muſt, of conſequence, remain in Ignorance of the Nearneſs and Remoteneſs, the direct or oblique Diſtances, of other Places with reſpect thereto; whence it comes to paſs, that the Phyſician is diſappointed of his End, and the Patient ſuffers double Miſery during Life.

By the Accounts of Cauteries which we meet with in Authors, it appears,

Firſt, That there is ſcarcely a Diſeaſe in which Burning, or the Uſe of Cauteries, has not, at ſome time or other, been thought ſeaſonable, as well by Phyſicians, as by the *Egyptian*, and other barbarous People; with this Difference, that theſe latter had recourſe to Cauteriſing as a ready and familiar Remedy, but the former never us'd it, before they had in vain try'd other Means. Secondly, That theſe Nations, and the antient Phyſicians, except the *Arabians*, made more uſe of actual than potential Cauſtics. Thirdly, That Men ſeem to have been taught the Uſe of Burning by fortuitous Caſes; and that Nature, now-and-then, takes Occaſion to invite us to imitate her Work; in Compliance with which, the Phyſician directs the making of Fontanels, which are no other than artificial Ulcers, and are pretty well procur'd by Cauſtics. They who recommend Cauteries for the Formation of Ulcers, by whoſe continual Diſcharge of purulent Matter Health may be obtain'd or preſerv'd, ſeem to have Nature declaring in favour of their Opinion, when ſhe labours to expel a Diſeaſe by ſpontaneous Ulcers or Abſceſſes, either by Derivation into a neighbouring Part, or Revulſion to Parts more remote from the Seat of the Diſorder. *Heurnius* commends Cauteries as an excellent Precaution againſt the Peſtilence, aſſuring us, that, by their Benefit, Multitudes of Perſons, who have the Care of thoſe who lie ſick of the Peſtilence, eſcape free and uninfected: They cauteriſe themſelves, he ſays, in many Parts of their Bodies. He adds, that Cauteries are only a Preſervative againſt, but no Cure for, the Peſtilence; for, before it can exert its Virtue, which is after ten Days, the Patient is carried off by the Diſtemper. We have a memorable Obſervation in *Riverius*, which demonſtrates, that the Matter of a Diſeaſe may, by means of ſpontaneous Abſceſſes, and artificial Ulcers, be diverted into remote and oppoſite Parts. A Man, he ſays, who had a long while laboured under a Pain of the Loins, all Remedies proving ineffectual, at laſt dy'd. A little before his Death, among other Means that were us'd, he had a Cautery apply'd to his Thigh, four Fingers Breadth above the Knee, from which, when the Eſchar or Cruſt fell off, there flow'd about half an Ounce of a ſort of Sanies, after which the Cautery every Day diſcharg'd an Ounce or more of true laudable Pus. The dead Body being diſſected, the Lungs were found to be purulent, which was the principal Cauſe of his Death; and in the Loins was diſcovered a large Abſceſs, from whence proceeded that long and obſtinate Pain with which the Patient had been afflicted. From this Abſceſs to the Cautery was traced a Duct, through which ſome Pus flow'd. This is a ſignal Inſtance of the Care and Induſtry of Nature in eliminating the Cauſes of Diſeaſes, for which End ſhe had form'd this Duct at the Abſceſs of the Loins, in order to evacuate and cleanſe it thro' the cauteris'd Part, which, however, ſhe had not Strength to accompliſh, but ſunk under the Work. *Mermannus*, in his *Conſultationes*, ſays he has found, by long and general Practice, that it is ſafer to apply Cauteries to the Arms than to the Legs; that Perſons who have corpulent Bodies, and big Bellies, but weak and ulcerous Legs, which are ſubject to an Eryſipelas, or Inflammations, are no ſafe or proper Subjects for a Cautery. To direct us in our Practice, let us obſerve a few Things from *Mercurialis*. Cauteries, ſays he, ſeem invented by Phyſicians, in Imitation of Nature, who, when ſhe works with a Deſign to free the Patient from ſome chronical or acute Diſeaſe, is accuſtom'd either to expel the morbific Matter out of the Body; which kind of Abſceſs *Hippocrates*, *Epid.* 2. and elſewhere, calls κατ' ἐμφασιν, or to depoſit it on ſome more ignoble Part, which he calls an Abſceſs, κατ' ἀπόθεσιν· and the Event, in both Caſes, is generally happy, when the Abſceſſes fall upon the inferior Parts, or, at leaſt, below the Seat of the Diſeaſe. A Phyſician, therefore, who would follow the Conduct of Nature, muſt cauteriſe in the inferior Parts, or, at leaſt, below the Diſeaſe. He adds, that old Age ought not to deter the Phyſician from the Uſe of Cauſtics; for the Spirits are ſo far from being weaken'd or diſſipated thereby, that they are the more excited, and the natural Heat is increaſed.

But let us hear the principal Objections againſt Fontanels. *Helmont* the Father, diſputing againſt the Uſe of Cauteries in Catarrhs, for preparing a new Emunctory by which Nature might free itſelf, ſays, that by raiſing a Fontanel we obtain not an Expurgation of a malignant Humour from the Body, but only a Diminution of the Blood, ſucceſſively converted into Pus, which is generated in the Ulcer. Of the ſame Opinion is the celebrated *Albinus*, who, in his Diſcourſe on Fontanels, after totally rejecting the Uſe of Cauteries, concludes in the Words of *Helmont*, *Conſulto claudantur Fontanellæ*, "Be ad-"viſed, and dry up your Iſſues."

But omitting Authorities, *Helmont* himſelf grants, that Cauteries may do the ſame Service as may be expected from a continual and inſenſible Diminution of the oppreſſive Redundance of the Blood by Fontanels, and may, therefore, on Occaſion, be of Benefit to corpulent Perſons, great Eaters, plethoric Bodies,

Bodies, and thoſe who lead a ſedentary Life; but then he calls them only palliative Medicines; and tho' he allows they may now-and-then be of Service in Catarrhs, yet the Reaſon of this, he ſays, is not becauſe they evacuate the deſcending Matter of a Catarrh, or divert it another Way, but becauſe they diminiſh the Maſs of the alimentary Blood and Humours.

That, in an artificial Ulcer, or Fontanel, the good Humours which flow thither are converted into Pus, cannot be deny'd, it being a thing evident to all who know, that, in every wounded Place, a Conflux of Liquids, in Conjunction with the half-mortify'd Fibres, generates Pus: And that the Pus, which diſtils from Fontanels, is no other than the Aliment corrupted, *Rodericus a Caſtro* proves by Experience and Obſervation, which ſhew, that an Arm or Leg, in which is a Fontanel, are much more extenuated than the other; for which Reaſon *Ettmuller* ſeems to be in the right, when he preſcribes opening of Fontanels in exceſſively fat and unwieldy Bodies. I will allow alſo, with *Hoffman*, that theſe artificial Ulcers are rather a Preſervative againſt a Diſtemper, and conduce more to a palliative than a perfect and radical Cure. But that all Fontanels, without Exception, ſhould be dried up at once, is contradicted by Experience, which aſſures us, that as old Ulcers, too ſpeedily heal'd, without due regard to the Temperament of the Blood and Humours, induce a Cachexy, ſlow Fever, and different kinds of ſpaſmodical Affections, in Bodies abounding with ill Humours; ſo a too ſudden Suppreſſion of a Flux, by means of Fontanels, produces much the ſame Effects; and one experimental Proof, as *Hoffman* ſays, is worth a hundred of the moſt plauſible Reaſons. The before-mention'd *Rodericus a Caſtro* alſo, after a long Ratiocination againſt Fontanels, adds, "I "would not have any think, that I am abſolutely againſt the "Uſe of Fontanels; I only condemn their Frequency, and "promiſcuous Uſe; for I muſt confeſs, that I have myſelf, "on Occaſion, open'd Fontanels, with very great Benefit to "the Patient." He then propoſes the Caſes in which he judges a Fontanel would be convenient; as, firſt, With reſpect to the Quality of the offenſive Matter, when the ſame is vaporous or pituitous, or, at leaſt, fluid and diluted; ſecondly, With reſpect to the Quantity, when the Diſeaſe is very oppreſſive, and requires Vent at every Part; thirdly, When the uſual Paſſages for the natural Evacuations are ſtopt up; and, laſtly, When the nervous and muſcular Syſtems are affected with wandering Rheums.

Cauteries are alſo of Uſe whenever it ſhall be found proper to act by determining the Humours to or from any Place requir'd; to which Caſe belongs their Application, in order to ſtop the Progreſs of a Sphacelus, where, by opening a Paſſage for the Effuſion of the ſound Humours, we prevent their Communication with thoſe which are corrupted. Their Efficacy is alſo evident in opening Abſceſſes, in the Extirpation or Separation of uſeleſs and corrupted Subſtances, in mitigating Pains, in quickening the Nerves, in drying and ſtrengthening the Parts, and in ſtopping Hæmorrhages. To theſe Caſes, I ſuppoſe, may be reduc'd all the various Actions of cauſtic Remedies. Their Uſefulneſs in opening Abſceſſes, in Extirpation of uſeleſs Parts, as Warts, for Inſtance, and Separation of corrupted Parts, as in a carious Bone, is obvious from Experience, as they deſtroy the Part to which they are apply'd: But that they ſhould eaſe Pains, by ſuppreſſing Motion that proceeds from the Nerves, and is thence communicated to the whole Body, and, again, that they ſhould excite Motion in the Syſtem of the Nerves, ſeem, at firſt Sight, to be contradictory Effects: We muſt therefore obſerve, that when a Cautery is apply'd to a pain'd Nerve, it immediately renders it inſenſible by its Deſtruction. That an exquiſite Pain is excited by the Application of the Cautery, cannot be deny'd; but as ſoon as the Virtue of the Thing apply'd ceaſes to act, the Pain ceaſes with it, the Motion, which was the Cauſe of the former Pain, ceaſing with the Deſtruction of the Part moved. Cauſtics do not, indeed, in themſelves, or immediately, act upon the Cauſe of the Pain, when wandering in the Veſſels, or ſettled in the Humours, but they remove its Effect on a particular Part. Wherefore *Sydenham*, ſpeaking of the Cure of the Gout by Burning, ſays that ſuch a Remedy may contribute ſomething towards the Mitigation of the Pain, by attracting and diſſipating the moſt ſubtile and ſpirituous Part of the morbific Fomes depoſited in the Joints. But Cauteries may be alſo conceiv'd to exert their Influence by ſtimulating the Veſſels, in exciting a new Pain, and, by that means, communicating Motion to the peccant Humours, compelling them to take new Courſes, and ſo relinquiſh the Part affected; or in reſolving, by the excited Motion, tenacious viſcous Humours, and rendering them more fluid; or, laſtly, by diminiſhing the Conflux of the Humours, by deſtroying ſome of the ſmaller Veſſels.

Having thus explain'd the anodyne or ſedative Effect of Cauſtics, it is eaſy to comprehend, at the ſame time, how they are qualify'd to anſwer, upon Occaſion, that other Intention of cauſing Commotions in the nervous Syſtem, in cold Bodies, which require a ſtrong Stimulus: We underſtand alſo the Cauſe why intermitent Fevers may be cur'd by Cauſtics; and why, and at what Seaſon, it is proper to apply them, in order to provoke the Menſes, by deriving the Humours towards particular Places, ſtimulating the inert Veſſels, and exciting a briſk Motion in the Humours. For theſe Reaſons *Amatus* adviſes the Uſe of Cauteries in a cold Catarrh, but will not permit it in a hot one, except in the Intervals of the Diſeaſe; "Becauſe," ſays he, "a Cautery increaſes the Inflammation, and renders "the Matter more fluxile, ſharp, and acrimonious, as we have "experienc'd." *Cent.* 2. & 5. That Cauteries may excite Motions of conſiderable Moment in the Body, appears from an Obſervation of *Hildanus*, where he ſays, that a cauſtic Oil, apply'd to the cancerous Breaſt of a Woman big with Child, had, beſides other diſmal Symptoms, almoſt cauſed an Abortion. But how can Cauſtics be ſaid to be Strengtheners? It is anſwer'd, they work ſuch an Effect, firſt, by diſſipating Humidities, drying, exciting Heat, and ſtimulating the Solids; and, ſecondly, becauſe, when the Cruſt is removed, and the Ulcer conſolidated, the Cicatrix which is induc'd, proceeding from the Veſſels which before were broken, and are now render'd juiceleſs, hard, and callous, cauſes a Rigidneſs of the Part, from a Coalition of the Veſſels, and a greater Conſtriction of the Skin. Hæmorrhages from the ſmaller Veſſels, which is the laſt Effect that remains to be accounted for, are ſtopt by the Action of Cauteries, as it cauſes a Criſpation and Corrugation of thoſe Veſſels by Aduſtion and Conſtriction.

Since an imprudent or unſeaſonable Uſe of the moſt approv'd Remedies diſappoints the Expectation of the Phyſician, it cannot ſeem ſtrange, that Cauteries ſhould ſometimes fail of having the deſired Effect; and, moreover, that the fatal Symptoms, which have often ſucceeded their Application, are ſufficient to perſuade us, that they are of the Number of thoſe Remedies, which a prudent Phyſician never has recourſe to, but in Caſes of Neceſſity. In their Application great Care is required in chuſing a proper Place: Let the Nerves, and Tendons of the Muſcles be avoided; nor let a conſiderable Vein or Artery be cauteriſed, without urgent Indication, for fear of exciting a Gangrene, or a great Hæmorrhage. Suffer not your Cautery to penetrate too deep, and make too great an Eſchar; for this is not only terrible and painful, but hurtful to the Nerves, and ſucceeded by great and continual Pain, and other diſmal Symptoms; and, by the great Suppuration, the Body is exhauſted and weaken'd. In cancerous Tumors, Cauteries are ſeldom or never to be uſed; and *Hippocrates* pronounces Cauteriſing unſeaſonable at ſome Seaſons of the Year [*See his Treatiſe of Air, Water, and Situations, under our Article* AER]. But *Albucaſis* directs a Cautery to be uſed at any Time of the Year, "Becauſe ſome mortal Diſorder may require "ſpeedy Help by this Remedy; and particularly under urgent "and violent Pains, which will admit of no Delay, and where "more Danger is to be apprehended from the Malignity of "the Diſeaſe, than from the painful, tho' tranſient, Action of "a Cautery."

Whether actual or potential Cauſtics are to have the Preference, Authors are not agreed; and it ſeems hardly poſſible to give a general Determination of the Queſtion, becauſe of the Variety of Caſes, in which ſometimes one, ſometimes the other, may be required. *Fienus*, *Lib.* 3. *Cap.* 17. prefers actual Cauteries, where a hard and ſolid Cicatrix is intended to be produced. *Claudinus*, *Lib.* 2. *Sect.* 1. *C.* 7. approves of the actual Cautery in two Caſes; firſt, if it be a noble and principal Part, or, at leaſt, one which wants to be corroborated, that requires the Operation, on which account none but an actual Cautery ought ever to be applied to the Head: The other Caſe is, when the Part requires to be ſpeedily evacuated, cleanſed, and dry'd. *Veſalius* is of the ſame Opinion; and ſo is *Bottonus*, *Gynæc. T.* 2. "For actual Fire, he ſays, will perform "without Pain, and with the greateſt Speed and Safety, Ef-"fects which cannot be expected otherwiſe." *Scultetus* diſapproves of potential Cauſtics, becauſe they operate ſlowly, and generally with a great deal of Pain; and cannot be applied with Safety, becauſe we have no exact Knowledge of their Virtues, and therefore find them ſometimes more or leſs efficacious than we expected. *Hildanus* gives the following Reaſons, why, in the Cure of a Gangrene and Sphacelus, an actual Cautery is, by good Authors, preferr'd before a potential one: (1.) Becauſe Fire, as *Albucaſis* obſerves, is ſomething ſimple, and void of extraneous Qualities, for which Reaſon it leaves nothing behind it but Heat, and an Empyreuma; whereas, on the contrary, a potential Cauſtic, eſpecially Arſenic, Sublimate, and the like, have, and leave behind them, a malignant Quality in the Part affected. (2.) Becauſe Fire has its Action determin'd: Thus, a red-hot Iron operates no farther than the Surgeon pleaſes; whereas the Operation of a potential Cautery is not in the Power of the Surgeon, but in the Quality of the Medicine. (3.) An actual is preferr'd to a potential Cauſtic, for this Reaſon, that, becauſe of the Vehemence of the Fire, it operates in a Moment; but a potential Cauſtic, whoſe Virtue and Power of Burning are only potential, operates ſlowly: Now a Gangrene, being a very acute Diſtemper, and giving no Reſpite, is to be treated with the moſt ſpeedy Remedy, which is a red-hot Iron. (4.) The Redundance of excrementitious Humours in the Gangrene and
